Brooklyn, a twp. of Green Lake co., Wis. Pop. 1339.

Brooks, a county of Georgia, bordering on Florida. Area, 550 square miles. It is intersected by the Ocopilco River. The surface is level and the soil sandy. Corn, oats, rice, cotton, and wool are raised. It is traversed by the Atlantic and Gulf R. R. Capital, Quitman. Pop. 8342.

Brooks, a township of Buena Vista co., Ia. Pop. 71.

Brooks, a post-township of Waldo co., Me., on the Belfast branch of the Maine Central R. R., 13 miles N. by W. of Belfast. It has manufactures of lumber, spools, carriage-wheels, etc. Pop. 868.

Brooks, a township of Newaygo co., Mich. Pop. 974.

Brooks, a township of Cedar co., Neb. Pop. 40.

Brooks (Charles Shirley), an English journalist, lecturer, dramatist, and novelist, born in Oxfordshire in 1815. He produced dramas entitled "The Creole," "Our New Governess," etc. Among his novels are "Aspen Court" (1857), "The Silver Cord," and "Sooner or Later." He was for several years editor of "Punch." His style was delightfully genial and witty, and he was personally greatly beloved. Died Feb., 1874.

Brooks (Charles Timothy), a Unitarian minister and poet, born at Salem, Mass., June 20, 1813. He graduated at Harvard in 1832, and became in 1837 pastor at Newport, R. I. He is eminent as a translator of "Faust," "Hesperus," "Titan," and many small poems from the German.

Brooks (Elbridge Gerry), D. D., born at Dover, N. H., July 29, 1816, studied law (1833–35) with Chief-Justice Tenney of Maine, began preaching in 1836, was ordained over a Universalist church in West Amesbury, Mass., 1837, has been pastor in East Cambridge, Lowell, and Lynn, Mass., in Bath, Me., in New York City, and since 1868 in Philadelphia, Pa. He was general secretary of the Universalist General Convention (1867–68).

Brooks (Erastus), an American journalist, born at Portland, Me., Jan. 31, 1815. He graduated at Brown University, and became editor of the "N. Y. Express" in 1836.

Brooks (Horace), U. S. army, b. in Boston, Mass., was a son of Maria G. Brooks, the poet. He graduated at West Point in 1835, and was assistant professor of mathematics there 1836–39; served with distinction in Florida, Mexico, and the civil war, becoming in 1863 colonel of the Fourth Artillery, and in 1865 brevet brigadier-general.

Brooks (James) was born in Portland, Me., Nov. 10,

1810, and graduated at Waterville in 1831. He was educated by his own industry and self-denying efforts. He studied law with John Neal the novelist, taught school, and at the same time engaged in political journalism. When twenty-one years of age he was elected to the State legislature, and in the following year became a newspaper correspondent at Washington. He afterwards travelled in the South and in Europe. In 1836 he established the "New York Express." He was a member of Congress 1849–53, 1864–67, his seat being at last successfully contested by Hon. W. E. Dodge, and 1868–73. He died April 30, 1873.

Brooks (John), M. D., LL.D., born in Medford, Mass., May 31, 1752, practised medicine at Reading, fought with the greatest honor as an officer at Lexington, White Plains, Saratoga, Monmouth, etc., becoming a colonel and adjutant-general. He practised medicine at Medford, Mass., after the war, and held many important offices. He was governor of Massachusetts (1816–23), and president of the Massachusetts Medical Society (1817–25). Died Mar. 1, 1825.

Brooks (Kendall), D. D., born at Roxbury, Mass., Sept. 3, 1821, graduated at Brown University 1841, Newton Theological Institute 1845, tutor in Columbian College 1841–43, pastor of the Baptist church at Eastport, Me., 1845–52, professor of mathematics and natural philosophy in Waterville College 1852–55, pastor at Fitchburg, Mass., 1855–65, editor of the "National Baptist," Philadelphia, 1865–68, and since 1868 president of Kalamazoo College, Mich.

Brooks (Maria Gowen), a poetess, born at Medford, Mass., about 1795. She was married young to a Mr. Brooks, a merchant of Boston. Her chief work is "Zophiel, or the Bride of Seven" (1825), which was praised by the poet Southey, who called her Maria del Occidente ("Maria of the West"). She died at Matanzas Nov. 11, 1845.

Brooks (Peter Chardon), born in North Yarmouth, Me., Jan. 6, 1767. He engaged in marine insurance in Boston, and attained great wealth. He held many public offices of trust. Edward Everett, Charles Francis Adams, and N. L. Frothingham, D. D., were sons-in-law of Mr. Brooks. Died Jan. 1, 1849.

Brooks (Rev. Phillips), an eloquent American divine, born in Boston Dec. 13, 1835, and graduated at Harvard in 1855. He studied in the Episcopal Theological Seminary at Alexandria, Va., was ordained in 1859, became the same year pastor of the Church of the Advent in Philadelphia, and in 1862 of the Church of the Holy Trinity, where he remained until 1870, when he accepted the pastoral charge of Trinity church in Boston.

Brooks (Nathan Covington), LL.D., an American scholar, born in Cecil co., Md., Aug. 12, 1809, became president of the Baltimore Female College in 1848. He has published a number of poems and a popular "History of the Mexican War," besides numerous school-books of merit.

Brooks (Preston S.), a politician, born in Edgefield co., S. C., Aug. 4, 1819, graduated at South Carolina College in 1839. He was elected a member of Congress in 1853 and 1855. He violently assaulted Senator Sumner (for words spoken in debate) in the Senate chamber in May, 1856. He was censured by the majority of the Representatives, and resigned his seat, but was re-elected. Died Jan. 27, 1857.

Brooks (William T. H.), an American officer, born in Ohio in 1821, graduated at West Point in 1841, major Eighteenth Infantry Mar. 12, 1862, and Sept. 28, 1861, brigadier-general U. S. volunteers. He served in the Florida war 1841–42, on frontier duty 1843–45, in the military occupation of Texas 1845–46, in the war with Mexico 1846–48, was engaged at Palo Alto, Resaca de la Palma, Monterey (brevet captain), Vera Cruz, Cerro Gordo, Contreras, Churubusco (brevet major), and the city of Mexico, as aide-de-camp to Brevet Major-general Twiggs 1848–51, in active operations in New Mexico in 1858, and engaged in several skirmishes against Navajos. In the civil war he served in the Virginia Peninsula campaign 1862, engaged at Yorktown, Golden's Farm, Savage Station (wounded), and Glendale, in the Maryland campaign 1862, engaged at Crampton Pass and Antietam (wounded), and commanding division in the Rappahannock campaign 1862–63, in command of the department of the Monongahela 1863–64, when Pittsburg was threatened by a raid, in command of the Tenth Corps before Richmond 1864, engaged at Swift's Creek, Drury's Bluff, Bermuda Hundred, Cold Harbor, and the siege of Petersburg. Failing health from exposure and wounds caused him to resign from the army July 14, 1864, and in 1866 he retired to a farm in Huntsville, Ala., where he reposed upon his well-earned laurels till his death, July 19, 1870, aged forty-nine. George W. Cullum, *U. S. Army.*

Brooks'ton, a post-village of Prairie township, White co., Ind. Pop. 406.

Brooks'ville, a post-township of Hancock co., Me. Pop. 1275. It has four churches and manufactures of lumber, etc.

Brook'ville, a post-township of Blount co., Ala. Pop. 910.

Brookville, a township of Coosa co., Ala. Pop. 689.

Brookville, a post-village, capital of Hernando co., Fla.

Brookville, a post-township of Ogle co., Ill. Pop. 746.

Brookville, a post-village, capital of Franklin co., Ind., is at the confluence of the forks of the White Water River, and on the White Water Valley R. R., 42 miles N. W. of Cincinnati. It has water-power in abundance, a national bank, two paper-mills, two flouring mills, two weekly papers, one grain distillery, and is the seat of Brookville College. Pop. of Brookville township, 4207.
Wm. A. Beasley & Co., Eds. "Brookville American."

Brookville, a post-village of Spring Creek township, Saline co., Kan. Pop. 201.

Brookville, a post-village, capital of Bracken co., Ky. Pop. 348.

Brookville, a village of Oyster Bay township, Queen's co., N. Y., is the seat of "Jones Institute" for the support of the poor of Oyster Bay and North Hempstead.

Brookville, a post-village, capital of Jefferson co., Pa., on Red Bank Creek, 170 miles W. N. W. of Harrisburg. It has a national bank and two weekly newspapers. Coal, timber, and iron abound. Pop. 1942.

Brookville, a township of Campbell co., Va. P. 4960.

Broom, a name given to several shrubs of the order Leguminosæ. They belong to the allied genera of *Spartium, Genista,* and *Cytisus.* The common broom of Europe (*Cytisus Scoparius*) grows on dry and sandy soils and heaths, and bears handsome yellow flowers. The branches, which are very tough and angular, are used for making brooms. The young tops and seeds, being strongly diuretic, are used in medicine, and are beneficial in dropsy. All kinds of broom have long, slender branches. The Spanish broom (*Spartium junceum*) grows wild in the south of Europe, and possesses medical properties like the common broom. The fibre of its branchlets is used in Italy and Spain for making cloths and ropes. The *Cytisus albus,* or white broom, also a native of Europe, is cultivated in England as an ornamental shrub, and bears white flowers which are much admired. It sometimes attains a height of fifteen feet or more. The broom (Fr. *genêt*) gave name to the royal family of Plantagenet, one of its ancestors having the broom for his crest.

Broom Corn (*Sorghum vulgare*), a plant of the order Graminaceæ, is a native of the East Indies, and is cultivated in the U. S. It has a jointed stem, which grows to the height of eight or ten feet, and bears spikelets, two and three together, on the ramifications of an open panicle. Only the middle or terminal one of these is fertile; stamens three. The panicle is extensively used in the manufacture of brooms, and the seeds are valuable as food for domestic animals. It is stated that this plant was first introduced into the U. S. by Dr. Franklin, who, finding a seed on a whisk that had been imported, planted it and propagated it. It succeeds best in alluvial soils, but will generally produce a fair crop on any land that is adapted to maize. Broom corn is largely cultivated by the Shakers, who make brooms of a good quality. It is planted in rows about three feet apart, and in hills about eighteen inches apart. The weeds are removed from the growing crop by the cultivator or the hoe. The average produce of an acre is about 500 pounds of the brush or material for brooms. The usual practice in harvesting is to bend the stalks about three feet from the ground, leave them for a few days to dry, and then cut them six or eight inches below the brush or panicle.

Broome, a county of New York, bordering on Pennsylvania. Area, 706 square miles. It is intersected by the Susquehanna River, and also drained by the Chenango and Otselic rivers. The surface is hilly or undulating; the soil in some parts is fertile. Cattle, grain, tobacco, wool, hay, fruit, and dairy products are extensively raised. It has manufactures of leather, lumber, flour, wagons, etc. It is traversed by the Erie R. R., and other railroads extend from this county to Albany and Syracuse. Capital, Binghamton. Pop. 44,103.

Broome, a township of Schoharie co., N. Y. Pop. 1834.

Broome (John L.), U. S. M. C., born Mar. 8, 1824, in the State of New York, was appointed a second lieutenant in the marine corps Jan. 12, 1848, became a first lieutenant in 1857, a captain in 1861, and a major in 1864. He served with the marine battalion in Mexico during the Mexican war. While in command of the marine guard of the Hart-

ford during 1862 and 1863 he participated in the attack on Forts St. Philip and Jackson and capture of New Orleans, and in all the many actions of that famous vessel in the waters of the Mississippi. In his official report of the action of June 28, 1862, with the Vicksburg batteries, Commander Richard Wainwright writes: "The marine guard, under the command of Captain J. L. Broome, had charge of two broadside guns, and fought them well, thus sustaining the reputation of that distinguished corps." At the close of the war, Captain Broome, who had been twice wounded, received the brevets of major and lieutenant-colonel "for gallant and meritorious conduct."

FOXHALL A. PARKER, U. S. N.

Broom'field, a post-township of Isabella co., Mich. Pop. 118.

Bro'ra Beds, a series of strata at Brora, a village in the county of Sutherland, Scotland. Here is a seam of good coal three and a half feet thick, and the thickest bed of true coal hitherto discovered in any secondary strata of Great Britain. The fossils indicate that it belongs to the lower oolitic series.

Bross (WILLIAM). See APPENDIX.

Broth'ers, Lay, an inferior class of Roman Catholic monks, not in holy orders, but bound by monastic rules, and employed as servants in monasteries.

Broth'ers' Val'ley, a tp. of Somerset co., Pa. P. 1597.

Broth'ertown, a post-township of Calumet co., Wis. Pop. 1605.

Brough (JOHN), born in Marietta, O., Sept. 17, 1811, was a printer in his youth, and studied at Ohio University. He edited several political journals, became a powerful Democratic orator, and held important public offices. In 1846 he became a lawyer. In 1848 he left political life for a time and became a railroad president. In 1864 he became governor of Ohio, receiving the joint vote of all parties who were in favor of prosecuting the war against the insurgent States. Died at Cleveland Aug. 29, 1865.

Brough'am (HENRY), LORD, an eminent and learned British orator, lawyer, and writer, was born in Edinburgh Sept. 19, 1779. His mother was a niece of Dr. Robertson, the historian. He graduated in the University of Edinburgh, studied law, and was admitted to the Scottish bar in 1800. He was intimate with Francis Jeffrey and Sydney Smith, whom he aided in founding the "Edinburgh Review" in 1802, and he continued to contribute to that review for many years. In 1808 he removed to London, was called to the English bar, and chose the common-law courts as the scene of his practice. He became a Whig member of Parliament in 1810, and soon acquired a high reputation as a debater as well as a forensic pleader. He was considered at that period the most powerful speaker in the House of Commons except Canning, who was his political opponent. As a parliamentary orator he was distinguished for vehemence and energy, and the rather free use of sarcasm and invective. He represented Winchelsea from 1816 to 1830. Among his famous performances as an advocate was his defence of Queen Caroline (1821), by which he gained great popularity. In 1819 he married Miss Eden, a daughter of Thomas Eden and niece of Lord Auckland. He distinguished himself as a promoter of popular education, as a reformer of laws, and a friend of political reform and progress. In 1825 he published "Practical Observations on the Education of the People." He took a prominent part in founding the Society for the Diffusion of Useful Knowledge, of which he became in 1827 the first chairman. In a great speech which he delivered in 1827 he enumerated the defects in nearly every branch of English law, and made proposals for dealing with law reform on a proper scale. He made a powerful speech against slavery in 1830, soon after which he was returned to Parliament by the great popular constituency of Yorkshire. In the same year he was appointed lord chancellor in the new Whig ministry, and was raised to the peerage as Baron Brougham and Vaux. He retired from office with his colleagues in Nov., 1834, after which he ceased to act with the Whigs, without joining any other party, but pursued an independent political course.

Having cultivated various sciences with success, and written many and various works, he was chosen a foreign associate of the French Institute in 1833. Among his writings are a "Treatise on the Objects, Advantages, and Pleasures of Science;" "Sketches of Statesmen of the Time of George III." (3 vols., 1839–43); "Political Philosophy" (3 vols., 1840–44); and "Contributions to the 'Edinburgh Review,' Political, Historical, and Miscellaneous" (3 vols., 1857). He had only two children, who died before their father. He died at Cannes, in France, May 9, 1868. He had published an edition of his collected works in 10 vols., 1857. (See LORD CAMPBELL, "Life of Lord Brougham," 1869; "Quarterly Review" for April, 1859; "Edinburgh Review" for April, 1858.)

WILLIAM JACOBS.

Brougham (JOHN), actor and author. Brilliance of mind, warmth of heart, and genial courtliness of manners have seldom been united to form so fascinating a public character as this comedian. John Brougham was born at Dublin, Ireland, in 1810, and there he passed his childhood and went to school. He was educated well, and was trained to be a surgeon. He walked the Peter Street Hospital, in Dublin, for eight months. Reverses of fortune, affecting his family, led, however, to a change of plan, and threw him upon his own resources, whereupon he drifted into the dramatic profession, making his entrance upon the stage at the Tottenham Theatre, London, in 1830. His first effort was characteristic of his prodigious mental force and vivacity, since he undertook twelve or fourteen parts in the play of "Tom and Jerry," then new and a popular favorite. After this he was engaged by Madame Vestris to act in her stock company at the London Olympic Theatre. Here he rose rapidly, both in talent and favor. His first dramatic composition was a burlesque, written for Mr. William E. Burton, then an actor at the Pavilion Theatre, London, afterwards famous in the U. S. It succeeded, and he wrote many similar pieces of a light description. Madame Vestris, having been wedded by Mr. Charles Mathews, removed from the Olympic to Covent Garden, and Brougham acted for a while at that theatre. It was at this period that he wrote, in conjunction with Mr. Dion Boucicault, the comedy of "London Assurance," the authorship of which is commonly ascribed to Mr. Boucicault alone. A little later he undertook the management of the London Lyceum during several seasons, and for this stage he wrote "Life in the Clouds," "Love's Livery," "Enthusiasm," "Tom Thumb the Second," and—in association with Mr. Mark Lemon—"The Demon Gift."

In 1842 Brougham came to America, accompanied by his first wife, an English actress, known to the London stage as Miss Emma Williams. They acted at the Park Theatre Oct. 4 in that year—one as O'Callaghan in "His Last Legs," and the other as Lady Teazle. Afterwards they made a professional tour of the theatrical cities of America. Brougham then settled down as a member of the stock company of Burton's Theatre, New York. Here he wrote "Bunsby's Wedding," "The Confidence Man," "Don Cæsar de Bassoon," "Vanity Fair," "The Irish Yankee," "Benjamin Franklin," "All's Fair in Love," "The Irish Emigrant," and a dramatization of "Dombey and Son." He then undertook the management of Niblo's Garden, and wrote a fairy play called "Home," and a piece for Mademoiselle Blazy called "Ambrose Germain." On Dec. 23, 1850, he opened Brougham's Lyceum. This building stood on the W. side of Broadway, and was the second structure S. of the corner of Broome street. It afterwards became Wallack's Theatre, and so remained till 1860. Brougham did not keep it long, but while there he wrote "The World's Fair," "Faustus," "The Spirit of Air," "Row at the Lyceum," a dramatization of "David Copperfield," and, for Charlotte Cushman, a new version of "The Actress of Padua." His next venture was made at the Old Bowery Theatre (1856–57), where he brought out "King John," with a cast of parts that included Mr. and Mrs. Edward L. Davenport, Mr. William Wheatley, Mr. J. B. Howe, and Miss Kate Reignolds. Afterwards he wrote, and produced at the Bowery, "The Pirates of the Mississippi," "The Red Mask," "Tom and Jerry in America," "The Miller of New Jersey," and other dramas of a common sort, but profitable. Then he accepted an engagement at Wallack's Theatre, and while there he wrote "The Game of Love," a version of "Bleak House," "My Cousin German," "A Decided Case," "The Game of Life," "Pocahontas," "Neptune's Defeat," "Love and Murder," "Romance and Reality," "The Ruling Passion," and "Playing with Fire." A little later he left Wallack's and rejoined Burton at the Metropolitan Theatre—first known as Tripler Hall, and last as the Winter Garden, burned in 1866—and here he produced his burlesque of "Columbus."

In 1861–62, Brougham went to London, where he remained upwards of four years. During this time he wrote "The Duke's Motto" and "Bel Demonio"—based on French originals—for Mr. Charles Fechter; dramatic versions of two novels by Miss M. E. Braddon called "Lady Audley's Secret" and "Only a Clod," for Miss Herbert; "While There's Life There's Hope," played at the Strand Theatre; "The Might of Right," played at Astley's Theatre; and "The Golden Dream," played at Manchester. He also wrote the words of three operas—"Blanche de Nevers," "The Demon Lovers," and "The Brides of Venice." Shortly after his return to America, in 1866–67, he appeared in one of the finest of his compositions, an Irish drama, entitled "O'Donnell's Mission." On the 25th of Jan., 1869, he opened Brougham's Theatre, on the S. side

of Twenty-fourth street, N. Y., adjacent to the Fifth Avenue Hotel. This afterwards became Daly's Fifth Avenue Theatre, and was destroyed by fire Jan. 1, 1873. Brougham kept it ten weeks, when he was dispossessed of his lease by the owner, the notorious adventurer James Fisk, Jr. At this place he brought out, among other pieces, his burlesque called "Much Ado about a Merchant of Venice." Among his later works are "The Lottery of Life," "Little Nell and the Marchioness"—dramatized from Charles Dickens's novel of "The Old Curiosity Shop"—"The Lily of France," a play on the story of Joan of Arc, and a melodrama called "Atherley Court."

Brougham started in New York a comic paper called "The Lantern," and he is the author of two volumes of miscellaneous writings, entitled "A Basket of Chips" and "The Bunsby Papers." He was separated from his first wife in 1845. The lady died near New York in 1865, under the name of Mrs. Robertson. His second wife, Miss Nelson, whom he wedded in 1847, was known as an actress and celebrated as a person of extraordinary beauty. This lady died in Twenty-fourth street, N. Y., in 1870. Brougham has latterly acted at Wallack's Theatre, at Daly's Grand Opera-House, and miscellaneously at provincial theatres. In Oct., 1873, he appeared for the first time in the lyceum, giving, at Boston, Mass., a reading from his own works. In earlier times he was noted for his personal beauty, and he won many successes in light-comedy characters, to which his immense animal spirits, grace of motion, polish of manners, and drollery of temperament made him admirably suitable. In maturer years he was excellent as a delineator of Irish character, and possessed in this a very wide range of power and skill, being equally at home in Dennis Bulgruddery, Sir Lucius O'Trigger, Maurice Fitz Maurice, and Tim O'Brien, which it seems fair to denote as representative parts. His engaging personal qualities and mental attributes, however, account, better than his artistic powers, for his great popularity. Magnanimity, charity, scholarship, wit, a charming ease in conversation, the spontaneous habit of sympathy with weakness, sorrow, worth of character, and worth of effort, and the frank, off-hand demeanor of rugged yet gentle manliness, shown in a long career of steady usefulness to the stage and to society, have won affection and respect, as well as reputation and competent fortune, for John Brougham.

WILLIAM WINTER, *of the "N. Y. Tribune."*

Brough'ton, a twp. of Livingston co., Ill. Pop. 823.

Broussa. See BRUSA.

Broussais (FRANÇOIS JOSEPH VICTOR), M. D., an eminent French medical writer, born at Saint-Malo Dec. 17, 1772, is called the founder of the so-called physiological school of medicine. He became in 1832 professor of pathology in the faculty of Paris, and was a member of the Institute. His chief works are a "History of Chronic Inflammations" (1808), and an "Examination of the Medical Doctrine generally adopted" (1816). Died Nov. 17, 1838. (See PRIOU, "Notice historique sur Broussais," 1841.)

Brousson (CLAUDE). See APPENDIX.

Broussone'tia, a genus of trees allied to the mulberry, comprises the paper mulberry (*Broussonetia papyrifera*), the fibrous bark of which is used by the Chinese and Japanese in the manufacture of paper. It is a small tree with deciduous leaves of variable shape. It is planted as a shade tree in some American cities.

Brow'ers, a township of Randolph co., N. C. P. 781.

Brown [Fr. *brun*], in painting, a dark dusky color, inclined to red, of various degrees of depth. It belongs to the tertiary colors known as russets and olives, in which the hue is modified by an admixture of black or a dark pigment. Among the brown pigments are bistre, umber, raw and burnt sienna, and brown madder.

Brown, a county in the W. part of Illinois. Area, 320 square miles. It is bounded on the E. by the Illinois River, and on the N. E. by the La Moin or Crooked River. The surface is undulating or level; the soil is fertile. Coal is found in some parts. Cattle, grain, tobacco, wool, and hay are raised extensively. Stone and earthen ware is manufactured at various points. It is intersected by the Toledo Wabash and Western R. R. Capital, Mount Sterling. Pop. 12,205.

Brown, a county in the S. part of Indiana. Area, 325 square miles. It is drained by Bean Blossom and Salt creeks. The surface is diversified with hills of moderate height; the soil is mostly fertile. Grain, tobacco, and wool are the staple products. Capital, Nashville. Pop. 8681.

Brown, a county of Kansas, bordering on Nebraska. Area, 576 square miles. It is drained by the Sauterelle, Wolf, and Webster creeks. The surface is somewhat diversified; the soil is productive. It is intersected by the St. Joseph and Denver City R. R. Grain, wool, and tobacco are the staple products. Capital, Hiawatha. Pop. 6823.

Brown, a county in the S. part of Minnesota. Area, 450 square miles. It is bounded on the N. E. by the Minnesota River, and intersected by the Big Cottonwood River. The county contains several small lakes. The soil is fertile. Grain and wool are the staple products. Capital, New Ulm. Pop. 6396.

Brown, a county of Ohio, bordering on Kentucky. Area, 500 square miles. It is bounded on the S. by the Ohio River, and drained by the Eagle and White Oak creeks. The surface is mostly undulating; the soil is based on limestone, and is very fertile. Cattle, grain, tobacco, and wool are largely raised. Lumber, saddlery, etc. are manufactured extensively. Capital, Georgetown. Pop. 30,802.

Brown, a county in the central part of Texas. Area, 1050 square miles. It is nearly all prairie. Stock-raising is the principal pursuit. It is bounded on the S. W. by the Colorado River, and drained by Pecan and Jim Ned creeks. Capital, Brownwood. Pop. 544.

Brown, a county in the E. part of Wisconsin. Area, 525 square miles. It is partly bounded on the N. by Green Bay, and intersected by Fox or Neenah River, which is navigable for steamboats. This county was originally covered with dense forests. The soil is fertile. Grain and wool are largely raised. It is intersected by the Chicago and North-western R. R. Capital, Green Bay. P. 25,168.

Brown, a township of Darlington co., S. C. P. 1598.

Brown (AARON V.), an American statesman, born in Brunswick co., Va., Aug. 15, 1795, graduated at Chapel Hill in 1814, removed to Tennessee in 1815, was a member of Congress 1839–45, and was elected governor of the State in 1845. He became postmaster-general of the U. S. in 1857. Died in 1859.

Brown (ALBERT G.), born in Chester district, S. C., May 31, 1813, was chosen governor of Mississippi in 1843, and elected to the U. S. Senate in 1853. He was re-elected in 1858 for six years, but withdrew from the Senate in 1861.

Brown (BENJAMIN GRATZ), born in Lexington, Ky., May 28, 1826, graduated at Yale in 1847. He commenced the practice of law at St. Louis, Mo., was a member of the State legislature (1852–58), and edited the Missouri "Democrat" (1854–59). On the breaking out of the war in 1861, he raised a regiment and fought on the side of the Union. He afterwards commanded a brigade of militia. He was among the most active and influential in procuring the adoption of the ordinance of freedom in 1864 by the State of Missouri. He was U. S. Senator in 1863–67, and was made governor of Missouri in 1871. He was nominated at the Cincinnati Convention, May, 1872, for the office of Vice-President of the U. S., the Hon. Horace Greeley being the nominee for President.

Brown (CHAD) went from Massachusetts to Rhode Island in 1636, on account of his religious opinions, and in 1642 became one of the elders of the Baptist church at Providence. He was the ancestor of many distinguished citizens. Died in 1665.

Brown (CHARLES BROCKDEN), an American novelist, born at Philadelphia Jan. 17, 1771. He published "Wieland" (1798), "Ormond, or the Secret Witness" (1799),

and "Arthur Mervyn" (1800). He founded in 1803 "The Literary Magazine and American Register," which he edited for nearly five years. His mind was remarkable for ingenuity and imagination. Among his other works are "Clara Howard" (1801) and "Jane Talbot" (1804). He married a Miss Linn in 1804, and died Feb. 22, 1810. "His peculiar merits," says Prescott, "appeal to a higher order of criticism than is to be found in ordinary and superficial readers." (See PRESCOTT, "Life of C. B. Brown," in Sparks's "American Biography," vol. i.; W. DUNLAP'S "Life of Charles B. Brown," prefixed to an edition of his works, 1827.)

Brown (DAVID PAUL), a distinguished American lawyer, born in Philadelphia in 1795. He published in 1856 "The Forum, or Forty Years' Full Practice at the Philadelphia Bar," besides several dramatic and other works. Died July 11, 1872.

Brown (FRANCIS), D. D., was born at Chester, N. H., Jan. 11, 1784, graduated at Dartmouth College in 1805, was tutor from 1806 to 1809, was settled over the Congregational church in North Yarmouth, Me., in 1810, and was chosen president of his alma mater in 1815. It was during his presidency that the famous Dartmouth College case was carried up to the U. S. Supreme Court. Jeremiah Mason and Daniel Webster admired the ability with which he served them in their management of the case. Rufus Choate, one of his pupils, speaks in the highest terms of his genius, character, and culture. He published only pamphlets and sermons. Died July 27, 1820.

Brown (Sir GEORGE), a British general, born near Elgin, Scotland, in 1790, served in the Peninsular war. In the Crimean war he commanded a division, and was severely wounded at Inkerman in Nov., 1854. He directed a storming-party which attacked the Redan of Sebastopol in 1855. Died Aug. 27, 1865.

Brown (GEORGE), U. S. N., born June 19, 1835, in Indiana, entered the navy as a midshipman Feb. 5, 1849, became a passed midshipman in 1855, a lieutenant in 1856, and a commander in 1866. He was in command of Admiral Porter's flag-ship, the Octorora, at the attack on Vicksburg, June 28, 1862, and is thus commended by the admiral in his official report of that battle: "The officers and crew of the Octorora behaved like veterans; and I am much indebted to that excellent officer, Lieutenant George Brown, for the drill of the crew and the perfect arrangements made for going into action." On the night of Feb. 24, 1863, Brown, in the steamer Indianola, defended his vessel for an hour and twenty-seven minutes against the rams Queen of the West and William H. Webb, and two large "cotton-clads," surrendering the Indianola only when she was "fast filling with water." He commanded the steamer Itasca at the battle of Mobile Bay Aug. 5, 1864, and during the subsequent operations against the defences of Mobile. FOXHALL A. PARKER, U. S. N.

Brown (GEORGE L.), an eminent American landscape-painter, born in Boston in 1814. Among his masterpieces are a view in the White Mountains entitled "The Crown of New England," and "New York Harbor" (both in possession of the prince of Wales).

Brown (GOOLD), an American grammarian and teacher, born in Providence, R. I., Mar. 7, 1791. He published "Institutes of English Grammar" (1823), which was very successful, and "Grammar of English Grammars" (1850). Died Mar. 31, 1857.

Brown (HARVEY), an American officer, born in 1795 at Rahway, N. J., graduated at West Point in 1818, colonel Fifth Artillery May 5, 1861. He served chiefly at seaboard posts 1818–61, as aide-de-camp to Maj.-Gen. Brown 1824–25, on quartermaster duty 1826–29, in the Black Hawk expedition 1832, in the Florida war 1836–38; engaged at Wahoo Swamp, suppressing Canada border disturbances 1839–41, in the war with Mexico 1846–48; engaged at Monterey, Vera Cruz, Cerro Gordo, Contreras (brevet lieutenant-colonel), Molino del Rey, and the City of Mexico (brevet colonel), on recruiting service 1848–52, being superintendent 1851–52, in Florida hostilities 1852–53, in command of the artillery school for practice 1857–58, and inspector of artillery 1859–60. In the civil war he was engaged in the defence of Fort Pickens, Fla., 1861–62 (brevet brigadier-general), and as military commander of the city of New York Jan. 15–July 16, 1863, suppressed the draft riots (brevet major-general). Retired from active service Aug. 1, 1863. Died at Clifton, Staten Island, N. Y., Mar. 31, 1874. GEORGE W. CULLUM, *U. S. Army*.

Brown (HENRY KIRKE), an American sculptor and painter, born at Leyden, Mass., in 1814. Among his best works are the equestrian statue of Washington in Union Square, New York, a colossal statue of Governor Clinton at Greenwood Cemetery, the "Angel of the Resurrection," also at Greenwood, and a colossal equestrian statue of Gen. Winfield Scott. His statue of Gov. Clinton at Washington is perhaps the finest. He is also a painter of no mean ability. His versatility is remarkable.

Brown (JACOB), born in Bucks co., Pa., May 9, 1775, removed to New York in 1798. He joined the army in 1812, and defended Sackett's Harbor in 1813. Having been raised to the rank of major-general, he invaded Canada in the spring of 1814, and commanded with success at Chippewa and Niagara Falls in July of that year. He became commander-in-chief of the U. S. army in 1821. Died Feb. 24, 1828.

Brown (JAMES), born near Staunton, Va., Sept. 11, 1766, graduated at William and Mary College, became an eminent lawyer of Kentucky and Louisiana, representing the latter State in the U. S. Senate (1812–17 and 1819–24), and was minister to France 1824–29. Died April 7, 1835. He was one of the compilers of the Louisiana code.

Brown (JOHN), a Scottish religious writer, was born in Perthshire in 1722. He preached at Haddington, and had a high reputation for piety and learning. It is stated that he knew nine languages. Among his works are a "Dictionary of the Bible" (1769), and a "Self-Interpreting Bible" (1778). Died June 19, 1787.

Brown (JOHN), M. D., a Scottish physician, the author of the Brunonian system of medicine, was born at Dunse in 1735. He published in 1780 "Elementa Medicinæ," in which he propounded his new system. This was received with favor by many physicians. His favorite medicines were alcohol and opium. Died in London in 1788.

Brown (JOHN), born in Providence, R. I., Jan. 27, 1736, became a partner with his three brothers in a mercantile firm. He was leader of the men who on the night of June 17, 1772, destroyed the "Gaspee" sloop-of-war, for which he was arrested and put in irons, but escaped. He supplied the troops around Boston with powder during the siege. He was a man of wealth, a liberal patron of Brown University, and a member of Congress from Rhode Island (1799–1801). Died Sept. 20, 1803.

Brown (JOHN), a patriot, born in Sandisfield, Mass., Oct. 19, 1744, graduated at Yale in 1761. He became king's attorney in the New York colony, and afterwards practised law at Pittsfield, Mass. In 1774 and 1775 he operated for the cause of freedom in Canada, aided in the capture of Ticonderoga, took Fort Chambly, fought at Quebec, became a lieutenant-colonel, and in 1777 surprised the outposts at Ticonderoga, and made important captures. He left the service for a time from hostility to Arnold the traitor. He was killed by the Indians in the Mohawk Valley campaign Oct. 19, 1780.

Brown (JOHN), a brother of Senator James Brown, was born at Staunton, Va., Sept. 12, 1757, served in the Revolutionary war, studied at Princeton and at William and Mary College, removed to Kentucky in 1782, was a member of Congress from Virginia (1787–88 and 1789–93), and U. S. Senator from Kentucky (1793–1805). Died Aug. 29, 1837.

Brown (JOHN), M. D., a son of Rev. Dr. John Brown (1784–1858), a celebrated preacher, was born in Scotland Sept., 1810. He practised in Edinburgh, and published a work entitled "Horæ Subsecivæ" (1858), containing the well-known "Our Dogs" and "Rab and his Friends."

Brown (JOHN) **of Ossawatomie,** a zealous opponent of slavery, was born at Torrington, Conn., May 9, 1800. He removed to Ohio in early youth, and married and worked at the trade of a tanner. In 1855 he emigrated to Kansas, where he fought against the pro-slavery party, and lived at Ossawatomie. He was the master-spirit of the convention which met at Chatham, Canada, in May, 1859, and organized an invasion of Virginia in order to liberate the slaves. In July of that year he rented a farmhouse about six miles from Harper's Ferry. On the 16th of October, aided by about twenty friends, he surprised Harper's Ferry, and captured the arsenal and armory. He was wounded and taken prisoner by the Virginia militia on the next day, and was hanged at Charlestown Dec. 2, 1859. (See REDPATH, "Life of Captain John Brown," 1860; WEBB, "Life and Letters of John Brown.")

Brown (JOHN A.) was a son of Alexander Brown, a banker of Baltimore. He was born in Ballymena, Ireland, May 21, 1788, came in youth to the U. S., and became manager of the Philadelphia branch of the great banking firm of Brown Brothers. He was eminent for upright dealing and benevolence. Among numerous other gifts, he presented $300,000 to the Presbyterian Hospital of Philadelphia. Died Dec. 21, 1872.

Brown (JOHN G.), a painter, born in the north of England, settled at Brooklyn, N. Y., in 1856. His portraits of children are greatly admired.

Brown (John Newton), D. D., a Baptist divine, born at New London, Conn., June 29, 1803, published in 1831 an "Encyclopedia of Religious Knowledge," and in 1834 "Memorials of Baptist Martyrs." Died May 15, 1868.

Brown (Joseph E.), a distinguished citizen of Georgia, was born in Pickens co., S. C., April 15, 1821. During his youth his father moved to Georgia. He was elected governor of that State for two years, and was re-elected four times. While he was in the executive chair he took a leading part in the secession movement in 1861. When the war was over he took a prominent part in support of the reconstruction measures of Congress. Under the new State constitution he became chief-justice of the supreme court in 1868, and supported Gen. Grant for President of the U. S. that year. He resigned his position in 1871 to assume the presidency of the Western and Atlantic R. R. Company. He supported Mr. Greeley for President in 1872.

Brown (Mason), LL.D., father of B. Gratz Brown, was born in Philadelphia Nov. 10, 1799, graduated at Yale in 1820, was a judge of a Kentucky circuit court for many years, and secretary of state of Kentucky (1855–59). He was one of the authors of "Morehead and Brown's Digest." Died at Frankfort, Ky., Jan. 27, 1867.

Brown (Milton), born in Ohio, became a resident of Tennessee, and was a member of Congress from that State (1841–47). He was in 1845 the author of the resolution for incorporating Texas into the Union.

Brown (Nicholas), a benevolent merchant, born at Providence, R. I., April 4, 1769, graduated at Rhode Island College in 1786. He gave to that college about $100,000 at various times, and in 1804 it took the name of Brown University in his honor. He gave largely to other institutions. Died Sept. 27, 1841.

Brown, or **Browne** (Robert), an English theologian, the founder of the sect of Brownists, was born in 1549. His doctrines differed little from those of the Anglican Church, but he maintained that the congregation has a right to elect its own minister. Died after 1630.

Brown (Robert), F. R. S., D. C. L., an eminent botanist, was born at Montrose, Scotland, Dec. 21, 1773. He studied medicine in the University of Edinburgh, but did not practise it long, preferring to devote himself to botany. He was employed as naturalist of the expedition which Captain Flinders conducted to Australia in 1801. In 1805 he returned with a collection of 4000 species of Australian plants, and in 1810 he published a Flora of that region, "Prodromus Floræ Novæ Hollandiæ." He also wrote "General Remarks, Geographical and Systematical, on the Botany of Terra Australis" (1814). He adopted the natural system of Jussieu, and made important discoveries in vegetable physiology. In 1827 he became keeper of the botanical department of the British Museum, and in 1833 was chosen one of the eight foreign associates of the French Academy of Sciences. Humboldt styled him "Botanicorum facile princeps." Died in London June 10, 1858.

Brown (Samuel), M. D. See Appendix.

Brown (Samuel Gilman), D. D., LL.D., son of President Francis Brown, noticed above, was born at North Yarmouth, Me., Jan. 4, 1813, graduated at Dartmouth College in 1831, and at Andover Theological Seminary in 1837, travelled in Europe from 1838 to 1840, was professor in Dartmouth College, first of oratory from 1840 to 1863, and then of intellectual philosophy from 1863 to 1867, when he was chosen president of Hamilton College. Besides numerous addresses and articles in reviews, he has published a "Biography of Self-Taught Men," 1847, and "The Life of Hon. Rufus Choate," 1862. He has also lectured with marked success on "British Orators."

Brown (Thomas), M. D., an eminent Scottish metaphysician, born near Dumfries Jan. 9, 1778. He was a pupil of Dugald Stewart in Edinburgh. In 1798 he published an able refutation of Darwin's "Zoonomia." Having studied medicine, he graduated in 1803, and practised medicine about seven years. In 1810 he was appointed colleague of Dugald Stewart as professor of moral philosophy in the University of Edinburgh. He was very popular as a lecturer, and published "Lectures on the Philosophy of the Human Mind" (4 vols., 1820). His other chief work is "Observations on the Relation of Cause and Effect" (1804; 3d ed., enlarged, 1818). His chief contribution to psychology is an explication of the sixth or *muscular* sense. Died April, 1820. (See Dr. Welsh, "Account of the Life and Writings of Thomas Brown," 1825.

Brown (Thompson S.), an American officer and engineer, born 1807 in New York, graduated at West Point in 1825. He served, while lieutenant of engineers, as assistant professor at the Military Academy, 1825, in the construction of Fort Adams, R. I., 1825–26, and 1828–33 as aide-de-camp to his uncle, Maj.-Gen. Brown, 1826–28, in the improvement of Arkansas River, 1833, in charge of Cumberland road in Illinois, 1833–34, in the construction and repair of defences of Charleston harbor, S. C., 1834–35, and the improvement of Lake Erie harbors and lighthouses, 1835–36. He resigned Oct. 31, 1836, and till his death was an eminent civil engineer. He was chief engineer of Buffalo, N. Y., and Erie, Pa. (Lake Shore), R. R., 1836–38, of Lake Erie harbor improvements, 1836–38, of western division of the New York and Erie R. R., 1838–42, and of the entire road, 1842–49. Upon the invitation of the czar of Russia he became consulting engineer of the St. Petersburg and Moscow Railway. Died Jan. 30, 1855, at Naples, Italy, aged forty-eight. George W. Cullum, *U. S. Army.*

Brown (W. M.), a popular American painter, born at Troy, N. Y., in 1827. His works are chiefly landscapes and fruit-pieces.

Brown Coal. See Lignite.

Browne (Charles Farrar), known as **Artemus Ward,** a humorous writer, born at Waterford, Me., April 26, 1834. He learned the business of a printer, and gained distinction by writing for the public journals a series of "Letters from Artemus Ward, Showman." He became a popular lecturer, visited California in 1863, and London in 1866. Died at Southampton, England, Mar. 6, 1867. He published "Artemus Ward his Book," and other works.

Browne (John Ross), an American writer, born in Ireland in 1817. Among his works is "Yusef, or the Journey of a Frangi: a Crusade in the East." He was minister to China in 1868–70. Died Dec. 8, 1875.

Browne (Samuel J.), born in England Mar. 19, 1788, became in 1798 a resident of Cincinnati, O. He was long a minister of the United Brethren, and afterwards of the Presbyterians. Died Sept. 10, 1872, leaving a large amount of money to found a church, a university, and a free school.

Browne (Sir Thomas), M. D., an English philosopher and writer, born in London Nov. 19, 1605. He practised medicine at Norwich for many years. He published, besides other works, "Religio Medici" (1642), which is highly esteemed, and "Inquiries into Vulgar and Common Errors" (1646). He was knighted by Charles II. in 1671. Died Nov. 19, 1682.

Brownell (Henry Howard), born in Providence, R. I., Feb. 6, 1820, graduated at Washington College, Hartford, Conn., in 1841, was admitted to the bar, but became the author of numerous works, such as "The Old World," "The New World," and several other historical works, a volume of "Poems" (1847), "Lyrics of a Day" (1864), "War Lyrics" (1866). His poetry has more than ordinary merit. In the civil war he was a volunteer naval officer, serving on Farragut's staff. Died Oct. 31, 1872.

Brownell (Rt. Rev. Thomas Church), D. D., LL.D., was born at Westford, Mass., Oct. 19, 1779, and graduated at Union College in 1804. He held various professorships, etc. in the college until 1816, when he took orders in the Protestant Episcopal Church. In 1819 he was consecrated bishop of Connecticut, and was the first president of Trinity College, Hartford (1824–31). He published an "Expositor" of the New Testament, a "Commentary on the Book of Common Prayer," "Religion of the Heart and Life" (5 vols., 1839–40), and other works. Died Jan. 13, 1865.

Brown'field, a post-township of Oxford co., Me., on the Portland and Ogdensburg R. R., 43 miles N. W. of Portland, has manufactures of leather, tubs, etc. P. 1323.

Brown'helm, a post-twp of Lorain co., O. Pop. 1461.

Brown'hill, a township of Franklin co., Va. P. 1692.

Brownian Movements are those seen with the microscope among minute particles (not living) in a limpid liquid. Robert Brown the botanist first described them in 1827. These molecular movements have often been mistaken for *vital* motions. When the minute organisms called *Bacteria* are exposed to a heat of 200° F. they are killed, but molecular motion still goes on in a manner obviously different from their living movements. The same phenomenon can be exhibited by rubbing fine powder of gamboge in water, and placing it under a microscope. Beale considers of the same nature the motions of very minute bubbles ($\frac{1}{20000}$ of an inch in diameter) within certain crystals. These movements have not been satisfactorily explained. Beale suggests their possible connection with heat.

Brown'ie, a spirit of the fairy order in the old superstitions of Scotland. The tradition is that he was a good-humored goblin, who attached himself to farmhouses, and occupied himself when the family were in bed in performing any work, such as churning, threshing, etc.—a spirit not seen or spoken to, and only known by the performance of voluntary labors. In Cornwall a goblin known as Browny is called to assist at the swarming of bees.

Brown'ing, a post-township of Schuyler co., Ill. Pop. 2139.

Browning (Elizabeth Barrett), an eminent English poetess, born in Herts in 1809. She was liberally educated, and studied the Greek and Latin languages with success. She published in 1826 a volume entitled an "Essay on Mind, and other Poems," and in 1833 translated from the Greek of Æschylus "Prometheus Bound." Her next production was "The Seraphim, and other Poems" (1838). Her health having been impaired by the rupture of a blood-vessel, she passed several years in seclusion. In 1846 she was married to the poet Robert Browning, and went with him to reside in Italy. She published in 1850 her collected works, including "The Drama of Exile," and a new poem called "Lady Geraldine's Courtship." Among her other poems are "Casa Guidi Windows" (1851), "Aurora Leigh" (1856), and "Poems before Congress" (1860). She died at Florence June 29, 1861, with the reputation of being the greatest poetess England had ever produced.

Browning (Orville H.), a statesman, was born in Harrison co., Ky., was educated at Augusta College, studied law, was called to the bar in 1831, and removed to Quincy, Ill. He served in the Black Hawk war, became a prominent State politician, was U. S. Senator (1861–63), secretary of the interior (1866–68), and acting attorney-general of the U. S. (1868–69).

Browning (Robert), an eminent English poet, born at Camberwell, a suburb of London, in 1812, was educated in the University of London. He published in 1835 the drama of "Paracelsus," a poem remarkable for subtlety of thought. His tragedy of "Strafford" (1837) was performed without success. He married Miss Barrett in 1846, after which he resided in Italy until 1861. In 1855 he produced two volumes entitled "Men and Women," which are much admired. According to an anonymous critic, "they are unsurpassed in the English language for depth and subtlety of conception and profound analysis of the human mind." Among his other works are "Pippa Passes," "The Ring and the Book" (1869), "Fifine at the Fair, and other Poems" (1872), and the "Red Cotton Night-cap Country" (1873). His poetry is too obscure to please the general public.

Brown'ington, a post-township of Orleans co., Vt., 2 miles from Barton Landing. It has three churches, an academy, and manufactures of lumber, starch, and carriages. Pop. 901.

Brown'low (William Gannoway), an American Methodist divine and politician, born in Wythe co., Va., Aug. 29, 1805, removed to Tennessee, where he edited the "Knoxville Whig." After the breaking out of the war of 1861 he was a firm adherent of the Union party, and in 1865 was elected governor of Tennessee by the Republicans, and re-elected in 1867. He became a member of the U. S. Senate in 1869.

Brownlow, Earls, and Viscounts Alford (1815, in the United Kingdom). Barons Brownlow (1776, in Great Britain), and Baronets (1677), a prominent family of Great Britain. — Adelbert Wellington Brownlow, the third earl, born Aug. 19, 1844, succeeded his brother in 1867. He was member of Parliament for North Shropshire 1866–67.

Brown'marsh, a post-township of Bladen co., N. C. Pop. 800.

Browns'burg, a post-village of Lincoln township, Hendricks co., Ind. Pop. 551.

Brown-Séquard (C. Edouard), M. D., a distinguished physiologist, was born in the island of Mauritius in 1818. He was the son of Edward Brown, a Philadelphian, and a French lady named Séquard. He studied in Paris, where he graduated as M. D. in 1840. He gained distinction by experiments on blood, animal heat, and the spinal cord. These highly important researches are believed to have thrown as much light as those of any other observer upon the physiology and diseases of the nervous system. In 1869 he was appointed professor in the School of Medicine in Paris. He has published valuable professional works, and resides chiefly in the U. S.

Brown'son (Nathan), a physician and statesman of Georgia, graduated at Yale in 1761, was a member of the provincial Congress (1775), a surgeon of the Revolutionary army, member of the Continental Congress (1776 and 1778), was chosen governor of Georgia in 1781, and was afterwards a prominent official of the State. Died in Liberty co., Ga., in 1796.

Brownson (Orestes Augustus), LL.D., an American journalist and theologian, born at Stockbridge, Vt., Sept. 16, 1803. He founded in 1838 "The Boston Quarterly Review," of which he was editor for five years, and was a frequent contributor to the "Democratic Review." He became a Roman Catholic in 1844, having previously been a Presbyterian, Universalist, and Unitarian. He published a novel, "Charles Elwood, or the Infidel Converted," and other works. He conducted Brownson's "Quarterly Review." D. Apr. 17, 1876.

Brown Spar, a name given to a variety of dolomite or magnesian limestone, which is tinged with oxide of iron and manganese, and is sometimes called pearl spar.

Brown's Store, a tp. of Lunenburg co., Va. P. 2147.

Browns'town, a post-village, capital of Jackson co., Ind., on the Ohio and Mississippi R. R., 98 miles W. of Cincinnati and 70 miles S. of Indianapolis. Iron ore and timber abound here. It has one weekly newspaper. Pop. 572; of Brownstown township, 2580.

Brownstown, a post-township of Wayne co., Mich. Pop. 2037.

Brownstown, a township of Davidson co., N. C. P. 987.

Browns'ville, a township of Lee co., Ala. Pop. 1425.

Brownsville, a post-village of Prairie co., Ark., 27 miles E. of Little Rock, on the road to Memphis, Tenn. Here an engagement took place, Aug. 25, 1863, between a division of U. S. cavalry under Gen. J. W. Davidson and the Confederate force under Gens. Marmaduke and Walker. The Confederates were driven from the town after a brief struggle.

Brownsville, a post-township of Union co., Ind. Pop. 900.

Brownsville, a post-village, capital of Edmondson co., Ky., on Green River, 130 miles S. W. of Frankfort and 10 miles W. of the Mammoth Cave.

Brownsville, a post-village of Saline co., Mo. It has one weekly newspaper.

Brownsville, a post-village and township of Houston co., Minn. The village is on the Mississippi River, about 11 miles below La Crosse. Pop. 615; total pop. 1589. Grain is shipped here in steamboats.

Brownsville, a post-borough of Fayette co., Pa., on the Monongahela, 35 miles S. of Pittsburg, has four banks, nine churches, large glass-factories, coal-mines, iron-foundries, machine-shops, distilleries, planing-mills, and numerous other industries. It has one weekly newspaper, and is connected with Pittsburg by steamboat navigation. It is in a very wealthy agricultural and mineral region. It has a fine bridge across the river. Pop. 1749.

Seth T. Hurd, Ed. "Clipper."

Brownsville, a post-township of Marlborough co., S. C. Pop. 1597.

Brownsville, a post-village, capital of Haywood co., Tenn., is on the Memphis and Louisville R. R., 57 miles N. E. of Memphis. It is in a rich cotton-growing district, 5 miles N. of the navigable river Hatchie. It ships 23,000 bales of cotton yearly, and has a $500,000 cotton factory, 4 colleges (3 female, 1 male), 2 weekly newspapers, and gas-works. Pop. 2457. Ed. "Bee."

Brownsville, a river-port, capital of Cameron co., Tex., is on the left bank of the Rio Grande, opposite Matamoras (Mexico), and about 40 miles from the mouth of the river. It is about 280 miles S. W. of Galveston. It has the advantage of steam-navigation on the Rio Grande, and has an extensive trade with the Mexicans. Here is a custom-house and a Roman Catholic college. Brownsville was taken from the Confederates by General Banks in Nov., 1863. It has one daily, one semi-weekly, and two weekly newspapers. Pop. 4905.

Brown University, an institution of learning founded in 1764 at Warren, R. I., and removed to Providence, its present seat, in 1770. Its first name was Rhode Island College, but in 1804 it received its present name, in honor of Nicholas Brown, one of its chief benefactors. James Manning, D. D., was its first president (1765–90); Jonathan Maxcy, D. D., was president 1792–1802, and Asa Messer, D. D., 1802–27. From 1827 to 1855, the Rev. Francis Wayland, D. D., was president of this university, and contributed greatly to its reputation. He was succeeded by the Rev. Dr. Barnas Sears, who resigned in 1867 to accept the presidency of the Peabody Educational Fund. His immediate successor was Dr. Caswell, who had maintained almost a lifelong connection with the university. He gave place, in 1872, to the Rev. E. G. Robinson, D. D., for many years president of Rochester Theological Seminary. Brown University is distinguished by its unsectarian character, though the Baptists are its chief patrons, and a majority of the board of trustees must be of that denomination. One of the chief attractions of this seat of learning is its choice library of 38,000 volumes, one of the very best in America for educational purposes. Its statistics for 1873 are as follows: instructors, 13; undergraduates, 204; alumni,

2554; invested funds, $602,653; property (at least), $1,200,000.

Brownville, a township of Clay co., Ala. Pop. 795.

Brownville, a township of Piscataquis co., Me. P. 860.

Brownville, a city, capital of Nemaha co., Neb., on the W. side of the Missouri River, 95 miles by water S. E. of Omaha, or 65 by rail, and at the same distance N. W. of St. Joseph, Mo. It has Presbyterian, Methodist, Baptist, Episcopal, and Roman Catholic churches, and a congregation of Christians, 3 benevolent societies, 1 national and 1 private bank, graded schools, 2 weekly papers, 3 manufactories of tobacco and cigars, 2 of wagons, 1 brewery, 1 soap-factory, and 1 flouring mill, besides other less important industries. Five railroads are projected to this point. Pop. 1305; of Brownville precinct, 2386.

R. O. Whitehead, Ed. "Democrat."

Brownville, a post-village of Jefferson co., N. Y., on the right bank of Black River, and on the Rome and Watertown R. R., 4 miles N. W. of Watertown, and about 5 miles from Lake Ontario. It has several manufactories and mills. Pop. of Brownville township, 3219.

Brown'wood, a post-village, capital of Brown co., Tex., about 125 miles N. W. of Austin City.

Bruce, a county in the W. part of Ontario (Canada). It is bounded on the N. W. by Lake Huron, and intersected by the Saugeen River. Area, 922 square miles. Pop. 48,515. Capital, Walkerton.

Bruce, a township of La Salle co., Ill. Pop. 1921.

Bruce, a township of Benton co., Ia. Pop. 567.

Bruce, a township of Macomb co., Mich. Pop. 2145.

Bruce, a township of Guilford co., N. C. Pop. 1034.

Bruce, the name of a noble family of Scotland, descended from Robert de Bruis (or de Brus), a Norman knight who followed William the Conqueror to England in 1066. He derived his lineage from Brusi, a Northman, a son of the famous Sigurd. His younger son, Adam, who acquired a large estate in Yorkshire, left a son, Robert, who received from David I. of Scotland a grant of the lordship of Annandale, held by the tenure of military service. He died in 1141, and left a son, Robert, who was the second lord of Annandale. This second lord had a grandson, Robert, who was the fourth lord of Annandale. He married Isabel, a daughter of David, earl of Huntingdon, younger brother of King William the Lion, and thus laid the foundation of the royal house of Bruce. He died in 1245. Robert de Bruce, a son of the preceding, and the fifth lord of Annandale, was born in 1210. When the Scottish throne became vacant by the death of Queen Margaret in 1290, this Robert de Bruce and Baliol claimed the throne. The dispute was referred to Edward I. of England, who decided in favor of Baliol. Robert died in 1295, leaving a son, Robert, who by his marriage with the countess of Carrick obtained the title of earl of Carrick (1271). He fought in the English army against Baliol at the battle of Dunbar. He died in 1304, and left a son, Robert, who became king of Scotland.

Bruce (Archibald), M. D., born in New York in 1777, was the son of a British army surgeon. He graduated at Columbia College in 1795, and studied medicine and mineralogy five years in Europe. He was (1807–11) professor of materia medica and mineralogy in the College of Physicians and Surgeons, N. Y., became a member of many learned societies, and in 1810 edited the "Journal of American Mineralogy." Died Feb. 22, 1818.

Bruce (Sir Frederick William Adolphus), a British diplomatist, born at Elgin Castle in 1814, was a brother of Lord Elgin. He was consul-general in Egypt in 1849, and in 1865 succeeded Lord Lyons as ambassador at Washington. Died in Boston in 1867.

Bruce (George), born in Edinburgh, Scotland, June 26, 1781, came in 1795 to the U. S., and became a printer in Philadelphia. In 1803 he became publisher and printer of the New York "Daily Advertiser;" in 1806, with his brother David, he began printing books; in 1812 they introduced stereotyping into the U. S., and soon after established an extensive type and stereotype founding business, in which they acquired great reputation. George, with his nephew David, invented a successful type-casting machine. Died July 6, 1866.

Bruce (James), a Scottish traveller, born in the county of Stirling Dec. 14, 1730. He was appointed consul-general at Algiers in 1763, after which he studied several Oriental languages, and explored the antiquities of Barbary. In 1768 he departed from Cairo on a journey to Abyssinia, in order to discover the source of the Nile. Passing through Syene, Cosseir, and Jidda, he reached Gondar in Feb., 1770. He discovered the source of the Blue Nile in November of that year, and remained about two years in Abyssinia, the king of which treated him kindly. He passed through great dangers and hardships in his return, and arrived in England in 1774. In 1790 he published "Travels to Discover the Source of the Nile" (5 vols.). His veracity was at first doubted by many, but his statements have been confirmed by Salt, Belzoni, and others. Died April 27, 1794. (See A. Murray, "Life of Bruce.")

Bruce (Michael), a Scottish poet, whose productions (mostly hymns) are characterized by singular pathos and beauty, was born at Kinneswood, in the county of Kinross, Mar. 27, 1746. He died of consumption July 5, 1767. In 1770 his "friend," the Rev. John Logan (1748–88), published what purported to be his literary remains. In 1781 this same Logan published another volume of poems, which he called his own. The best of these, it is now almost absolutely certain, came from the pen of Michael Bruce. A baser act of literary piracy was never perpetrated. (See "The Works of Michael Bruce," edited by Rev. Alexander B. Grosart, 1865.)

Bruce (Robert), a heroic and famous king of Scotland, born Mar. 21, 1274, was a son of Robert de Bruce, earl of Carrick. In 1296, as earl of Carrick, he swore fealty to Edward I. of England, but he soon joined the Scottish leaders who were fighting for the independence of Scotland. Having made peace with Edward I., he became in 1299 one of the four regents who ruled the kingdom. In 1305 he was involved in a quarrel with the Red Comyn, who was a nephew of Baliol and was a claimant of the throne. Bruce killed Comyn, and then assembled his vassals and was crowned at Scone in the spring of 1306. His small army was soon defeated by the English, and he was compelled to take refuge in the island of Rathlin, on the coast of Ireland, where he remained all winter. Renewing the contest in the spring, he defeated the English at Loudon Hill in May, 1307. In less than two years he made himself master of nearly all Scotland, and in 1309 he drove back an invading army of Edward II. The latter invaded Scotland again in 1314 with an army of about 100,000 men. Bruce, who had less than half as many, gained a complete victory at Bannockburn, June 24, 1314. In 1318 the Scots invaded England, and after several other campaigns the war was suspended in 1323 by a truce. By a treaty of peace concluded in 1328 the English king recognized the independence of Scotland. Bruce died in June, 1329, and was succeeded by his son David.

Bru'cea, a genus of shrubs which has been referred to the order Rutaceæ. A species called *Brucea antidysenterica* is a native of Abyssinia. Its leaves are said to be tonic, astringent, and efficacious in dysentery. The leaves of *Brucea Sumatrana*, a native of Sumatra and China, have similar medicinal virtues, and are very bitter.

Bruce Mines, a port of entry of the Algoma district, Ontario (Canada), near the N. end of Lake Huron, 35 miles below Sault Ste. Marie. It has very productive mines of copper, and exports considerable quantities of fish. Pop. about 1250.

Bruceville, a post-township of Bullock co., Ala. P. 862.

Bruch'sal, a town of Germany, in Baden, on the river Salzbach, and on the railway from Heidelberg to Carlsruhe, 14 miles by rail N. E. of the latter. It is the northwestern terminus of a railway which extends to Friedrichshafen, on Lake Constance. It has an old castle, a fine palace, a gymnasium, and a paper-mill. Pop. in 1871, 9786.

Bru'cia, or **Brucine,** a very bitter and poisonous vegetable alkaloid found in *Strychnos nux vomica*. It is characterized by giving a blood-red color with concentrated nitric acid. It was discovered in bark incorrectly supposed to be that of *Brucea antidysenterica*, whence its name. Its toxicological effects are like those of strychnia, but it is far less active.

Bru'cite, the native magnesic hydrate, MgH_2O_2. It is found in serpentine at Hoboken, N. J. The finest specimens occur in the chrome-mines of Texas, Pa.

Brück'e (Ernst Wilhelm), a German physiologist, born at Berlin June 6, 1819, became in 1846 teacher of anatomy at the Berlin Art Academy, and in 1849 professor of physiology in Vienna. He is the author of "Anatomische Beschreibung des Augenapfels" (1847), and "Grundzüge der Physiologie und Systematik der Sprachlaute" (1856).

Bruck'er (Johann Jakob), a German historian and Protestant minister, born at Augsburg Jan. 22, 1696. Among his works is a "Critical History of Philosophy" (in Latin, 5 vols., 1741–44), which has a high reputation. It contains valuable biographical materials, but is deficient in critical analysis. Died Nov. 26, 1770.

Bruel'lett's, a township of Edgar co., Ill. Pop. 1086.

Bru'ges [Dutch *Brugge*, or *Bruggen* (*i. e.* "bridges"); Lat. *Brugæ*], a fortified city of Belgium, capital of the province of West Flanders, is situated on a fertile plain about 8 miles from the ocean, and 64 miles by rail N. W. of Brussels; lat. 51° 12′ N., lon. 3° 14′ E. The railway from Ostend to Brussels passes through Bruges, which is connected with the ocean by several canals. It derives its name from the numerous bridges (about fifty-four) which here cross the canals. It contains many fine Gothic edifices, some of which were built in the fourteenth century, and are richly adorned with works of art. Among these are the church of Notre Dame, which has a spire 450 feet high, and contains a splendid monument of Charles the Bold; the town-hall, with a lofty tower and a celebrated chime of forty-eight bells; and the cathedral of St. Sauveur, furnished with paintings of eminent artists. Memling's "Shrine of St. Ursula" and his other works at Bruges are of great importance in the history of mediæval art. Bruges has an academy of painting, a public library, a museum, an episcopal college, a hospital, a school of surgery, and an institution for the blind. Here are manufactures of cotton, linen, and woollen fabrics, lace, leather, cordage, tobacco, and soap. Several thousand females are employed in the manufacture of lace of fine quality. Bruges was an important commercial town before the Norman conquest (1066), after which it continued to increase in riches and population. In the thirteenth century it was the great central mart of the Hanseatic League. Its manufactures were also very extensive. The tapestry and cloths of Bruges were celebrated for their excellence. The population once exceeded 200,000. Its prosperity was injured by a popular revolt in 1488, and by the persecutions and vexations which it suffered under Philip II. of Spain. P. 47,621.

Brugsch (Heinrich Karl), Ph. D., a German archæologist, born at Berlin Feb. 18, 1827. He was Prussian consul to Cairo in 1864, and in 1868 was charged by the viceroy of Egypt with the organization of the first Egyptian university in Cairo, where he now (1873) resides. He has published a "Grammaire Démotique," "Monuments of Egypt," a "Hieroglyphic Demotic Dictionary" (4 vols., 1867–68), and other similar works.

Brühl (Gustavus), M. D., born at Herdorf, Prussia, May 31, 1826, studied in the colleges of Siegen, Münstereifel, and Treves, where he graduated; studied medicine at Munich, Halle, and Berlin; graduated M. D. at the university Sancti Ludovici; became in 1848 a physician of Cincinnati, O.; was physician of St. Mary's Hospital, lecturer on laryngoscopy, etc. in Miami Medical College; one of the founders and first president of the Peter Claver society for the education of colored children; was in 1871 Democratic candidate for State treasurer; acquired fame as a lecturer and political speaker; edited the *German Pioneer* 1869–71; has written much in prose and verse for journals; author of *Poesien des Urwalds* (1871); is (1874) one of the examiners of public schools, Cincinnati, O., and a member of many learned and literary societies.

Brumaire, the second month in the calendar of the French Republic, is perhaps derived from *brume*, a "mist," a "fog." It comprised the time from Oct. 23 to Nov. 21. The 18th Brumaire (Nov. 9), 1799, was a famous epoch in French history. Then occurred the *coup-d'état* which subverted the power of the Directory and raised Bonaparte to supreme power as first consul. The Directory was not popular, and was weakened by dissensions among the directors themselves, two of whom, Sieyès and Ducos, promoted the design of Bonaparte by resigning on the eve of the crisis. The Council of Elders and Council of Five Hundred were dispersed or overawed by the soldiery, and the new régime was established with little fighting.

Bru'math, a town of Germany, in Alsace-Lorraine, 10 miles by rail N. N. W. of Strasburg. Pop. 5601.

Brum'mel (George Bryan), "Beau Brummel," a famous fop, born in London in 1778, was educated at Oxford. He had elegant taste in dress, became intimate with the prince of Wales, lived in sumptuous style, was recognised as an oracle in questions of etiquette and dress, squandered a fortune, went into exile in 1815, and died at Caen Mar. 29, 1840.

Brum'met's Creek, a tp. of Mitchell co., N. C. P. 217.

Brunai, a state and seaport of Borneo (which see).

Brunck (Richard François Philippe), an eminent classical scholar, born at Strasburg, in Alsace, Dec. 30, 1729. He was liberally educated in Paris, and became an ingenious critic and bold emendator of the classics. He edited Anacreon, Aristophanes, Sophocles, and Terence, and published "Analecta Veterum Poetarum Græcorum" (1772–76). In the French Revolution he warmly supported the popular cause. Died June 12, 1803.

Brundisium. See Brindisi.

Brunehaut, or **Brunehilde,** a famous queen, was a daughter of Athanagildus, king of the Visigoths. She was married in 568 A. D. to Sigebert, king of Austrasia. She was beautiful, ambitious, and high-spirited. Her husband was assassinated in 575 by the order of Fredegonda, queen of Neustria. She afterwards governed the kingdom with ability, and obtained an ascendency over her son Childebert, who was the nominal king. Having been defeated in battle and captured by Clotaire II., she was murdered in 613 A. D.

Brunel' (Isambard Kingdom), D. C. L., F. R. S., a British engineer, born at Portsmouth April 9, 1806. He was employed under his father as assistant engineer of the Thames Tunnel, in the construction of which he displayed great energy and ability. In 1833 he was appointed chief engineer of the Great Western Railway. He was the designer and engineer of the Great Western steamship and of the Great Eastern, said to be the largest vessel ever built in the world, and of the Royal Albert Bridge, Saltash. (See Bridge, by Gen. J. G. Barnard, U. S. Army.) Died Sept. 14, 1859.

Brunel (Sir Mark Isambard), F. R. S., a celebrated engineer, born near Rouen, in France, April 25, 1769, was the father of the preceding. Driven from France by the Reign of Terror, he removed to New York in 1793, and designed the Bowery Theatre of that city. In 1799 he went to England, and married a Miss Kingdom. He was distinguished for his mechanical ingenuity, and invented several useful machines. His most important work is the Thames Tunnel, which was commenced in 1825 and opened in 1843. Died Dec. 12, 1849. (See R. Beamish, "Life of M. I. Brunel.")

Brunelles'chi (Filippo), an eminent Italian architect and sculptor, born at Florence in 1377. He improved the theory of perspective, and efficiently promoted the restoration of the ancient style of architecture as a substitute for the Gothic, which in his youth prevailed in Italy. About 1418 he was appointed architect of the cathedral of Florence (Santa Maria del Fiore), which had been commenced about 1296, and was unfinished. He raised over it a grand and beautiful dome, which is one of the largest in the world. Among his other works is the Pitti Palace of Florence. Died in 1444. (See Baldinucci, "Vita di F. di Ser Brunellesco," 1812.)

Bru'ni (Leonardo), a learned Italian writer, a native of Arezzo, and hence called Leonardo Aretino, was born in 1369. He obtained a high office at Florence, promoted the study of Greek literature, and translated into Latin some works of Aristotle and other classics. Among his original writings is a "History of Florence," in Latin. Died Mar. 9, 1444.

Brünn [Slavic, *Brno*, the "ford"], a fortified city of Austria, and the capital of Moravia, is beautifully situated at the confluence of the Schwarza and the Zwittawa, 94 miles by rail N. N. E. of Vienna and 159 miles by rail S. E. of Prague; lat. 49° 11′ 39″ N., lon. 16° 36′ 39″ E. Here is the castle of Spielberg, used as a state prison. Among the remarkable public buildings are the cathedral, the Gothic church of St. James, the *Landhaus*, formerly a rich Augustine convent, several palaces of the nobility, and a theatre. Brünn also contains a museum, a public library, and a botanic garden. It has important manufactures of woollen, cotton, and silk fabrics, ribbons, glass, soap, and tobacco. It is the seat of the highest civil and military authorities of Moravia and Austrian Silesia and of a Roman Catholic bishop. Its manufactures of woollens are said to be the most extensive in the Austrian empire. Over 15,000 persons are employed in the factories, according to the census of 1869. Napoleon used Brünn as his head-quarters before the battle of Austerlitz. Pop. in 1869, 73,464.

Brun'now, von (Philipp), a diplomatist, was born at Dresden Aug. 31, 1797. He entered the Russian civil service in his youth, and was employed in several important offices and missions. He was sent as ambassador to London in 1840, was transferred to Frankfort in 1854, and attended the Conference of Paris in 1856. In 1858 he resumed his former position in London, and took part in the Conference of London in 1862.

Bru'no [Lat. *Brunus*], (Giordano), an eminent Italian philosopher, born at Nola, in the kingdom of Naples, in 1548. He was a man of independent and speculative spirit, and rejected the orthodox doctrines of the Church. On account of his opinions he was obliged to flee to Geneva in 1580, a few years after which he removed to Paris, and passed some time in England. His principal works are "Spaccio della Bestia trionfante" (1584), "Della Causa Principio e Uno," and "Del Infinito Universo e Mondi." About 1592 he returned to Italy and became a resident of Pavia. Having been accused of heresy, he was imprisoned at Rome for nearly two years, and was burned as a heretic

Feb. 17, 1600. His system is called Pantheism, and has had much influence in modern philosophy. (See C. G. von Murr, "Leben und Schriften des G. Bruno," 1805; N. Moeller, "G. Bruno, sa Vie et ses Doctrines," 1840; Berti, "Vita di Giordano Bruno," 1868.)

Bruno, Saint, founder of the Carthusians, was born at Cologne about 1040. In 1086 he retired from the world, and with a few friends began to live in solitude near Grenoble. He founded there the order of Carthusians, who adopted the rule of Saint Benedict. The monastery of the Grande Chartreuse was afterwards built at the same place. He died Oct. 6, 1101.

Bruno the Great, archbishop of Cologne, born 925 A. D., was a younger brother of the emperor Otho I. He was a man of great talents, virtue, and learning, and had a powerful influence in the Church and State. He became lord high chancellor of the empire. Died in 965.

Bruno City, a township of Elko co., Nev. Pop. 122.

Brunol'ic Acid, a substance which occurs in oil of coal-tar, associated with carbolic, cresylic, and rosolic acids.

Bruns'wick, a duchy of the German empire, consists of three larger parts and several enclaves. Area, 1425 square miles. The larger part, containing the capital, is entirely surrounded by Prussia. The chief mountain-range is a part of the Hartz Mountains in the S., the highest point of which in the duchy is the Wormberg, 3245 feet high. It is traversed by the Ocker in the N., and the Leine, Aller, and Bode. The chief products are grain, flax, and hops. Among the mineral products are silver, lead, iron, lignite, salt, etc. It has extensive manufactures of linen, wooden wares, glass, sugar, tobacco, paper, cloths, etc., also large beer-breweries. It has five gymnasia, one polytechnic school, a theological seminary, two normal,-and numerous other schools. The government is a constitutional monarchy, and the supreme power is vested in a duke and a legislative body of forty-six members. The receipts and expenses for the three years 1870–72 were each estimated at 7,196,400 thalers. The public debt in 1871 amounted to 23,765,768 thalers. Brunswick is represented by two members in the Bundesrath of the empire, and three deputies in the imperial Reichstag. Its contingent to the German army forms part of the tenth army corps. Pop. in 1871, 311,819.

History.—Brunswick formed originally a part of the duchy of Saxony, and was given in 1194 to Henry the Lion. His grandson Otto became first duke of Brunswick in 1235. After having been divided and reunited by the descendants of Otto, they were again united under Ernest the Confessor (died 1546). His two sons, Henry and William, again divided the country, and formed the two branches Brunswick-Oels and Brunswick-Lüneburg, the latter of which reigned as electors of Hanover, and in the person of George I. ascended the British throne. Brunswick was annexed to the kingdom of Westphalia in consequence of the treaty of Tilsit, but in 1813 it again became an independent state under Frederick William, who was killed in the battle of Quatrebras in 1815. He was succeeded by his son Karl, who was expelled from the country in 1830, and was succeeded by his brother Wilhelm, who is the present duke. Brunswick joined the German customs-union in 1844, assisted Prussia in the war of 1866, joined the North German Confederation in the same year, and became a member of the German empire upon its revival in 1870. With the death of Duke Wilhelm the ducal line of Brunswick will become extinct, Duke Charles having died in Aug., 1873, without issue. While the duke desires the ex-king of Hanover or his son for his successor, it is believed that Prussia would favor the succession of one of the sons of Queen Victoria. A. J. Schem.

Brunswick [Ger. *Braunschweig;* anc. *Brunonis Vicus*], a city of Germany, capital of the duchy of the same name, is on the river Oker and in a level district, 47 miles by rail E. S. E. of Hanover; lat. 52° 16′ 11″ N., lon. 10° 32′ 09″ E. The old fortifications have been demolished and converted into pleasant promenades. It contains a magnificent ducal palace, an ancient cathedral, the church of St. Andrew, with a steeple 316 feet high, a mint, an opera-house, a town-hall, and a museum which contains paintings by Albert Dürer, Rembrandt, Holbein, and other great masters. Railways extend from this town to Hanover, Magdeburg, and other places. Here are manufactures of linen and woollen goods, lacquered wares, *papier-maché*, tobacco, hardware, etc. A great annual fair is held here. Among its institutions are a college, a gymnasium, a real-schule, and an asylum for deaf-mutes. This is a very old town. It was enlarged and beautified by Henry the Lion in the twelfth century. It formerly belonged to the Hanse League. Pop. in 1871, 57,883.

Brunswick, a county of North Carolina, bordering on South Carolina. Area, 950 square miles. It is bounded on the S. by the Atlantic Ocean, on the E. by the Cape Fear River, and on the W. by the Waccamaw. The surface is level, and partly occupied by swamps. Corn, rice, cotton, and wool are produced. It is intersected by the Carolina Central and the Wilmington Columbia and Augusta R. Rs. Capital, Smithville. Pop. 7754.

Brunswick, a county of Virginia, bordering on North Carolina. Area, 600 square miles. It is intersected by the Meherrin River, and bounded on the N. by the Nottoway. The surface is undulating; the soil is productive. Grain, tobacco, and wool are raised. Capital, Lawrenceville. Pop. 13,427.

Brunswick, a port of entry, capital of Glynn co., Ga., on St. Simon's Sound, 8 miles from the Atlantic Ocean and 80 miles S. S. W. of Savannah. It is the S. E. terminus of the Macon and Brunswick R. R., and the E. terminus of the Brunswick and Albany R. R. It has a safe and spacious harbor, and is chiefly engaged in the manufacture and export of yellow-pine lumber. It has one weekly paper. At the S. end of St. Simon's Island, and on the N. side of the entrance to the sound, is St. Simon's light-house; lat. 31° 08′ 03″ N., lon. 81° 23′ 26″ W. It is of brick, 108 feet high, and shows a fixed light varied by red and white flashes. Pop. 2348.

T. F. Smith, Ed. "Seaport Appeal."

Brunswick, a post-village of Cumberland co., Me., on the right bank of the Androscoggin River, and on the Maine Central R. R., 30 miles N. E. of Portland and about 8 miles W. of Bath; lat. 43° 54′ 5″ N., lon. 69° 57′ 4″ W. It is the S. terminus of the Androscoggin R. R., and is the site of Bowdoin College (which see). The river here falls nearly 50 feet in the distance of half a mile, affording abundant water-power. Brunswick has six churches, three national banks, a cotton-mill, and other manufactories. It has a weekly paper. Many ships are built and owned here. Pop. 1449; of Brunswick township, 4687.

Brunswick, a post-village, capital of Kanabec co., Minn., on Snake River, 64 miles N. of St. Anthony. P. 93.

Brunswick, a post-village of Chariton co., Mo., on the N. bank of the Missouri River, 292 miles by water from St. Louis, and on the St. Louis Kansas City and Northern R. R., 90 miles E. by N. from Kansas City. A branch railroad extends from this place north-westward to Chillicothe. It is situated on a level, fertile prairie. It has one weekly newspaper. Pop. 1645; of Brunswick township, 4576.

Brunswick, a township of Rensselaer co., N. Y., contains a part of the suburbs of Troy. Pop. 3128.

Brunswick, a post-township of Medina co., O. Pop. 980.

Brunswick, a post-township of Essex co., Vt. It contains a mineral spring of some note. Pop. 221.

Brunswick, a township of Eau Claire co., Wis. Pop. 575.

Brunswick-Bevern (August Wilhelm), Duke of, a Prussian general, born Oct. 15, 1715, took part in the wars of Frederick the Great against Austria. He distinguished himself in the battles of Lowasitz, Reichenberg, Prague, and Kollin. He was defeated and taken prisoner at Breslau in 1757, and was released in 1758. Died Aug. 1, 1781. He was the tallest soldier of his time in the Prussian army.

Brunswick Black is a varnish employed to coat over coarsely-finished iron grates, fenders, etc. It is composed mainly of lampblack and turpentine. It is applied with a brush, dries quickly, and leaves a shining, jet black surface.

Brunswick Green, a pigment used in the arts, consisting of the hydrated chloride and the oxide of copper. It is obtained by exposing metallic copper to the action of muriate of ammonia, or by mixing sulphate of copper and common salt into a paste with water. It is also generated by the action of sea-water on copper, and occurs native in Atacama in the form of green sand, hence called atacamite.

Bruns'wick-Lü'neburg (Karl Wilhelm Ferdinand), Duke of, a German general, born Oct. 9, 1735, was a nephew of Frederick the Great, and the eldest son of Duke Karl. He fought for his uncle in the Seven Years' war, and succeeded to the dukedom in 1780. He became in 1792 commander-in-chief of the allied armies of Austria and Prussia, which invaded France and were repulsed by Dumouries. In 1793 he resigned the command. He took command of the Prussian army in 1806, and was defeated by the French at Jena in October of that year. In this battle he was mortally wounded. Died Nov. 10, 1806.

Bru'sa, or **Bur'sa** (anc. *Prusa ad Olympum*), a city of Asia Minor, in Anatolia, is pleasantly situated at the N. base of Mount Olympus, about 60 miles S. by E. from Constantinople. It is on a beautiful and fertile plain, and presents a magnificent external appearance, having more than 200 mosques and minarets, some of which are very hand-

some. The streets are narrow, but are kept clean by running water. Here are many colleges and schools, several Armenian churches, and large bazaars supplied with European goods. Brusa is one of the most commercial cities in Asiatic Turkey, and raw silk is the chief article of export. It has manufactures of silk, satin, gauze, cotton cloths, and tapestry. The silks of Brusa are highly esteemed in the European markets. Here are warm mineral springs which were celebrated in ancient times. *Prusa* was the capital of ancient Bithynia. It was taken by the Turkish sultan Orkhân in 1326, after which it was the capital of the Turkish empire until 1453. Feb. 28, 1855, the town was nearly destroyed by an earthquake. Pop. about 70,000.

Brusanti'ni (Vincenzo), Count, an Italian poet of the sixteenth century. He went in youth to Rome to seek his fortune, but forgot his purpose, and was put into prison on account of certain indiscreet acts. In prison he suffered much. He afterwards made a long tour throughout Italy, and his talents won him the patronage of many princes. His indiscretion, however, lost him whatever favors he had gained, and in 1570 he died at Ferrara, his native town. He is known by his "Angelica Inamorata" and "Cento Novelle," imitations, the one of the "Orlando Furioso" of Ariosto, and the other of the "Decameron" of Boccaccio. Both are clumsy, cold, and untasteful performances.

Brusasor'ci (properly Domenico **Ri'ccio**), a painter, born at Verona, Italy, in 1494. His title of "the Titian of Verona" was conferred upon him on account of his imitation of the style of that master. His works, which have been greatly overpraised, are chiefly at Verona. Many of them are in fresco. Died in 1567.—His son, Felice Riccio, called the Younger Brusasorci (1540–1605), was a skilful painter on marble and alabaster.

Brus'chius, or **Brusch** (Gaspard), a German historian, born Aug. 19, 1518, at Schlakenwald in Bohemia, was in 1552 made a count palatine and poet laureate by Ferdinand, king of the Romans. He favored Luther and Melanchthon, and in 1559 was murdered in a forest by some gentlemen who thought themselves satirized by him. His chief historical works are "De Germaniæ episcopatibus epitome" (1549) and "Monasteriorum Germaniæ præcipuorum Chronologia" (1551).

Brush, an instrument for removing dirt from various surfaces by friction, for adjusting the hair, or for polishing, or applying paints, whitewashes, and the like. Hogs' bristles furnish a large part of the material for the friction surface of the best brushes, but for delicate work camel's, badger's, sable's, and rabbit's hair is used. Wire brushes are used in various departments of manufacturing industry. Split whalebone is sometimes employed as a substitute for bristles. Broom-corn and twigs of trees are often employed for stiff brushes, and the coarse instruments used in cleaning streets are partly made from piassaba and other imported palm fibres. Most brushes are made by joining some of the above materials to a stock of wood, leather, bone, or metal, by various methods—a business which gives employment to many thousands in Europe and the U. S. Ingenious machines have been invented for the performance of various parts of the work of making brushes; and these machines have greatly reduced the labor and expense of making some kinds of brushes. Other kinds are still made by hand.

Brush (George Jarvis), born at Brooklyn, N. Y., Dec. 15, 1831, was educated at Yale College, at the University of Munich, the Mining Academy of Freiberg, Saxony, and the School of Mines in London. He became in 1855 professor of metallurgy in Yale, to which the professorship of mineralogy was added in 1864. He is executive officer of the Sheffield Scientific School, and has published numerous papers in the "American Journal of Science," and is author of parts of the fifth edition of Dana's "Mineralogy."

Brush Creek, a twp. of Washington co., Ark. P. 740.

Brush Creek, a township of Faribault co., Minn. Pop. 422.

Brush Creek, a township of Yancy co., N. C. P. 495.

Brush Creek, a township of Jefferson co., O. P. 697.

Brush Creek, a post-township of Muskingum co., O. Pop. 1292.

Brush Creek, a township of Scioto co., O. P. 1410.

Brush Creek, a township of Fulton co., Pa. P. 876.

Brush Turkey (*Talegalla Lathami*), sometimes called **Wattled Tallegalla** and **New Holland Vulture,** a bird of Australia remarkable for the peculiar manner in which its eggs are hatched. Several pairs of these birds having united to build a nest, collect leaves, grass, etc. into a heap, sometimes to the amount of several cart-loads. In this mass the several females deposit their eggs, where they remain till hatched by the artificial heat of the mound. The bird is about the size of our common turkey, and has wattles on its head and neck. When pursued, it endeavors

Brush Turkey.

to make its escape by running through the tangled brush or by flying into the low branches of a neighboring tree.

Besides the above, there are several other species and genera, all Australian, and nearly all closely resembling the above bird in its peculiar habits. These now constitute the family Megapodidæ. (See Megapodidæ.) The birds are edible, and are much sought as game.

Brush Valley, a post-township of Indiana co., Pa. Pop. 1606.

Brushy Creek, a post-township of Anderson co., S. C. Pop. 1752.

Brushy Lake, a township of Cross co., Ark. Pop. 313.

Brushy Mountain, a township of Wilkes co., N. C. Pop. 434.

Bruso'ni (Girolamo), an Italian historian and poet, born at Legnano Dec. 10, 1610. He wrote many Latin and Italian poems, and was for a time confined in prison at Venice for assuming improperly the dress of a Carthusian monk. He wrote many historical and other works, of which the most celebrated is "Istoria d'Italia" (1656–80). Died after 1679.

Brus'sels, a post-township of Door co., Wis. P. 406.

Brus'sels [Dutch, *Brussel;* Fr. *Bruxelles*], the capital of Belgium, is situated in the province of Brabant, on the river Senne, 27 miles by rail S. of Antwerp, and 227 miles by rail N. N. E. of Paris; lat. 50° 51′ 10″ N., lon. 4° 22′ 13″ E. It is built partly on the slope of a hill which rises 220 feet above the level of the sea, and partly on a fertile plain. The upper town on the hill is the most modern and fashionable, and contains the royal palace, public offices, and the finest hotels. Brussels is the most important and populous city of Belgium, is remarkable for the number and richness of its antique buildings, and ranks among the finest cities of Europe. The walls which formerly surrounded this city have been converted into boulevards, broad promenades lined with double rows of shade trees. The Allée Verte is a fashionable promenade along the Scheldt Canal, and extends to the royal palace of Laeken, about 3 miles N. of the city. The principal public squares are the Place Royale, the Grande Place, in which stands the hôtel de ville, and the Place de la Monnaie, which contains the mint, the theatre, and the exchange. Among its remarkable edifices are the hôtel de ville, a fine Gothic structure, with a spire 364 feet high, in the grand hall of which the emperor Charles V. abdicated in 1555; the Gothic cathedral of St. Gudule, which was built about 1270, and is celebrated for its painted windows, numerous statues, and carved pulpit; the church of Notre Dame de la Chapelle, commenced in 1134; the royal palace; the modern church of Notre Dame de Bon Secours; the former palace of the prince of Orange; and the Palace of the Fine Arts, which contains a large collection of paintings of the Flemish school. Brussels has a public library of about 200,000 volumes; a botanic garden; an astronomical observatory, one of the finest in Europe; a magnetic observatory; a free university, founded in 1834, with four faculties—viz. law, medicine, mathematical and physical sciences, and belles-lettres; a normal school, a polytechnic school, and institutions for the blind and for deaf-mutes. The only mint of the kingdom is situated here. Brussels is one of the great centres of Belgian industry, and is celebrated for the manufacture of lace which is considered the finest in the world. The other chief products of its manufactories are fine linens, damasks, ribbons, gold and silver embroidery, glass mirrors, jewelry, paper, porcelain, hats, mathematical and musical instruments, carriages, and chemical products. Its trade is facilitated by a canal which connects it with Antwerp, and by railways which radiate in many

directions. About one-third of the people of this city speak French, and the others Flemish or Dutch. Pop. in 1869, with suburbs, 314,077. REVISED BY A. J. SCHEM.

Bru'ton, a township of York co., Va. Pop. 1839.

Bru'tus, a township of Cayuga co., N. Y. It contains the village of Weedsport. Pop. 2621.

Brutus (LUCIUS JUNIUS), a famous Roman patriot, was a son of Tarquinia and a nephew of Tarquin the Proud. According to tradition, that tyrant was about to put him to death, but he saved his life by feigning idiocy, which was the origin of his surname *Brutus*. When the tragic fate of Lucretia had prepared the people to revolt, Brutus led them, expelled the Tarquins from Rome, and founded a republic (509 B. C.). He was then elected one of the consuls. He ordered the execution of his own sons, Titus and Tiberius, who were convicted of treason. About 507 he was killed in a battle against the Tarquins.

Brutus (MARCUS JUNIUS), a Roman republican, a descendant of the preceding, was b. in 85 B. C. He married Porcia, the daughter of Cato Uticensis, who was his maternal uncle. In the civil war he fought under Pompey against Cæsar, but after the battle of Pharsalia he was kindly treated by the dictator, with whom he entered into friendly relations; he was appointed governor of Cisalpine Gaul. His zeal for republican liberty and the influence of his friend Cassius induced him to join the conspiracy against Cæsar; both took part in his murder; became prominent leaders of the republican party; led an army against that of Antony and Octavius at Philippi (42 B. C.), and after the reverse of Cassius, Brutus killed himself on the field.

Brüx, or **Brix,** a town of Bohemia, on the river Bila, 14 miles N. of Saaz. It has a gymnasium, a realschule, numerous churches, coal-mines, and manufactures of salts from the famous mineral spring of Seidlitz. P. in 1869, 6308.

Bry'an, a county of Georgia, bordering on the Atlantic. Area, 472 square miles. It is bounded on the N. E. by the Ogeechee River, and intersected by the Cannouchee. The surface is nearly level; the soil is sandy. Rice, corn, oats, cotton, and wool are raised. The Atlantic and Gulf R. R. passes through it. Capital, Eden. Pop. 5252.

Bryan, a post-village of Sweetwater co., Wy., on the Union Pacific R. R.

Bryan, a township of Surrey co., N. C. Pop. 1032.

Bryan, capital of Williams co., O., on the Air-Line R. R., 54 miles W. of Toledo. It has two banks, an academy, and important manufactures, and is noted for its artesian wells. Two newspapers are issued here. Pop. 2284. P. C. HEYES, PUB. "PRESS."

Bryan, a city, capital of Brazos co., Tex., on the Texas Central R. R., 100 miles N. W. of Houston and 8 E. of Brazos River, has a cotton-gin and mill-factory, a manufactory of tobacco, one of carriages, one of soap, and one of cotton-seed oil. It has a college, a newspaper, two academies, three benevolent societies, eight churches, and is the seat of the State Agricultural and Mechanical College. GOODWIN & SMITH, EDS. "BRYAN APPEAL."

Bryanites. See BIBLE CHRISTIANS.

Bry'ant (WILLIAM CULLEN), b. Nov. 3, 1794, at Cummington, Hampshire co., Mass.; educated at Williams College, which he entered in 1810. He studied law, and in 1815 was admitted to the bar, but after practising successfully for ten years, first at Plainfield and then at Great Barrington, removed in 1825 to New York, and engaged in the business of an editor. In 1826 he became connected with the "Evening Post," of which he is still (1875) the editor-in-chief. Under his direction this paper has maintained through a long series of years a high standing in the American press by the boldness of its protest against slavery before the war, by the vigor of its support to the government during the war, by the fidelity and ability of its advocacy of Democratic freedom in trade and legislation, and by the purity of its moral tone. In 1834, 1845, 1849, and 1857, Mr. Bryant visited Europe, and presented the literary fruit of his travel in a series of "Letters of a Traveller" and "Letters from Spain and other Countries," which rank high in literature of their class. Unpretending yet elegant in manner, they give the facts as these presented themselves to the writer without embellishment of fancy or ornament of style. In the world of literature Mr. Bryant is known chiefly as a poet, and here his name is illustrious both at home and abroad. Bryant's career as a poet began very early. He contributed verses to the county gazette before he was ten years old; in his fourteenth year he published a political satire, "The Embargo," together with another long poem "The Spanish Revolution," which in a twelvemonth reached a second edition. "Thanatopsis," perhaps the most impressive and most widely known of his pieces, was produced in his nineteenth year. He published the first volume of poems in 1821 at Cambridge, and the first complete collection in 1832 at New York. Nevertheless, his poems are not many, nor are they the product of a facile muse. The ear for rhythm and the talent for graceful expression are probably gifts of his nature, for they are present in his first poems, "The Ages" and "Thanatopsis." But the principal characteristic of his poetry is thoughtfulness; the intellectual process by which ideas ripen in his mind would seem to be long and slow, and consequently they lack that flash which accompanies the revelations of an impassioned imagination; but they are bright, clear, and sweet. The latest fruit of his genius is his translation of Homer, of which the "Iliad" appeared in 1870, and the "Odyssey" in 1871. The work is a monument of industry; and in some important respects, in the fluency and variety of the rhythm, and in the simplicity, copiousness, and dignity of the expression, deserves a place with the masterpieces of translation. Mr. Bryant has responded to frequent invitations to make ceremonial addresses—a duty that he discharges with rare felicity. His efforts in this kind have been collected in a volume of "Orations and Addresses." In his old age, too, he has been honored in many ways by his fellow-citizens, who have delighted to pay tributes of respect to his literary eminence, the breadth of his public spirit, the faithfulness of his public service, and the worth of his private character. Mr. Bryant's summer residence is at Roslyn, L. I.; his winter home is in New York. REVISED BY O. B. FROTHINGHAM.

Bry'antown, a post-twp. of Charles co., Md. Pop. 3629.

Bryd'ges (Sir SAMUEL EGERTON), an English writer and bibliographer, born in Kent Nov. 30, 1762, published, besides many novels, letters, poems, etc., "Censura Literaria, containing Titles and Opinions of Old English Books" (10 vols., 1805–09), "The British Bibliographer" (4 vols. 8vo, 1810–14), and "Res Literariæ" (3 vols., 1821). He claimed that he was the lawful heir to the barony of Chandos, but his title was not recognized. D. at Geneva Sept. 8, 1837. (See his "Autobiography," 2 vols., 1834.)

Bryen'nius (NICEPHORUS), a Byzantine historian and general, was a minister of Alexis Comnenus, whose daughter, Anna Comnena, he married. Died about 1137. His "History of Constantinople" was edited by MEINEKE (1836).

Bryn'hild, or **Brynhil'da,** a beautiful maiden, celebrated in the Norse mythology. Though called a valkyria, she is evidently the same person as the Princess Brunhild of the "Nibelungen Lied." (See THORP'S "Northern Mythology," vol. i.; see also NIBELUNGEN LIED, in this work.)

Bry'ony (*Bryonia*), a genus of plants of the order Cucurbitaceæ, having triadelphous stamens, with distinct anthers, and stems which climb by means of lateral tendrils. The flowers are campanulate, 5-partite, and unisexual. The common bryony (*Bryonia dioica*) is a native of England, has palmate or 5-lobed leaves, and bears red berries about as large as a pea. It abounds in a fetid and acrid juice. The large perennial root is a purgative and emetic, and is employed in medicine, especially in homœopathic practice. The root of *Bryonia alba* possesses similar properties, and contains a bitter, poisonous principle called *bryonine*. The *Bryonia Boykinii* grows in the Southern U. S.

Bryony, Black (*Tamus communis*), a plant of the order Dioscoreaceæ, is a native of many parts of Europe. It has long twining stems, cordate, undivided leaves, and red berries which are succulent but unwholesome. It is acrid, but the young suckers, in which the acrid principle is not fully developed, are eaten in Greece like asparagus.

Bryozo'a [Gr. βρύον, "moss," and ζῷον, "an animal"], an order of animals which appears to occupy an intermediate place between mollusks and articulates. Most writers have called them mollusks; others class them with the "molluscoids;" while some refer them to the Articulata. They are very small, and moss-like or polyp-like in appearance, mostly marine, but some species live in fresh water.

Bry'son, a village of Pontiac co., Quebec (Canada), has one weekly newspaper.

Bryson (ANDREW J.), U. S. N., born July 25, 1823, in New York, entered the navy, became commander in 1862 and captain in 1866; commanded the iron-clad Lehigh in 1863 and 1864 at the reduction of Fort Macon, and was in all the important fights with the defences of Charleston harbor. FOXHALL A. PARKER.

Bu'aze, an African plant, of which the botanical relations are not yet known, but which is likely to prove of importance on account of its fibre. Dr. Livingstone found it growing in large quantities north of the Zambesi, and thinks its fibre stronger and finer than that of flax.

Bu'balus, Bubalis, or **Bubalé** [Gr. βούβαλος, a term

anciently applied to a species of antelope], a genus of Bovidæ which is formed by the buffaloes of India and Africa, the anoa, and perhaps the musk ox of North America (*Bubalus* or *Ovibos moschatus*). It includes those species which have the bony core of the horn excavated, with large cells or sinuses communicating with the cavity of the nose. The horns are flattened, and bend laterally with a backward direction. The *Antilope Bubalus*, a native of Barbary, is about the size of a large stag, and has a head and muzzle like an ox. Its horns are furnished with a number of thickened rings, and are curved so that the points are directed backward. It is gregarious. The figure of this animal is found on the monuments of ancient Egypt.

Bubas'tis (the *Pi-beseth* of Scripture and modern *Tel-basta*), a ruined city of Lower Egypt, in the Delta of the Nile, about 75 miles a little E. of N. from Cairo; lat. 30° 36′ N., lon. 31° 33′ E. The site is now occupied by extensive mounds containing the remains of brick houses and broken pottery.

Bubastis, a goddess of ancient Egypt, a deification of the moon corresponding to the Greek Artemis, said to signify literally "she who multiplies her aspects;" so called in allusion to the changes of the moon. According to other authorities, Bubastis was the deification of the cat, which animal, as is well known, was an object of worship in ancient Egypt. Her name, according to modern Egyptologists, was *Pecht* or *Pasht*.

Bub'ble [Lat. *bulla*; Fr. *bulle*], a globular film or vesicle of water or other liquid inflated with air, vapor, or gas. The air usually expands until the film is burst by the distension. Bubbles formed with a mixture of water and soap will float in the air and exhibit interesting optical phenomena. "The colors," says Sir J. Herschel, "which glitter on a soap-bubble are the immediate consequence of a principle the most important from the variety of phenomena it explains, and the most beautiful from its simplicity and compendious neatness, in the whole science of optics." (See THIN PLATES, COLORS OF.) The formation of bubbles of steam (ebullition) always occurs when water is heated to the boiling-point.

Buccaneer' [Fr. *boucanier*], a name applied to the famous adventurers or filibusters who in the sixteenth and seventeenth centuries infested the West Indies and the Spanish colonies of South America. They were mostly English and French, and were united by a common hostility to the Spaniards, to plunder whom was their principal object and business. For mutual protection against the cruelty of the Spaniards, they organized themselves into an association or community bound by a simple code of laws. The island of Tortuga was at one time occupied by them, and was their chief base of operations. They took immense booty from the Spanish galleons which conveyed precious metals to Spain, and often attacked towns on the coasts. Among the famous and able leaders of the buccaneers were the French Montbar, surnamed THE EXTERMINATOR, and Henry Morgan, a Welshman, who was born about 1637. He organized fleets and armaments, took strong fortresses, and displayed remarkable military talents. He was knighted by Charles II. The navigator Dampier also took part with the buccaneers in some expeditions against the Spaniards. (See JAMES BURNEY, "History of the Buccaneers.")

Buccina'tor [Lat. *buccino*, "to swell the cheeks," as in blowing a trumpet, from *bucca*, the "cheek"], the name of a muscle situated in the substance of the cheeks; so called because, when the cheeks are distended with air, the contraction of the buccinator muscle forces it out. Its principal use is to compress the food during mastication.

Bucci'no, a town of Italy, in the province of Salerno, is on the river Botta, here crossed by an old Roman bridge, 23 miles W. of Potenza. Here are quarries of fine marble. Pop. in 1861, 5493.

Buc'cinum [a Latin word signifying a "trumpet"], a genus of gasteropod mollusks, characterized by a shell with a smooth nonplicated columella, and with a fissure or short respiratory canal inflected towards the left. The shape of some species of this genus resembles that of a trumpet. *Buccinum undatum* is the systematic name of the shell called whelk. Most of the living species are found in the cold zones; many are fossil.

Buc'cleugh, DUKES OF (1663), dukes of Queensberry, marquesses of Dumfriess-shire, earls of Drumlanrigand Sanquhar (1684), earls of Buccleugh (1619), earls of Dalkeith (1663), viscounts of Nith, Torthorwold, and Ross, and Barons Douglass (1684), Barons Scott of Buccleugh (1606), Barons Scott of Eskdale (1619), Lords Scott of Winchester (1663, in Scotland), earls of Doncaster, and Barons Tynedale (1662, in England), a noble family of Scotland, descended from Sir Walter Scott of Branxholm and Buccleugh, a brave and powerful chieftain who lived in the reign of James V. He fought at the battle of Pinkie in 1547, and died in 1552. Some incidents of his life formed the subject of Scott's poem, the "Lay of the Last Minstrel." His great-grandson, also named Sir Walter, was raised to the peerage as Lord Scott of Buccleugh in 1606. The first duke was beheaded in 1685, but the duchess retained the title and estates. Henry, the third duke, born in 1746, was a pupil and friend of Adam Smith. He distinguished himself by his efforts to improve his extensive estates by planting trees, enriching the soil, making roads, and improving the breed of sheep. Died in 1812.—His grandson, WALTER FRANCIS, born Nov. 25, 1806, the fifth duke of Buccleugh and the seventh of Queensberry, is said to have spent £320,000 in improving the harbor of Granton, about two miles from Edinburgh, the greatest public work ever executed in Scotland by an individual at his own expense. He succeeded his father in 1819, was lord of the privy seal 1842–46, and president of the council in 1846.

Bucen'taur [It. *Bucentoro*], the name of a celebrated Venetian galley which was gilded and sumptuously furnished, and was used only once a year in a splendid aquatic procession when the doge performed the ceremony of espousing the Adriatic on Ascension Day by dropping a ring into the water. It was about 100 feet long, and was propelled by oars. In the annual procession the Bucentaur, which conveyed the doge and other high functionaries, was followed by many gondolas and feluccas. It was burned in 1797, having been kept for this service since 1177.

Buceph'alus [Macedonian Gr. Βουκέφᾰλας, for Βουκέφαλος, *i. e.* "ox-head" or "big-head"], the favorite horse of Alexander the Great, who rode on him in all his campaigns. He was purchased in Thessaly by King Philip, and cost, according to Pliny, sixteen talents, equal to $20,000, nearly, of our money. The royal grooms were unable to manage him, but Alexander, then very young, tried and succeeded; and Bucephalus would never permit any one but Alexander to ride him. Bucephalus died in India from the effect of wounds received in battle about 326 B. C., and Alexander built in his honor the city *Bucephala* on the Hydaspes.

Bu'cer [from the Gr. βοῦς, a "cow," and κέρας, a "horn," being a literal translation of his German name, *Kuhhorn*], (MARTIN), a German Reformer, was born near Strasburg in 1491, and was for a time a Dominican friar. He became a Protestant in 1521. He was a friend of Luther, and studied Greek and Hebrew at Heidelberg. He introduced the Reformed doctrines at Strasburg 1523, and was for many years professor of theology at that city. When dissensions arose between Luther and Zwingle, Bucer acted the part of mediator. His opinions in relation to the sacrament accorded more nearly with those of Zwingle than those of Luther. He attended the Diet of Augsburg in 1548, and there conducted himself with moderation, but he refused to subscribe to the "Interim." At the invitation of Archbishop Cranmer he went to England in 1549, and became professor of theology at Cambridge. He wrote in Latin and German numerous religious works and commentaries on Scripture. Died Feb. 27, 1551.

Bu'ceros [from βοῦς, an "ox," and κέρας, a "horn"], a genus of birds of the order Insessores, remarkable for the excessive size of the mandibles, of which the upper in some species supports a large horn-like protuberance. These birds are called horn-bills. They are natives of the Old World.

Buch, von (LEOPOLD), a celebrated Prussian geologist, born at Stolpe-on-the-Oder April 25, 1774. He studied mineralogy under Werner at Freiberg. He explored the geology of many countries of Europe, generally travelling on foot. In 1805 he witnessed an eruption of Mount Vesuvius, which converted him to the Plutonic theory. Among his principal works are "Geognostic Observations during Travels in Germany and Italy" (2 vols., 1802–09), "Travels in Norway and Lapland" (1810), and "On the Mountain-Systems of Russia" (1840). He published an excellent geological map of Germany (1824). He was the author of the doctrine of the slow upheaval of continents. Died in Berlin Mar. 4, 1853. (See the English translation of FLOURENS' "Eulogy on L. von Buch," in the Smithsonian Report for 1862, p. 358.)

Buch'an, a district of Scotland, in the north-eastern part of Aberdeenshire, consisting of about one-fourth of the county lying between the Doveran and the Ytham.

Buchan, EARLS OF, and Lords Auchterhouse (1469), Barons Cardross (1606, in Scotland), a noble family of Scotland.—DAVID STUART ERSKINE, the thirteenth earl, was born in Nov., 1815, and succeeded his father in 1857.

Buchan'an, a county in N. E. Central Iowa. Area, 576 square miles. It is intersected by the Wapsipinicon

River, and also drained by Buffalo Creek. The soil is fertile. Cattle, grain, and wool are raised. The Dubuque and Sioux City R. R. passes through this county. Capital, Independence. Pop. 17,034.

Buchanan, a county of Missouri, bordering on Kansas. Area, 400 square miles. It is bounded on the W. by the Missouri River, and intersected by the Platte or Little Platte. The soil is very productive. Cattle, grain, tobacco, and wool are raised. This county is traversed by the Hannibal and St. Joseph R. R., the Kansas City St. Joseph and Council Bluffs, and the St. Joseph branch of the St. Louis Kansas City and Northern R. Rs. Capital, St. Joseph. Pop. 35,109.

Buchanan, a county of Virginia, bordering on Kentucky. Area, 500 square miles. It is drained by the Louisa Fork and Russell Fork of Sandy River. The Cumberland or Big Black Mountain extends along the N. W. border of this county, the surface of which is mountainous. Grain, tobacco, and wool are raised. Capital, Grundy. Pop. 3777.

Buchanan, a post-village, capital of Haralson co., Ga., about 50 miles W. of Atlanta. Pop. 768.

Buchanan, a township of Jefferson co., Ia. P. 1499.

Buchanan, a township of Page co., Ia. Pop. 771.

Buchanan, a flourishing village of Berrien co., Mich., on the St. Joseph River and on the Michigan Central R. R., 87 miles E. of Chicago and 197 miles W. of Detroit. It is situated in the midst of a rich agricultural and fruit region, has a large trade, and contains a national bank, two large bedstead and furniture factories, a zinc collar-pad factory, a large wagon factory, several flouring and saw mills, one sash and blind factory, one foundry and machine-shop, a large washing-machine and clothes-wringer factory, and a weekly newspaper and steam printing establishment. Pop. 1702; of township, 2857. WAGNER & KINGERY, PUBS. "BERRIEN COUNTY RECORD."

Buchanan, a township of Atchison co., Mo. Pop. 905.

Buchanan, a township of Douglas co., Mo. Pop. 430.

Buchanan, a township of Sullivan co., Mo. Pop. 1104.

Buchanan, Alleghany co., Pa. See BIRMINGHAM.

Buchanan, a post-village and township of Botetourt co., Va. The village is on the S. bank of James River, 135 miles W. of Richmond. Pop. of township, 4000.

Buchanan, a township of Outagamie co., Wis. P. 823.

Buchanan (CLAUDIUS), D. D., a Scottish preacher, born near Glasgow Mar. 12, 1766. He was professor in the College of Fort William in Bengal. He wrote "Christian Researches in Asia" (1811), and promoted the spread of the gospel in India. Died Feb. 9, 1815.

Buchanan (FRANKLIN), born at Baltimore, Md., became a midshipman of the U. S. navy in 1815, and passed through the various grades of the service, becoming a captain in 1855. In 1861 he resigned, intending to enter the Confederate service, but subsequently he asked to be restored. His request was refused, and he then joined the Southern navy. He commanded the Merrimack frigate after she was fitted up as an iron-clad, and with her engaged and sunk the wooden frigates Congress and Cumberland. Being wounded in this affair, the command of the Merrimack in the encounter with the Monitor devolved upon Lieut. Catesby Jones. Became a rear-admiral; was defeated and made prisoner by Farragut in Mobile Bay, Aug. 5, 1864, when he fought on board the Tennessee iron-clad, and lost a leg.

Buchanan (GEORGE), an eminent Scottish poet and historian, born at Killearn, in the county of Sterling, in Feb., 1506. He was well educated in Paris, and became a professor in a college of that city. Having adopted the Reformed doctrines, he returned to Scotland in 1537, and wrote "Somnium," a satire against the monks, for which he was persecuted. He took refuge in England, and passed over to France about 1540. He was employed as a teacher in Bordeaux and Paris for several years, during which he wrote some Latin tragedies. After several changes of residence and adventures, he returned to Scotland in 1560. In 1562 he was appointed classical tutor to Mary queen of Scots. His religious and political principles rendered him a supporter of Regent Murray in the civil war that ensued. He became preceptor to the young king, James VI., in 1570, and keeper of the privy seal in the same year. Died Sept. 28, 1582. As a scholar he was almost unrivalled by any of his contemporaries. He wrote Latin verse with great purity, and was humorous, sarcastic, and profound. His chief works are a "History of Scotland" ("Rerum Scoticarum Historia," 1582), a metrical Latin version of the Psalms (1570), and "Franciscanus," a poetical satire. (See his "Autobiography," 1608; DAVID IRVING, "Memoirs of the Life of George Buchanan," 1807.)

Buchanan (ISAAC), a Canadian politician, born in 1810, became a leading merchant and president of the board of trade of Hamilton, Ontario. He was active in putting down the rebellion of 1837, and has for many years been prominently engaged in public affairs. He has published "The Relations of the Industry of Canada with the Mother-country and the U. S."

Buchanan (JAMES), fifteenth President of the U. S., born in Franklin co., Pa., April 23, 1791, graduated at Dickinson College, Carlisle, in 1809, and was admitted to the bar in 1812. He was a Federalist in his youth, but voted for General Jackson in 1828, and was then elected to Congress. In 1831 he was sent as minister to Russia, was U. S. Senator 1833–45; and was then appointed secretary of state. After four years of private life, he was sent as minister to England in 1853. He was nominated by the Democrats and elected President of the U. S. in 1856. The other candidates were John C. Fremont, Republican, and Millard Fillmore, "American." Mr. Buchanan received 174 electoral votes. His policy was hostile to those who opposed the extension of slavery. In his message of Dec., 1860, he blamed the Northern people for the disruption of the Union, and affirmed that the Executive had no power or right to prevent the secession of a State. He published in 1866 "Mr. Buchanan's Administration," a work in defence of his policy as President. Died June 1, 1868.

Buchanan (ROBERT C.), an American officer, born in 1811 in Maryland, graduated at West Point in 1830, and Feb. 8, 1864, colonel Tenth Infantry. He served at frontier posts 1830–70, in Black Hawk war 1832, engaged in command of gunboats in the battle of Bad Axe River, as adjutant Fourth Infantry 1835–38, in Florida war 1836–38—1841–42, engaged at Camp Izard, Oloklikaha, and Okeecho-bee, emigrating Cherokees to the West 1838, in the military occupation of Texas 1845–46, in the war with Mexico 1846–48, engaged at Palo Alto, Resaca de la Palma (brevet major), Monterey, San Antonio, Churubusco, Molino del Rey (brevet lieutenant-colonel), Chapultepec, and the city of Mexico; in command of district of Oregon and Northern California 1856, engaged against Rogue River Indians, and as superintendent of Western recruiting 1857–59. In the civil war he served in the Virginia Peninsula 1862, engaged at Yorktown, Gaines' Mill (brevet colonel), Glendale, and Malvern Hill (brevet brigadier-general), in Northern Virginia campaign 1862, engaged at Manassas, in the Maryland campaign 1862, engaged at Antietam and Potomac Run, in the Rappahannock campaign 1862–63, engaged at Fredericksburg (brevet major-general), as assistant provost marshal, etc. for New York 1864, and member of commissions 1865–68. Retired from active service Dec. 31, 1870. GEORGE W. CULLUM, *U. S. Army.*

Buchanan (THOMAS MCKEAN), U. S. N., born Sept. 10, 1837, at Bellefonte, Pa., graduated at the Naval Academy in 1855, and became a lieutenant in 1860, and a lieutenant-commander in 1862. He was in many engagements with the enemy on the lower Mississippi in co-operation with our army, and on the 15th of Jan. fell, with a bullet through his head, while "encouraging in his own person his officers and men to fight courageously" in the sharp action at Bayou Tèche. In his report to the navy department of this battle Rear-Admiral Farragut writes: "Lieutenant-Commander Buchanan was one of our most gallant and persevering young officers. He informed me two days ago that he thought the enemy was about to make an attack on him, and that he would anticipate them. In reply to my letter, in which I enjoined him to do his whole duty on this occasion, he assured me that I need give myself no uneasiness upon that score, as they had all determined to go down rather than surrender."

FOXHALL A. PARKER, U. S. N.

Buch'anites, a Scotch fanatical sect, now extinct, which derived its existence (in 1783) and its name from a Mrs. Buchan, whose maiden name was Elspeth Simpson. She was born in 1738, and claimed to be the woman mentioned in Rev. xii. The last of the sect died in 1846.

Bu'charest, the capital of Wallachia, is situated in a fertile plain on the river Dimbovetza, about 140 miles N. W. of Varna; lat. 44° 25′ 30″ N., lon. 26° 5′ 24″ E. The houses are mostly mean, and the streets dirty and not well paved. It is said to contain ninety-five churches, one college, a public library, several hospitals, and an excessive number of gaming-houses. This city has the reputation of being the most dissolute capital in Europe. It is the entrepôt for the trade between Austria and Turkey, the chief articles of which are grain, wool, salt, building timber, cattle, and wax. The treaty of peace by which the sultan ceded Bessarabia and part of Moldavia to Russia was concluded here in May, 1812. Pop., according to the "Almanach de Gotha" for 1872, 141,754.

Buchez (PHILIPPE JOSEPH BENJAMIN), an able French

philosophical writer and republican, was born in Ardennes in 1796. He studied medicine, and took part in several plots against the Bourbons. He wrote, besides other works, "The Science of the Development of Humanity" (1833), and a "Complete Treatise on Philosophy from the Catholic and Progressive Point of View" (3 vols., 1840). Buchez and Roux published "The Parliamentary History of the French Revolution" (40 vols., 1833–38). He was president of the National Assembly in May, 1848. Died in 1865.

Buch'holz, a town of Germany, in Saxony, 46 miles S. W. of Dresden. Pop. in 1871, 5247.

Büch'ner (Friedrich Karl Christian Ludwig), born at Darmstadt, in Germany, Mar. 29, 1824, is a leading writer of the present time in advocacy of "humanitarian," materialistic, and atheistic opinions. His best-known work is entitled "Kraft und Stoff" ("Force and Matter," 1854). He has written also two volumes with the title "Physiological Pictures" (1861); one on "Natural Philosophy," "Six Lectures on Darwin" (1868), and a work on "Man in the Past, Present, and Future" (1869–70). The latter has been translated (1872) into English by W. S. Dallas, F. L. S. With considerable acquaintance with recent science, an easy style, and some ingenuity of argument, the principal attraction of Büchner's works to most readers is, probably, his audacity. In 1872–73 Büchner made a lecturing-tour in the U. S., under the auspices of the German Turnvercin, but without marked results in the propagation of his opinions.

Bu'chu [a South African word], the leaves of *Barosma crenata*, *crenatula*, and *serratifolia*, and of other strong-smelling South African plants used in medicine for their diuretic properties. They belong to the order Rutaceæ, and are used by the Hottentots for many diseases. The natives also prize them for their fragrance, and use them in perfuming their bodies. In commerce the various kinds of buchu are known as "round" and "long" buchu, etc. They all contain a volatile oil.

Buck, a name given to the male of the fallow deer and other species of deer; also to the male of sheep, goats, and antelopes. The term is not properly applied to the male of red deer or American deer, which is called a stag. The term doe is applied to the females of those species of deer the males of which are called bucks.

Buck, a township of Edgar co., Ill. Pop. 794.

Buck, a township of Hardin co., O. Pop. 1259.

Buck, a township of Luzerne co., Pa. Pop. 574.

Bucka'ria, a township of Halifax co., N. C. Pop. 1782.

Buck'au, a town of Prussia, in the province of Saxony, forms a suburb of Magdeburg. Pop. in 1871, 9696.

Buck Bean, or **Marsh Trefoil** (*Menyanthes trifoliata*), a plant of the order Gentianaceæ, the only known species of its genus. It is indigenous in Europe and the U. S., and is widely distributed in the colder parts of the northern hemisphere. It grows in bogs and marshes. The leaves are ternate, the corolla funnel-shaped and 5-parted, and the fruit is a pod or 2-valved capsule. A bitter extract obtained from the leaves is a valuable remedy for dyspepsia and disorders of the bowels. The whole plant is tonic, and is used in Germany as a substitute for hops.

Buck Creek, a township of Hancock co., Ind. P. 1227.

Buck'eye, the popular name of certain American exogenous trees and shrubs of the genus *Æsculus* and the order Sapindaceæ. The Ohio buckeye (*Æsculus glabra*), growing in the Valley of the Mississippi, is a large tree with a strong-smelling bark, small, obscure flowers, and prickly fruit containing the seed, which is a large nut resembling that of the horse-chestnut tree, which is a near relative of this buckeye. The sweet buckeye (*Æsculus flava*), a tree, sometimes a shrub, of a range rather more to the S. than that of the preceding, has yellow or sometimes dull purple flowers. The red buckeye (*Æsculus Pavia*) has a still more southern habitat, ranging southward from the Ohio River to Florida. It is generally small, and has bright-red flowers. The white buckeye (*Æsculus parviflora*) is a shrub of the mountains of the Southern States, with panicles of white flowers. There are various other species in Asia.

Buckeye, a post-township of Yolo co., Cal. Pop. 860.

Buckeye, a township of Stephenson co., Ill. Pop. 1761.

Buckeye, a township of Hardin co., Ia. Pop. 159.

Buckeye, a post-township of Frederick co., Md. Pop. 2414.

Buck'field, a post-village of Oxford co., Me., on the Portland and Oxford Central R. R., 48 miles N. of Portland. It has considerable manufactures. Pop. of Buckfield township, 1494.

Buckhan'non, a post-village, the county-seat of Upshur co., West Va., on Buckhannon River, 28 miles S. of the line of the Baltimore and Ohio R. R., and near the centre of the State. It has one weekly paper. Pop. 475; of Buckhannon township, 1674.

C. G. Rapp, for Ed. "Delta."

Buck'hart, a post-tp. of Christian co., Ill. Pop. 2028.

Buckhart, a township of Fulton co., Ill. Pop. 1577.

Buck'horn, a township of Talladega co., Ala. P. 1614.

Buckhorn, a post-township of Brown co., Ill. P. 1050.

Buckhorn, a township of Harnett co., N. C. P. 1438.

Buckhorn, a township of Wake co., N. C. Pop. 1694.

Buckhout (Isaac Craig). See Appendix.

Buck'ingham, a post-village and township of Ottawa co., Quebec (Canada), on the river du Lièvre. It has an academy of the Sisters of Charity, and manufactures and trade in lumber and leather. Pop. of village about 1200.

Buckingham, a county in the central part of Virginia. Area, 680 square miles. It is bounded on the N. and N. W. by the James River, and on the S. by the Appomattox, and also drained by Slate River. The surface is partly hilly; the soil near the rivers is fertile. Tobacco, grain, and wool are raised. Valuable gold-mines and slate-quarries have been opened in this county. Capital, Maysville, or Buckingham Court-house. Pop. 13,371.

Buckingham, a post-township of Tama co., Ia. P. 634.

Buckingham, a post-township of Bucks co., Pa., about 27 miles N. by E. of Philadelphia. Pop. 2910.

Buckingham, a township of Wayne co., Pa. Pop. 1127.

Buckingham (George Villiers), Duke of, the favorite of James I. of England, was born in Leicestershire Aug. 20, 1592. He became in 1617 a gentleman of the bed-chamber, and obtained in the space of two years the titles of baron, viscount, and earl. In 1616 he was appointed lord admiral of England. He accompanied Charles, prince of Wales, when he went to Madrid in 1623 to obtain in marriage the infanta of Spain. The failure of this suit was ascribed to the arrogance of Villiers, who in his absence was created duke of Buckingham. After the death of James I. he became the favorite and prime minister of Charles I., but he made himself odious to the nation. He was assassinated by John Felton Aug. 23, 1628.

Buckingham (George Villiers), Duke of, a son of the preceding, was born in Westminster Jan. 30, 1627. He was an adroit courtier, but profligate and unprincipled. On the defeat of the royalist party in 1651 he went into exile. At the Restoration (1660) he became a member of the privy council and an enemy of Lord Clarendon, after whose fall (1667) he was a confidential minister of Charles II. He was the president of the ministry called the "Cabal." He wrote the "Rehearsal," a comedy, and other plays. Died April 16, 1688.

Buckingham (Joseph Tinker), an American writer, born at Windham, Conn., Dec. 21, 1779, published "Specimens of Newspaper Literature, etc.," and became successively editor of the "New England Galaxy," the "Boston Courier," and the "New England Magazine." Died April 11, 1861.

Buckingham (William Alfred), LL.D., born at Lebanon, Conn., May 28, 1804, was governor of the State (1858–66), and in 1869 was elected to the U. S. Senate by the Republicans. Died at Norwich, Conn., Feb. 5, 1875.

Buckinghamshire (England). See Bucks.

Buckingham and Chandos, Dukes of, marquesses of Chandos and Earls Temple of Stowe (1822, in the United Kingdom), marquesses of Buckingham (1784), Earls Temple (1749), Viscounts and Barons Cobham (1718, in Great Britain), Earls Nugent (1776, in Ireland), Barons Kinloss (1601, in Scotland), a noble family of Great Britain.—Richard Plantagenet Campbell Temple Nugent-Brydges Chandos Grenville, the third duke of this family, born in 1823, succeeded his father in 1861. He was lord president of the council 1866–67, secretary of state for the colonies 1867–68, and is at present lord lieutenant of Bucks.

Buckingham Court-house, or **Maysville,** a post-village, capital of Buckingham co., Va.

Buck'inghamshire, Earls of (1746, in England), Barons Hobart (1728, in Great Britain), and baronets (1611, in England), a noble family of Great Britain.—Augustus Edward Hobart, the sixth earl, born Nov. 1, 1793, succeeded his brother in 1849.

Buck'land, a post-township of Franklin co., Mass. The village of Shelburne Falls is partly in this town. Pop. 1946.

Buckland (Cyrus), an American inventor and machinist, born at Manchester, Conn., Aug. 10, 1799, invented machines for working gunstocks, and a machine to cut the grooves in the barrel of a rifle.

Buckland (William), D. D., F. R. S., an English geologist, born at Axminster in 1785, was educated at Oxford. His principal work is the Bridgewater Treatise entitled "Geology and Mineralogy, considered with reference to Natural Theology" (2 vols., 1836). In 1825 he became a canon of Christ Church, Oxford. Died Aug. 14, 1856.

Bucklan'dia, a large and beautiful evergreen tree of the order Hamamelaceæ, a native of the Himalaya Mountains. The trunk is sometimes seven feet in diameter at five feet from the ground, and grows to the height of forty feet before it branches. The foliage is thick and glossy, but the timber is not very valuable.

Buck'le (Henry Thomas), a popular English author, born at Lee, in Kent, Nov. 24, 1822. His father was a merchant, at whose death he came into the possession of an ample fortune, and was enabled to gratify his fondness for books, forming, it is said, one of the finest private libraries to be found in all Europe. He published in 1857 the first volume of the "History of Civilization in England," a work displaying great boldness as well as affluence of thought, and characterized by an easy and vigorous style. It is, however, wanting in that accuracy of knowledge and closeness of reasoning which are so important in the treatment of those profound and recondite inquiries which form the subject of his work. The second volume of Mr. Buckle's "History" appeared in 1861, but having been written under the great disadvantage of declining health, it attracted less attention than the first had done. To recruit his failing health, Mr. Buckle set out on an Eastern tour in 1861. He died at Damascus May 29, 1862.

Buck'ley, a post-village of Iroquois co., Ill.

Buckley (Samuel Botsford), Ph. D. See Appendix.

Buck'lin, a post-village of Linn co., Mo.

Buck'minster (Joseph), D. D., an orthodox divine, was born at Rutland, Mass., Oct. 14, 1751, graduated at Yale in 1770, became pastor of a church at Portsmouth, N. H., in 1779, and an eloquent and popular preacher. Died June 10, 1812.

Buckminster (Joseph Stevens), D. D., a Unitarian minister, a son of the preceding, born at Portsmouth, N. H., May 26, 1784. He graduated at Harvard in 1800, and became minister of the Brattle Street church, Boston, in 1804. He sailed to Europe for his health in 1806. Died June 9, 1812.

Buck'ner (Simon Bolivar), born 1823 in Kentucky, graduated at West Point in 1844, in infantry 1844–52, and subsequently as commissary of subsistence, rank of captain. He served at frontier posts 1844–52, as assistant professor at the Military Academy 1846, in the war with Mexico 1846–48, engaged on the march through Coahuila, at Vera Cruz, Cerro Gordo, Amazoque, San Antonio, Churubusco (wounded and brevet first lieutenant), Molino del Rey (brevet captain), Chapultepec, and the city of Mexico, and quartermaster Sixth Infantry, as assistant instructor at the Military Academy 1848–50, and on commissary duty at New York City 1852–55. Resigned Mar. 26, 1855. He was superintendent of construction of Chicago customhouse 1855, adjutant-general, rank of colonel, of Illinois 1857, colonel of Illinois volunteers for Utah expedition (not mustered into service), inspector-general commanding Kentucky home guards 1860–61, and farmer near Louisville 1860–61. He joined the Southern army in the civil war, and was in command of Bowling Green, which he evacuated on the capture of Fort Henry, falling back to Fort Donelson (surrendered Feb. 16, 1862, to Gen. Grant, with 16,000 troops and vast stores); prisoner of war at Fort Warren till Aug., 1862, in command of a division of Hardee's corps in Bragg's army in Tennessee, as major-general assigned to the third grand division, engaged at Murfreesboro' and Chickamauga, and included, May 26, 1865, in Kirby Smith's surrender to Gen. Canby.

George W. Cullum, *U. S. Army.*

Buck Prairie, a tp. of Lawrence co., Mo. Pop. 1514.

Bucks, or **Buck'inghamshire,** an inland county of England, is bounded on the N. by Northampton, on the E. by Bedford and Hertford, on the S. by Berks, and on the W. by Berks and Oxford. It has an area of 730 square miles. The surface is diversified by valleys and hills of moderate height. The Chiltern range of chalk-hills, about 900 feet high, extends across the county in a N. E. and S. W. direction. Near the middle of the county is the fertile Vale of Aylesbury, which is farther N. than the Chiltern Hills; the soil is generally fertile, and contains a large portion of clay. It is drained by the Ouse, the Thame, and other small rivers. The staple products are wheat, beans, butter, cattle, and mutton. The sheep of the Vale of Aylesbury are noted for their fine and heavy fleeces. Bucks county is intersected by the Great Western and North-western Railways. The chief towns are Aylesbury, Buckingham, and Marlow. Pop. in 1871, 175,870.

Bucks, a county of Pennsylvania, bordering on New Jersey. Area, 600 square miles. It is bounded on the N. E. and S. E. by the Delaware River, and is drained by the Neshaminy and Perkiomen creeks. The surface is mostly undulating or hilly; the soil is productive and well cultivated. Cattle, grain, tobacco, wool, and hay are staple products. Quarries of limestone and sandstone, valuable for building, have been opened in this county, and iron, titanium, and zircon are found in it. The manufacturing interests include lumber, leather, cigars, wagons, clothing, and many other commodities. It is intersected by the North Pennsylvania R. R. and the Philadelphia and Trenton R. R. Capital, Doylestown. Pop. 64,336.

Bucks, a township of Tuscarawas co., O. Pop. 1127.

Buck's, a township of Horry co., S. C. Pop. 1481.

Buck'shoal, a township of Yadkin co., N. C. Pop. 1390.

Bucks'port, a township and village of Humboldt co., Cal. The village is on Humboldt Bay; lat. 40° 46′ 37.09″ N., lon. 124° 10′ 43.8″ W. Pop. 388.

Bucksport, a post-village of Hancock co., Me., in Bucksport township, and on the left (E.) bank of the Penobscot River, 18 miles S. of Bangor. It derives its support from shipbuilding, fisheries, and commerce. It has a national bank, manufactures of various kinds, and is the seat of the East Maine Conference Seminary. Pop. of the township, 3433.

Buck'skin, a township of Ross co., O. Pop. 2229.

Buck'stone (John B.), an English dramatist and comic actor, born in 1802. He performed with success in London, and wrote a great number of popular dramas, among which are "The Green Bushes," "The Rough Diamond," "The Wreck Ashore," and "Good for Nothing."

Bucks'wort, a township of Marshall co., Ala. P. 390.

Buck'thorn, a township of Mecklenburg co., Va. Pop. 2046.

Buckthorn (*Rhamnus*), a genus of shrubs or small trees of the order Rhamnaceæ, distinguished by a bell-shaped calyx which is four or five cleft, and petals which are small and sometimes wanting. The fruit is a berry-like drupe, containing two to four separate seed-like nutlets. The species are numerous, and natives of many temperate and tropical regions. The common buckthorn (*Rhamnus catharticus*) is a deciduous shrub, a native of Europe, and naturalized in the U. S. It has spiny branches, ovate leaves, and small black berries (or drupes) which are nauseous and purgative, and which yield the pigment called sap-green (or bladder-green). This shrub is planted for hedges in the U. S. The Atlantic U. S. have two native species. The alder buckthorn (*Rhamnus Frangula*) is a European shrub which is not armed with spines, and has ovate, entire leaves. The berries are violently cathartic. The bark has been employed in medicine, and is used for dyeing yellow. The unripe fruit of dyers' buckthorn (*Rhamnus infectorius*), a shrub which grows in Southern Europe, yields a bright yellow dye. The so-called French berries or Avignon berries used by dyers are the fruit of the last and other species.

Buck'town, a township of Dorchester co., Md. P. 885.

Buck'wheat* (*Fagopyrum esculentum* or *Polygonum Fagopyrum*), an annual plant of the order Polygonaceæ, is said to be a native of Central Asia and the basin of the Volga. It is cultivated for food in Europe and the U. S., thrives on poor soils, and grows to the height of two feet or more. It has triangular, heart-shaped or halberd-shaped leaves. The seeds are triangular and resemble a beech-nut in form. Cakes of buckwheat eaten warm are a favorite article of food, which is very nutritious. Buckwheat meal contains about 10 per cent. of gluten and 50 per cent. of starch. Bees are partial to the flowers of this plant, which secrete a large portion of honey, which, however, is not of the first quality. Buckwheat comes to maturity in a shorter time than most other grains, and may be sown late. In the U. S. the seeds are usually sown broadcast. The quantity of seed required for one acre is a bushel or one bushel and a half. It requires little manure, and does not exhaust the soil. A good crop of this grain yields about forty bushels on an acre, and a bushel of it weighs from forty-five to forty-eight pounds.

* Originally "beech-wheat," because its seeds are shaped like beech-nuts; in German it is *Buchweizen*, which is literally "beech-wheat."

Another species, called Tartarian buckwheat (*Fagopyrum Tartaricum*), is a hardy native of Siberia, and is adapted to cold climates. It is distinguished from the common buckwheat by the toothed edges of its seeds, and is inferior in quality.

Buckwheat Tree, a small tree or shrub of Georgia and the Gulf States (the *Cliftonia ligustrina*), a smooth, elegant evergreen of the order Cyrillaceæ. It has clusters of white, fragrant blossoms in March, April, and May. It grows around swamps, ponds, and streams, and is often called *titi*. Its pendulous winged fruit is sometimes shaped like a kernel of buckwheat; whence the name.

Bucol'ic [Gr. *βουκολικός* (from *βουκόλος*, an "ox-herd," derived from *βοῦς*, an "ox," and *κολέω*, to "care for," a word which only occurs in compounds, but whose root is seen in the Lat. *colo*); Lat. *bucolicus*], pastoral or pertaining to herdsmen. This term is applied to a kind of pastoral poetry written in hexameter verse. The poems of Theocritus and the "Eclogues" of Virgil are the most perfect models of bucolic poetry.

Buctouche, a port of Wellington township, Kent co., New Brunswick, on Buctouche River, has considerable shipbuilding, and a trade in oysters and lumber. Pop. about 500.

Bucy'rus, the county-seat of Crawford co., O., on Sandusky River, on the Pittsburg Fort Wayne and Chicago R. R., 62 miles N. of Columbus. It is the seat of a large farming and manufacturing community, has the largest union school-house in the State, and is well supplied with churches. There are mineral springs in the town and neighborhood. The skeleton of a mastodon was found in the vicinity in 1838. It has one national bank and two weekly and one semi-weekly paper. Pop. 3066; of township, 4184.

J. R. Clymer, Ed. "Crawford County Forum."

Buczacz, a town of Austria, in Eastern Galicia, often mentioned in the wars between Poland, Hungary, and Turkey. Pop. 8523.

Bu'da [Ger. *Ofen;* Slavonic, *Budin;* Lat. *Buda*], a free city of the Austrian empire, capital of Hungary, is on the right bank of the Danube, opposite Pesth, with which it is connected by a magnificent suspension bridge. It is 130 miles S. E. of Vienna, and in lat. 47° 29′ N., lon. 19° 3′ E. It is built in the form of an amphitheatre around a hill which rises 485 feet above the level of the sea, and presents a picturesque appearance. This hill is crowned by a citadel and a royal palace. The other remarkable edifices are the cathedral, the palaces of the nobility, and the observatory, which is on the top of a hill called Blocksberg. Here are hot sulphur springs, from which Buda derives its German name of *Ofen*—*i. e.* "oven." It has manufactures of silks, velvets, cotton and woollen goods, leather, and gunpowder. Large quantities of excellent wine, called *Ofner*, are produced in this vicinity. Buda was formerly considered the key of Christendom. It was taken by Solyman the Magnificent in 1541, and occupied by the Turks until 1686. Pop. in 1869, 53,998.

Buda, Old [Ger. *Alt Ofen;* Hun. *O'Buda*], a municipal town of Hungary, in the county of Pesth, on the Danube, almost adjoining the suburbs of Buda. It is supposed to be the ancient *Sicambria*. Pop. in 1869, 16,002.

Buddæ'us (John Francis), a distinguished Lutheran theologian and philosopher, born at Anclam June 25, 1667. At the age of twenty he was master of arts and adjunct professor in the philosophical faculty at Wittenberg, and in 1689 at Jena. He was elected in 1692 professor of the Greek language at Coburg, and in 1693 he was invited to take the chair of moral philosophy at Halle. In 1705 he became professor of theology at Jena. His position was one which harmonized orthodoxy and pietism. His erudition was enormous (he was the most universal scholar among the theologians of his time), yet accurate, and his judgment was of the most solid kind. He wrote more than a hundred books, most of which are still sought by scholars, and several of which are acknowledged standards. His practical skill as an instructor was of a high order, and many of his pupils rose to great eminence. His writings which are most read in our day are "Institutiones Philosoph. eclecticæ," "Theologia Moralis," "Historia Ecclesiæ Veteris Testamenti," "Theologia Dogmatica," "Isagoge ad Theologiam Universam," "Ecclesia Apostolica." In philosophy he was an eclectic. His writings are marked by tact, clearness, logical arrangement, and ease of style. His Latin is above the common standard. He was distinguished for his eminent purity of character, his fidelity to the faith of the Church, and his firmness and moderation towards those who dissented from it. Died at Jena Nov. 19, 1729.

C. P. Krauth.

Buddha, or **Buddhism.** See Boodhia.

Bud'ding, or **Inocula'tion,** is a mode of propagating improved and choice varieties of fruit which cannot be reproduced by seeds. It is the best mode of propagating peaches, and is convenient in the case of plums, cherries, apples, pears, roses, etc. The best time for budding is the last half of summer. The operation is performed by opening the bark of the stock with a vertical and transverse cut, nearly like a letter T, and inserting into it a leaf-bud of another variety. The length of the bark and wood cut off with the bud is about one inch. These buds are taken from a branch formed in the present or preceding year. They should be cut squarely at the top, so as to fit the transverse section of the bark of the stock. The leaf growing close to the bud should be cut off. The process is finished by tying the bud with bass matting, soft cotton twine, or woollen yarn. The operation just described is called "shield-budding," and is more rapidly performed than grafting.

Bud'dlea, a genus of shrubs of the natural order Scrophulariaceæ, comprises many species, which are natives of warm climates. Some of them are prized for the beauty of their flowers. *Buddlea globosa*, a native of Chili, is cultivated in gardens, and is hardy enough to bear the climate of England. It has globose heads of orange-colored flowers. *Buddlea Neemda*, a native of India, has beautiful flowers.

Bude Light, a name originally applied to a brilliant light invented by a Mr. Gurney of Bude, in Cornwall, England. He introduced a stream of oxygen into a flaming jet of oil or gas. The expense of this system has prevented its general use. The same name is sometimes inappropriately given in England to other similar inventions.

Budg'ell (Eustace), an English essayist, born at Exeter in 1685, was a friend of Addison. He contributed to the "Spectator" a number of essays signed "X." Having lost about £20,000 by the South Sea Bubble, he committed suicide May 4, 1737.

Bud'get [Fr. *bougette*]; originally a bag, a small sack with its contents; hence a stock, a store, or collection of things. In England the term is applied to a condensed statement of the revenue and expenditure of the nation; an annual financial statement which the chancellor of the exchequer presents in a speech to the House of Commons. It comprises an exposition of the relative amounts of money received and expended during the past year, an estimate of the probable expenditures of the ensuing year, and sometimes a scheme to meet by a loan or new taxes the actual or anticipated deficit. Budget is also used in France to denote the annual financial statement.

Bud'ington (William Ives), D. D., a Congregational clergyman, born April 21, 1815, at New Haven, Conn., graduated at Yale College in 1834, studied theology at the Yale Divinity School and at Andover, leaving the latter institution in 1839. He was ordained pastor of the First church, Charlestown, Mass., April 22, 1840, where he remained fourteen years. In 1855 (April 22) he took charge of the Clinton avenue Congregational church, Brooklyn, N. Y. In 1845 he published "History of the First Church, Charlestown, Mass.," and has also published occasional sermons. He is an eloquent and acknowledged leader in the denomination to which he belongs.

Budukhshan. See Badakhshan.

Bud'weis, or **Bud'witz,** a town of Bohemia, on the Moldau, 77 miles S. of Prague. It is well built, consisting of an old town surrounded by walls and three suburbs; has an interesting cathedral, a gymnasium, and an academy; also manufactures of woollen cloths, muslins, damasks, etc. A railway (the first on the European continent) extends from this town to Linz. Pop. in 1869, 17,413.

Bu'el, a post-township of Sanilac co., Mich. Pop. 216.

Buel (Jesse), a journalist, born at Coventry, Conn., Jan. 4, 1778. He founded the "Albany Argus," a Democratic journal, in 1813, and in 1834 became the first editor of the "Albany Cultivator," an agricultural paper. He also published the "Farmer's Companion." Died Oct. 6, 1839.

Bu'ell (Don Carlos), an American officer, born Mar. 23, 1818, near Marietta, O., graduated at West Point in 1841, and after serving in the infantry till 1848, became, July 17, 1862, assistant adjutant-general U. S. A., rank of colonel, and Mar. 21, 1862, major-general U. S. volunteers. He served in the Florida war 1841–42, on frontier duty 1843–45, in the military occupation of Texas 1845–46, in the war with Mexico 1846–48, engaged at Palo Alto, Resaca de la Palma, Monterey (brevet captain), Vera Cruz, Cerro Gordo, and Churubusco (severely wounded and brevet major), and as adjutant of the Third Infantry 1847–48, as assistant adjutant-general at Washington, D. C., 1848–49, and at head-quarters of various departments 1849–61. In the civil war he was in command of the department of the Ohio 1861–62, in command of the army of the Ohio 1862, engaged

at the battle of Shiloh, siege of Corinth, operations in Northern Alabama, and the retreat to Louisville to cut off the army of Bragg, which he drove from Kentucky, and before a commission to investigate his operations 1862–63. He resigned from the army June 1, 1864, and since 1865 has been president of the Green River (Ky.) Iron-works.

GEORGE W. CULLUM, *U. S. Army.*

Bu'el's Gore, a township of Chittenden co., Vt. P. 29.

Bue'na Vis'ta, a county in the N. W. of Iowa. Area, 600 square miles. It is drained by the Little Sioux and Raccoon rivers. The surface is undulating; the soil is fertile. Cattle, grain, and wool are raised. It is intersected by the Dubuque and Sioux City R. R. Capital, Sioux Rapids. Pop. 1585.

Buena Vista, a township of Columbia co., Ark. P. 538.

Buena Vista, a township of Stanislaus co., Cal. Pop. 357.

Buena Vista, a post-village, capital of Marion co., Ga., 33 miles S. E. of Columbus. Pop. 525.

Buena Vista, a township of Schuyler co., Ill. Pop. 1152.

Buena Vista, a township of Clayton co., Ia. P. 308.

Buena Vista, a township of Jasper co., Ia. P. 1073.

Buena Vista, a post-township of Saginaw co., Mich. Pop. 1005.

Buena Vista, a township of Humboldt co., Nev. Pop. 520.

Buena Vista, a township of Atlantic co., N. J. Pop. 948.

Buena Vista, a township of King and Queen co., Va. Pop. 2985.

Buena Vista, a post-township of Portage co., Wis. Pop. 624.

Buena Vista, a township of Richland co., Wis. Pop. 1044.

Buena Vista, a hamlet in Mexico, situated about 90 miles S. W. of Monterey and 7 miles S. of Saltillo, famous for the battle fought in its vicinity between the American forces under Gen. Zachary Taylor and the Mexican army under Santa Anna, Feb. 22–23, 1847. Gen. Taylor, having become assured, from reconnoissances on Feb. 20, that the enemy was in heavy force at Encarnacion, 30 miles in front of Agua Nueva, with the evident intention of attacking his position, withdrew his army on the 21st from the camp at Agua Nueva, which could be turned on either flank, and took up a strong line a little in front of Buena Vista, 7 miles south of Saltillo. A cavalry force left at Agua Nueva for the purpose of covering the removal of supplies was driven in during the night, and on the morning of the 22d the Mexican army appeared immediately in front of Buena Vista, and at 11 A. M. (Feb. 23) a flag was sent from Santa Anna with a summons of unconditional surrender, to which Gen. Taylor laconically replied that he "declined to accede to the request."

The line occupied by the American troops was one of remarkable strength. The road at this point becomes a narrow defile, the valley on its right being rendered impracticable for artillery by a system of deep and impassable gullies, while on the left a succession of rugged ridges and precipitous ravines extends back towards the mountain which bounds the valley. The features of the ground were such as nearly to paralyze the artillery and cavalry of the enemy, while his infantry could not derive all the advantage of his numerical superiority. The action was commenced about 3 o'clock in the afternoon of the 22d, between the light troops on the left, and skirmishing continued till dark, but no serious attack was made until the morning of the 23d. During the night of the 22d the Mexicans had occupied the mountain-side by light troops, with the intention of forcing the left flank of the American army, and it was here that the action commenced on the 23d, and an obstinate and sanguinary conflict was maintained, with short intervals and varying success, throughout the day, resulting in the repulse of the enemy from our lines, which, however, had been much contracted since morning. An attack of cavalry upon Buena Vista and a demonstration upon Saltillo were also repelled, and during the night Santa Anna abandoned his position and fell back upon Agua Nueva. A reconnoissance made on the 26th disclosed the fact that the retreat had been continued in the direction of San Luis Potosi, and Gen. Taylor resumed his former camp at Agua Nueva on the 27th.

The American force engaged was about 5200, while the Mexican army was stated by Santa Anna in his summons to be 20,000 strong. The American loss was 746, of which 267 were killed; the Mexican loss in killed and wounded was about 2000. Much of the credit of final success in this unequal contest is due to the uniform bravery and efficiency of the regular artillery; the volunteers, though at times displaying the greatest courage, were wanting in discipline and experience, and but for the steady behavior of the regular troops the result must at least have been less decisive and complete.

Buen Ayre, one of the Dutch West India Islands, is near the coast of Venezuela, 30 miles E. of Curaçoa. Length, 20 miles; average width, 4 miles. It has a tolerable harbor, and produces cattle and salt. Pop. in 1870, 3870.

Bue'nos Ay'res, a province of the Argentine Republic, is bounded on the N. E. by the Rio de la Plata, on the E. and S. E. by the Atlantic Ocean, and on the S. W. by the Rio Negro, which separates it from Patagonia. The area is estimated at 72,400 square miles. The surface is an alluvial plain, in which timber and stones are scarce; the soil is mostly fertile. Here are vast treeless, grassy plains, called *Pampas*, which afford pasture to immense herds of cattle and horses. These constitute the principal riches of the inhabitants. This province is not liberally supplied with rivers or running streams, but contains a great number of salt lakes. The principal river besides the Paraná (La Plata) is the Rio Colorado, which traverses the S. W. part of the province. The climate in the N. part is mild, and has a mean summer temperature of 90° F. It became independent of Spain in 1810, seceded from the Argentine Republic in 1853, and was reunited to it in June, 1860. A large number of Europeans have recently emigrated to this province. Capital, Buenos Ayres. Pop. in 1869, 495,107.

Buenos Ayres, a seaport of South America, and the largest city of the Argentine Republic, is situated on the right bank of the La Plata, and 150 miles from the ocean; lat. 34° 36′ S., lon. 58° 22′ W. It is the capital of the state or province of Buenos Ayres, and is nearly opposite to Montevideo, which is 100 miles distant. The streets cross each other at right angles, are paved with granite, and bordered by low brick houses, which usually have each a garden adjoining. The principal public buildings are a large cathedral, numerous churches, the house of representatives, and a college, with which are connected a large library, an observatory, and a normal school. The adjacent country is alluvial, and nearly destitute of timber. The climate is dry and healthy, but variable. Among the disadvantages of this city is a scarcity of fresh water, which can be obtained only from the river, and is conveyed about the streets in carts. The trade and prosperity of Buenos Ayres are impeded by the want of a safe and commodious harbor. Vessels drawing more than twelve feet of water cannot come within five miles of the city, and smaller vessels usually anchor one mile from the shore. During a S. E. wind vessels are here exposed to a violent surf. The chief articles of export are precious metals, hides, beef, wool, tallow, horns, and skins. In 1866 the exports amounted to $22,312,400, and the imports to $31,218,000. Several English and French newspapers are published here. This city was founded by the Spaniards in 1580, and became the capital of the viceroyalty in 1776. Its growth has been retarded by civil wars and political commotions. Pop. in 1868, 180,000.

Buf'falo, a name given to two species of ruminant animals of the family Bovidæ, the *Bubalus Buffelus* and *Bubalus Caffer*. The former is a native of India, where it has been long domesticated, and is an important and useful animal. It is generally used as a beast of burden in India and also in Italy, where it was introduced about 600 A. D. It is larger and more powerful than an ox, and has a larger head in proportion to the size of the body; the dorsal line rises into a considerable elevation above the shoulders. It has large crooked horns, which are curved first outward and downward, and next backward and upward. The buffalo is partial to marshy places, and is addicted to wallowing in the mud and shallow water. Its flesh is inferior to that of the ox, but the milk of the female is said to be excellent in quality. The tame buffaloes of India are easily managed and guided by a mere rope, and the driver often rides on their backs. The jungles of India are also infested by wild buffaloes of the same species, sometimes called arna or arnee, a fierce and dangerous animal, which is more than a match for a tiger. The Cape buffalo (*Bubalus Caffer*) is a native of South Africa, and has not been domesticated. It has large horns, the bases of which are close together. The horns spread or diverge laterally, are next bent downward, and

Cape Buffalo.

have the point curved upward and inward. The animal measures about eight feet from the base of its horns to its tail, and is about five and a half feet in height. It is a dangerous animal, which will attack men without provocation, but it is sometimes mastered by the lion. Its hide is so thick and tough that the Caffers make of it shields impenetrable to a musket-ball. Vast herds are found in S. Africa. (For the American buffalo see BISON.)

Buffalo, a county of Central Dakota, bounded on the W. by the Missouri River. Area, 750 square miles. Iron ore is found. Pop. 246.

Buffalo, a county of Central Nebraska. Area, 850 square miles. It is bounded on the S. by the Platte River, and also drained by Wood River and a stream called South Branch. The soil is fertile. The county is intersected by the Union Pacific R. R. Capital, Gibbon. Pop. 193.

Buffalo, a county of Wisconsin, bordering on Minnesota. Area, 650 square miles. It is bounded on the S. W. by the Mississippi River, on the W. by the Chippewa. The surface is diversified; the soil is fertile. Grain and wool are staple products. Capital, Alma. Pop. 11,123.

Buffalo, a township of Craighead co., Ark. Pop. 221.

Buffalo, a township of Marion co., Ark. Pop. 268.

Buffalo, a township of Searcy co., Ark. Pop. 195.

Buffalo, a township of Ogle co., Ill. Pop. 3524.

Buffalo, a township of Buchanan co., Ia. Pop. 598.

Buffalo, a township of Linn co., Ia. Pop. 508.

Buffalo, a post-township of Scott co., Ia. Pop. 1435.

Buffalo, a township of Cloud co., Kan. Pop. 303.

Buffalo, a post-village, capital of Wright co., Minn., in a township of its own name, on a small lake about 45 miles W. N. W. of St. Paul. Pop. of the township, 508.

Buffalo, the capital of Dallas co., Mo., 4 miles W. of Niaugua River and 33 miles N. E. of Springfield, has fine iron and lead ore, several mines in operation, and also has coal. It is on the line of the Laclede and Fort Scott R. R., and has a fine court-house and two weekly papers. P. 278. A. G. HOLLENBECK, ED. "REFLEX."

Buffalo, a township of Morgan co., Mo. Pop. 543.

Buffalo, a township of Newton co., Mo. Pop. 785.

Buffalo, a township of Pike co., Mo. Pop. 2880.

Buffalo, a township of Caldwell co., N. C. Pop. 792.

Buffalo, a city, port of entry, and shire-town of Erie co., N. Y., in lat. 42° 53′ N., lon. 78° 55′ W., at the foot of Lake Erie, and at the head of Niagara River. It is also the western terminus of the Erie Canal. In population and wealth it is the third city in the State. The city is delightfully situated, having a water-front of about five miles, with numerous substantial and extensive piers, breakwaters, basins, and canals, constructed at an expense of several millions of dollars, partly by the Federal government and partly by the State and municipal authorities. The city extends down the Niagara River five miles, and at right angles with it about the same distance, but the northerly and easterly portions are sparsely settled.

On the 31st of Dec., 1813, Buffalo, then containing about 200 inhabitants, was burned by the British. After the war it speedily began to increase, and in 1828 contained about 7000 inhabitants, the completion of the Erie Canal in 1825 giving a strong impetus to its growth. It became a city in 1832, and then had 15,000 inhabitants; in 1835 it contained 15,700; in 1840, 18,200; in 1845, 30,200; in 1850, 42,300; in 1855, 74,200; in 1860, 81,130; in 1865, 94,210; and in 1870, 117,714. A private enumeration in 1873 indicated that the population had reached 161,782. The report of the State assessors for 1873 puts the valuation, for the purpose of taxation, at $38,000,000. The "true valuation," according to the census of 1870, was $110,100,000.

Buffalo is noted for its wide and beautiful streets, and the profusion of trees and shrubbery with which they are decorated. It claims to be the best paved, best lighted, and best sewered city in the U. S. It has long been a most important commercial entrepôt, especially in the receipt, handling, and shipment of grain. In 1872 there were received by lake over 62,000,000 bushels of grain (including flour estimated as wheat), and at least 30,000,000 bushels by rail, making 92,000,000 bushels in a single year. In addition there were receipts of lumber, live-stock, and other property, estimated to equal the grain receipts in value. In addition to the water-communication by lake and canal, which is practically unlimited, Buffalo has railroad trunk-lines in almost every direction—viz. the New York Central, the Erie, the Lake Shore, the Buffalo New York and Philadelphia, the Grand Trunk and the Great Western, the Canada Southern, and the Buffalo and Jamestown R. Rs. The New York and Oswego Midland, the Lake Ontario Shore, and the Northern Pacific R. Rs. will be important auxiliaries to Buffalo's growth and commerce. The Niagara is here crossed by a fine iron truss railroad bridge.

In the public works essential to a large city Buffalo is either already well supplied or is rapidly becoming so. It has extensive waterworks, the property of the city; three gas companies; a magnificent park, and boulevards almost surrounding the city; a State normal school, a central grammar school, and thirty-six first-class district schools. A city and county hall will be completed in 1875. It is to be of granite, and the estimated cost is $1,250,000. The State is erecting an insane asylum, to accommodate 1000 patients, and to cost over a million dollars. The city contains a penitentiary and a county almshouse. There are four large markets; thirty grain-elevators; a stone post-office belonging to the U. S. government; a State arsenal; a commodious hall and library building belonging to the Young Men's Association; and over seventy church edifices. Of the latter, two (one Roman Catholic and the other Episcopalian) are imposing cathedrals. With literary, benevolent, and educational institutions Buffalo is well supplied. Among them may be named the Young Men's Association, with a library of 20,000 volumes, and real estate and buildings worth $250,000; the Society of Natural Science, with an extensive collection and a large museum of casts of fossil remains; a well-endowed art-gallery; an historical society, law library, mechanics' institute, Young Men's Christian Union, Grosvenor Library (free), a general hospital, orphan asylums, special hospitals, a medical college, a female seminary, and several Catholic colleges. There are ten lodges of Free Masons, four chapters of Royal Arch Masons, two councils, two commanderies, and a Masonic brotherhood of 2000. The Odd Fellows have ten lodges and two encampments. There are a number of singing societies and three clubs. Buffalo has twenty newspapers and periodicals, seven of them dailies. Their aggregate circulation, aside from advertising sheets, is about 75,000. There are eleven banks of discount, with an aggregate capital of $3,150,000; four savings banks, with deposits amounting to about $15,000,000; one fire insurance company, with $200,000 capital and $352,857 assets in July, 1873.

Buffalo is divided into thirteen wards, and its city government is composed of a mayor and twenty-six aldermen. It has a paid fire department, with twelve steam fire-engines, seven hose companies, three hook-and-ladder companies, one ladder-and-bucket company, and one tarpaulin-protection company.

At present the most important interest of the city is its commerce. The registered marine of the port on the 1st of Jan., 1873, was 726 vessels, of 145,116 tons, representing an investment of $54,000,000, and doing a business of $250,000,000 per annum. The lake tonnage was valued at but $24,000,000 in 1862, showing the remarkable growth of thirty millions in a single decade. The manufactures are rapidly increasing, especially those of iron. There are upwards of thirty large establishments, employing at least 5000 men, to say nothing of the smaller enterprises. The city has four blast furnaces, two large rolling-mills, several machine-shops, stove-foundries, iron shipyards, forges, etc. etc. It has large manufactories of agricultural implements, car-shops, tanneries, flouring-mills, etc. The opening of the Buffalo New York and Philadelphia Railway to the bituminous coal-fields of Pennsylvania has given a largely added impetus to manufactures. The census of 1870 gives the statistics of manufactures only by counties. We have therefore only the estimated manufactures of Erie county, and not those of Buffalo by itself; yet as most of the manufacturing of the county is conducted within its limits, we should not exceed the truth if we regarded the statistics of Erie county in 1870 as representing those of Buffalo in 1873. The growth of some manufactures within three years is undoubtedly greater than the total amount of manufacturing out of Buffalo in Erie county in 1870, when there were 1429 establishments, employing 13,274 persons and a capital of $13,043,790, paying wages to the amount of $4,946,414, using raw material to the value of $15,274,440, and producing annually $27,446,683. Iron and iron wares were produced to the value of $5,471,000; flour, etc., $1,981,932; clothing, $1,481,485; malt and distilled liquors, $2,240,330; lumber, planed and sawed, $1,786,441, besides $225,950 in sash, doors, and blinds; machinery, $1,252,445; leather, tanned and dressed, $1,701,044; metallic wares, $502,244; boots and shoes, $696,010; agricultural implements, $499,305; furniture, $590,719; tobacco, snuff, and cigars, $400,511; gas, $427,481; carriages and wagons, $368,257; malt, $600,821; boats, $311,820; cooperage, $286,800; vinegar, $271,000; bricks, $278,800; soap and candles, $341,599.

S. M. CHAMBERLAIN,
OF THE "COURIER AND REPUBLIC."

Buffalo, a township of Noble co., O. Pop. 780.

Buffalo, a township of Butler co., Pa. Pop. 1495.

Buffalo, a township of Perry co., Pa. Pop. 779.

Buffalo, a township of Union co., Pa. Pop. 1521.

Buffalo, a post-township of Washington co., Pa. Pop. 1189.

Buffalo, a township of Kershaw co., S. C. Pop. 1764.

Buffalo, a township of Prince Edward co., Va. Pop. 3415.

Buffalo, a township of Rockbridge co., Va. P. 2445.

Buffalo, a township of Brooke co., West Va. Pop. 2191.

Buffalo, a township of Clay co., West Va. Pop. 790.

Buffalo, a post-township of Putnam co., West Va. Pop. 1448.

Buffalo, a post-township of Buffalo co., Wis. P. 1594.

Buffalo, a township of Marquette co., Wis. Pop. 712.

Buffalo Bayou (or **River**) of Texas flows eastward through Harris co., passes by Houston, and enters Galveston Bay. Steamboats can ascend from its mouth to Houston, which is about 40 miles from the bay.

Buffalo Heart, a township of Sangamon co., Ill. Pop. 538.

Buffalo Lick, a township of Chariton co., Mo. Pop. 1267.

Buffalo Prairie, a post-township of Rock Island co., Ill. Pop. 1291.

Buffalo Springs, mineral springs of Mecklenburg co., Va., 7 miles W. of Clarksville. The waters of the springs are remarkably stimulant, and belong to the saline chalybeate class. They are especially recommended for various diseases of the mucous membranes.

Buffalo Station, a township of Wallace co., Kan. Pop. 10.

Buf'fer, an elastic cushion attached to a railway car or carriage, in order to break or moderate the shock when one car is pushed against another. It is usually formed of horse-hair covered with leather, of vulcanized caoutchouc, or of strong iron springs.

Buf'fington, a township of Indiana co., Pa. Pop. 877.

Buffon, de (Georges Louis Leclerc), Comte, a celebrated French naturalist and philosopher, born at Montbar, in Burgundy, Sept. 7, 1707. He was liberally educated, and travelled in his youth in Italy and England. In 1739 he was elected to the Academy of Sciences, and appointed intendant of the royal garden in Paris. He published in 1749 the first three volumes of his "Natural History" ("Histoire naturelle, générale et particulière"), in which he was assisted by Daubenton. Twelve other volumes of it appeared between 1749 and 1767. This work, which made an epoch in the study of the natural sciences, displays a brilliant imagination and presents many ingenious ideas. His writings obtained great celebrity, due partly to the fascination of his style. "Like all great poets," says Condorcet, "he knows how to render interesting the delineations of natural objects, by blending with them moral ideas which affect the soul at the same time that the imagination is amused or astonished." He was admitted into the French Academy in 1753, and married a lady named Saint-Belin in 1762. Among his most admired works is the "Epochs of Nature" ("Epoques de la Nature"), which appeared in a supplement to his "Natural History." He received from the king the title of Count de Buffon in 1776. Died in Paris April 16, 1788. (See Condorcet, "Éloge de Buffon;" Cuvier, "Éloge de Buffon," prefixed to an edition of the "Natural History," 36 vols., 1826; Flourens, "Buffon: Histoire de sa Vie, etc.," 1844.)

Bu'ford, a township of Union co., N. C. Pop. 1158.

Buford (John), an American officer, born in 1826 in Kentucky, graduated at West Point in 1848, captain Second Dragoons Mar. 9, 1859, and Dec. 16, 1863, major-general U. S. volunteers. He served on frontier duty 1848–61, as quartermaster of the Second Dragoons 1855–58, in the Sioux expedition 1855, engaged at Blue Water, in quelling the Kansas disturbances 1856–57, on the Utah expedition 1857–58. In the civil war he served as assistant inspector-general (major), making inspections 1861–62, in command of cavalry brigade in Northern Virginia campaign 1862, engaged at Madison Court-house, Kelley's Ford, Thoroughfare Gap, and Manassas (wounded), as chief of cavalry of the Army of the Potomac in Maryland campaign, engaged at South Mountain and Antietam, in Rappahannock campaign, commanding cavalry brigade, 1862–63, engaged at Fredericksburg, Stoneman's raid, and Beverly Ford, in command of a division of cavalry in the Pennsylvania campaign 1863, engaged at Gettysburg and numerous skirmishes, in Central Virginia 1863, engaged at Culpeper, Bristow Station, and numerous movements and skirmishes. He was an admirable cavalry officer, and from the effects of exposure and wounds died Dec. 16, 1863, at Washington, D. C.

George W. Cullum, *U. S. Army.*

Buford (Napoleon B.), an American officer and engineer, born Jan. 13, 1807, in Woodford co., Ky., graduated at West Point in 1827, and April 15, 1862, brigadier-general U. S. volunteers. He served, while lieutenant of artillery, on garrison and topographical duty, and as assistant professor at the Military Academy till Dec. 31, 1835, when he resigned. He was civil engineer on the Licking River improvement 1835–42, iron-founder at Rock Island, Ill., 1843–61, president of the Rock Island and Peoria R. R. 1857–61, and president of the bank of the Federal Union, Rock Island, 1858–61. In the civil war he was colonel of the Twenty-seventh Illinois Volunteers till promoted brigadier-general, engaged in the battle of Belmont, demonstration on Columbus, Ky., attack of Island No. 10, capture of Union City, Ky., expedition to Fort Pillow, siege and battle of Corinth, Miss., siege of Vicksburg, and in command of Helena, Ark. Brevet major-general U. S. volunteers Mar. 13, 1865, for gallant and meritorious services, and Aug. 24, 1865, mustered out of volunteer service. He was superintendent of a mining company in Colorado, special U. S. Indian commissioner 1867–68, and Union Pacific Railway commissioner 1868–69.

George W. Cullum, *U. S. Army.*

Buford Bridge, a post-township of Barnwell co., S. C. Pop. 1385.

Bug, or **Bog,** a river of Russian Poland, rises in Galicia, flows nearly northward and north-westward, and after a course of about 400 miles enters the Vistula at the fortress of Modlin, about 18 miles N. W. of Warsaw.

Bug, or **Bog** (anc. *Hypanis*), a river of Russia, rises in Podolia, flows nearly south-eastward, and enters the estuary of the Dnieper 30 miles W. of Kherson. Its whole length is estimated at 400 miles. It is navigable for small vessels from its mouth to Vosnesensk, upwards of 100 miles.

Bug'bie's Mill, a township of Baker co., Ala. Pop. 1436.

Bugeaud (Thomas Robert), duc d'Isly, a French general, born Oct. 15, 1784. Soon after the revolution of 1830 he was created a marshal of France. Having won several victories in Algeria, he was appointed governor-general of the same in 1840. He defeated the army of the emperor of Morocco at Isly in 1844. During the revolution of Feb., 1848, he commanded the army at Paris. Died of cholera in Paris June 10, 1849.

Bu'genhagen (Johann), surnamed Pomeranus, a learned German Protestant Reformer, born at Wollin, in Pomerania, June 24, 1485. He was converted to the doctrines of Luther in 1520, and became professor of theology at Wittenberg in 1522. He was a devoted friend of Luther, whom he assisted in the translation of the Bible, and he wrote several religious works. He organized churches in Hamburg, Brunswick, and Denmark. Died April 20, 1558.

Bug'hall, a township of Bullock co., Ala. Pop. 1823.

Bug'hill, a township of Columbus co., N. C. Pop. 513.

Bu'gis, a people of the Malay Archipelago, chiefly inhabiting Celebes and Macassar. They are noted for their commercial enterprise, and own many vessels employed in the navigation of the East Indian seas. They are muscular, middle-sized, and of a light-brown color, and have made considerable progress in civilization. They manufacture cotton cloth, build durable sailing-vessels, and are said to be skilful workers in copper and iron.

Bu'gle, a brass musical wind instrument, which has been improved by keys so as to be capable of all the inflections of the scale.

Bugle (*Ajuga*), a genus of plants of the natural order Labiatæ, has an irregular corolla with a very short upper lip and trifid lower lip. The species are mostly natives of the colder parts of Europe or Asia. The *Ajuga reptans* is common in British pastures and woods. The Alpine bugle (*Ajuga Alpina*) has beautiful flowers.

Bu'gloss [Gr. βούγλωσσος, *i. e.* "ox tongue," perhaps from the shape and roughness of its leaves], a common name given to several species of plants of the order Boraginaceæ and of the genera *Anchusa* and *Lycopsis*. The *Lycopsis arvensis* is a common weed in the grain-fields of Great Britain. The *Lycopsis* has a funnel-shaped corolla with a curiously curved tube. The *Echium vulgare*, called viper's bugloss, is a native of Europe and naturalized in the U. S.

Bugul'ma, a town of Russia, in the government of Samara, 170 miles S. E. of Kasan. Pop. 5455.

Buguruss'lau, a town of Russia, in the government of Samara, 65 miles S. of Bugulma. Pop. 7440.

Buhle (Johann Gottlieb). See Appendix.

Buhl-Work, or **Boule-Work,** a kind of marquetry or inlaid work in wood, gilt metal, or tortoise-shell, the name of which is derived from its inventor, Boule, a French cabinetmaker (1642–1732). He employed veneers of dark-colored tortoise-shell, inlaid with brass, and was patronized by several sovereigns. A German named Reisner made cabinets which were highly prized, in which he used woods of contrasted colors.

Bujalan'ce, a town of Spain in the province of Córdova, about 18 miles E. of Córdova. It is surrounded by a wall flanked with old towers, and has an old Arabian castle and a college. Here are manufactures of woollen goods, glass, and pottery. Pop. 8312.

Bukâ'a, the Arabic name of Cœle-Syria (which see).

Bukovi'na, a province of Austria, is bounded on the N. by Galicia, on the E. and S. by Roumania, and on the W. by Hungary, Transylvania, and Galicia. Area, 4035 square miles. With the exception of both banks of the Pruth, its chief river, the country is mountainous throughout. The climate is severe, but healthy. It has very little commerce and industry. The chief occupations of the inhabitants are agriculture and cattle-raising. Iron, copper, and rock-salt are mined in large quantities. Bukovina was originally a part of Transylvania, with which country it passed under Turkish rule in 1529, was ceded to Austria in 1777, united with Galicia in 1786, and organized as a separate crown-land in 1849. Pop. in 1869, 513,404.

Bula'ma Boil, a painful affection of the skin somewhat resembling an ordinary boil in appearance. It prevails in Bulama and the neighboring islands, known as the Bissagos (which see). It is said to be caused by the larva of some insect, and that the only cure for it is to remove the larva, which burrows beneath the skin.

Bulb [Gr. βολβός; Lat. *bulbus*], in botany, a short stem or bud (usually subterraneous), covered with imbricated scales, having at their base a disk, from which the roots grow downward, while from the middle of the scales an annual herbaceous stem grows upward. The scales are regarded as modified leaves, and are sometimes all fleshy; sometimes the outer scales are membranous, as in the onion. The corm of the crocus is often called a solid bulb. Plants which are produced from bulbs are usually called bulbous-rooted. The bulb is generally subterranean, but sometimes grows above ground in the axils of the leaves, as in the tiger lily. When the scales are broad and enwrap all that is within, so as to form a succession of coats one over another, the bulb is said to be tunicated. The onion, tulip, and hyacinth are familiar examples of such bulbs. Most bulbs, if removed from the ground when vegetation is most dormant, may be kept in a dry place without injury. The flora of the Cape of Good Hope is remarkable for the abundance of bulbous-rooted plants, many of which bear beautiful flowers.

The term "bulb" is also applied to the round cavity at the lower end of the tube of a thermometer.

Bul'bul, the Persian name of the nightingale, is sometimes used by English poets. The same name is given by the people of India to a different species of bird, the *Pycnonotus hæmorrhous*, of the tribe Dentirostres. It is a small bird of brilliant plumage, and remarkable for its pugnacity and its sweet song.

Bulga'ria (anc. *Mœsia Inferior*), a province of European Turkey, is bounded on the N. by the Danube, on the E. by the Black Sea, and on the S. by the Balkan Mountain range, which separates it from Rumili, and on the W. by Servia. Area, 28,700 square miles. The surface is level in the N., and mountainous in the S., and is generally well wooded. The soil in some parts is fertile. It is drained by numerous small tributaries of the Danube. The chief articles of export are horned cattle, grain, wine, iron, wood, hides, wax, and attar of roses. The principal towns are Varna, Widin, Silistria, Sophia, and Schoomla. The Bulgarians belong to the Greek Church, but have for many years been endeavoring to become independent of the patriarchate of Constantinople, and to have all the Bulgarian dioceses of Turkey united under one Bulgarian exarch. The demand was granted by the Turkish government in 1872. They are of the Slavic race, as is shown by their language. This province was conquered by the Turks in 1392. Pop. about 2,250,000.

Bulk'heads, in a ship, are the partitions between the several portions of the interior, whether to separate it into rooms or as a safeguard in case of wreck. In ships of war, the bulkheads or partitions between the several cabins or storerooms are chiefly of wood, and most or many of these are removed when preparing for action, in order to obtain clear space for working the guns. In emigrant ships the bulkheads between the cabins are frequently mere lattice-work.

Watertight bulkheads are among the improvements in modern shipbuilding; they are iron walls running athwart the hold, as a means of dividing it into several portions; the interior is thus cut off into cells, each watertight in reference to its neighbors. When such a ship is leaking in any one of the compartments, there is thus a chance that the others may be kept dry until the damage is repaired. Most of the large passenger-steamers are to some extent provided with these bulkheads.

Bulk'ley (Eliphalet Adams), born at Colchester, Conn., June 29, 1803, graduated at Yale in 1824, became a lawyer of Hartford, Conn., was for many years the president of life insurance companies, and accumulated a large fortune. Died Feb. 13, 1872.

Bull [Lat. *taurus*; Fr. *taureau*], the male of animals belonging to the family Bovidæ and genus *Bos*. (See Bovidæ and Ox.) Also the name of one of the twelve signs of the Zodiac, and of a constellation which does not coincide with the sign. (See Taurus.)

Bull [Lat. *bulla*, a "seal;" so called from the seal mentioned below], or **Papal Bull,** an ordinance or decree of the pope, equivalent to the edicts, proclamations, or letters-patent of secular sovereigns, some of which are, however, called bulls. (See Bull, Golden.) All bulls are written in Latin, except those addressed to the United Greek churches. They are generally designated by the first words of the text; thus the bull issued in 1536 against heretics was called the bull "In Cœna Domini," and that directed against the Jansenists in 1713 was the bull "Unigenitus." The publication of a bull is termed fulmination (from the Lat. *fulmino, fulminatum*, to "hurl a thunderbolt," *fulmen*). Bulls are written on parchment, and the leaden seal of the Church is appended to every bull by means of a silken cord if the bull be a gracious one, but if it be severe the cord is of hemp. A collection of papal bulls is called a "bullarium."

Bull (Ole Bornemann), a famous Norwegian violinist, born at Bergen Feb. 5, 1810. He visited Paris in his youth, and afterwards performed in Italy and England with great applause. In 1845 he came to the U. S., purchased a large tract of land in Pennsylvania, and founded the colony of Oleona. This proved to be a failure, and he returned to Europe. He has since resided in the U. S. several times.

Bul'la, a Latin word signifying a "bubble," also a stud or boss with which the ancient Romans ornamented their dress or military equipments; an amulet or ornament, in the shape of a heart, worn round the neck by noble Roman children until they were seventeen years old, when the bulla was consecrated to the Lares.

Bulla, a genus of gasteropodous mollusks, having the male and female organs of sex in the same individual. They have a convoluted and generally thin shell, which serves as a protection for the gills, and which in some species is large enough for the entire animal; in others it is itself enveloped in the mantle. The mouth of the shell is large, extending the whole length, widening towards one end, the lip being acute. The gizzard is very muscular, and among its thick coats, in some species, are found calcareous plates, which, being moved against each other by muscles, serve to grind the food. All the species are marine, and some are found on the American coasts. Some, from their form and fragility, are called bubble-shells. The *Bulla velum* of the Indian and European seas is one of the most elegant.

Bulla velum.

Bull-baiting, a sport once very common in England, and in which all classes delighted, but now rare even among the lowest. It consists in causing a bull to be attacked by dogs; and that the bull may be made as furious as possible, his nose is sometimes blown full of pepper. Another form of this sport is to fasten the bull by a rope, and to send bull-dogs against him, one at a time, to seize him by the nose; this is called *pinning* the bull. No small enjoyment is derived from the success with which the attacks of the dogs are met by the bull lowering his head and receiving them on his horns, often tossing them to a great distance.

Bull-dog [so-called from the now obsolete practice of causing this animal to fight with the bull], a variety of the dog especially bred in England, and more remarkable for

courage, persistency, and strength than for docility or intelligence. It is now much less frequently bred than in past times. The size of the neck and fore quarters of this dog is quite in excess of the development of the other parts. The bull-dog is one of the most fierce, and even dangerous, of his species. Its chief value at present is for crossing with other breeds. The greyhound, the terrier, and the pointer, each have their courage and persistency much improved by this cross, if judiciously made.

Bull'et [Fr. *balle;* Ger. *Kugel*], a projectile of lead to be discharged from various kinds of small-arms. For smooth-bore arms bullets are usually spherical, but for rifled musketry various forms of the elongated bullet are used. Most of these bullets have an expansive base, either hollow or plugged with wood; the design being to force the soft lead outward, so as to cause it to fit the grooves of the rifle, and thus give the bullet a rotation around its long axis during the motion forward. This rotation, as is well known, increases the range and precision. Bullets were formerly always cast, but now they are more frequently stamped in steel dies. Copper bullets are used by the Circassians.

Bull'etin [Fr.], in diplomatics, a term equivalent to schedule, and variously applied to different public acts. In recent times the word is often used to denote an official report, a despatch of a military commander, and in a wider sense any public notice or announcement, especially of recent events. In France the ticket or slip of paper which each elector uses in voting at elections is called a bulletin. In the U. S. official bulletins of the weather are issued daily by the war department.

Bull-fight [Sp. *corrida de toros* or *fiesta de toros*], a combat of men with bulls for public entertainment. They were common in Thessaly and in Rome under the emperors, where they were introduced by Julius Cæsar B. C. 45, though in later times they were forbidden. They were introduced into Spain by the Moors before 800 A. D. They are still a favorite pastime in Spain, Spanish America, etc. In Spain they were abolished by Charles IV., but Joseph Bonaparte re-established them, the mass of the population being passionately fond of the sport. Bull-fights were at one time instituted by the monarchs themselves; at present they are held either as private speculations or for the benefit of public institutions. In Madrid the proceeds go to the hospital. The fights take place in the Plaza de Toros, round which the seats rise like the steps of a stair, with a tier of boxes over them. This plaza at Madrid is capable of containing 10,000 people, who pay a high price for admission. The men employed in the fight have generally been bred to it, but amateurs may take part. The bull-fight is divided into three acts. The performers in the first are the *picadores;* in the second, the *chulos;* the last act devolves on the *matador*. The picadores are mounted, dressed like knights of the olden time, and armed with a lance; they take position in the middle of the arena. The chulos, on foot, are gay with ribbons and bright-colored cloaks. The matador, or chief combatant, is on foot. He is handsomely dressed, and holds a sword and a *muleta*, a stick with a piece of scarlet silk attached. On a sign given by the magistrate a bull is let out; the picadores stand waiting his charge. With a brave bull they act on the defensive; with a cowardly one, on the offensive; and should their stabs be ineffectual in rousing the animal, the beast is hooted by the crowd, and stabbed ingloriously. The bull frequently kills several horses, and sometimes one or more men. When the bull begins to tire the picadores are succeeded by the chulos with *banderillas*—darts about two feet long, ornamented with flags—which they stick into the animal. Sometimes these darts have fire-crackers attached. The matador now enters alone. As soon as the bull sees the muleta, he generally rushes at it, and the matador dexterously plunges the sword in before the left shoulder, and the animal falls. The matador is greeted with acclamations, and not less so the bull should he wound or kill the matador, in which case another matador steps into the arena. Ten and sometimes even twenty bulls are despatched in a day, twenty minutes being about the time taken for one.

Bull-Finch (*Pyrrhula vulgaris*), a European bird of the family of Fringillidæ, is a little larger than the common linnet, now naturalized to some extent in the U. S., and often kept as a cage-bird, especially by the Germans. It is easily trained. The genus is characterized by its short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper mandible overhangs that of the lower. The plumage is bluish-gray above, the breast is of a bright tile red, and the crown of the head and the greater wing-coverts are black. It builds on bushes or trees near the ground, and feeds chiefly on seeds, berries, and buds. Its song is not naturally very agreeable, but it can be improved by education, and trained bull-finches are sold for high prices. The pine bull-finch (*Orythus enucleator*), is a beautiful northern bird of both hemispheres. The male is of a splendid red, the female an orange-green.

Bull-Finch.

Bull-frog (*Rana pipiens*), a frog found in the U. S., is of an olive-green color, and is generally eight to twelve inches long, though in some cases it attains the length of nineteen to twenty-one inches. It derives its name from the remarkable loudness of its voice, which is bass and resembles the bellowing of a bull. It is almost wholly aquatic. The hind legs of this frog are often used as food.

Bull, Golden, a term applied to a decree or enactment of Charles IV., emperor of Germany, published in 1356, in two diets held in succession at Nuremberg and Metz, in order to fix the laws in the election of emperor and to regulate the number and privileges of electors. It is preserved at Frankfort-on-the-Main. Another "golden bull," of Andrew II. of Hungary in 1222, fixed the privileges of the nobles, and was regarded as a national constitution.

Bull'head, the popular name of small fishes of the genus *Cottus*, of which there are several species in Europe and America. Another name commonly given them is "miller's thumb." The common catfish and several others are locally known as bullheads.

Bullion, uncoined gold and silver in bars or other masses. In political economy the term is also used to denote gold and silver coin. The word was originally applied to the mint, or place where the precious metals were alloyed and converted into stamped money. In 1810 a celebrated bullion report was made to the British Parliament by Francis Horner and Sir Robert Peel, who promoted the resumption of specie payments, which had long been suspended.

Bul'lion, a post-village, capital of Piute co., Ut. P. 82.

Bul'lions (Peter), D. D., a learned divine and educational writer, born in Perthshire, Scotland, in 1791, removed to America in 1817, and became in 1824 professor of Latin and Greek in the Albany academy. He published a "Latin Reader," a "Greek Reader," a "Latin-English Lexicon," etc., which are highly esteemed. Died Feb. 12, 1864.

Bull'itt, a county of Kentucky, near the Ohio River. Area, 300 square miles. It is bounded on the S. W. by Salt River, and is intersected by the East Fork of that river. The surface is moderately hilly; the soil is productive. Grain and wool are the chief products. It is traversed by the Louisville and Nashville R. R. Capital, Shepherdsville. Pop. 7781.

Bullitt (Alexander Scott), born in Prince William co., Va., in 1761, emigrated to Kentucky in 1784, became a prominent politician, was president of the State senate for several years, and lieutenant-governor (1800–04). Died in Jefferson co., Ky., April 13, 1816.

Bull'ock, a county in S. E. Alabama. Area, 600 square miles. It is drained by the sources of Pea River. The soil is mostly fertile. Corn, oats, and cotton are raised. It is intersected by the Mobile and Girard R. R. and the Montgomery and Eufaula R. R. Capital, Union Springs. Pop. 24,474.

Bullock, a county in the E. of Georgia. Area, 900 square miles. It is bounded on the N. E. by the Ogeechee, and on the S. W. by the Cannouchee River. The surface is level; the soil is sandy, and partly covered with forests

of pine. Corn, oats, rice, cotton, and wool are raised. Capital, Statesborough. Pop. 5610.

Bullock (Alexander Hamilton), LL.D., was born in Royalston, Mass., Mar. 2, 1816, and graduated at Amherst in 1836. He was called to the bar in 1841, became a resident of Worcester, Mass., and held many important public offices. He was governor of Massachusetts (1866–69).

Bullock (Archibald), a native of Charleston, S. C., was a delegate to the Philadelphia Congress from Georgia in 1775, and in the following year president of the executive council of Georgia, the highest office in the State. Died in 1777.—His son, William B. Bullock (died Mar. 6, 1852), was in 1813 U. S. Senator from Georgia.

Bullock (Rufus B.), the first governor of Georgia under the new constitution adopted in pursuance of the reconstruction measures of Congress. He was a native of New York, but had resided some years before and during the war in the city of Augusta, Ga. He was a member of the constitutional convention which was called in 1867, and took an active part in its proceedings. On the adoption of the constitution formed by it, he was declared to be duly chosen at the same election in 1868 governor of the State under it for the term of four years. This office he held until the fall of 1871, when he resigned it and abandoned the State.

Bullock's Creek, a post-township of York co., S. C. Pop. 3068.

Bull Pond, a township of Barnwell co., S. C. Pop. 2400.

Bull Run, a township of Elko co., Nev. Pop. 43.

Bull Run, Battle of. The battle of Bull Run has, with propriety, been classed as one of the "Decisive battles of the War." As the *first* pitched battle—the first trial of strength between the North and South—its inception and issue were pregnant with grave consequences to the future of a struggle in which the two combatants were yet hesitating to engage. In its purely *military* results it has been well said that "the cannon of Bull Run echoed henceforth on every battle-field of the war." The bombardment of Fort Sumter found the government completely destitute of an organized force—the army scattered on distant frontiers (a large portion indeed captured through the agency of its commander), and the navy dispersed to remote quarters of the earth. For no inconsiderable period the possession of the national capital seemed to be due rather to hesitation or irresolution of the Confederates than to its capability of vigorous defence. But the President's call for 75,000 volunteers for "three months" (his power to call out the militia to "suppress insurrection" being thus legally limited) had assembled in Washington and elsewhere a large militia force which, strengthened by such portions of the regular force as could be made available, had been diligently trained under direction of army officers.

Simultaneously with our occupation of the Virginia shore of the Potomac, the Confederates had established themselves at "Manassas Junction," a point on the railroad twenty-five miles west from Alexandria, and the junction of the great southern railroad route (connecting Washington with Richmond and the South) and the Manassas Gap Railroad, leading to the valley of the Shenandoah, where another Confederate force under Johnston confronted Patterson, who had recently crossed the Potomac at Harper's Ferry.

The occupation of Manassas was recommended to the Confederates by the fact that it controlled the railroad routes, and was itself a strong position. An elevated plateau, in the crotch, formed by the Occoquan and its principal tributary from the north, Bull Run, of which the beds are canal-like cuts in horizontal strata of red sandstone, it was of difficult approach to an attacking army, while the general character of the country, broken, wooded, with few roads fit for the movement of an army, was favorable to the defence.

Map of the Battle of Bull Run, July 21, 1861.

Leading almost directly west from Alexandria, diverging slightly to the north from the railroad, a macadamized road led to Centreville, twenty-two miles distant.

From Centreville, a little west of south and six or seven miles distant, lay Manassas Junction. About midway between these two points flowed the rivulet of Bull Run (the real defensive line of the enemy) in a general direction from north-west to south-east.

A road led from Centreville almost directly to the "Junction," crossing Bull Run three miles from Centreville at "Mitchell's Ford," a short distance below which is "Blackburn's Ford." The turnpike before mentioned continued its westerly course towards Warrenton, in a nearly straight line beyond Centreville, crossing Bull Run at the "Stone Bridge," four miles distant. Somewhat eastwardly of south, a country road from Centreville crossed Bull Run and the railroad at "Union Mills."

The Confederate force was distributed along Bull Run from Union Mills to the Stone Bridge (nearly eight miles), with reserves and a fortified position at or near the Junction.

The line was a strong one, for the stream, though containing but little water at that season, was, owing to the character of the bed and to the abrupt and wooded slopes of its right bank, a formidable obstacle.

The army of General McDowell, which marched to the attack of this position, numbered about 30,000 men. Save perhaps 700 or 800 regular troops (fragments of regiments) of the old army, it was composed wholly of raw volunteers, none of whom had been in a soldier's garb more than two or three months, and at least half of whom were enlisted only for a term of three months, then just about expiring. Such an army as this was certainly not the best suited for an offensive campaign. Troops *utterly* raw; brigades and divisions, the component parts of which had never been brought in contact before, commanded by officers who, though generally of ability, were for the first time exercising these extensive commands, and who had hardly seen the troops they commanded.

Such was the army which marched from the banks of the Potomac on the afternoon of July 16th. It moved in four columns, one by the turnpike, one by the lateral country roads on the right, one on the left of the railroad, and another between the turnpike and railroad, following what is known as the "Braddock" road, from its having been made by that general on his memorable march to Fort Duquesne in 1754, which terminated in his disastrous defeat and death.

The "plan" of the campaign organized by General McDowell had been carefully studied by him in conjunction with his staff officers for a week or two before the movement commenced. It was a feature of it, after reaching Fairfax Court-house, to make a sudden movement to the left, crossing the Occoquan just below the junction of that stream with Bull Run, aiming at the enemy's railroad communications. His personal reconnaissances in that direction, made on the 18th, led him to consider the country impracticable for the operations of his army.

However imperative it was (for many reasons) to lose no time (a regiment the term of which expired on the eve of the battle, actually marched "to the rear," as Gen. McDowell expressed it, "to the sound of the enemy's cannon") it was out of the question to attack until some plan could be devised which would promise success. A day was accordingly spent in reconnaissances.

The "Stone Bridge," already mentioned as forming the left of the enemy's defensive position, was a single arched structure over the narrow stream. The passage was found to be guarded by field-guns, and the road and adjacent ground beyond obstructed by formidable abattis. Several roads were ascertained to lead to fords between Blackburn's and the Stone Bridge, but they were mere by-paths, the opposite banks of the stream generally steep and tangled, and probably obstructed.

It was found that a couple of miles above the Stone Bridge there was a good ford at "Sudley Spring," which was but slightly guarded, and that above that point the stream was, almost everywhere, easily passable. No continuous road communicated from the turnpike with the "Sudley" ford, but our reconnaissances showed that the intervening country was almost everywhere practicable to all arms.

The writer finds in his note book the following memorandum of a "plan of battle" or attack, which, founded upon the above results of reconnaissance, was submitted to Gen. McDowell.

1st.—One division to advance on Warrenton Turnpike at 3 o'clock to-morrow morning. The leading brigade to threaten the bridge over Bull Run—throwing skirmishers into the woods on both flanks. No serious effort will be made on the bridge but artillery may be opened upon it, as if to open the way for an assault, and the operation to be conducted *as if* an assault were intended.

The 2d, 3d, and 4th Brigades to turn to the right at the road ½ to ¾ of a mile beyond "Cub Run." On reaching the forks to the two fords a Brigade will turn off on the *left* fork advancing on it *just enough* to clear the route for the passage of the two following Brigades which take the *right* fork towards Sudley Spring. The ford at Sudley Springs will be turned by a march around and some 200 yards above it. The leading brigade will be followed by the one in rear and the whole force advance rapidly by the road from Sudley Spring southward to reach the Warrenton 'Pike by the shortest route. The brigade left on the road to the lower ford will then pass over. Detachments from the advanced brigades should be sent to take in rear the defenders of the lower ford and Warrenton 'pike bridge. The brigade left at the Stone Bridge will cross over and join the other two.

2d.—Another division should follow to take position behind Bull Run to be ready to pass over if necessary—but unless ordered from Hd. Qrs. to remain on the E. side.

3d.—Another division should simultaneously with the commencement of the first operation commence the semblance of an attack on Blackburn's Ford. Every appearance of a formidable assault should be made, but *no attempt to force the passage*, unless the enemy shows unmistakable signs of retiring.

4th.—Another division should remain in reserve at Centreville.

This plan was adopted by the General, modifying the composition only of the different columns thus,

One division under Colonel Miles to remain in reserve at Centreville, and to make, with one of its brigades, a false attack on Blackburn's Ford; another division (Tyler's) to move by the turnpike up to the Stone Bridge and threaten that point, and, at the proper time, to carry it and unite with the principal column, which, consisting of the two divisions (of Hunter and Heintzelman) of about 12,000 men, was to diverge from the turnpike, and, by a flank movement, reach the Sudley Ford, and descending the right bank of the stream, take the defences of the Stone Bridge in the rear. The united force would then give battle, strike at the enemy's railroad communication, or act otherwise, as circumstances might dictate.

This plan was carried out in its main features, but it failed in one important particular. It was calculated that the marching column should diverge from the turnpike by early daylight (the route being so wooded that a night march was deemed imprudent) and reach Sudley Ford by six or seven A. M. The Stone Bridge division did not clear the road over which both, for a certain distance, had to pass, so that the column could take up its march until near six o'clock. The route through fields and woods to Sudley proved to be far longer and more difficult than was believed. The column did not reach the Sudley Ford till near half-past nine, three or four hours "behind time." When it reached the ford the heads of the enemy's columns were visible, on the march to meet the attack.

This loss of time caused the loss of the battle. It might have been unwarrantable to have *counted* on punctuality with an army so utterly inexperienced in tactical manœuvres and in marching; nevertheless the immediate end aimed at was gained—the passage of Bull Run was accomplished and the Confederate left turned. While the appearance of Tyler's column in the front of the Stone Bridge had disconcerted his plan of attacking *our* left by crossing at the lower fords. Hunter, having crossed at Sudley Spring, led his column down to take in reverse the Stone Bridge position. Evans who held the confederate left at that point had had his attention occupied through the morning hours by Tyler in his front; but the march of Hunter's column became evident long before the ford was reached and ere it reached the bridge, Evans, sending for re-inforcements, had formed "*en potence*" across Hunter's line of march. A sharp combat ensued which resulted in forcing the confederate position and in opening the Stone Bridge to Tyler's division, two of the brigades (W. T. Sherman's and Keyes') immediately passed and joined their force with Hunter's. Thus had been gained the *immediate* end of the tactical plan of the operation. The Confederate left had been turned, the Warrenton turnpike taken from them (opening to us the Stone Bridge); and their line had been driven back a mile and a half. Gen. McDowell had thus brought nearly all his three divisions into position on the enemies left flank and was advancing nearly 18,000 strong. The Confederate left (all his troops that had been engaged) had been thrown into confusion. Gen'ls Johnston and Beauregard hastened to the scene, ordering up to their routed left all the brigades which could be spared from the centre and left of their line. "We came," says Johnston, "not a moment too soon," for "the long contest had greatly discouraged the troops of Bee and Evans." He found "that the aspect of affairs was critical;" but by great efforts, "and some example," the "battle was re-established," and, after a time, "many of the broken troops, fragments of companies, and individual stragglers, were re-formed and brought into action."

The position on which a stand was now made was a broad table land in which the slopes from Young's Creek (crossing our line of march at right angles and emptying into Bull Run near the Stone Bridge) terminate in the general level of the country. To carry the position, McDowell advanced the brigades of Wilcox and Howard on the right, supported by part of Porter's brigade, and the cavalry under Palmer; the brigades of Franklin and Sherman in the centre and up the road, and Keyes' brigade on the left. Schenck's brigade (of Tyler's division) was still at Centreville; but the positions of these troops, coupled with the demonstrations made, still detained several Confederate brigades confronting them.

A severe contest ensued for this position with varying success; the result of which was at 3 P. M., the possession of the hill; the fighting having commenced at 10.30 A. M. of a July day. The men who had been up since two o'clock in the morning were exhausted by fatigue, want of food

and water, and somewhat demoralized by the vigorous resistance they had encountered.

"It was at this time," says Gen. McDowell, "that our adversary's reinforcements came to his aid from the railroad train, understood to have just arrived from the valley with the residue of Johnston's army. They threw themselves in the woods on our right, and toward the rear of our right, and opened a fire of musketry on our men, which caused them to break and retire down the hill-side. This soon degenerated into disorder, for which there was no remedy. Every effort was made to rally them, even beyond the reach of the enemy's fire, but in vain. According to the statement of the Confederate commander, Gen. Beauregard (Gen. Johnston, the ranking officer, having waived the command for the reason that, just arrived, he was unfamiliar with the country and troops), it was not wholly "reinforcements just arrived from the Valley" *vid* Manassas Junction —Elzey's brigade, under Gen. E. K. Smith—which at *this* critical moment "threw themselves on our right, etc.," with consequences described by Gen. McDowell. In fact, our extreme right was flanked by Early's brigade of Beauregard's forces, which having been employed in partial execution of his plan of attack on our left and rear at Centreville, had been thus decisively brought up when that plan failed by the miscarriage of his orders to Ewell (who was to begin the movement from his extreme right), coupled with the development of our attack on his left.

Enough has been written to show how greatly misrepresented and misunderstood has been this battle. It was one (and the first) of the few battles of the whole war deliberately *planned* beforehand, *executed* (except as to punctuality in time) in full accordance with its plan, and *successful* up to a point at which it was believed the final result must be decided. That the success so far accomplished did not, as it should have done, prove decisive, was due to causes inherent in the raw and otherwise unsuitable character of the attacking force for tactical movements and long-continued *aggressive* action. The battle was pronounced by the Confederate President, himself a soldier, who at Buena Vista had learned the meaning of such words, "a hard-fought field."

On the authority of Gen. Jordan, Beauregard's chief of staff, Ewell's, Longstreet's, Jones's, Holmes's, and half of Bonham's brigades, not engaged at all, Early's and Elzey's brigades and other regiments, some newly arrived—in all over 15,000 men—were "in excellent condition:" the real obstacle to an advance after the battle was "the lack absolutely of one day's rations, coupled with insufficient transportation for the indispensable small-arms and artillery ammunition—as the advance would have been, not upon the Federal position at Arlington, but by crossing the Potomac somewhere about Edwards' Ferry, and taking Washington in reverse." On our part, Miles's whole division, in reserve at Centreville, and Runyon's, seven miles farther back, guarding communications, had been unengaged, whilst Howard's and Keyes's brigades were nearly fresh. Both sides had received severe handling, and the language already quoted from Gen. Johnston shows the critical aspect and gloom on the Confederate side of the field up to the moment when the elation of scarcely-expected victory came to dispel it.

And concerning the "panic" which, although *military* writers have generally been free from this injustice, has been so commonly held up as *the* picture of the battle the instances even with armies of veteran troops like Napoleon's (Albuhera and Vittoria, &c.) are so numerous that the exceptional case of Bull Run, when the army was almost wholly made of three months' men, should excite no surprise: moreover, it was not such as to prevent a stand at Centreville, "the apparent firmness" of which, says Gen. Johnston, "checked our pursuit." The disorder and mob-like appearance was rather, as described by Major (now Brevet Major-General) H. J. Hunt, the result of "sheer fatigue." They were, says he "footsore, hungry, and tired; but had we been attacked I have little doubt that a stout resistance would have been made."

Let us rather admire the courage and fortitude with which men just from their farms and firesides, for whom the battle-field and the cannon's roar had been divested of none of their horrors, unsustained by the confidence in each other which association and discipline engender, vindicated, in this the first great battle of the long and saddening series, the American claim to those qualities, and to the patriotism which could call forth their exhibition.

J. G. Barnard, *U. S. Army.*

Bull Run, Second Battle of. A junction, upon the Rappahannock, of the forces under Gens. McClellan and Pope having been determined upon, McClellan was ordered (Aug. 3, 1862) to transfer his army from Harrison's Landing to Acquia Creek; to which point Burnside was also ordered (Aug. 1). The latter moved promptly, arriving Aug. 3, but the evacuation of Harrison's Landing was not commenced until Aug. 14.

To gain time and facilitate the withdrawal of the Army of the Potomac, Pope crossed the Rappahannock, occupied Culpeper and threatened Gordonsville. Jackson's and Ewell's forces were hurried back to the Rapidan where on the 9th of August they encountered Bank's corps at Cedar Mountain, a severe contest ensuing resulting in the defeat of the latter, Jackson holding his position on the mountain for two days when he withdrew across the Rapidan. As information received showed that Lee was moving the main body of his army by forced marches, to attack Pope before a junction could be formed between him and the Army of the Potomac, Pope was advised by the Gen.-in-Chief to take up his position in rear of the Rappahannock, which he accordingly did Aug. 17–18, prepared to hold its passes as long as possible; he had been reinforced by King's division, and a part of Burnside's corps under Gen. Reno. Burnside occupied Barnett's and Richard's fords between him and Pope, and though repeated attempts were made by the Confederates to cross at different points on the Rappahannock they were all repulsed and the line of this river was held for eight days, during which time it was hoped sufficient forces from the Army of the Potomac would reach Acquia Creek, and prevent any further advance of Lee and eventually with the combined armies to drive him back upon Richmond; but the expected aid not arriving Pope telegraphed to Washington that he was overmatched and unless reinforced must retreat. He was directed on the 21st to maintain his position two days longer when he would be reinforced; but though he held his ground for four days he received during that time but about 7000 men. On the 21st a portion of Confederate cavalry under Gen. Stuart crossed the river at Waterloo Bridge and on the night of the 22d, during a furious storm, surprised Pope's headquarters at Catlett's station capturing his despatch books, and much of his personal baggage, numerous horses and wagons; the latter were burned. Pope's actual Headquarters at this time were at Rappahannock Station.

On the 24th by a flank movement Lee crossed a portion of his forces under Jackson above Waterloo bridge; but being repulsed here moved further up the river and entered the valley which lies between the Blue Ridge and Bull Run mountains; the object of this movement being to gain Pope's rear and cut off his supplies, at the same time gaining a position by which Washington could be attacked or Maryland invaded. Jackson passed through Thoroughfare Gap and reached Bristow Station Aug. 26, from whence he sent Stuart with a detachment of cavalry to capture Manassas Junction which was accomplished that night, immense quantities of commissary and quartermaster's stores, besides 8 pieces of artillery, 10 locomotives, and large trains falling into their hands: the main body of the Confederate army in the meantime engaging Pope at Sulphur Springs and Waterloo Bridge. The Confederate army at this time numbered probably 80,000, while Pope had barely 40,000; but, relying, with reason, on being reinforced by as many more veterans from the peninsula, he indicated the positions to be taken up by them on arrival and laid his plans for the impending struggle with the firm belief that it was to be fought by the combined armies.

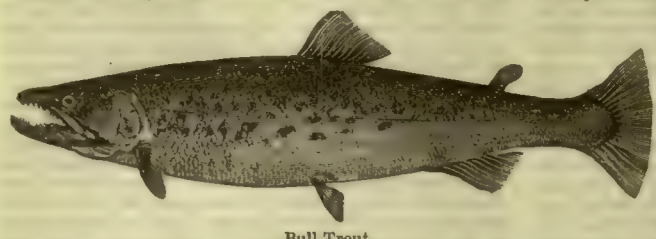
Discovering the movement on his right flank, and failing to receive any adequate reinforcements, Pope fell back in three columns from Warrenton and Warrenton Junction, and was at this time joined by Heintzelman's corps of 10,000 (but without artillery, wagons, or horses for officers) and Porter's corps, foot-sore and fatigued by long marching night and day. Under these circumstances Pope could not maintain his front, after detaching a sufficient force to meet Jackson operating on his flank.

Gen. Pope's disposition of his troops at this juncture (27th) was as follows: the corps of McDowell and Sigel and the Pennsylvania Reserves under Reynolds were advanced to Gainesville, Reno and Kearny were directed upon Greenwich, while Hooker's division was sent against Ewell along the railroad; the movement however was too late, as a large part of Lee's army was already east of Thoroughfare Gap.

Hooker encountered the Confederates near Kettle Run (27th) and a sharp engagement ensued, resulting in driving Ewell from the field.

As McDowell, Sigel and Reynolds had reached their positions there was every prospect that Jackson could be overwhelmed before reinforcements could reach him. On the evening of the 27th Gen. Pope ordered Gen. Porter to be at Bristow Station by daylight on the morning of the 28th, with Morell, and also directed him to communicate to Banks the order to move forward to Warrenton Junction. All trains were ordered this side of Cedar Run and to be protected by a regiment of infantry and section of artillery. For some reasons Porter did not comply with this order and his corps was not in the battles of the 28th and 29th. (Porter was afterward tried and cashiered.)

Heintzelman's corps pressed forward to Manassas on the morning of the 28th and forced Jackson to retreat across Bull Run by the Centreville turnpike. McDowell had succeeded in checking Lee at Thoroughfare Gap, but the latter took the road from Hopeville to Newmarket and hastened to the relief of Jackson who was already in rapid retreat. A portion of McDowell's corps encountered the retreating column on the afternoon of the 28th near the Warrenton turnpike and a severe but successful contest ensued. Jackson was again attacked on the 29th near the old battle ground of July, 1861. Knowing that Longstreet was not distant he made a most desperate stand; the fight continued nearly all day, and was terminated only by darkness. It was renewed in the morning (30th), and a desperate battle continued all through the day, but Pope could not hold out against the combined strength of Lee's army, now united, and after a hard day's fighting was forced to fall back behind Bull Run. Pope's loss during this campaign was nearly 30,000 men; the Confederate loss about 15,000.



Bull's Eye, in architecture, the technical name given to a glass lens used for the purpose of concentrating the light of a given centre upon an object. It is also applied to a circular window of plain glass. On shipboard the bull's eye is a small pulley in the form of a ring, with a rope spliced round the outer edge, and another sliding through a hole in the centre. In rifle practice the small black centre in the circle on the target is called the bull's eye. In astronomy, the bull's eye is Aldebaran, a bright star in Taurus.

Bull'skin, a township of Fayette co., Pa. Pop. 1657.

Bull Swamp, a township of Lexington co., S. C. P. 933.

Bull-terrier, a dog bred by a cross, more or less remote, between the bull-dog and some one of the terriers, and frequently uniting in a remarkable degree the courage and strength of the bull-dog with the docility, activity, quick scent, and intelligence of the terrier. This little animal is especially famous for its zeal and success in killing rats.

Bull Trout, Gray Trout, Whitling, or **Sewen,**

Bull Trout.

the *Salmo Eriox,* a fish of Europe closely resembling the salmon in size, appearance, and habits, but much inferior as food. It is common in England and Wales. It affords good sport to anglers.

Bulsar', or **Bulsaur,** a seaport of India, on the Gulf of Cambay, and in the presidency of Bombay, 44 miles S. of Surat. It has manufactures of ginghams, and an active trade in grain, salt, and sugar. Pop. about 8000.

Bul'ti, Iskar'do, or **Little Thibet,** the upper end of the Indus Valley, subject to Cashmere, having Chinese Tartary on the N., Afghanistan on the W., and Cashmere on the S., between lat. 34° 30′ and 36° N. and lon. 74° 40′ and 76° 30′ E. The inhabitants are Mohammedans of Thibetan origin. The climate has greater extremes than that of Cashmere; the soil produces grains and fruits in abundance. This region is also called Baltistan.

Bul'wark [Fr. *boulevard*], in fortification, a rampart or bastion; an outwork for defence; that which secures against an enemy; a shelter or means of protection. On shipboard a bulwark is the parapet raised round the deck for the purpose of protecting men and goods from slipping overboard, and of excluding the waves from the deck. In ships of war the bulwark is sufficiently high and solid to afford the crew some protection against the shot of the enemy.

Bulwer (Edward George Earle Lytton), Baron Lytton, a celebrated English novelist, born in Norfolk in May, 1805, was the youngest of the three sons of William Earle Bulwer and Elizabeth Lytton. Both parents were descended from ancient families. His early education was superintended by his mother, a woman of intellectual tastes and culture. Having entered Cambridge, he gained the chancellor's prize for English verse by his poem on "Sculpture" (1825), and in 1826 graduated at Trinity Hall. He soon after visited France, and published after his return his novel of "Falkland" (1827), which was followed by "Pelham, or the Adventures of a Gentleman" (1828), "The Disowned" (1828), "Devereux" (1829), "Paul Clifford" (1830), "The Siamese Twins," a poem (1831), and "Eugene Aram" (1832). In 1831 he was returned to Parliament for St. Ives, and from 1832 to 1841 he represented the city of Lincoln. He published in 1833 "England and the English," and the same year visited Germany and Italy. He produced in rapid succession "The Pilgrims of the Rhine," "The Last Days of Pompeii," "Rienzi, the Last of the Tribunes" (1835), and "The Student," a series of contributions to the "New Monthly Magazine," of which he was for some time editor. His drama entitled "The Duchess of La Vallière" (1836) was not well received. In 1837 he brought out "Athens, its Rise and Fall," and "Ernest Maltravers," a novel, which was continued under the title of "Alice, or the Mysteries." His dramas entitled "The Lady of Lyons" (1838) and "Richelieu" were very successful, as well as the comedy of "Money," which came out soon after. His "Night and Morning," a novel, published in 1841, was followed by "Zanoni" (1842), "The Last of the Barons" (1843), "Lucretia, or the Children of the Night" (1846), and "Harold, the Last of the Saxon Kings" (1848). His novels entitled "The Caxtons" (1850), "My Novel" (1851), and "What will he Do with It?" (1858) first appeared in "Blackwood's Magazine," to which Bulwer has been a frequent contributor. "A Strange Story" came out in "All the Year Round" in 1861. Although his reputation rests chiefly on his novels, he has distinguished himself in various departments of literature. His translations of Schiller's poems (1844) were received with favor, and he has published original poems—"O'Niel, or the Rebel" (1827), "The New Timon" (1846), and "King Arthur" (1848). His novels have great popularity in England, America, and on the Continent, and have been translated into several languages. Bulwer was made a baronet in 1838, and in 1844, on the death of his mother, came into possession of the Knebworth estates and assumed the name of Bulwer-Lytton. He had published in 1835 a liberal political pamphlet entitled "The Crisis," which caused a great sensation. He was elected lord rector of the University of Glasgow in 1856, and in 1858 he held for a time the office of secretary of state for the colonies. He was made a peer in 1866 with the title of Baron Lytton. In 1827 he married Miss Rosina Wheeler of Limerick (b. 1807), who wrote "Chevely, or the Man of Honor" (1839), "Bianca Capello," "The Budget of the Bubble Family," and other books. The union was unhappy, and the parties separated in 1836. Died Jan. 18, 1873.

J. Thomas.

Bulwer (Edward Robert). See Lytton (Edward Robert Bulwer-Lytton).

Bul'wer (Henry Lytton Earle), Baron Dalling and Bulwer, an English diplomatist and author, a brother of the preceding, was born in 1804. He was elected to Parliament in 1830, and was sent as ambassador to Madrid in 1843. In 1849 he was transferred to Washington, and in 1851 was created a knight grand cross of the Bath. He became minister plenipotentiary at Constantinople in 1858. He was afterwards ennobled. Among his works are "France, Social and Literary," and a "Life of Lord Byron." Died May 27, 1872.

Bummalo'ti (*Saurus ophiodon*), a fish of the family Scopelidæ, which is regarded as a subdivision of the family Salmonidæ. It is a native of the seas of India, from which it is exported in large quantities, salted and dried, being highly esteemed for its flavor. In commerce it is known by the appellation of "Bombay duck." It is long, with a very large mouth, the gape of which extends behind the eyes, and which is furnished with a great number of long, slender, barbed teeth.

Bum'mingtown, a township of Macon co., N. C. Pop. 320.

Bum'stead (Freeman Josiah), M. D., born at Boston, Mass., April 21, 1826, graduated at Williams College in 1847, studied medicine in Paris, and became a practitioner in New York, where he was appointed professor of venereal diseases in the College of Physicians and Surgeons, also surgeon to the Eye and Ear Hospital and the Charity Hospital. He has published "Pathology and Treatment of Venereal Diseases" (1861), and valuable translations from Ricord and Cullerier.

Bunce (Francis M.), U. S. N., born Dec. 25, 1836, in Hartford, Conn., graduated at the Naval Academy in 1857, became a lieutenant in 1861, a lieutenant commander in 1863, a commander in 1871. Had charge of the naval howitzers in the combined army and navy expedition of July 10, 1863, which resulted in the capture of a part of Morris Island. Participated in all the important attacks

on the defences of Charleston harbor during the summer and fall of 1863, and was in the disastrous assault upon Fort Sumter of Sept. 18, 1863, where, for his "gallant support and zealous co-operation," he received the thanks of his commanding officer, Captain Thomas H. Stevens.

FOXHALL A. PARKER, U. S. N.

Bun'combe, a county in the W. of North Carolina. Area, 450 square miles. It is intersected by the French Broad River, and bounded on the E. by the Blue Ridge. The surface is partly mountainous; the soil of the valleys is fertile. Cattle, grain, tobacco, and wool are raised. Capital, Asheville. Pop. 15,412. The phrase "talking for Buncombe," often heard among politicians, was first used by a member of Congress from this district. During a long speech which he made, several members, who had not patience to listen, retired from the hall. He then told the remaining members that they also might go, for he "was only talking for *Buncombe*."

Buncombe, a post-township of Johnson co., Ill. Pop. 1385.

Bun'delcund', or **Bundlecund,** a territory of Hindostan, is bounded on the N. E. by the river Jumna. It extends from lat. 24° to 26° 26′ N., and from lon. 78° to 81° 36′ E. Area, about 18,000 square miles, of which about 8700 square miles are subject to the British, while the rest of the country is governed by numerous native princes, who are tributary to the British. It is situated in the North-western Provinces. The surface is diversified by many hills or isolated precipitous rocks. The soil is fertile, but requires irrigation. It is said to contain diamonds and rich beds of iron ore. The chief towns are Calpe, Banda, Jhansi, and Callinger. Pop. 2,592,800.

Bundemeer' (anc. *Araxes*), a river of Persia. It flows through a richly wooded valley, emptying into the Bakhtegan Lake after a course of 150 miles.

Bun'galow [from the Hindostance *bāngla*, a "summer-house"], the name of a kind of rural dwelling very common among the Europeans in India. Bungalows usually have but one story, and are always surrounded with a verandah, the covering of which affords shelter from the sun. Besides private bungalows, there are military bungalows for the use of soldiers in cantonments, and for the accommodation of travellers there are public bungalows belonging to the government on all the principal roads in India. Travellers sometimes carry their provisions, servants, etc. with them, paying a rupee (a half dollar of our money) per day for the use of the bungalow. But on the most frequented roads one can nearly always find native cooks, or rather "stewards" (*khânsâmân*), as they are called, who furnish food for travellers, and cook it.

Bun'ion, or **Bunyon** [said to be from the Gr. *βούνιον*, the "earth-nut," from its fancied resemblance in shape], is a painful inflammation of the *bursa mucosa*, or membranous sac of the joint which connects the great toe with its metatarsal bone. The pressure of a boot causes this bursa to inflame and swell, and this may go on to suppuration. Rest and poulticing are generally sufficient to subdue the attack, and wearing a shoe so constructed as to save the bunion from pressure will generally prevent a recurrence.

Bunka'ra, or **Blue River,** of Colorado, rises in the Middle Park, among the Rocky Mountains, flows nearly south-westward, and unites with the Gunnison River to form the Grand River. Total length, estimated at 200 miles.

Bun'ker Hill, a post-village of Macoupin co., Ill. It has one weekly newspaper.

Bunker Hill, a post-township of Ingham co., Mich. Pop. 957.

Bunker Hill, the county-seat of Russell co., Kan., on the Kansas Pacific R. R., 176 miles W. of Topeka, has one weekly paper. J. B. CARBOLT, ED. "NEW REPUBLIC."

Bunker Hill, a rounded eminence in Charlestown, now a part of Boston, Mass. It is about 110 feet high and connected by a ridge with another small eminence 700 yards distant called Breed's Hill. These two elevations are famous for the battle fought here between the British and American forces June 17, 1775. The American redoubt was on Breed's Hill, but by common usage the event is known as the battle of Bunker Hill.

After the stirring events of the spring of that year the troops organized in New England had taken up a line extending from Roxbury to Cambridge under command of Gen. Artemas Ward; Putnam, Starke, Prescott, Gridley, and Pomeroy were there, and by the middle of June not less than 20,000 men had assembled.

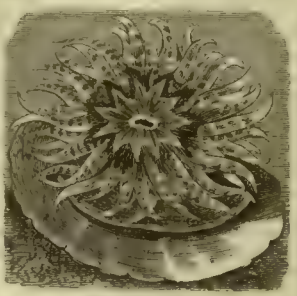
Gen. Gage was in chief command of the British at Boston, and had been recently largely reinforced by Gen'ls Howe, Burgoyne and Clinton.

It having been ascertained by the provincial army that Gage meditated seizing and fortifying Bunker Hill and the heights of Dorchester on the night of the 18th, it was determined by the Americans to forestall this design, and, on the night of the 16th, a detachment of 1000 men under command of Col. Wm. Prescott, was despatched from Cambridge to Charlestown for the purpose of fortifying Bunker Hill. They were joined at Charlestown Neck by Gen. Putnam and Major Brooks and at a council it was decided to fortify Breed's Hill not as high as Bunker Hill but nearer Boston. By daylight a formidable work had been thrown up on the spot now marked by the Bunker Hill Monument. This being discovered by daylight the "Lively" opened fire upon it which soon extended to all the shipping and the battery on Copp's Hill in Boston; the British troops were called to arms and preparations for an attack were made; Prescott meanwhile continued to strengthen his position and sent to Cambridge for reinforcements; the entire American force engaged, however, did not probably exceed, at any time, 1500.

A force of British under Gen'ls Howe and Pigot, covered by the guns of their shipping, had embarked in boats and landed at Morton's Point east of the foot of Breed's Hill. This movement produced the greatest excitement in Cambridge and reinforcements were hastened to Charlestown, Gen'ls Warren and Pomeroy arriving at 2 P. M. at the moment Howe, whose force by this time had been increased to about 4000, began his advance around the eastern slopes of Breed's Hill and along the Mystic river with the intention of gaining the rear of the American lines; but this movement having been anticipated Knowlton had taken up a position near Bunker Hill and thrown up a breastwork nearly two hundred and fifty yards in length, and another line had been built in front of a stone and rail fence between which was placed new mown hay, and between the breast work and the rail fence the artillery was placed. The Conn. and N. H. troops were west of the redoubt and a force was posted at the foot of the S. W. side of Breed's Hill, near Charlestown, and a work had been commenced on Bunker Hill. Gen. Warren, who was with Prescott in the redoubt, having refused to take command from either Prescott or Putnam, saying he came to fight as a volunteer. Howe was foiled in his flank movement and compelled to make a direct attack and having ordered the guns of the shipping and the battery at Copp's Hill to open fire on the redoubt moved forward under its cover up the slopes of Breed's Hill in two wings, the right under his own command the left under Pigot: Gen. Howe with his command to carry the position at the rail fence while Pigot attacked the redoubt. Prescott's orders to his men were to reserve their fire on the advancing columns till the whites of the men's eyes could be seen. The British opened fire when within gunshot but no reply was heard from the breastworks till they were within close range when volley after volley was poured into their ranks causing them to fly in disorder toward their boats. Howe succeeded, however, in quickly rallying his troops and being reinforced by some 400 marines and provided with artillery, of which latter they were deficient in the first attack, a second advance was made over the same ground.

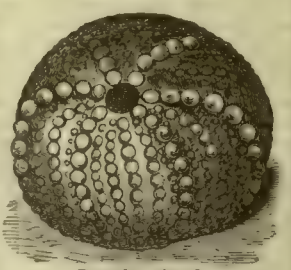
In the meantime reinforcements had been sent to Prescott but those sent from Cambridge were prevented from crossing Charlestown Neck by the severe fire of the batteries and shipping of the British, and but few additional troops reached the redoubt before the second attack.

As before the Americans reserved their fire till the British line was at short range when it was delivered with the same deadly effect.



Hot shot from Copp's hill having meanwhile set fire to some houses in Charlestown the whole town was soon in flames and Gen. Howe hoped to storm the redoubt under cover of the smoke; but a light wind which had just sprung up cleared away the smoke and disclosed the advancing columns which were again broken and driven in confusion by the fatal fire from the patriots within the redoubt. Howe was now reinforced by Clinton and a third attack was made upon this little band whose ammunition was now nearly exhausted and Howe, having discovered the weakness of this part of the line, attacked the position between the rail fence on the east of the redoubt and the breastwork, sweeping it with his artillery and forcing its defenders within the redoubt. The ammunition of the Americans was now completely exhausted and the British advancing scaled the work but were met by the Americans with muskets clubbed and a hand to hand conflict ensued. But the superiority of the British in numbers was too great and Prescott was compelled to order a retreat, himself and Warren being the last to leave the works. Stark and Knowlton maintained their position at the rail fence until the retreat had been effected, when they retired slowly and in good order. Warren had hardly left the redoubt when he fell shot through the head; Prescott escaped uninjured. Falling back across

Bunker Hill, Putnam here made an ineffectual attempt to rally the retreating army within the partially finished works. The retreat continued across Charlestown Neck where many were killed by a severe fire from the shipping and batteries; but the British did not continue their pursuit beyond this point.



The British loss in killed and wounded was about 1050; the American loss was not over 450.

A granite obelisk 221 feet in height now marks the scene of this important struggle on Breed's Hill, and is known as Bunker Hill Monument. Gen. Lafayette laid the corner stone June 17, 1825, and Daniel Webster delivered one of his most memorable orations on the occasion. The monument was completed in 1842 and was dedicated June 17, 1843 in the presence of the President of the U. S. and his Cabinet, Daniel Webster being, as before, the orator of the occasion.

Buno'des Gemma'cea, called in English *gem pimplet*, a zoophyte of the order Actinoida (sea anemones; see ANEMONE, SEA). When open it bears a striking resemblance to a flower, but when closed it assumes a spherical form, having the appearance of an echinus stripped of its spines. The generic name is from the Greek βουνώδης, signifying "resembling an eminence or a woman's breast" (referring to its form when closed); the specific name is from the Latin *gemma*, a "bud," or small protuberance, and has allusion to the wart-like protuberances on the exterior surface.

Bunodes, open.

Bunodes, closed.

Bun'sen (ROBERT WILHELM), a very distinguished German chemist, born at Göttingen Mar. 31, 1811, became in 1851 professor of chemistry at Breslau, and in 1852 at Heidelberg. He is the author of several works, the most important perhaps being on gas analysis. His investigations on organic compounds of arsenic, kakodyl, etc., in 1841, attracted much attention. He has invented several most important pieces of apparatus, several of which bear his name, as the Bunsen battery, gas-burner, photometer, filter pump, etc. His most brilliant discovery was probably that of spectrum analysis and the SPECTROSCOPE (which see), made in connection with Kirchoff. This instrument established a new era in astronomy, and has already led to most valuable discoveries in chemistry. By its aid Bunsen himself discovered two new alkaline metals, *cæsium* and *rubidium*, and Lamy and Crookes discovered *thallium* and Riche and Richter *indium*. He also devised a new system of analysis by flame reactions. His laboratory is still a favorite resort for Americans studying chemistry in Europe. C. F. CHANDLER.

Bunsen, von (CHRISTIAN KARL JOSIAS), PH. D., D. C. L., CHEVALIER, an eminent German writer and diplomatist, born at Korbach, in Westphalia, Aug. 25, 1791. He studied the Oriental languages in his youth. He was appointed secretary to the Prussian embassy at Rome in 1818, where he remained many years and devoted much time to philology and historical research. In 1827 he succeeded Niebuhr as Prussian minister at Rome. He was sent as ambassador to London in 1841, and acquired a greater influence and a higher position in English society than any German diplomatist had ever enjoyed. His principal works are "Die Verfassung der Kirche der Zukunft" (1845), "Egyptens Stelle in der Weltgeschichte" (5 vols., 1845–57), "Christianity and Mankind" (7 vols., 1854), and "Gott in der Geschichte" (2 vols., 1868). He had a high reputation as an Egyptologist, and was liberal in religion and politics. He was recalled from the court of St. James in 1854, and was raised to the peerage as Freiherr (baron) in 1858. Died at Bonn Nov. 29, 1860. (See "Memoirs of Baron Bunsen," by his wife, 2 vols., 1868.)

Bunt. See MILDEW.

Bun'ter Sand'stein ("variegated sandstone"), a German term imported into English geology, and applied to the "new red sandstone," the lowest portion of the triassic series, called *grès bigarré* by French geologists. As the trias is more perfectly developed in Germany than in Great Britain, the German beds are considered the typical group of the triassic period. Large quantities of bunter sandstein flank the Vosges Mountains. It is there generally a fine-grained, solid sandstone, useful as a material for building, and is often of a blue, red, or greenish tint. The most remarkable fossils of this formation are the remains of huge batrachians, including the *Labyrinthodon*.

Bun'ting [cognate with the Ger. *bunt*, "variegated," a term appropriate to many of the species], a name properly

The Cirl Bunting (*Emberiza cirlus*).

given to numerous small birds of the genera *Emberiza*, *Euspiza*, and *Plectrophanes*. These birds are mostly European, but some are found in America. One of their number is the ortolan of Europe, so highly prized for the table. The bobolink is sometimes called rice-bunting, and several other birds are often improperly called buntings.

Bunting (JABEZ), D. D., an English Wesleyan minister, born at Manchester May 13, 1779. He gained distinction as an eloquent preacher, and had much influence in the Church. Died June 16, 1858. (See his Life by T. P. BUNTING, 1859.)

Bunt of a Sail is that portion nearest the central perpendicular line. If a sail be divided into four equal portions from side to side, the bunt would comprise the two middle strips.

Buntz'lau, or **Bunzlau,** a town of Prussia, in Silesia, is on the Bober, 28 miles by rail W. N. W. of Liegnitz. It has a normal school, and manufactures of woollen goods, hosiery, linens, etc. Pop. in 1871, 8817.

Buntzlau, or **Bunzlau, Jung** (*i. e.* "Young Buntzlau"), a town of Bohemia, on the river Iser, 37 miles N. E. of Prague. It has an old castle, a gymnasium, and manufactures of cotton and woollen fabrics, leather, and soap. Pop. in 1869, 8695.

Bun'yan (JOHN), author of "Pilgrim's Progress," was born near Bedford, England, in 1628, and learned the trade of a tinker. He was dissipated in his youth, and enlisted in the army of the Parliament about 1645. He married about the age of twenty, soon quitted the army, and joined the Baptists. After passing through severe spiritual conflicts he became a preacher in 1655. He preached at Bedford until 1660, and was then committed to Bedford jail, in which he was confined twelve years. In this jail he wrote "Pilgrim's Progress" (1678), and other religious works, amounting in all to sixty volumes, large and small. After his liberation he resumed his ministerial labors at Bedford. Died Aug. 31, 1688. "We are not afraid to say," says Macaulay, "that though there were many clever men in England during the latter half of the seventeenth century, there were only two great creative minds. One of these produced the 'Paradise Lost,' and the other the

'Pilgrim's Progress.'" (See MACAULAY, "Essay on Southey's edition of 'Pilgrim's Progress;'" IVIMEY, "Life of John Bunyan," 1809.)

Bu'ol-Schau'enstein, von (KARL FERDINAND), COUNT, an Austrian diplomatist, born in Switzerland May 17, 1797. He was sent as ambassador to St. Petersburg in 1848, and was transferred to the court of St. James in 1851. He was minister of foreign affairs from 1852 to May, 1859. Died Oct. 28, 1865.

Buoy (pron. bwoy or boy), a floating body usually intended as a mark for the guidance of mariners. It is made either of wood or metal, and is often hollow. Buoys are generally moored by chains to the bed of the channel. They are of various shapes, sizes, and colors, partly to render them conspicuous, and partly to distinguish them one from another. Sometimes buoys point out the best channel; sometimes they warn the mariner away from shoals; sometimes they form a continuous double line between which ships can with safety pass. A hollow conical buoy is called a "can-buoy," a double conical buoy is called a "nun-buoy," a floating wooden spar is a "spar-buoy." The bell-buoy is a contrivance for rendering a buoy audible, whether it is visible or not; so long as any stream of water, caused by a tide or current, passes through the lower part of the buoy, it moves an undershot wheel, which rings a bell. In laying submarine telegraphs buoys are used when cables are thrown overboard in stormy weather. Such weather might severely strain the telegraphic cable, but it may be cut, buoyed, and abandoned during the rough weather, and afterwards picked up and repaired, and the work of laying the cable can go on as before the storm.

A buoy-rope, on shipboard, is the rope which connects the anchor with a buoy floating above it. It is simply intended to point out the locality of the anchor, but if it be strong it is useful in assisting to raise the anchor at times when the proper cable is cut or injured.

Buphaga. See BEEFEATER.

Bupres'tis [from the Gr. *βούπρηστις*, the name of an

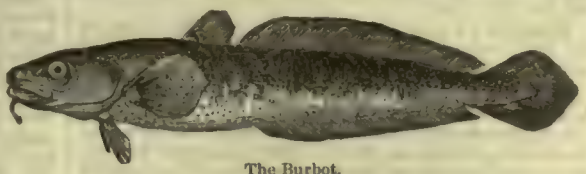
The Giant Buprestis.

insect whose bite is said to have caused cattle to swell up; derived from *βοῦς*, an "ox," and *πρήθω*, to "puff up" by blowing], a genus of coleopterous insects of the family Buprestidæ, which includes more than 1000 species. They are remarkable for the splendor and richness of their colors. They are found in North America, but are more abundant in tropical countries. The *Buprestis gigas*, of Cayenne, is about two inches long, and is larger than any of the North American species.

Bur, a rough, prickly covering (involucre) of the seeds of some plants, as the chestnut. The term is also applied to the flower-head or involucre of the *Arctium lappa* (burdock), the prickles of which are hooked at the point. In engraving on steel or copper, bur is a slight ridge raised on the edges of a line by the graver or the dry-point.

Bura'no, an island and town of Italy, in the Adriatic, 5 miles N. E. of Venice. The inhabitants are employed in fishing and cultivating vegetables for the market of Venice. Pop. 5693.

Bur'bage (RICHARD), an English actor, one of Shakspeare's associates. Died in 1619.



Bur'bank, a post-township of Monongalia co., Minn. Pop. 523.

Burbank, a post-village of Canaan township, Wayne co., O. Pop. 258.

Bur'beck (HENRY), an American officer, born in Boston June 8, 1754. He was a soldier in the Revolution, and was appointed captain under the Confederation May 1, 1787. In 1789 he was commissioned a captain of artillery, major in 1791, lieutenant-colonel in 1798, and colonel in 1802. He served with distinction in the Revolutionary war, that of 1812 with Great Britain, and on frontier service. He was brevetted brigadier-general 1813, and retired from the army June, 1815. Died at New London, Conn., Oct. 2, 1848.

Bur'bois, a post-township of Gasconade co., Mo. Pop. 800.

Bur'bot (*Lota vulgaris*), a fish of the same genus as the ling, is found in certain rivers of England, and is the only British fresh-water species of the family Gadidæ. It

The Burbot.

is also found in the northern parts of the continent of Europe, and in Asia. The larger specimens weigh eight or ten pounds. It has two dorsal fins, the second of which is very long, and a very long anal fin. Its flesh is white, firm, and is esteemed as food. It is capable of living a long time out of water. Several burbots are found in the U. S.

Bur'bridge (STEPHEN GANO), an American general of volunteers, born in Scott co., Ky., Aug. 19, 1831; educated at Georgetown College and at Kentucky Military Institute, Frankfort; studied law in the office of the late Senator Garrett Davis at Paris, Ky. In 1849 he returned to Georgetown, and engaged in mercantile business till 1853, when he turned his attention to farming, and at the outbreak of the recent civil war was conducting a large farm in Logan county. He at once ardently espoused the cause of the U. S., and by his voice and influence raised the famous Twenty-sixth Kentucky, which he led in the field until the battle of Shiloh, where, for distinguished gallantry, he was promoted to be a brigadier-general of U. S. volunteers. Upon Bragg's invasion of Kentucky in 1862 he was ordered there, remaining till Bragg was driven from the State, when he was ordered to join the expedition against Vicksburg. He led the charge at Arkansas Post and at Port Gibson, being among the first to enter each place. In the various actions about, and at the siege of, Vicksburg he was conspicuous. He subsequently commanded the military district of Kentucky, and it was during this time that he defeated John Morgan in his raids, and drove him into Tennessee. For this service he received the thanks of President Lincoln, and was brevetted major-general. He resigned in 1865.

Burch'dale, a township of Todd co., Minn. Pop. 124.

Burch'ville, a township of Lawrence co., Ala. P. 656.

Burchville, a township of St. Clair co., Mich. Pop. 726.

Burckhardt (JAKOB). See APPENDIX.

Burck'hardt (JOHANN LUDWIG), an enterprising Swiss traveller, born at Lausanne Nov. 24, 1784. He went to London in 1806, and entered the service of the African Association, which in 1809 sent him to explore the interior of Africa. He spent about two years in Syria, and prepared himself by the study of Arabic and medicine. He travelled through Cairo and Nubia to Mecca, where he arrived in 1814. Disguised as a Moslem hâjî, he made a pilgrimage to Mount Ararat and to Medina. He died at Cairo Oct. 15, 1817. He was eminently qualified for the

part of a traveller and explorer. His "Travels in Nubia" (in English, 1819), "Travels in Syria and Palestine" (1822), "Travels in Arabia" (1829), "Notes on the Bedouins and Wahabis" (1830), and "Manners and Customs of the Modern Egyptians" (1830), are highly esteemed.

Bur'den (HENRY), born at Dumblane, Scotland, April 20, 1791, was educated at Edinburgh, and in 1819 came to the U. S., where he finally became a large iron manufacturer at Troy, N. Y. He made the first cultivator used in America, and invented several useful machines. His horse-shoe machine he brought out in 1835, and the hook-headed spike used on railroad tracks in 1843. Died Jan. 19, 1871.

Burden of Proof, the obligation or necessity of proving the fact in dispute in an issue joined in a court of justice. The general rule is, that the burden of proof is with the party who asserts the affirmative of the issue. The same rule is applied if he grounds his case on negative statements or allegations. The rules concerning the burden of proof are of great importance in criminal prosecutions. The burden of proof is on the government throughout the whole case.

Burdett', a post-village of Hector township, Schuyler co., N. Y., has a tannery, foundry, a factory of agricultural tools, a woollen mill, and three churches.

Burdett (Sir FRANCIS), a popular and liberal English legislator, was born Jan. 25, 1770. In 1793 he married a rich heiress, Sophia Coutts. He was elected to Parliament about 1795, became an effective speaker, opposed the ministry, and advocated parliamentary reform. He represented Westminster for many years (1807–36), and was the idol of the London populace. Died Jan. 23, 1844.

Burdett-Coutts (ANGELA GEORGIANA), BARONESS, a daughter of Sir Francis Burdett, born April 25, 1814. She gained distinction by the liberal use of her vast fortune. She is now a baroness in her own right.

Bur'dock (*Lappa officinalis*), a plant of the order Compositæ, has a globular involucre with imbricated coriaceous scales, each tipped with an abrupt and spreading, awl-shaped, hook-pointed appendage. This involucre, which is called a *bur*, catches hold of the clothes of persons who come into contact with it. It is a native of Europe and naturalized in the U. S., growing as a weed in waste places, fence-corners, and near dwellings. It is used in medicine as a diuretic and diaphoretic.

Burd'wan, a town of India, in Bengal, is on the Dummodah, and on the Grand Trunk Road, 68 miles by rail N. W. of Calcutta. It has manufactures of silk and cotton fabrics, and a large palace, but the houses are generally rather mean. Pop. estimated at 50,000.

Bu'reau, a French word, much used also in various other languages. In France it signifies a writing-table, a desk, an office in which public business is transacted. It is also applied to each one of the numerous committees of the French National Assembly. The parliamentary phrase *déposer sur le bureau* signifies "to lay upon the table." In the U. S. the term bureau is commonly applied to a chest of drawers, a piece of furniture for a bed-chamber. Soon after the end of the civil war in the U. S., a department called the Freedmen's Bureau was organized, in order to protect, feed, and clothe the liberated slaves. The term is also applied to the minor divisions of the executive departments at Washington.

Bureau, a county of Illinois. Area, 800 square miles. It is bounded on the S. E. by the Illinois River, and intersected by Green River and Bureau Creek. The surface is undulating or nearly level; the soil is fertile. The greater portion of the county is prairie-land. It has important mines of coal. Cattle, grain, dairy products, wool, and hay are raised extensively. The chief manufactures are carriages, wagons, saddlery, etc. It is traversed by the Chicago Burlington and Quincy and Chicago Rock Island and Pacific R. Rs. Capital, Princeton. Pop. 32,415.

Bureau, a township of Bureau co., Ill. Pop. 1145.

Burg, a German word signifying a "castle," a "fortress," occurs as the termination of the names of many towns of Europe.

Burg, a town of Prussian Saxony, is on the river Ihle, 17 miles by rail N. E. of Magdeburg, and on the railway which connects Magdeburg with Berlin. It was settled by French and Walloon colonists, and in one of the churches the service is in French. It has been for many centuries celebrated for its manufactures of woollen cloth, which are still flourishing. The annual value of the cloth made here is about 7,500,000 thalers. Here are also manufactures of linen, machinery, pottery, etc. Pop. in 1871, 15,184.

Burg'dorf [Fr. *Berthoud*], a town of Switzerland, in the canton of Berne, on the river Emmen, 13¾ miles by rail N. E. of Berne. It has a castle and manufactures of ribbons and silk. Pestalozzi opened a school here in 1798. The Sommerhaus baths are in the vicinity. Pop. in 1870, 5078.

Bür'ger (GOTTFRIED AUGUST), a popular German poet, born near Halberstadt Dec. 31, 1747. He studied at Göttingen, and his literary career was greatly influenced by reading Shakespeare. His works consist chiefly of ballads and songs, which, though very popular, did not relieve him from poverty. Among his best productions are "Lenore" (1772) and the "Wild Huntsman." Died June 8, 1794.

Bur'ges (TRISTAM), LL.D., an American statesman and orator, born at Rochester, Mass., Feb. 26, 1770, and graduated at Brown University in 1796. He studied law, which he practised with success at Providence, R. I., and became a leader of the Federal party. He was for a time chief-justice of Rhode Island, and afterwards a professor in Brown University. In 1825 he was elected a member of Congress, in which he continued ten years, and gained a high reputation. He was eminently logical and terribly sarcastic. Died Oct. 13, 1853.

Bur'gess, a citizen or freeman of a borough; a representative or magistrate of a borough. This title was formerly given to members of the lower branch of the Virginia legislature.

Burgess (Rt. Rev. GEORGE), D. D., born at Providence, R. I., Oct. 31, 1809, graduated at Brown University in 1826, and was a tutor there for a time. He studied in Germany two years, was rector of Christ church (Protestant Episcopal), Hartford, Conn. (1834–47), and was in 1847 consecrated bishop of Maine, acting also as rector of Christ church, Gardiner. He went to Hayti to found a mission, and died there of apoplexy April 3, 1866. He published "Pages from the Ecclesiastical History of New England," "The Last Enemy Conquering and Conquered," a volume of sermons, and other works. (See his Life, by ALEXANDER BURGESS, his brother.)

Burgk'mair (HANS), a noted German painter and engraver on wood, was born in Augsburg in 1472. He was a friend of Albert Dürer. Died in 1531.

Bur'glary [from *burg*, a "town," and the Old Fr. *laire* (Lat. *latro*), a "thief"], in criminal law, the act of breaking and entering into a dwelling-house of another or a church in the night-time, with intent to commit a felony therein. There are four circumstances necessary to constitute the offence, referring to place, time, the acts done, and the intent. The place is a dwelling-house or a church. It is not necessary, in order to constitute a "dwelling-house," that there should be any person residing in the house at the time. It is enough if it be habitually used as a dwelling, though it may at the time be closed, as in the case of a person having two or more residences. Difficult questions sometimes arise as to buildings connected with the house and within the curtilage, and as to the case of lodgers having separate rooms and entering by a common door. In the last instance the inquiry would be whether each lodger has a distinct dwelling-house. (Consult BISHOP or WHARTON on "Criminal Law.")

As to time, the rule is that the offence must be committed by night. The better opinion is, that both the breaking and entering must be by night, though the two acts, so far as they are distinct in their nature, may be committed on separate nights. It is held to be night when a person cannot by the light of the sun clearly discern the face of another. This is quite indefinite, and as burglary is a heinous offence, some fixed though arbitrary rule seems desirable. In some of the States the time is fixed by statute. The fact that the face can be seen by moonlight does not affect the question.

The acts to be done are breaking and an entry. The word "breaking" is not to be construed so as to require any great degree of force or violence. Unlatching a door or raising a window is sufficient. If a door or window be left open, an entry through them would not be a breaking, though the act of coming down a chimney would be. Any entry will suffice, such as thrusting the hand or an instrument through a broken pane of glass. The act of discharging a loaded pistol or gun through a door or the glass of a window would be both a breaking and an entry. It is doubtful whether the act of *breaking out* of a house will be sufficient, though the other ingredients of the offence, except breaking in, be present.

Finally, there must be an intent to commit a felony. If a felony be actually committed, the intent may be inferred. It will be immaterial whether the felony exists at common law or is created by statute. An intent to commit a trespass will not suffice.

The common-law ingredients of this crime have been modified in this country by statute. Burglary is sometimes divided into degrees; some of these degrees would include breaking and entry in the daytime, or into build-

ings other than dwelling-houses and churches, or breaking out of a building, as well as into it. In some of the States, statute law makes the intent to commit any crime sufficient.

T. W. Dwight.

Bur'gos, a province of Spain, in Old Castile, is bounded on the N. by Santander, on the E. by Biscay, Alava, and Logroño, on the S. E. by Soria, on the S. by Segovia, and on the W. by Valladolid and Valencia. Area, 5651 square miles. It is drained by the Douro and the Ebro, which rises within its limits. The surface is partly mountainous. Gold, silver, copper, iron, and lead are found in it. Pop. in 1867, 357,846.

Burgos [Lat. *Burgi*], a city of Spain, capital of the above province, is situated on the river Arlanzon, at the foot of the Sierra de Oca, 140 miles by rail N. of Madrid; lat. 42° 20′ N., lon. 3° 45′ W. It was formerly the capital of Old Castile, and was far more populous than it is now. It was founded in 844 A. D., and has many antique buildings. The court was removed from Burgos to Madrid in the sixteenth century, after which the importance of the former declined. The most remarkable edifice here is the cathedral of white marble, which is one of the noblest specimens of Gothic architecture in Europe. This was commenced in 1221. Burgos is the seat of an archbishop, and has a college and some manufactures of woollen and linen fabrics. The railway which connects Bayonne with Valladolid passes through this town. Pop. 25,721.

Burgoyne (John), a British general and dramatist, born in 1730. He commanded a force which captured Alcántara, in Spain, in 1762. In the summer of 1777 he took command in Canada of an army of about 8000 men, which was ordered to enter New York State and operate against the revolted colonists. He was repulsed at Stillwater in September, and was captured with his whole army at Saratoga in Oct., 1777, by Gen. Gates. He wrote successful dramas called "The Maid of the Oaks" (1780), "Bon Ton," and "The Heiress" (1786). Died June 4, 1792.

Burgoyne (Field-Marshal Sir John Fox), son of the general above named, and godson of Charles James Fox, was born in London July 24, 1782, entered the Royal Engineers as second lieutenant in 1798. "During a period of 73 years' service, he slowly but steadily ascended, until at an age far beyond the scriptural limit of the life of man, he reached that summit of his professional career, which, in a published letter, dated Wilhelmshohe, Oct. 29, 1870, earned for him from the French Emperor, Napoleon III., the designation of

"Le Moltke de l'Angleterre."

He served as Commanding Engineer under General Frazer at the assault of Alexandria and siege of Rosetta (Egypt) in 1807; and under Sir John Moore in his Portuguese campaign and retreat, in 1808. Through the Peninsular war, as an engineer officer he took a prominent part in its greater sieges and battles, *e. g.* the siege of Ciudad Rodrigo, the two sieges of Badajoz, as Commanding Engineer at the desperate siege of Burgos and of that of Sebastian (shot through the neck in the assault) and the battles of Busaco, Salamanca, Bidassoa, Nivelle, &c. He came out of the Peninsular war, aged 32, the senior officer of Engineers who had been engaged in the sieges of Spain. As commanding engineer under Gen. Pakenham he was present at the assault of Gen. Jackson's lines below New Orleans, January 8, 1815, as also at the capture of Fort Bowyer (Mobile Point) February 11. He was called again to the field (aged 72) for the Crimean war, rendering distinguished services both in the debarkation, the battle of the Alma and subsequent march, and in the siege. Against the opinion of the French engineers he pointed out at the beginning the Malakoff as the proper and decisive object of the siege operations. On his recall he resumed his position at the War office as Inspector General of Fortifications, to which place he had been appointed in 1845. His services in this capacity and his home services during the long interval between the Peninsular and Crimean wars are numerous and important and his various reports and official writings have been deemed of such importance as to justify the publication of a work entitled "Military Opinions" of Sir John Burgoyne. After 70 years' service he retired in 1868 with promotion to the rank of Field Marshal, and the appointment of Constable of the Tower of London. Though then aged 86 his physical powers were good and his mind unimpaired. "Seventy years of work have left in me," he writes, "a train of thought that I now continue to indulge in." A past history and experience of 70 years had had no effect in blunting his mind to the *present* and its progress. His interest in all that concerned our own great war was unflagging and his mind keenly open to every "improvement" he could discern. Our reports on military bridges, military railway transportation, sieges, torpedoes, submarine blasting, &c., he sought for and appreciated. How much longer a noble life and a grand career might have been protracted it is useless to speculate, for a blow fell in September, 1870, in the loss of his only son, Capt. Hugh Burgoyne, V. C., Commander of the ill fated "Captain," from the effects of which he never rallied. He died Oct. 7, 1871. For one who "has done more under fire than any soldier in Europe," even though, to use his own modest explanation, he "had been a long time about it," whose life is a shining illustration of the motto of the Royal Engineers, "*Quo fas et gloria ducunt*" this tribute from one who was honored with his friendship and who reverently followed his remains to their last resting place, in the historic Tower of London, is due.

J. G. Barnard, *U. S. Army.*

Bur'gundy [Fr. *Bourgogne*; Lat. *Burgundia*], one of the most important of the former provinces of France, now forming the departments of Côte d'Or, Saône-et-Loire, Yonne, part of Ain, and part of Aube. The whole population of the departments of Ain, Saône-et-Loire, Côte d'Or, Yonne, Aube, Haute-Marne, and Haute-Saône amounts to 2,460,730. The name was derived from an ancient German tribe called in Latin *Burgundi* or *Burgundiones*, who settled in this part of Gaul about 408 A. D. Gondemar, king of Burgundy, was defeated and killed in 534 by the Franks, who then obtained possession of Burgundy. The kingdom of Burgundy re-established in 561 was much more extensive than the province of that name, and its extent varied in different periods. It included the provinces of Burgundy, Franche-Comté, Dauphiné, a part of Switzerland, Lyonnais, and nearly all the basin of the Rhone. In 879 A. D., Burgundy renounced its allegiance to the weak Carlovingian king, and became an independent state ruled by King Boso. It afterwards in part belonged to the kingdom of Arles (933–1032). Upper Burgundy was a kingdom from 888 to 933. In these ages there were often several lines of princes claiming the title of king of Burgundy, and ruling over parts of the country. King Rudolf III., dying without male issue in 1032, bequeathed his kingdom to the emperor Conrad II. Conrad's son, Henry, erected it into a duchy, feudal to Germany, sometimes called Little Burgundy. Meanwhile the north-western portion of old Burgundy remained a fee of the French crown, governed by a line of dukes. This line became extinct in 1361, but John II. of France made his son, Philip the Bold, duke in 1364. After this Burgundy became an important state, which was much of the time virtually independent. Several of the dukes who reigned over it were powerful and famous princes. On the death of Charles the Bold, in 1477, the ducal line became extinct, and the duchy was annexed to France. From 915 to 1384 Franche-Comté was under a line of counts of Burgundy, but Philip the Bold made it a part of his dominions in 1384. (See De Barante, "History of the Dukes of Burgundy," 13 vols., 1826.)

Burgundy, Dukes of. See Charles the Bold, Philip the Bold, Philip the Good.

Burgundy (Louis), Duke of, dauphin of France, born in 1682, was a grandson of Louis XIV. and the father of Louis XV. He was a youth of violent passions and extremely haughty, but his character was, it is said, reformed by Fénelon, who was his preceptor. He married Adelaide of Savoy about 1698. On the death of his father he became dauphin and heir-apparent to the throne. Died in 1712.

Burgundy Pitch (*Pix Burgundica*), a resinous substance, is a concrete exudation from the *Abies excelsa* or Norway fir. It is prepared by melting it in hot water, by which process part of the volatile oil which it contains is separated from it. By straining it through a coarse cloth some impurities are removed. It is of a yellowish-white color, is hard and brittle when cold, but is softened by a moderate degree of heat. It has a pleasant resinous odor and a slightly bitter taste. It is used in medicine as an external application in the form of a plaster. The Burgundy pitch of commerce comes chiefly from the neighborhood of Neufchâtel, Switzerland.

Burgundy Wines, the name of excellent French wines produced in the former province of Burgundy, chiefly on the range of hills called Côte d'Or, between Dijon and Châlons. These hills are about 800 to 1000 feet high. The wines are celebrated for richness of flavor and perfume. The best red wines of Burgundy are called Clos-Vougeot, Chambertin, Romané-Conti, Volnay, Pomard, and Richebourg. The white wines of Burgundy are said to be the finest in France, but the quantity produced is less than that of the red. The total annual product of Burgundy wines is from 2,500,000 to 3,500,000 hectolitres.

Bu'ri, a name of a species of palm, a native of the Philippine Islands. Its trunk is employed in the construction of houses; sugar and spirituous liquors are made of the

sap; the pith yields a valuable article of food (sago); and mats and sails are made from its fibre. This palm is the *Saguerus saccharifer*.

Bu'ri, or Bure [from a root cognate with the Anglo-Saxon *bora*, "one who bears" or produces, because, being the first of the gods, he was the progenitor of all the others], the first of the gods of the Norse mythology (Æsir). It is related that when the mythic cow Audhumla (whose name, from *audr*, "desert," and *hum*, "darkness," may be said to symbolize the original chaotic darkness) began to lick the frost-covered rocks of the primeval chaos, there came forth a beautiful and mighty being in human form called Buri, whose son Bör (that is "born," and hence, like the Latin *natus*, signifying a "son") was the father of Odin.

Buridan (Jean), a French scholastic philosopher, born at Béthune, in Artois, flourished about 1350. He was a pupil of Occam, lectured at Paris, and belonged to the Nominalist school. He wrote commentaries on Aristotle's "Metaphysica," and other works, and was the reputed author of a celebrated sophism called "Buridan's Ass." The subject of this was an ass placed between two equidistant and equal bundles of hay, and starving on account of the equal balance of the two motives.

Bu'rin, a post-town and port of entry of Newfoundland, capital of Burin district, has a fine harbor on the W. side of Placentia Bay, and has a jail. Pop. 1850.

Burke, a county of Georgia, bordering on South Carolina. Area, 1640 square miles. It is bounded on the N. E. by the Savannah River, and on the S. by the Ogeechee, and is intersected by Brier Creek. The surface is undulating or nearly level; the soil is fertile. Corn and cotton are staple crops. Limestone abounds here. Burke county is intersected by the Central R. R. Capital, Waynesborough. Pop. 17,679.

Burke, a county in the W. of North Carolina. Area, 450 square miles. It is intersected by the Catawba River, and also drained by Linville River. The Blue Ridge extends along the N. W. border of this county, which presents beautiful mountain-scenery. Grain, tobacco, and wool are raised. It contains gold, native antimony, and small quantities of silver and platinum. True diamonds have been found here. The soil of the valley is fertile. It is traversed by the Western R. R. Capital, Morganton. Pop. 9777.

Burke, a post-township of Franklin co., N. Y. P. 2141.

Burke, a post-township of Caledonia co., Vt. It has five churches, and manufactures of lumber, shingles, and starch. Pop. 1162.

Burke, a township of Dane co., Wis. Pop. 1127.

Burke (Edmund), LL.D., an eminent statesman, orator, and writer, born in Dublin Jan. 1, 1728, or, according to some writers, in 1730. He was the son of Richard Burke, a distinguished attorney, and Miss Nagle, a lady of a Roman Catholic family. He was one of four children, the only survivors of a numerous family, and at an early age became the pupil of Abraham Shackleton, a Quaker of superior attainments and excellent character, who taught a school at Ballitore. Having entered Trinity College, Dublin, he devoted himself to history, philosophy, the classics, etc., not neglecting poetry and other works of imagination. He afterwards studied law at the Middle Temple, but returned to Ireland in 1751, and took the degree of A. M. His "Vindication of Natural Society," an ironical criticism of Lord Bolingbroke's attacks on Christianity, came out anonymously in 1756. "The imitation of Bolingbroke's style and manner was so perfect," says Prior, "as to constitute identity, rather than resemblance." This was followed by a "Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful," which was highly commended by Dr. Johnson. Burke married, in 1757, Mary Jane, daughter of Dr. Nugent of Bath, and the union appears to have been a very happy one. Soon after this he formed an intimacy with Dr. Johnson and Garrick; the former, from his first acquaintance with Burke, felt the warmest admiration for his talents, and was accustomed to say that "no man of sense could meet Mr. Burke, by accident under a gateway, to avoid a shower, without being convinced that he was the first man in England." In 1759 he became private secretary to William Gerard Hamilton, through whose influence chiefly he received a pension from the government of £300 per annum; but finding that his political independence would be compromised by its acceptance, he threw it up at the end of the year. He was returned to Parliament for Wendover, in Buckinghamshire, about 1765, and re-elected in 1768. Having soon after purchased an estate, he wrote to his friend Shackleton, "I have made a push with all I could collect of my own, and the aid of my friends, to cast a little root into this country. I have purchased a house with 600 acres of land in Buckinghamshire, 24 miles from London." The "Letters of Junius," which appeared about this time, were almost universally ascribed to Burke, but his repeated denials were not generally believed until the publication of the "Grenville Papers." His "Thoughts on the Cause of the Present Discontent" came out in 1770, and in 1771 he was appointed agent to the colony of New York. In 1772, Sir Charles Colebrook, in the name of the directors of the East India Company, offered to Burke, who had already considerable knowledge of Indian affairs, "the first position in a supervisorship of three, empowered to trace out in detail the whole administrative system of India, and to remedy all they could find amiss." This offer he declined, feeling perhaps unwilling to leave Parliament at a time when American affairs were becoming more complicated, and the condition of France filled him with anxious forebodings. Soon after his return from a short residence in Paris he said in a speech in Parliament, "I see propagated principles which will not leave to religion even a toleration, and make Virtue herself less than a name." In April, 1774, he made a speech on American taxation, and he appears to have been the only member of Parliament who fully comprehended the dangers which threatened the American colonies. An intelligent American gentleman, who was present on this occasion, is said to have exclaimed, "You have got a most wonderful man here; he understands more of America than all the rest of your House put together." In Nov., 1774, Burke represented the city of Bristol in Parliament, and in Mar., 1775, made an admirable speech in favor of conciliatory measures towards the American colonies. Fox said of this oration, "Let gentlemen read this speech by day and meditate upon it by night; they would there learn that representation was the sovereign remedy for every evil." In 1780 he delivered his speech "On the Economical Reform," and in 1782 became a privy-councillor and paymaster-general of the forces under the Rockingham ministry. His speech on the "East India Bill" in Dec., 1783, is esteemed one of his best. The bill was lost in the House of Lords, although it passed that of the Commons. Burke retired from office soon after the accession of Pitt as prime minister, and held no position afterwards under the government. In Feb., 1785, he made a speech on the debts of the nabob of Arcot, which, says Prior, "was one of those outpourings of a fertile and vigorous intellect which on an unpromising theme seemed to combine all that could instruct, dazzle, and even overpower the reader." His prosecution of Hastings, the most arduous enterprise of his life, was commenced in Jan., 1786. The articles containing the different charges were so numerous and extensive as to require the attention of the House for a considerable part of two sessions. After Sheridan's speech on the Begum case in Jan., 1787, a committee of impeachment was formed, and on the 10th of May, Burke, as chairman of the committee, accused Hastings at the bar of the House of Lords in the name of the Commons of England. On the 15th of Feb., 1788, Burke made his memorable speech in Westminster Hall, in the presence of an immense assembly. Although a verdict of acquittal was passed in 1795, the noble efforts of Burke led the way to great reforms in the government of India. "Never," says Lord John Russell, "has the great object of punishment, the prevention of crime, been attained more completely than by this trial—Hastings was acquitted, but tyranny, deceit, and injustice were condemned." In 1790 Burke published his "Reflections on the Revolution in France," of which more than 30,000 copies are said to have been sold within a few months. It was translated into French, and received with enthusiasm in all parts of Europe. Soon after this he published "An Appeal from the New to the Old Whigs," in which he refutes the charge brought against him by Fox of having abandoned the principles of his party. About 1795, Burke received considerable pensions granted at the desire of the king, and without solicitation on his part or that of his friends. His acceptance of these well-merited rewards exposed him to severe attacks upon his character, in reply to which he wrote his "Letter to a Noble Lord," which was received with great favor. Burke's only son, Richard, a young man of great promise, had died in 1794, and this severe affliction probably hastened the father's death, which took place July 9, 1797. "If we are to praise a man in proportion to his usefulness," says Schlegel, "I am persuaded that no task can be more difficult than to do justice to the statesman and orator Burke. This man has been to his own country, and to all Europe, a new light of political wisdom and moral experience. He corrected his age when it was at its height of revolutionary frenzy; and without maintaining any system of philosophy, he seems to have seen farther into the true nature of society, and to have more clearly comprehended the effect of religion in connecting individual security with national welfare, than any philosopher

of any preceding age." A writer in the "London Quarterly Review" observes of Burke's speeches on the Stamp Act, "This was the appropriate start of a man who, whether as a statesman, a thinker, or an orator, was without an equal. Pitt and Fox were great, but Burke belongs to another order of beings, and ranks with the Shakspeares, the Bacons, and the Newtons. . . . By the incessant practice of composition he learned to embody his conclusions in a style more grandly beautiful than has ever been reached by any other Englishman with either the tongue or the pen" (*London Quarterly Review for January and April*, 1858). (See PRIOR, "Life of Burke;" DR. GEO. CROLY, "Political Life of Edmund Burke;" LORD JEFFREY, "Miscellanies.") J. THOMAS.

Burke (Sir JOHN), a genealogist, born in Ireland in 1786. He published, besides other works, a "Dictionary of the Peerage and Baronetage of the British Empire" (1826), often reprinted. He was for some time Ulster King of Arms. Died in 1848.—His second son, Sir JOHN BERNARD BURKE, LL.D., born in 1815, is (1873) Ulster King of Arms, an office which he has held since 1853. He has written many works on heraldry and kindred subjects.

Burke (WILLIAM). See APPENDIX.

Burke's Fork, a township of Floyd co., Va. P. 671.

Burkesville, a post-village, capital of Cumberland co., Ky., on the Cumberland River, about 125 miles S. by W. of Frankfort. It has one weekly newspaper.

Burkesville, a post-village of Nottoway co., Va. It is situated at the crossing of the Richmond and Danville and the South Side R. Rs. It has one weekly newspaper.

Bur'kittsville, a post-village of Petersville township, Frederick co., Md. Pop. 293.

Bur'leigh (WILLIAM **Cecil**), LORD, an able English statesman, born at Bourne, in Lincolnshire, in 1520. He graduated at Cambridge, studied law, and married Mildred, a daughter of Sir Anthony Cook. In 1548 he was appointed secretary of state. As he was a Protestant, he resigned office on the accession of Queen Mary in 1553. He was one of the few eminent Protestants who escaped from persecution in that reign. He was again appointed secretary of state by Queen Elizabeth in Nov., 1558, and he was virtually prime minister for forty years from that date. In 1571 he received the title of Baron Burleigh, and in 1572 became lord treasurer. According to Hume, "he was the most vigilant, active, and prudent minister ever known in England." He died in 1598, and left no less than 300 landed estates. "Lord Burleigh," says Macaulay, "can hardly be called a great man. He was not one of those whose genius and energy change the fate of empires. Nothing that is recorded either of his words or actions indicates intellectual or moral elevation. But his talents, though not brilliant, were of an eminently useful kind. He had a cool temper, a sound judgment, great powers of application, and a constant eye to the main chance." (See ARTHUR COLLINS, "Life of William Cecil," 1732; MOTLEY, "History of the United Netherlands," chaps. vi., viii., and xviii.; FROUDE, "History of England," vol. v.)

Burleigh (WILLIAM HENRY), an American poet, born at Woodstock, Conn., Feb. 2, 1812. He was an opponent of slavery and editor of several journals. In 1848 he produced a volume of poems. Died Mar. 18, 1871.

Bur'leson, a county of the S. central part of Texas. Area, 976 square miles. It is bounded on the N. E. by the Brazos River, and on the S. by Yegua Creek. The soil is fertile. Great numbers of cattle are raised. Wool, cotton, and corn are staple products. Capital, Caldwell. P. 8072.

Burleson, a post-township of Franklin co., Ala. Pop. 1050.

Burlesque [It. *burlesco*, from *burla*, a "jest," "mockery"], a species of ludicrous composition. The Italian "poesia burlesca" signifies comic or sportive poetry. The term in French and English is commonly restricted to compositions of which the humor consists in a ludicrous mixture of things high and low, as high thoughts clothed in low expressions, or, *vice versâ*, ordinary or mean topics invested with the artificial dignity of poetic diction. Scarron's works and Butler's "Hudibras" are remarkable examples of the burlesque.

Burlet'ta, an Italian word, signifies a comic operetta or musical farce.

Bur'lingame, the county-seat of Osage co., Kan., on the Atchison Topeka and Santa Fé R. R., 24 miles S. S. W. of Topeka. Coal is found in abundance here, also a fine quality of fire-clay. It has four churches and a fine brick school-house. The surrounding country is unsurpassed in productiveness. The climate is healthy. It has one newspaper. Pop. 655; of Burlingame township, 1549.

ED. OF OSAGE COUNTY "CHRONICLE."

Burlingame (ANSON), LL.D., an American diplomatist, born at New Berlin in Chenango co., N. Y., Nov. 14, 1822, and graduated at Harvard in 1846. He became a lawyer and a resident of Boston, and represented the fifth district of Massachusetts in Congress from 1854 to 1860. He acted with the Republicans, and gained distinction as an orator. In 1861 he was sent as commissioner to China, and in 1867 was appointed ambassador from China to the U. S. and the great powers of Europe. Died Feb. 23, 1870.

Bur'lington, a county of New Jersey. Area, 600 square miles. It extends entirely across the State. It is bounded on the N. W. by the Delaware River, and on the S. E. by the Atlantic Ocean. It is drained by Little Egg Harbor River and Rancocus Creek. The surface is mostly level; the soil is fertile in the N. W. part, and sandy in the other portions. Grain, cattle, hay, and dairy and garden products are the chief staples. It has manufactures of lumber, clothing, boots, shoes, etc. It is intersected by the Camden and Amboy R. R. and the New Jersey Southern R. R. Capital, Mount Holly. Pop. 53,639.

Burlington, a post-village of Boulder co., Col., on the St. Vrain River, 42 miles N. W. of Denver.

Burlington, a post-township of Hartford co., Conn. Pop. 1319.

Burlington, a post-township of Kane co., Ill. P. 919.

Burlington, a post-township of Carroll co., Ind. Pop. 1198.

Burlington, a city and river-port of Iowa, capital of Des Moines co., is situated on the Mississippi River, 45 miles above Keokuk, 207 miles W. S. W. of Chicago, 250 miles by water above St. Louis, and 296 miles by railroad E. of Omaha. The river is here a broad, deep, and beautiful stream. The plan of the city is regular, and the houses are mostly of brick or stone. Many of the private residences are built on high bluffs which afford extensive views of river-scenery. This place is the seat of Burlington University. It contains about fourteen churches, three national banks, and several manufactories. It is the eastern terminus of the Burlington and Missouri River R. R., and is connected with Chicago by the Chicago Burlington and Quincy R. R. The Burlington Cedar Rapids and Minnesota R. R. connects it with Cedar Rapids and St. Paul. Here occurs a valuable variety of carboniferous limestone. (See BURLINGTON LIMESTONE.) Burlington is sometimes called the "Orchard City." It has two daily, one tri-weekly, one semi-weekly, and three weekly newspapers. Pop. in 1860, 6706; in 1870, 14,930.

Burlington, a post-village, capital of Coffee co., Kan., on the right bank of the Neosho River, and on the Missouri Kansas and Texas R. R., 28 miles S. E. of Emporia and 65 miles S. of Topeka. It has an abundant water-power, a national bank, a weekly paper, a public school-house costing $30,000, and first-class mills. Pop. 960; of Burlington township, 1600. A. D. BROWN, PUB. of "PATRIOT."

Burlington, a post-village, capital of Boone co., Ky., is 16 miles S. W. of Cincinnati. It has four churches. Pop. 277.

Burlington, a post-township of Penobscot co., Me. Pop. 553.

Burlington, a post-township of Middlesex co., Mass., has a public library and woollen print-works. Pop. 626.

Burlington, a post-township of Calhoun co., Mich. Pop. 1485.

Burlington, a township of Lapeer co., Mich. P. 880.

Burlington, a city of Burlington co., N. J., is on the Delaware River, nearly opposite Bristol, 20 miles above Philadelphia and 12 miles S. W. of Trenton. It is on the Camden and Amboy R. R. The river is here nearly 1 mile wide, and encloses an island of 300 acres. The city is the seat of Burlington College (Episcopalian), founded in 1846, and contains ten churches, a public library, a national bank, and two weekly newspapers. Pop. 5817; of Burlington township, 1025.

Burlington, a post-township of Otsego co., N. Y. Pop. 1476.

Burlington, a township of Licking co., O. Pop. 1061.

Burlington, a post-village in Burlington township, Bradford co., Pa., 8 miles W. of Towanda. Pop. of township, 1375.

Burlington, a city and capital of Chittenden co., Vt., is situated on Burlington Bay of Lake Champlain, 40 miles W. from Montpelier, the capital of the State. It was incorporated as a city in 1865, and is the largest place in the State. Pop. in 1840, 4271; in 1850, 7585; in 1860, 7713; in 1870, 14,387; in 1873, estimated from registered vote, 17,000. Area of original township, 6 square miles; about two-fifths were included in the municipal limits, the rest

forming a new town called South Burlington. Estimated value of property in the city (April 1, 1873), $9,307,500; city and State taxes for 1873, $95,391; city debt, Feb. 1, 1873, bonded and floating, $214,000; expenses of city government, 1872, $78,000.

The heaviest trade in the city is in lumber. There are five planing-mills, one of which alone dresses 50,000,000 feet a year, and the whole amount dressed is 8,000,000 or 10,000,000 feet per month. The capital invested is over $1,000,000, and, including the sales made by firms here of lumber which goes elsewhere, Burlington is the third market in the U. S. for size. There are large quarries of building-stone, of limestone, and fine marble within or near the city limits; lime-kilns and brick-yards are in active operation, and steam marble-mills, machine-shops, foundries, sash-factories, chair and furniture factories, paper-mills, and many smaller manufacturing trades, are thriving. On the N. E. limit of the city the abundant water-power of the Winooski is utilized for woollen and cotton mills, flour-mills, machine-shops, chair-factories, etc. A line of passenger steamers and a large fleet of tugs and barges ply between Burlington and every port on the lake.

The University of Vermont and State Agricultural College is situated here; it was chartered in 1791, has 8 professors and an average attendance of 100 students, besides a flourishing medical department, and ranks as one of the best institutions in the country. Since 1872 young women have been admitted to the classical and scientific departments on the same terms as young men. The college buildings stand on the crown of the hill on whose side the city is built, overlooking the lake in a most beautiful and commanding position. The library and museum are in a fireproof building, and the third story of the edifice contains an art-gallery. A park of 7 acres lies in front of the college buildings, and lands of the university in the rear. The city schools are 14 in number, having 37 teachers and 800 pupils, divided in three grades, besides the high school, and are under control of a board of commissioners elected by the people. The high-school building, erected in 1871 at a cost of $20,000, is one of the best in the State. The cost of maintaining schools in 1872 was $22,726. There are also two large Roman Catholic schools and an Episcopal institute for boys within the city limits, and several private schools. The churches are—two Congregational, one each Baptist, Methodist, Episcopal, and Unitarian, and two Roman Catholic, besides several mission chapels. The edifices are all good, and most of them new, all but one of stone or brick; and St. Mary's (Roman Catholic) cathedral is one of the finest church edifices in this part of the country. There are two orphan asylums—one Roman Catholic, accommodating 60 children, and one Protestant, with 35 inmates. The chief public buildings are the city hall, the county court-house (a handsome stone building, erected in 1872), the county jail, and the U. S. post-office and custom-house (a large fireproof brick building, erected in 1858). The banks are the Merchants' National and Howard National, united capital $1,100,000, the Burlington Savings Bank, deposits $214,000, and the Farmers' and Mechanics' Trust Company, capital $100,000. The libraries are the University Library, 15,000 volumes; Young Men's Association, 2000 volumes; Young Men's Christian Association, 1000 volumes, and the Fletcher Free Library, to be under control of the city, and not yet opened, fund $20,000. There are three newspapers, one daily and weekly, and two weekly. The Vermont Life and Champlain Mutual Fire Insurance Companies have their head offices in this city.

The city is supplied with water from the lake, raised by steam-pumps to a reservoir on the hill, which gives a head of 280 feet; the water-works are under the control of the city, but the gas-works are the property of a corporation. Some of the streets are sewered and paved, and $20,000 was appropriated by the city council for the street department for 1873. Lakeview Cemetery, opened by the city in 1868, on the bluff overlooking the lake, is already a beautiful spot, and Green Mount Cemetery, on the eastern side of the city, overlooking the valley of the Winooski, a magnificent location, contains the monument to Ethan Allen, who was one of the early settlers and buried here—a shaft of granite surmounted by a heroic statue of Allen in marble, which was unveiled with imposing ceremonies July 4, 1873.

Burlington was first settled in 1773, but no permanent residences were made till the close of the Revolutionary war, and in 1800 the population was 600. The principal streets are four rods wide, laid out at right angles, many of them well shaded with elm and maple trees. The location of the city is unequalled in this part of the country, and the beauty of its scenery unsurpassed anywhere. The geographical position of the city, midway of the eastern shore of Lake Champlain, and the facilities for transportation by rail and water, make the whole valley of the lake tributary to it in the way of business. Railroads run direct to Boston, Albany, and New York. Montreal, Ogdensburg, and the West, while other lines are under construction to centre here or connect with roads already built. When the proposed Caughnawaga Ship Canal is completed Lake Champlain must become a portion of the great highway between West and East, and Burlington a chief place of transshipment of goods for the Eastern cities and Europe.

B. L. Benedict,
of the City Directory and "Free Press."

Burlington, a post-village of Racine co., Wis., on the Pishtaka or Fox River, and on the Western Union R. R., 27 miles W. by S. of Racine. It has several factories and mills, one national and one State bank, and one weekly paper. Pop. 1589; of Burlington township, 2762.

Ed. "Burlington Standard."

Burlington Limestone, a variety of sub-carboniferous magnesian limestone, which derives its name from Burlington, Ia., the typical locality where it was first studied. It also occurs as a surface-rock in Missouri and Illinois, adjacent to the Mississippi River. It is a valuable building-stone, and is peculiarly interesting to naturalists. The upper bed is of a light gray color, and is nearly pure carbonate of lime. The lower bed contains more magnesia. "It is," says A. H. Worthen, "exceedingly rich in fossils, especially Crinoidea, and has afforded a greater number both of species and individuals than all the other palæozoic rocks of this continent combined."

Bur'mah, Birmah, or **Birma,** sometimes called the **Burmese Empire** or **Kingdom of Ava** [native *Myamma* or *Bramma*; Chinese *Meen-teen*], a country of Farther India, mostly included between lat. 19° and 27° N. It is bounded on the N. W. by Assam, on the N. by Thibet, on the E. by China and the river Salwen, on the S. by the British province of Pegu, and on the W. by Munnipoor and Aracan. Area, estimated at 190,500 English square miles. It is enclosed on several sides by mountain-ranges. The surface is diversified by high ridges, rolling uplands, and alluvial basins. The soil is generally fertile, and the climate in most parts is healthy. The rainy season in the southern part lasts from May to October, and is followed by several months of cool, dry, and pleasant weather. It is intersected by the river Irrawaddy, which divides it into two nearly equal parts. Burmah is rich in minerals, including gold, silver, copper, antimony, lead, tin, iron, marble, coal, and sulphur. It has valuable mines of rubies and sapphires, and wells of petroleum. The annual value of the gems found in Burmah is estimated at about £14,000. The staple productions of the cultivated soil are rice, maize, millet, pulse, cotton, indigo, tobacco, yams, and bananas. Among the indigenous plants are the bamboo, the cocoa-nut palm, the palmyra palm, the betel, the oak, and the teak tree, of which last Burmah has inexhaustible forests. The principal wild animals found here are the elephant, rhinoceros, tiger, leopard, and buffalo. The elephant and buffalo are tamed and employed as domestic animals. The Burmese belong to that branch of the Mongolian race which is characterized by a monosyllabic language. Their figure is short, squat, and robust; their hair is black, coarse, and lank; and their complexion is light-brown or yellowish. They have eyes obliquely placed and lozenge-shaped faces. A large majority of them profess the religion of Booddha, to which a great number of pagodas and temples are dedicated in Burmah. Connected with this religion is a monastic system and a multitude of monks bound by vows of poverty and celibacy. Besides the Burmese proper there are a great variety of other peoples, among which are the Shans and Karens (which see). The government is an hereditary despotism. The Burmese excel in boatbuilding, and are skilful workers in metals. They weave cotton fabrics and manufacture lacquered wares. They export teak-timber, petroleum, gold-leaf, silver, copper, indigo, tobacco, cotton, horns, and gums. Capital, Mandelay. The total population is estimated at 4,000,000.

History.—This empire was formerly much more extensive than it is now. In this region the rival kingdoms of Ava and Pegu long contended for mastery. The seat of government was fixed about 1364 at Ava, which continued to be the capital for 369 years. The most celebrated martial king in Burmese history was Alompra, the founder of the present dynasty of Burmah, who conquered Pegu about 1756 and died in 1760. The empire attained its greatest extension about 1822, soon after which date the Burmese were involved in war with the British, who reduced the limits of the empire by the conquest of Aracan, Martaban, Pegu, and the Tenasserim provinces. In 1873 the Chinese troops invaded Northern Burmah and burned some towns. (See Winter, "Six Months in Burmah," 1858; Malcom, "Travels in the Burman Empire;" J. W. Palmer, "The Golden Dagon," 1853.)

Revised by A. J. Schem.

Burmah, British, a collective term applied to several provinces of the Anglo-Indian empire conquered from the kings of Burmah. These are Aracan, Martaban, Pegu, and the Tenasserim provinces of Maulmain (or Amherst), Tavoy, and Mergui. Aracan and the Tenasserim provinces were ceded to the British by a treaty signed in Feb., 1826, at the end of the first war with Burmah. Pegu and Martaban were retained as compensation after the war of 1852. The American Baptist missionaries have in British Burmah one of the most successful missions of modern times. The area of British Burmah is 93,879 square miles. Pop. in 1869, 2,392,312. (See ARACAN and PEGU.)

Bur'mann (PETER), an eminent philologist, was born at Utrecht July 6, 1668. He became professor of history, eloquence, and the Greek language at Leyden in 1715. He edited Horace, Ovid, Virgil, Quintilian, Lucan, and other classics, and wrote several works, among which is a treatise "On the Revenues of Rome" ("De Vectigalibus Populi Romani," 1694). His writings are esteemed for their accurate erudition. Died Mar. 31, 1741.

Bur'meister (HERMANN), a German naturalist, born at Stralsund Jan. 15, 1807, became professor of zoology at Halle in 1842, and in 1860 director of a museum of natural history in Buenos Ayres. Among his works are a "Manual of Entomology" (4 vols., 1832-44) and "The Animals of Brazil" (2 vols., 1854-56).

Bur'nap (GEORGE W.), D. D., born at Merrimack, N. H., Nov. 20, 1802, graduated at Harvard in 1824, became in 1828 pastor of a church in Baltimore, and was the author of numerous works, principally for the defence and exposition of the school of Unitarianism to which he belonged. Died at Philadelphia Sept. 8, 1859.

Burnes (Sir ALEXANDER), a noted traveller and Orientalist, born at Montrose, Scotland, May 16, 1805. He entered the army of India in his youth, and by his knowledge of Oriental languages gained a rapid promotion. In 1832 he started from Lahore on an exploring expedition in Central Asia, and visited Balkh, Bokhara, Astrâbâd, Teheran, etc. Having returned to England in 1833, he published "Travels into Bokhara." In 1838 he was sent on a mission to Cabool, where he passed some years as political resident. He was murdered there Nov. 2, 1842, by the Afghan insurgents.

Bur'net, the popular name of two genera of plants, the *Sanguisorba* and *Poterium*, generally referred to the natural order Rosaceæ. The great burnet (*Sanguisorba officinalis*) is cultivated in Germany as a forage-plant, and yields a good crop on poor soils. A similar species grows wild in North America. The common burnet (*Poterium Sanguisorba*) furnishes valuable pasturage for sheep on the English downs. It is sometimes seen in American gardens, and is used in salads.

Burnet, a county in Central Texas. Area, 995 square miles. It is bounded on the W. by the Colorado River, by which the southern part of the county is intersected. The surface is partly hilly; the soil is productive. Good iron ore, petroleum, and marble abound. The water-power is great. Cedar timber is plentiful. Cattle, corn, cotton, and wool are largely produced. Capital, Burnet. Pop. 3688.

Burnet, a village, capital of the above county, is 45 miles N. W. of Austin, and 10 miles E. of the Colorado River. Pop. 280.

Burnet (GILBERT), F. R. S., an eminent British historian and prelate, born in Edinburgh Sept. 18, 1643. He became professor of divinity in the University of Glasgow in 1668, resigned that chair in 1675, and removed to London. In 1679 he published the first volume of his "History of the Reformation in England" (3 vols., 1679–1715). He refused a bishopric which was offered to him by Charles II. He was a courageous and able asserter of civil liberty in the important crisis which preceded the revolution of 1688, and gained the favor of William III., who appointed him his chaplain, and in 1689 bishop of Salisbury. Among his works are a "Life of Sir Matthew Hale" (1682) and a "History of his Own Times" (2 vols., 1724-34). Died Mar. 17, 1715. "The utmost malevolence of faction," says Macaulay, "could not deny that he served his flock with a zeal, diligence, and disinterestedness worthy of the purest ages of the Church." (*History of England.*)

Burnet (JACOB), LL.D., an American jurist, born at Newark, N. J., Feb. 22, 1770. He graduated at Princeton in 1791. He was one of the founders of Cincinnati, whither he removed in 1796. He became a judge of the supreme court of Ohio in 1821, and was elected to the Senate of the U. S. in 1828. He wrote "Notes on the Early Settlement of the North-west Territory." Died April 27, 1853.

Bur'nett, a county of Wisconsin, bordering on Minnesota. Area, 1100 square miles. It is bounded on the N. W. by the St. Croix River, and is drained by the Namekagon and Shell rivers. The surface is uneven, and partly covered with forests of pine. Capital, Grantsburg. Pop. 706.

Burnett, a township of Santa Clara co., Cal. Pop. 802.

Burnett, a post-township of Dodge co., Wis. Pop. 981.

Burnett (WALDO IRVING), M. D., a naturalist and microscopist, born at Southborough, Mass., July 12, 1828. He wrote, besides other works, "The Cell: its Physiology, Pathology," etc. Died July 1, 1854.

Burnett Prizes, The, are two premiums founded by Mr. Burnett, a merchant in Aberdeen, who for many years spent £300 annually on the poor. On his death in 1784 he bequeathed his fortune to found the above prizes, as well as to relieve poor persons and to support a jail-chaplain in Aberdeen. He directed the prize-fund to be accumulated for forty years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on the evidence that there is a Being all-powerful, wise, and good, by whom everything exists; "and particularly to obviate difficulties regarding the wisdom and goodness of the Deity, and this independent of written revelation and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind." The competition is open to the whole world, and the prizes are adjudicated by three persons appointed by the trustees, with the ministers of the Established Church of Aberdeen, and the principals and professors of King's and Marischal Colleges. On the first competition in 1815 the judges awarded the first prize, £1200, to Dr. Wm. L. Brown of Aberdeen for an essay entitled "The Existence of a Supreme Creator;" and the second prize, £400, to the Rev. J. B. Sumner, afterwards archbishop of Canterbury, for an essay entitled "Records of Creation." In 1855 the judges awarded the first prize, £1800, to the Rev. R. A. Thompson, for an essay entitled "Christian Theism;" and the second prize, £600, to the Rev. Dr. John Tulloch of St. Mary's College, St. Andrew's, for an essay on "Theism." The above four essays have been published.

Burnett's Disinfecting Fluid is a strong solution of chloride of zinc, with a small amount of iron, and when used it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a deodorizer and antiseptic, and does not exhibit the properties of a true disinfectant. It is of service in preserving dead animal tissues, as in the dissecting-room and in jars containing anatomical specimens. It has little action on steel instruments. When added to sewage water, the chloride of zinc mainly acts by decomposing the sulphide of ammonium, forming the sulphide of zinc and chloride of ammonium, both of which are odorless. It has been applied to the preservation of timber by a process called *burnettizing*. Crewe's disinfectant liquid is the same.

Bur'nettsville, a village of Jackson township, White co., Ind. Pop. 270.

Bur'ney (CHARLES), F. R. S., MUS. DR., an English composer, born at Shrewsbury in 1726, was a friend of Dr. Johnson and Edmund Burke. He wrote, besides other works, a "General History of Music from the Earliest Ages" (4 vols., 1776–89), which is highly esteemed, and a "Life of Handel." He was the father of Madame d'Arblay. Died in 1815.

Burney (FRANCES). See D'ARBLAY, MADAME.

Burn'ham, a village township of Waldo co., Me., at the junction of the Maine Central and Belfast and Moosehead Lake R. Rs., 30 miles N. W. of Belfast. It has manufactures of leather and lumber. Pop. 788.

Burnham (HIRAM), an American general of volunteers, entered the army as colonel Sixth Maine Volunteers, leading his regiment with daring and ability through the Peninsula campaign, at Antietam, Fredericksburg, and Gettysburg. Appointed brigadier-general of volunteers 1864, and in the memorable "Wilderness" campaign of that year he took a prominent part. His entire military career was conspicuous for gallantry and coolness; at the battle of Chapin's Farm, Sept. 29, 1864, he fell in the noble performance of his duty.

G. C. SIMMONS, *Clerk Board of Eng'rs.*

Burning Glasses and **Burning Mirrors,** the names given to glasses or mirrors so formed as to collect the sun's rays which fall on them into a point or *focus*, and thereby produce intense heat. The rays of light or heat may be concentrated either by refraction or reflection; in the former case they must pass through a transparent refracting substance, as glass formed into a proper shape; in the latter they fall on a concave polished surface of silvered glass or bright metal.

The method of exciting heat or producing fire by the concentration of the sun's rays was known from remote antiquity, but the most famous recorded achievement of this kind is that of Archimedes, who is reported to have burned by means of mirrors the Roman fleet in the harbor of Syracuse. The celebrated Buffon, with 168 mirrors, each about six inches square, set fire to planks of beech 150 feet distant, and this with the faint rays of the sun at Paris in the month of March.

In preparing a burning glass, the first thing to be considered is the figure necessary to collect all the rays into the smallest possible space. Descartes, in his "Optics," showed that a disk of glass convex on the one side and concave on the other, the convex side being a portion of an elliptic surface, and the concave a portion of a sphere, would cause parallel rays falling on its convex side to converge in a single point. But as the practical difficulties of forming a glass accurately into this shape are insuperable, both sides are ground into portions of a sphere. In a lens the focal length depends on the curvature, or the radius of the sphere, and on the refractive power of the substance of which the lens is formed.

The proper form for a burning mirror is the parabola, but as a parabolic curve is exceedingly difficult to obtain either upon metal or glass, opticians frequently rest content with a spherical curvature of long focus. Recently, burning mirrors have been constructed of glass, upon the curved surface of which pure silver is precipitated by chemical means. By this plan the curved surface is produced upon glass, and thus becomes permanent, whilst the reflection is effected by the polished surface of the silver, which can be easily renewed from time to time. The focus of a burning mirror is one-half of the radius of curvature.

Among those who have experimented, in modern times, upon the effects of burning glasses or mirrors, are reckoned Baron Napier, the illustrious inventor of the logarithms, Kircher, Dr. James Gregory, Sir Isaac Newton, and many others. The most powerful solid lens ever constructed was the work of Mr. Parker, an ingenious London artist. It was made of flint glass, was three feet in diameter, 3¼ inches thick at the centre, its focal distance 6 feet 8 inches, the diameter of the burning focus 1 inch, and its weight 212 pounds. The rays refracted by this lens were received on a second, the diameter of which in the frame was 13 inches, and its focal length 29 inches. The diameter of the focus of the combined lenses was half an inch, consequently, by the addition of the second lens, the burning power was increased four times. With this lens some of the most refractory substances were fused in a very short space of time: for example, 10 grains of common slate in 2 seconds; 10 grains of cast iron in 3 seconds; 10 grains of lava in 7 seconds; 10 grains of jasper in 25 seconds, etc. One account says, "the most infusible metals were instantly melted and dissipated in vapor." The difference in the statements may be reconciled by supposing the circumstances attending the use of the glass to be different, as there is a very great difference in the power of the sun's rays at different times, and especially in different countries. This glass was afterwards carried to China by one of the officers who accompanied Lord Macartney, and left at Pekin. A remarkable lens, formed by bending or moulding two plates of glass over a parabolic mould, and filling the cavity between with ninety quarts of spirits, was constructed by Rossini of Gratz, in Styria. The diameter of the plates was three feet three inches, and they were united by a strong ring of metal. The whole was mounted on a heliostat. In its focus a diamond was instantly kindled and dissipated, and a piece of platinum twenty-nine grains in weight was melted and thrown into violent ebullition. This lens now belongs to the French government. (For detailed information on this subject the reader may consult the article "Burning Glasses" in the "Encyclopædia Britannica," 8th edition.)

REVISED BY J. THOMAS.

Burning Springs, a post-township of Wirt co., West Va. Pop. 1368.

Burn'ley, a market-town of England, in Lancashire, on the Brun, near its entrance into the North Calder and 20 miles N. of Manchester. It is connected by railway with Blackburn, Liverpool, and other cities. It has manufactures of cotton and woollen fabrics, calico-printing works, brass and iron foundries, machine-shops, tanneries, and rope-walks. Its prosperity is partly derived from the collieries in the vicinity. Pop. in 1871, 31,608.

Burnouf (EUGÈNE), DR. LIT., an eminent French Orientalist, born in Paris Aug. 12, 1801. He studied the languages of Persia and India, was admitted into the Academy of Inscriptions, and became in 1832 professor of Sanscrit in the College of France. Among his works are a "Commentary on the Yaçna, one of the Liturgic Books of Persia" (1834), and an "Introduction to the History of Booddhism" (1845), which is highly commended. Died May 28, 1852. (See CHARLES LENORMANT, "Eugène Burnouf," 1852.)

Burns, a post-township of Henry co., Ill. Pop. 1144.

Burns, a post-township of Shiawassee co., Mich. Pop. 1557.

Burns, a township of Anoka co., Minn. Pop. 340.

Burns, a post-township of Allegany co., N. Y., on the Buffalo division of the Erie R. R. It contains Canaseraga Academy and several mills. Pop. 1340.

Burns, a post-township of La Crosse co., Wis. P. 743.

Burns (FRANCIS), D. D., a colored bishop of the Methodist Episcopal Church, was born in Albany, N. Y., Dec. 5, 1809, was sent as missionary to Liberia, Africa, in 1834, taught in a school at Cape Palmas, joined the Liberia Conference in 1838, founded the Monrovia Academy in 1851, was ordained bishop of his denomination, in Liberia, in 1858, and, after nearly five years of eminent episcopal service, died in 1863.

Burns (ROBERT), a gifted Scottish poet, was born near the town of Ayr on the 25th of Jan., 1759. His father was the son of a farmer, and "was thrown by early misfortunes," says the poet, "on the world at large, where, after many years' wanderings and sojournings, he picked up a pretty large quantity of observation and experience, to which I am indebted for most of my little pretensions to wisdom." Although his life seems to have been one long struggle with misfortune, Burns's father was at great pains to give his children a good education. When he was able he sent them to school; and not unfrequently when the day's work was ended he taught his children himself. "I owed much," says Burns, "to an old woman who resided in the family. . . . She had, I suppose, the largest collection in the country of tales and songs concerning devils, ghosts, fairies, brownies, witches, warlocks, enchanted towers, and other trumpery. This cultivated the latent seeds of poetry." Burns was early familiarized with those trials and hardships to which the poor are so often exposed, and to which he sometimes alludes with such power and pathos in his poetry. "My father," says the poet, "was advanced in life when he married; I was the oldest of seven children, and he, worn-out with early hardships, was unfit for labor. . . . We lived very poorly. I was a dexterous ploughman for my age." The poet had a robust frame and active body, as well as a strong intellect and acute sensibilities. He is said to have done at the age of fifteen the work of a man. In a touching account which his brother Gilbert wrote of the troubles of their early years, he says: "I doubt not but the hard labor and sorrow of this period of his life were in a great measure the cause of that depression of spirits with which Robert was so often afflicted through his whole life afterwards."

In the case of Burns, as in that of Sappho, it was love that taught him song. A little before he reached his sixteenth year he "first committed the sin of rhyme." A "bonnie sweet sonsie lass" had been associated with him in the labors of the harvest-field. Her singing "made his heart-strings thrill like an Æolian harp," and first inspired him with the idea of writing songs. An irresistible attraction towards what he calls the "adorable half of the human species" was perhaps his most remarkable characteristic; and hence it was as an amatory poet that he was especially distinguished. Unhappily, this remarkable susceptibility to the tender passion degenerated, under the influence of evil company, from its first purity, and led him into illicit amours, which were the cause of his principal misfortunes. In proportion as he cast off the restraints of morality, he seems to have lost his reverence for religion. He was one day seen, says Lockhart, "at the door of a public-house holding forth on religious topics to a whole crowd of country-people, who presently became so shocked with his levities that they fairly hissed him from the ground." With his other faults and vices, intemperance went hand in hand. But he had too much sense of right, and too much feeling, to be able to drown altogether the reproving voice of conscience. He sometimes alluded to his faults in a manner full of pathos and self-reproach; and he had at least the merit of not seeking to defend his errors.

He had formed in 1785 a *liaison* (which was, according to the usage of Scotland, virtually a marriage) with Jean Armour, a person somewhat above his own position in life. She bore him twins, and although he had previously given her a written acknowledgment of marriage, her father was greatly incensed against the poet, so that he determined to leave Scotland and seek his fortune in the New World. But before quitting his native country for ever, he resolved (1786) to publish his poems. The success of the experiment induced him to change his plans. He was encouraged

to visit Edinburgh, where he made the acquaintance of many men at that time distinguished in literature, including Dugald Stewart and Dr. Blair, besides many others. It was during Burns's visit to the capital that Scott, then a very young man, had an opportunity of beholding and listening to the gifted stranger. He has left a very interesting account of Burns's appearance. He seems to have been most struck with the eye of the rustic poet. "I never saw," says Scott, "such another eye in a human head, though I have seen the most distinguished men of my time. It was large and of a dark cast," and "literally *glowed* when he spoke with feeling or interest." "His conversation expressed perfect self-confidence, without the slightest presumption."

Among men of rank who interested themselves in the poet, Lord Glencairn was especially prominent. Burns always remembered his kindness with the most heartfelt gratitude, and afterwards dedicated to his memory the beautiful and touching lines entitled the "Lament for James, earl of Glencairn." Soon after his visit to Edinburgh he published (1787) a new edition of his poems. In 1788 he openly declared his marriage with Jean Armour, and about this time was appointed an officer of the excise, with a salary of fifty pounds a year; it was subsequently increased to seventy-five pounds. His intemperate habits, which had been aggravated by the excitement and irregularities of his recent life in Edinburgh, and his subsequent pecuniary distresses, gradually gained a great ascendency over him, but rarely if ever to the extent of rendering him incapable of performing the duties of his office. He removed in 1791 to Dumfries, where he passed the remainder of his life. He died July 21, 1796. Nearly twenty years after his death a splendid mausoleum was erected to his memory in the churchyard at Dumfries, whither his remains were removed on the 5th of June, 1815. (See Lockhart's "Life of Burns," 1828; Currie's "Life of Burns," prefixed to the "Correspondence" of the poet; A. Cunningham, "Life and Land of Robert Burns," 1840; Carlyle, "Miscellanies;" also F. G. Halleck's and Thomas Campbell's beautiful lines to Burns's memory.)

J. Thomas.

Burns (William W.), General, was born in Ohio, and graduated at West Point in 1847. He became a brigadier-general of volunteers in 1861, major-general volunteers in 1862, and brevet brigadier-general U. S. A. in 1865. He served in the Army of the Potomac until 1863.

Burns and Scalds of the body differ in the mode of application of the excessive heat which is the cause of injury—burns arising from the application of a hot solid body or flame, and scalds from hot water or steam. Severe burns are often fatal, especially to children; quite as much, perhaps, from the shock which attends them as from any appreciable injury. Burns which are not fatal frequently leave extensive scars, which often have a tendency to contract in such a way as to lead to frightful disfiguration. When the clothes take fire, the flames should be extinguished if possible by wrapping in a blanket or rug, that being usually the most available means at hand. In all cases the clothes should be removed with great care, so as not to remove the cuticle with them. If cold water be agreeable to the patient, it may be cautiously applied. Pain and shock may often be relieved by opiates or stimulants. The injured surfaces are to be dressed with carron oil (a mixture of olive oil and lime-water), with collodion, with oiled cotton, or they may simply have flour dredged over them. When the surface takes on an unhealthy action and granulations are excessive, a weak solution of nitrate of silver or other local stimulant may produce good results.

Burnt Offerings. See Sacrifice.

Burnt Prairie, a post-township of White co., Ill. Pop. 2186.

Burnt Sien'na, a fine orange-red pigment, transparent and permanent, obtained by burning the ferruginous ochreous earth called terra di Sienna. It is used both in oil-painting and painting with water-colors. Mixed with Prussian blue, it produces a beautiful green.

Burnt Swamp, a township of Robeson co., N. C. Pop. 1511.

Burnt Um'ber, a pigment of a russet-brown color, is semi-transparent, mixes well with other pigments, and dries quickly. It is prepared by burning umber, an ochreous earth first discovered in Umbria, Italy.

Bur Oak (the *Quercus macrocarpa*), a species of oak of medium size found in the U. S., principally E. of the Mississippi. It is also called over-cup oak and mossy-cup oak. Its timber is valuable.

Burr (Aaron), father of the Vice-President, was born at Fairfield, Conn., Jan. 4, 1716, graduated at Yale in 1735, licensed to preach in 1736, settled over the Presbyterian church in Newark, N. J., in 1738, chosen president of the College of New Jersey in 1748, and died Sept. 24, 1757. In 1752 he married Esther, daughter of the elder President Edwards. She died April 7, 1758, in the 27th year of her age. They left two children—a daughter, who married Hon. Tapping Reeve, chief-justice of the supreme court of Connecticut, and a son, Aaron, noticed below. He was both a scholarly and an eloquent man. He published a Latin Grammar, 1752, known as "The Newark Grammar," a pamphlet on "The Supreme Divinity of our Lord Jesus Christ," reprinted in 1791, and several discourses.

Burr (Aaron), born at Newark, N. J., Feb. 6, 1756, was a son of the preceding and a grandson of Jonathan Edwards. He graduated at Princeton in 1772, joined the Provincial army at Cambridge, Mass., in 1775, served as a private soldier, and afterwards as aide to Montgomery on the Quebec expedition, served on the staffs of Arnold, Washington (whom he disliked), and Putnam, becoming a lieutenant-colonel, and commanding a brigade at Monmouth. He resigned from the army by reason of ill-health in 1789. He practised law at Albany in 1782 and in New York City in 1783, and became attorney-general of New York in 1789. He was a Republican U. S. Senator 1791–97. In 1800 he and Jefferson each had 73 electoral votes for the office of President of the U. S. The choice was thus left to Congress, which, on the thirty-sixth ballot, chose Jefferson for President and Burr for Vice-President. In 1804 he mortally wounded in a duel his rival Alexander Hamilton, and in consequence lost greatly in political and social influence, and soon after embarked in a wild attempt upon Mexico and, as was asserted, upon the South-western territories of the U. S., thereby involving in ruin his friend Blennerhassett. He was in 1807 tried at Richmond, Va., on a charge of treason, but was acquitted. To escape his creditors he retired to Europe for a time, but returned to New York in

1812, and again practised law. Died Sept. 14, 1836. Burr was a man of much ability and very brilliant and popular talents, but his influence was destroyed by his unscrupulous political acts and his grossly immoral conduct in private life. (See his "Life," by M. L. Davis, 1836–37; by James Parton, 1857.)

Burr (Enoch Fitch), D. D., a kinsman of President Burr of the College of New Jersey, was born at Greens Farms, Fairfield, Conn., Oct. 21, 1818, graduated at Yale in 1839, spent several years in New Haven in scientific and other studies, became greatly broken in health, obtained partial relief by a year of foreign travel, and was settled over the Congregational church in Lyme, Conn., in 1850. After nearly twenty years of secluded and patient study, his reputation was suddenly made by several works of marked ability. He has published "A Treatise on the Application of the Calculus to the Theory of Neptune," 1848, "Ecce Cœlum," 1867, "Pater Mundi," 1870, "Ad Fidem," 1871, "Doctrine of Evolution," 1873, "A Song of the Sea" (an illustrated poem), 1873, and "Pasce Agnos, or What I have to Say to the Children," 1873.

Burrampooter. See Brahmapootra.

Bur'rell, a township of Decatur co., Ia. Pop. 852.

Burrell, a township of Armstrong co., Pa. Pop. 964.

Burrell, a township of Indiana co., Pa. Pop. 1374.

Burrell, a post-township of Westmoreland co., Pa. Pop. 1819.

Burria'na, a town of Spain, in the province of Castellon de la Plana, on the Rio Seco, near the Mediterranean, 8 miles S. of Castellon de la Plana. It exports wine, oil, and fruit. Pop. about 6200.

Bur'rill (Alexander M.), born about 1807, graduated at Columbia College with the highest honors in 1824, studied law with Chancellor Kent, and published a number of legal works, including a "Law Dictionary." Died at Kearney, N. J., Feb. 7, 1869.

Burrill (James), LL.D., born in Providence, R. I., April 25, 1772, graduated at Brown University in 1788, was called to the bar in 1791, and attained eminence. He was attorney-general of Rhode Island (1797–1813), chief-justice of the State supreme court (1816), U. S. Senator (1817–20), besides holding other important offices. Died Dec. 25, 1820.

Bur'rillville, a post-township of Providence co., R. I. It has numerous manufactures, and a national bank at Pascoag village. Pop. 4674.

Bur'ritt, a post-township of Winnebago co., Ill. P. 991.

Bur'ritt (Elihu), a reformer and linguist, called the Learned Blacksmith, was born in New Britain, Conn., Dec. 8, 1811. He worked for many years at the trade of a blacksmith, and became a self-taught master of many ancient and modern languages. As a public lecturer he advocated temperance and peace in the U. S. and in England. Among his works are "Sparks from the Anvil" (1848) and "Thoughts on Things at Home and Abroad" (1854).

Burr Oak. See Bur Oak.

Burr Oak, a township of Mitchell co., Ia. Pop. 425.

Burr Oak, a post-township of Winneshiek co., Ia. Pop. 960.

Burr Oak, a township of Doniphan co., Kan. Pop. 1015.

Burr Oak, a post-village and township of St. Joseph co., Mich. Pop. of village, 724; of township, 1911.

Bur'roughs (George), a victim of the witchcraft delusion, graduated at Harvard College in 1670, and was a preacher in Salem, Mass., in 1681. He soon after went to Falmouth (now Portland), Me., where he remained until the Indians sacked the town in 1690; returning to Salem, he was accused in 1692 of witchcraft, placed on trial, and, owing to the infatuation then prevailing, was declared guilty of exercising diabolical powers, and executed Aug. 19, 1692. At the scene of execution he declared his innocence, his appeal moving the spectators to tears; and though he repeated the Lord's Prayer, which no witch was supposed to be able to do without mistake, he was doomed to suffer.

Burroughs (Stephen), a famous adventurer, the son of a Congregational minister of Hanover, N. H., was born in 1765, and early became noted for mischievous conduct. When fourteen years old he enlisted in the Revolutionary army, deserted, and entered Dartmouth College, which he soon left to serve on a privateer. He became a ship's surgeon and schoolmaster, and under an assumed name was for a time minister of the church at Pelham, Mass. He was soon convicted of passing counterfeit money, and was confined at Northampton, Mass., in irons, but set fire to the jail, and was removed to Castle William (now Fort Independence) in Boston harbor, whence he escaped, but was retaken. After his sentence was served out he again became a counterfeiter in Canada, but reformed, and was for several years an exemplary Roman Catholic instructor of youth. He appears to have always possessed engaging and popular qualities. He published a remarkable autobiography in two volumes. Died at Three Rivers, Canada, Jan. 28, 1840.

Bur'rowing Owl (*Strix cunicularia* or *Athene cunicularia*), called also the **Coquimbo Owl,** is a remarkable bird, which, "disdaining all the traditions of its family," hunts for its prey (consisting chiefly of beetles and other insects) in broad daylight, facing the glare of the noonday sun without any inconvenience. It is a small,

Burrowing Owls.

lively bird, and is found in many parts of America, being especially abundant beyond the Mississippi, and inhabiting the same localities as the marmot (or prairie dog), whose dwelling it often shares, the rattlesnake sometimes making the third member of this singular family. On the Pacific slope a green snake (*Bascanion*) makes a fourth member of this group. Although the Coquimbo owl prefers to dwell in the holes already excavated by the marmot, it will, if obliged to do so, dig burrows for itself; but these are not so deep nor so neatly made as those of its friends and neighbors the prairie dogs.

Bur'rows (William), an American naval officer, born near Philadelphia Oct. 6, 1785. He entered the navy at the age of fourteen and served on the Barbary coast; on the outbreak of war with Great Britain (1812), while on his way to the U. S., he was taken prisoner. He reached home in June, 1813, and immediately resumed his duty. He commanded the brig Enterprise in an engagement with the British brig Boxer off Portland, Me., Sept. 5, 1813, during which he was mortally wounded. He lived, however, long enough to receive the surrender of the British vessel. His remains were interred in Portland by the side of the commander of the Boxer, who was also killed in the same action.

Burr'stone, or **Buhrstone,** a silicious rock containing small cells, which give it a roughness of surface adapting it for millstones. It is a sedimentary rock, and its cavities are often produced by the removal, through solution, of its calcareous fossil shells. Burrstone occurs in several geological formations. That which comes from Paris is eocene. The Alabama burrstone is of the same age. That of Ohio, West Virginia, etc. is of the carboniferous age. There are different varieties; those in which the cells are small and regularly distributed are most esteemed. Good burrstone is found in Wales, Scotland, Germany, and Italy, also in Ohio, Pennsylvania, South Carolina, and Alabama, but the finest stones are obtained from La Ferte-sous-Jouarre, near Paris. It is not unusual to form millstones of pieces of burrstone, bound together by iron hoops. The stone is found in beds or detached masses. It is cut out into the form of a cylinder; around this grooves are cut at the intended thickness of the millstones; into these grooves wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required. Millstones are not always made of burrstone, but sometimes of silicious gritstones, of sandstone, and even of granite. Burr-millstones are extremely durable.

Burs'lem, a market-town of England, in Staffordshire, 2½ miles N. W. of Newcastle-under-Line, on an eminence near the Trent Canal. The occupation of the inhabitants is earthenware manufacture, and it is the principal place in the district called the Potteries. Pop. 17,821.

Bur'sons, a township of Randolph co., Ala. Pop. 1214.

Burt, a county of Nebraska, bordering on Iowa. Area, 500 square miles. It is bounded on the E. by the Missouri River, and intersected by Logan's Creek. The surface is undulating; the soil is fertile. Grain and wool are raised. Capital, Tekama. Pop. 2847.

Burt, a township of Cheboygan co., Mich. Pop. 72.

Burt (William A.), born in Worcester, Mass., June 13, 1792, became a surveyor of Erie co., N. Y., and in 1824 removed to Michigan, surveyed Northern Michigan (1840–47), introducing important improvements in surveying. At the World's Fair in London, 1851, he obtained a medal for his solar compass. He was for a time a judge in one of the Michigan State courts, and one of the originators of the canal at Sault Ste. Marie. Died Aug. 18, 1858.

Bur'ton, a post-township of Adams co., Ill. Pop. 1423.

Burton, a township of McHenry co., Ill. Pop. 218.

Burton, a township of Genesee co., Mich. Pop. 1667.

Burton, a post-village, capital of Sunbury co., New Brunswick, is on the St. John's River, about 45 miles by land N. N. W. of St. John's.

Burton, a post-township of Geauga co., O. Pop. 1004.

Burton (Asa), D. D., was born at Stonington, Conn., Aug. 25, 1752, graduated at Dartmouth College in 1777, and on Jan. 19, 1779, was settled over the Congregational church in Thetford, Vt., where he died May 1, 1836. He was the champion of the so-called "Taste scheme," in opposition to the "Exercise scheme" of Dr. Emmons, and conducted the controversy with great ability. Besides occasional sermons, he published, in 1824, a volume of "Essays on Some of the First Principles of Metaphysics, Ethics, and Theology."

Burton (John Hill), LL.D., F. R. S. E., a Scottish historian and advocate, born at Aberdeen Aug. 22, 1809. He published, besides other works, "The Life and Correspondence of David Hume" (2 vols., 1846), "Political and Social Economy" (1849), and "The History of Scotland from Agricola's Invasion to the Revolution of 1688" (1867), which is highly esteemed.

Burton (Richard Francis), an eminent English traveller, born in Norfolk in 1821. Having served many years in the Indian army, he published in 1851 "Sindh, and the Races that inhabit the Valley of the Indus." Disguised as a Mussulman, he performed a perilous exploration of Arabia in 1853, and published a "Personal Narrative of a Pilgrimage to El Medinah and Meccah" (3 vols., 1856). Among his other works are "The Lake Regions of Central Africa" (1860) and "The Highlands of Brazil" (2 vols., 1869).

Burton (Robert), an English clergyman, born at Lindley, in Leicestershire, Feb. 8, 1576, was educated at Oxford. He became rector of Segrave in 1628. He was author of a quaint and popular work entitled "The Anatomy of Melancholy; what it is, with all the Kinds, Causes, Symptoms, Prognostics, and several Cures of it: Philosophically, Medicinally, Historically opened and cut up, by Democritus Junior" (1621). It is an amusing medley of quotations and reflections. Died Jan., 1640.

Burton (William Evans), a comedian and writer, born in London in Sept., 1802. He acted with distinguished success both in England and America. While in England he wrote a drama, "Ellen Wareham," which for a time enjoyed a great popularity. He compiled the "Cyclopædia of Wit and Humor." He was also very successful as a manager. He built the National Theatre in Philadelphia, and in New York purchased Palmo's Opera-house, and afterwards the Metropolitan Theatre on Broadway. Died in New York Feb. 10, 1860.

Burton-on-Trent, a town of England, in Staffordshire, on the river Trent, 11 miles by rail S. W. of Derby. The Trent is here crossed by a stone bridge of thirty-six arches, which was built before the Norman conquest, and is 1345 feet long. Burton has large breweries of celebrated ale; also iron-works and manufactures of cotton goods. It is on the Grand Trunk Canal. Pop. 13,671.

Bur'tonville, a post-village of Charleston township, Montgomery co., N. Y., on Schoharie Creek. Pop. 160.

Burt'scheid, or **Borcette,** a town of Rhenish Prussia, about half a mile from Aix-la-Chapelle, of which it is properly a suburb. Here are warm sulphur springs and manufactures of woollen cloths and cassimeres. Pop. in 1871, 10,079.

Bu'ry, a manufacturing town of England, in Lancashire, on the river Irwell, 10 miles by rail N. W. of Manchester. It is on a railway which connects it with Bolton and Liverpool. It contains more than twenty churches and dissenting chapels, several public libraries and literary institutions. Here are important manufactures of cotton and woollen goods, machinery, and paper, also calico printing works and dye-works. Mines of coal and quarries of good freestone have been opened in the vicinity. Bury returns one member to Parliament. The eminent statesman Sir Robert Peel was born near Bury. Pop. of the parliamentary borough in 1871, 41,517.

Burying Beetles are certain insects of the order Coleoptera and family Sylphidæ, famous for their valuable habits of interring the bodies of dead animals. When the carcass of a mouse or other small animal is found, several of them collect around it, and by digging the earth from beneath gradually sink it several inches below the surface. In it the female deposits her eggs, and when the larvæ are hatched, they find themselves in the midst of suitable food.

Bury St. Edmunds, or **St. Edmundsbury,** an ancient borough of England, in the county of Suffolk, is finely situated on the river Larke, 26 miles by rail N. W. of Ipswich and 95 miles by rail N. E. of London. It is well built and remarkably clean. It has a botanic garden, a guildhall, a fine Gothic church (St. Mary's), a celebrated grammar-school founded in 1550, and some remains of a large Benedictine abbey (505 feet by 212), which was founded by Canute, and became the richest (except one) in England. Here is an old belfry or quadrangular tower about eighty-five feet high, which is one of the finest remains of Saxon architecture extant in Britain. Parliaments were held here in 1272, 1296, and 1446. Bury has a large trade in wool, butter, grain, and cheese. Sir Nicholas Bacon was born here. Pop. in 1871, 14,928.

Bus'becq, or **Bousbecq** (Augier Ghislen), [Lat. *Busbequius*], an eminent Flemish scholar and traveller, born at Commines in 1522. He was employed on several important diplomatic missions, and was sent as ambassador from the emperor Ferdinand to Solyman II. of Turkey. He wrote a valuable account of this embassy, entitled "Legationis Turcicæ Epistolæ Quatuor" (1589). Died Oct. 28, 1592.

Bus'by (Dr. Richard), a famous English schoolmaster, born at Lutton, Northamptonshire, Sept. 22, 1606. He was head-master of Westminster School for about fifty-five years (1640–95), was a very successful teacher, and a strict disciplinarian. He is said to have educated a larger number of eminent men than any other teacher who ever lived. Died April 6, 1695.

Büsch'ing (Anton Friedrich), an eminent German geographer, born in Schaumburg-Lippe Sept. 27, 1724. He became in 1761 minister of a Protestant congregation in St. Petersburg, and in 1766 removed to Berlin, where he was employed as director of a gymnasium. He published a "Description of the Earth" (1754), which was the most complete work on geography that had then appeared; also a "Magazine for History and Geography" (25 vols., 1767–93). Died May 28, 1793.

Busen'to [Gr. Πυξοῦς; Lat. *Buxentum*], a river of Italy, in the province of Salerno, empties into the Gulf of Busento at the city of Policastro. Upon the death of Alaric, the Visigoth king, his followers turned the course of the river, and after having buried him, again led the river into its old course, thus covering all trace of Alaric's grave from the eyes of his enemies.

Bush (George), a theologian and biblical scholar, was born at Norwich, Vt., June 12, 1796, graduated at Dartmouth College in 1818, at Princeton Theological Seminary in 1821, in the same class with Albert Barnes, and from 1824 to 1829 was pastor of a Presbyterian church in Indianapolis, Ind. He became in 1831 professor of Hebrew and Oriental literature in the University of New York, and was converted to the doctrines of Swedenborg in 1847. Among his works are a "Life of Mohammed" (1832), a "Hebrew Grammar" (1835), and "Bible Commentaries" (8 vols., 1840 *et seq.*). Died Sept. 19, 1859.

Bush Creek, a township of Wayne co., Ill. P. 1470.

Bush Creek, a twp. of Gasconade co., Mo. Pop. 566.

Bush Creek, a township of Highland co., O. P. 1601.

Bush'el [Fr. *boisseau*], an English measure of capacity, containing eight gallons or four pecks. Each gallon holds ten pounds avoirdupois of distilled water, and measures 277.274 cubic inches; consequently the imperial bushel contains eighty pounds of distilled water, and is equal to 2218.192 cubic inches. The old Winchester bushel contains 2150.42 cubic inches. The State of New York, by statute of 1829, adopted the imperial bushel, but in the revised statutes of 1851 this was abolished, and the Winchester bushel substituted.

Bushire, or **Aboo-shehr,** a seaport of Persia, on the Persian Gulf, about 120 miles W. S. W. of Sheeraz; lat. 29° N., lon. 50° 50′ E. It is at the N. extremity of a sandy

peninsula, and is the principal commercial emporium on the coast of Persia. The anchorage, which is the best on the coast, consists of an outer harbor, exposed to the N. W. winds, and a safe inner harbor. It has a large trade with British India, from which it imports rice, indigo, sugar, and English cotton goods. The chief articles of export are raw silk, shawls, horses, carpets, silk goods, grain, Sheeraz wine, pearls, dried fruits, etc. Pop. about 18,000.

Bush'kill, a township of Northampton co., Pa. P. 1901.

Bush'men, or **Bosjesmans,** a name given to some roaming tribes of savages who live in Southern Africa, along the Orange River. They are similar to the Hottentots, are very diminutive in stature, and of a dark-brown complexion. They build no houses and have no tents. They are said to be malicious and intractable.

Bush'nell, a city of McDonough co., Ill., at the junction of the Chicago Burlington and Quincy, the Toledo Peoria and Warsaw, and the Rockford Rock Island and St. Louis R. Rs., 60 miles W. of Peoria, 70 miles N. E. of Quincy, and 194 S. W. of Chicago. It has one national bank, four hotels, good schools, a publishing-house, several manufactories, and a good supply of timber, coal, and excellent water. It is in a fine, high, and healthy prairie region, and has two weekly papers. Pop. 2003; of Bushnell township, exclusive of the city, 578. Ed. of "Bushnell Record."

Bushnell, a post-township of Montcalm co., Mich. Pop. 1266.

Bushnell (Horace), D. D., a Congregational clergyman, was born at Litchfield, Conn., April 14, 1802, graduated at Yale College in 1827, was tutor from 1829 to 1831, and was settled over the North church in Hartford, Conn., from 1833 to 1859, when the failure of his health compelled him to resign his pastorate, though he was still able to do literary work and preach occasionally. He was distinguished for the originality and boldness of his thinking, and for the brilliancy and vigor of his style. Among his published works are a Phi Beta Kappa oration in 1837 on "The Principles of National Greatness," "Christian Nurture" (1847), "God in Christ" (1849), "Nature and the Supernatural" (1858), "The Vicarious Sacrifice" (1865; revised in 1873). Died at Hartford, Conn., Feb. 17, 1876.

Bush'whackers (in the language of our late civil war) were those men who rarely or never wore a uniform, and claimed to be peaceful farmers or herdsmen when in presence of a superior hostile force, but had firearms concealed at a convenient distance, and did not scruple to use them on any opportunity to pick off a soldier from an ambush while he was moving in fancied security. Bushwhackers were especially murderous in Missouri, and were often treated, when captured, with unrelenting severity.

Bush'y, a township of Saline co., Ill. Pop. 1040.

Bushy Fork, a post-township of Person co., N. C. Pop. 1425.

Busi'ris [Gr. Βούσιρις], in Greek mythology, a fabulous personage, supposed to have been a son of Neptune, and a king of Egypt, who sacrificed all the foreigners who entered his dominions, and was killed by Hercules.

Bus'kin [Lat. *cothurnus*], a covering for the leg or for the ankle and foot; a shoe reaching up to the middle of the calf and tightly laced. The word buskin is used by English writers as a translation of cothurnus, which was a high shoe worn by ancient tragic actors, and had thick cork soles. The term is also used to denote the tragic drama or tragic style, having been used in contradistinction to *soccus*, a sock or flat-soled shoe worn by comedians.

Bus'seron, a post-township of Knox co., Ind. Pop. 1283.

Bus'sey (Benjamin), born at Canton, Mass., Mar. 1, 1757, served in the Revolutionary army at Burgoyne's capture. He was a silversmith of Dedham, Mass., and afterwards a very successful merchant of Boston. Died Jan. 13, 1842, leaving $350,000 to Harvard University, half to found the Bussey School of Agriculture, and half to sustain the Law and Divinity Schools.

Bus'su Palm (*Manicaria saccifera*), a palm growing in the tidal swamps of the Amazon, the only known species of its genus. The stem is ten to fifteen feet high, curved and deeply ringed. The leaves are undivided, and are the largest of the kind produced by any known palm, being often thirty feet long and four or five feet wide. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a vertical direction, and serve as gutters to carry off the water. The spathe is used by the Indians as a bag, and the larger ones to make caps.

Bust [It. *busto;* Fr. *buste*], a sculptured representation of the head and upper part of the human body. The earliest busts formed by the Greeks were probably heads of Mercury, which, when elevated on quadrangular blocks of stone, received the name of Hermæ. These blocks were afterwards frequently surmounted by representations of other divinities; and they gradually assume more of the human form, but they still were called Hermæ even after Alexander's time, when busts began to be used for portraiture in Greece. During the learned period of Greece, which commenced with Aristotle, portrait-busts formed an important department of art. The artists of this period exhibited remarkable ability in expressing the character. We have well-authenticated busts of Socrates, Plato, and other philosophers; of Isocrates and Demosthenes; of Athenian statesmen and distinguished women. In Rome, representations of the kings and persons of distinction belonging to the earlier period were probably made from the images of his ancestors which every patrician preserved, and which were commonly made of wax. These were often fanciful representations. The earliest well-authenticated Roman bust which we possess is probably that of Scipio Africanus the Elder, but we possess many examples of later date. In recent times portrait busts constitute an important department of plastic art.

Bustaman'te (often incorrectly written **Bustamente**), (Anastasius), M. D., a patriotic Mexican general, born in 1782. He was a physician by occupation. He obtained power as president of Mexico in 1830, was banished by Santa Anna about 1833, and was elected president in 1837. He was again banished in 1841. Died in 1851.

Bus'tard (*Otis*), a genus of birds which belongs to the order Cursores. They have three toes, which are all directed forward, long naked legs, and bills of moderate length. They are mostly inhabitants of open plains, to

Little European Bustard.

which all their habits are adapted. Although they are capable of flying, they often endeavor to escape from danger by running. The great bustard (*Otis tarda*) is the largest of European land-birds, and sometimes weighs thirty pounds. It is found in the eastern and southern parts of Europe, and abounds in the open plains or steppes of Tartary. The plumage is of a pale chestnut color on the upper parts, finely variegated with black. The wings are diversified with black and white, and the tail is tipped with white. The male has on each side of the chin or neck a tuft of feathers nearly nine inches long, under which is a spot of naked skin, and in the throat a sac or pouch capable of holding three or four pints of water. Their flesh is highly esteemed as food. The little bustard (*Otis tetrax*) is common in Southern Europe and Northern Africa, and is not half so large as the *Otis tarda*. South Africa produces a species called *Otis Kori*, or Kori bustard, which is five feet high or more, and is a noble-looking bird. Its flesh is good. Macqueen's bustard is a fine Asiatic bird. Several other bustards are known, all Old World species, except one, which is Australian.

Bus'ti, a post-township of Chautauqua co., N. Y. P. 1844.

Bus'to Arsiz'io, a town of Italy, in the province of Milan, 23 miles by rail N. W. of Milan, is situated on a fertile plain. It has several churches, one of which is adorned with fine old frescoes by Ferrari. Here are manufactures of cotton thread. Pop. 9978.

Busuluk', a town of Russia, in the government of Samara, 60 miles S. of Bugurusslau. Pop. 9932.

Butcher's Broom (*Ruscus aculeatus*), a biennial evergreen plant of the natural order Liliacere, has a stem from one to three feet high, and ovate, alternate, sharp-pointed leaves. The fruit is a red berry nearly as large as a wild cherry. It is indigenous in the south of Europe, and is cultivated for ornamental purposes. The root is aperient and diuretic.

Bute, an island of Scotland, in the Frith of Clyde, separated from the mainland by a narrow strait called the Kyles of Bute, which is about 1 mile wide. The island is about 16 miles long, and has an area of nearly 60 square miles. The mildness of the climate renders it a favorite resort for invalids. The chief town is Rothesay. Here are Rothesay Castle and Dungyle, a vitrified fort on the S. W. coast.

Bute, or Buteshire, a county in the S. W. part of Scotland, comprises the islands of Bute, Arran, the Cumbrays, Holy Isle, Pladda, and Inchmarnock. Area, 171 square miles, or 109,375 acres, of which 60,000 are cultivated. Chief town, Rothesay. Pop. in 1871, 16,977.

Bute, MARQUESSES OF, earls of Windsor and Viscounts Mountjoy (1796), Barons Mountstuart (1761), Barons Cardiff (1766, in Great Britain), earls of Dumfries (1633), earls of Bute (1703), viscounts of Ayr (1622), Viscounts Kingsairth, Lords Mountstuart, Cumbræ, and Inchmarnock (1703), Lords Crichton and Cumnock (1633), Barons Crichton of Sanquhar (1488, in Scotland), and baronets (1627, in Scotland).—JOHN PATRICK CRICHTON STUART, the third marquess, born Sept. 12, 1847, succeeded his father in 1848. He is said to be the richest man in England.

Bute (JOHN STUART), EARL OF, a minister of state, born in Scotland in 1713. He became groom of the stole to the prince of Wales, who was afterwards George III., over whom he acquired a great influence. In Mar., 1761, he was appointed one of the principal secretaries of state. He was prime minister from May, 1762, to April 8, 1763, and became very unpopular. His policy tended to exalt the royal prerogative. He was a liberal patron of literature and art. Died in 1792.

Bu'tea [named in honor of the earl of Bute], a genus of trees and shrubs of the natural order Leguminosæ, remarkable for the length of the standard of the flower, and having a compressed, 1-seeded pod. The *Butea frondosa*, called dhak tree, and *Butea superba*, are natives of India, and bear racemes of large and beautiful scarlet flowers, which present a gorgeous spectacle. The twigs yield a resinous exudation in the form of lurid red tears, which is one variety of lac. The sap of the trunk also yields gum-kino. A beautiful dye is obtained from the flowers, and the bark has a useful fibre.

But'ler [Old English *boteler* (*i. e.* "bottle-er"), a man who has charge of the bottles], a servant or household officer who has care of the wines, plate, etc. The "chief butler" of Pharaoh, mentioned in the Bible, an officer of high rank, was more properly a cup-bearer to the king.

Butler, a county in the S. of Alabama. Area, 850 square miles. It is drained by the Sepulga and Pigeon rivers. The soil is moderately fertile, and adapted to cotton. Oats, corn, and wool are also raised. Forests of pine timber abound. It is intersected by the Mobile and Montgomery R. R. Capital, Greenville. Pop. 14,981.

Butler, a county in Central Iowa. Area, 576 square miles. It is intersected by Shell Rock River and the West Fork of Cedar River. It contains extensive prairies. The soil is productive. Grain and wool are staple products. It is traversed by the Burlington Cedar Rapids and Minnesota and the Dubuque and Sioux City R. Rs. Capital, Butler Centre. Pop. 9951.

Butler, a county in the S. of Kansas. Area, 720 square miles. It is drained by the Walnut and Whitewater creeks. The surface is undulating; the soil is fertile. Cattle and grain are raised. Capital, Eldorado. Pop. 3035.

Butler, a county in S. W. Kentucky. Area, 500 square miles. It is intersected by Green River, which is here navigable for steamboats. The surface is hilly; the soil moderately fertile. Tobacco, grain, and wool are staple products. Coal is mined in this county. Capital, Morgantown. Pop. 9404.

Butler, a county of Missouri, bordering on Arkansas. Area, 560 square miles. It is bounded on the E. by the St. Francis, and intersected by the Big Black River. The surface is nearly level. Grain, tobacco, and wool are staple products. Capital, Poplar Bluff. Pop. 4298.

Butler, a county in the E. of Nebraska. Area, 576 square miles. It is bounded on the N. by the Platte River, and drained by the Big Blue River. The soil is productive. Grain and wool are the staple products. The county contains a large proportion of prairie. Capital, Savannah. Pop. 1290.

Butler, a county of Ohio, bordering on Indiana. Area, 455 square miles. It is intersected by the Great Miami River and the Miami Canal. The surface is nearly level; the soil is very productive. Cattle, grain, tobacco, wool, hay, and butter are largely raised. Trenton limestone, valuable for building, is abundant here. The manufactures are varied, including flour, metallic wares, carriages, clothing, saddlery, etc. The county is traversed by the Cincinnati Hamilton and Dayton, the Cincinnati Richmond and Chicago, and the Cincinnati and Indianapolis R. Rs. Capital, Hamilton. Pop. 39,912.

Butler, a county in the W. of Pennsylvania. Area, 800 square miles. It touches the Alleghany River on the N. E. and the S. E., and is drained by the Conequenessing Creek. The surface is undulating; the soil is fertile. Cattle, grain, dairy products, wool, and hay are largely raised. Bituminous coal, iron, and limestone are found here. The manufactures include lumber, furniture, leather, carriages, brick, saddlery, etc. Capital, Butler. Pop. 36,510.

Butler, a post-village, capital of Choctaw co., Ala., about 110 miles N. of Mobile.

Butler, a post-village, capital of Taylor co., Ga., on the South-western R. R., 50 miles W. S. W. of Macon.

Butler, a post-village of Montgomery co., Ill., on the Indianapolis and St. Louis R. R., 63 miles N. E. of St. Louis, and 3 miles N. W. of Hillsborough. Pop. 1648; of the township, 2107.

Butler, a township of Vermilion co., Ill. Pop. 925.

Butler, a post-township of De Kalb co., Ind. P. 1209.

Butler, a township of Franklin co., Ind. Pop. 1488.

Butler, a township of Miami co., Ind. Pop. 1535.

Butler, a township of Butler co., Ia. Pop. 1329.

Butler, a township of Jackson co., Ia. Pop. 857.

Butler, a township of Scott co., Ia. Pop. 889.

Butler, a post-village of Pendleton co., Ky. Pop. 144.

Butler, a post-township of Branch co., Mich. P. 1430.

Butler, a post-village, capital of Bates co., Mo., is in a fertile prairie, about 75 miles S. by E. from Kansas City. It has a national bank and two weekly papers. Pop. 1064.

Butler, a township of Harrison co., Mo. Pop. 748.

Butler, a township of Pemiscot co., Mo. Pop. 298.

Butler, a township of St. Clair co., Mo. Pop. 646.

Butler, a township of Platte co., Neb. Pop. 328.

Butler, a township of Wayne co., N. Y. Pop. 2023.

Butler, a township of Columbiana co., O. Pop. 1558.

Butler, a township of Darke co., O. Pop. 1524.

Butler, a township of Knox co., O. Pop. 701.

Butler, a township of Mercer co., O. Pop. 1301.

Butler, a township of Montgomery co., O. Pop. 2153.

Butler, a post-township of Richland co., O. P. 768.

Butler, a township of Adams co., Pa. Pop. 1333.

Butler, capital of Butler co., Pa., on the Conequenessing Creek, 31 miles N. of Pittsburg. A branch railroad

extends from the Alleghany River to the town. It has four banks, an educational institute, and a fine school building. It is situated in the "oil region," and two lines of pipe bring petroleum ten miles to the railroad. There are several machine-shops, two planing mills, two steam-grist-mills, and three weekly papers. Pop. of borough, 1935; of Butler township, 984. J. ZIEGLER,
ED. OF "DEMOCRATIC HERALD."

Butler, a township of Luzerne co., Pa. Pop. 1423.

Butler, a township of Schuylkill co., Pa. Pop. 5905.

Butler, a township of Darlington co., S. C. Pop. 1099.

Butler, a township of Edgefield co., S. C. Pop. 2080.

Butler, a township of Greenville co., S. C. Pop. 1646.

Butler, a township of Hancock co., W. Va. Pop. 979.

Butler, a township of Wayne co., W. Va. Pop. 1992.

Butler (ALBAN), a learned Roman Catholic divine, born at Northampton, England, in 1710; died May 15, 1773. He wrote "Lives of the Saints" (5 vols., 1745) and other works.

Butler (ANDREW PICKENS), born in Edgefield district, S. C., Nov. 18, 1796, graduated at South Carolina College in 1817, was admitted to the bar in 1818, became a judge in 1833, and was U. S. Senator from South Carolina (1846–57). —His father, WILLIAM BUTLER (1759–1821), was a brave soldier of the Revolution. A. P. Butler died May 25, 1857.

Butler (BENJAMIN FRANKLIN), lawyer and statesman, born at Deerfield, N. H., Nov. 5, 1818, son of Captain John Butler, who commanded a company of dragoons during the war of 1812, and served under Jackson at New Orleans. Reared by an excellent mother, B. F. Butler graduated at Waterville College, Me., and in 1840 was admitted to the bar at Lowell, Mass., where he rapidly advanced to an extensive and lucrative practice, in which he acquired a considerable fortune. He served in the State militia through all grades from private to brigadier-general. A Democrat by inheritance and conviction, he took an active part in politics, and in 1853 represented Lowell in the legislature, where he lent powerful aid to the bill for reducing the hours of labor in the factories of the State from thirteen to eleven. In 1853 he was a member of the constitutional convention, and in 1859 a member of the senate of Massachusetts. On April 15, 1861, upon a call for troops to hasten to the defence of Fortress Monroe and Washington, Brigadier-general Butler, who at 5 P. M. was in court in Boston trying a cause, issued the requisite orders for mustering the regiments of his brigade. April 16, the Sixth regiment left Boston, and on the 18th General Butler, at the head of the Eighth, took his departure, having been ordered to proceed to Washington by way of Baltimore. Two regiments of his brigade had, in the mean time, sailed for Fortress Monroe, which they garrisoned, and saved from falling into the hands of the enemy. Prevented from reaching Washington by way of Baltimore in consequence of the burning of bridges, he seized Annapolis, repaired the railroad between that city and Washington, and thus the Eighth Massachusetts and Seventh New York reached the capital in time to prevent all attempts on the part of hostile forces to seize it. May 13, 1861, at the head of 900 men, he marched upon Baltimore, and encamped on Federal Hill, in the midst of the city, without opposition—a service immediately (May 16) rewarded by President Lincoln with the commission of major-general in the service of the U. S., and by assigning him to the command of Fortress Monroe, where he arrived May 22. He here refused to send back the runaway slaves to their masters, on the ground, originated by him, that the slaves were "property contraband of war." Feb. 23, 1862, he was assigned to the command of the troops, 18,000 in number, forming part of the expedition against New Orleans, Captain Farragut commanding the naval force. After the heroic passing of the forts defending the Mississippi by Captain Farragut, General Butler (May 1, 1862) landed and took possession of the city, where he remained until Dec. 16 following, when he was relieved by Major-general N. P. Banks. During his administration of the department of the Gulf he taxed the wealthy Confederate citizens to support the thousands of inhabitants reduced to destitution by the war, and governed the city with an ability and justice never surpassed. Nov., 1863, he was appointed commander of the department of Virginia and North Carolina. In the winter he conceived the project of attacking Richmond from City Point and Bermuda Hundred. On May 5, 1864, he occupied City Point and Bermuda Hundred, and intrenched himself upon that peninsula, holding it with supplies, aiding the movement of General Grant upon Petersburg, after the repulse of the Wilderness and Cold Harbor. He went with a detachment of his forces in Nov., 1864, to New York during the presidential election, a rising being expected in New York City by which the election was to be carried by the Democracy. With a small force he held the city in peace and quiet, and compelled an orderly election. He was sent against Fort Fisher in Dec., 1864, but the navy not having reduced the fort by bombardment, a storm arising so that he could not land his troops, he took the responsibility of disobeying orders and returning; the enemy withdrew their troops, deeming all further attack upon that point to be given up; so that when another command was sent down against Fort Fisher, the enemy were found unprepared. Before the second expedition Gen. Butler was relieved of his command. In 1866 he was elected to Congress from the Essex district in Massachusetts, in which he had become a resident for that purpose, and has remained in Congress ever since.
JAMES PARTON.

Butler (BENJAMIN F.), an American lawyer and resident of Albany, N. Y., born Dec. 15, 1795, was attorney-general of the U. S. under President Jackson from Dec., 1831, to June, 1834. Died Nov. 8, 1858. (See his "Life" by W. L. MACKENZIE.)

Butler (CHARLES), a learned English jurist and writer, born in London in 1750, was a Roman Catholic. He wrote, besides other works, "Horæ Biblicæ" (1797), "Historical Memoirs of the English, Irish, and Scottish Catholics," and a continuation of his uncle's (Alban Butler's) "Lives of the Saints." Died in 1832.

Butler (CLEMENT M.), D. D., an American divine and scholar, was born in Troy, N. Y., Oct. 16, 1810. He was ordained a minister of the Protestant Episcopal Church in 1836, was rector of St. John's Church at Georgetown, D. C., from 1841 to 1844, rector of Grace Church, Boston, from 1844 to 1847, and rector of Trinity Church at Washington from 1847 to 1854. He officiated as chaplain of the Senate of the U. S. from 1849 to 1853. He was subsequently rector of Grace Church at Rome (in Italy) from 1862 to 1864; in the last-named year he was appointed professor of ecclesiastical history in the Divinity School of the Protestant Episcopal Church in West Philadelphia. Besides numerous sermons and lectures, Dr. Butler has published "The Book of Common Prayer Interpreted by its History" (1849), "Old Truths and New Errors" (1850), "The Flock Fed," etc. (1859), "St. Paul in Rome" (1865), "Inner Rome" (1866), "Manual of Ecclesiastical History from the First to the Thirteenth Century" (1868); also a "Continuation of the same from the Thirteenth to the Eighteenth Century," and various other works.

Butler (EZRA), born about 1762, was in the early years of Vermont history a prominent Jeffersonian of Weathersfield and Waterbury. He held justiceships and chief-justiceships of the courts of Chittenden and Jefferson counties, Vt., 1803–26, was a member of Congress (1813–15), and governor 1826–28. Died July 19, 1838.

Butler (GEORGE), U. S. M. C., born Jan. 20, 1839, in the District of Columbia, appointed a second lieutenant in the Marine Corps Feb. 11, 1859, became a first lieutenant in 1861, and a captain in 1862. Led the marines of the Minnesota in the assault upon Fort Fisher Jan. 15, 1865, and is thus honorably referred to by Lieut.-Commander James Parker, in his official report of the assault: "Captain George Butler of the marines also deserves mention for coolness and bravery. He reached and remained near the 'palisades,' a short distance inside of them." At the close of the rebellion Captain Butler was brevetted major "for gallant and meritorious conduct."
FOXHALL A. PARKER, U. S. N.

Butler (JOHN J.), D. D., a Free-will Baptist minister, born at Berwick, Me., in 1814, graduated at Bowdoin College in 1837, studied theology at Andover, Mass., was professor of sacred literature in Whitestown Theological Seminary (1844–54), of systematic theology at the Theological School of New Hampton, N. H. (1854–70), when he was appointed professor of sacred rhetoric and homiletics in Bates College Theological Seminary, Lewiston, Me. For many years he has been connected with the "Morning Star," a religious paper of Dover, N. H. He has published several commentaries on parts of the Bible, and a work on natural and revealed theology.

Butler (JOSEPH), an English bishop and eminent writer, was born at Wantage, in Berkshire, in 1692. About 1714 he wrote an able refutation of Dr. Samuel Clarke's celebrated *a priori* argument. He entered Oriel College, Oxford, in 1714, was appointed preacher at the Rolls Chapel in 1718, and obtained the rich benefice of Stanhope in 1725. He became chaplain to Lord Chancellor Talbot in 1733, and bishop of Bristol in 1738. In 1750 he was translated to the see of Durham. His chief work is "The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature" (1736). He died unmarried June 16, 1752. (See

T. Bartlett, "Memoirs of the Life of Joseph Butler, Bishop of Durham.")

Butler (Pierce), born in Ireland in 1744, was a relative of the Ormond family and an officer of the British army. While stationed at Boston, Mass., he resigned his major's commission, removed to South Carolina, was a member of Congress (1787), a member of the convention which drew up the Federal Constitution (1788), and U. S. Senator from South Carolina (1789–96 and 1802–04). Died Feb. 15, 1822.

Butler (Pierce M.), Colonel, and former governor of South Carolina, born in Edgefield district, S. C., April 11, 1798. He entered the army in 1819 as second lieutenant of infantry, was promoted to first lieutenant 1822, captain 1825, resigned from the army in 1829, and was president of a bank at Columbia until 1836, when he accepted the appointment of lieutenant-colonel in Goodwin's regiment of South Carolina volunteers, and served against the Seminole Indians in Florida. On his return was elected (1838) governor of South Carolina; at the end of his term became Indian agent, and was acting as such at the outbreak of the Mexican war, when he was elected colonel of the "Palmetto regiment" of South Carolina volunteers, which regiment he gallantly led to the seat of war, distinguishing himself at Cerro Gordo and subsequent battles; at the battle of Churubusco Aug. 20, 1847, he continued to lead his men after being wounded, when he was shot a second time, through the head, and killed.

Butler (Samuel), a witty English poet, born in Worcestershire in 1612. He was liberally educated, and became in early youth clerk to a justice of the peace, and afterwards entered the service of Sir Samuel Luke, who is supposed to be the prototype of Hudibras. About 1661 he married a widow named Herbert, who had an easy fortune, but it was lost by investment in unsound securities. He published in 1663 the first part of "Hudibras," a witty and satirical poem which obtained great popularity. The second part appeared in 1664, and the third in 1678. He died poor Sept. 25, 1680. He was hostile to the Puritans, whom he satirized in his famous poem. "The sense of Butler," says Hallam, "is masculine, his wit inexhaustible, and it is supplied from every source of reading and observation. But these sources are often so little known to the reader that his wit loses its effect through the obscurity of the allusions." (See A. Ramsay, "Butler and his Hudibras.")

Butler (William Allen), an American lawyer and poet, born at Albany, N. Y., 1825, graduated at the University of New York in 1843. He wrote, besides other works, an admirable poem, "Nothing to Wear, an Episode of City Life" (1857).

Butler (William Archer), a philosopher, born near Clonmel, Ireland, in 1814, was a writer of high promise. He became professor of moral philosophy in Trinity College, Dublin, in 1837. Among his works are "Lectures on the History of Ancient Philosophy" (2 vols., 1846). Died July 5, 1848.

Butler (William Orlando), an American general, born in Kentucky in 1793. He served in the war of 1812 and the Mexican war, and became a major-general in 1846. He was the Democratic candidate for the office of Vice-President in 1848, but was not elected.

But'lerage, an ancient duty belonging to the Crown of England, otherwise called the *prisage* of wines. This duty is mentioned in the Great Roll of Exchequer, 8 Richard I. The Crown could take two tuns of wine from every ship (English or foreign) importing into England twenty tuns or more, one before and one behind the mast; by charter of Edward I., it was changed into a duty of two shillings for every tun imported by strangers.

Butler Centre, a post-village, capital of Butler co., Ia., near the West Fork of Cedar River, about 95 miles N. N. E. of Des Moines. Pop. 152.

Butler's Isle, a township of Hancock co., Me. P. 12.

Butler's Landing, a post-village of Clay co., Tenn.

Butoma'ceæ, a natural order of endogenous aquatic plants, nearly related to the Alismaceæ. It derives its name from the *Butomus umbellatus* (Gr. βοῦς, an "ox," and τεμνω, to "cut," because the edges of its leaves cut the mouths of cattle), an aquatic plant which grows in ditches and ponds in many parts of Europe and Asia, commonly called flowering rush. The leaves are all radical, linear, triangular, and about two feet long. The scape terminates in a large umbel of beautiful rose-colored flowers, each of which has nine stamens. This plant was formerly used in medicine. Its root is eaten in Asia. None of these plants are found in North America.

Butte, a French word signifying a "small hill," a "knoll," a "rising ground." In parts of the U. S. the term is applied to mountains, as the Downieville Buttes, 8840 feet high.

Butte, a county in the N. part of California. Area, 1200 square miles. It is bounded on the W. by the Sacramento River, and is intersected by Feather River and its forks. The surface is hilly or mountainous, and the scenery picturesque. The name of the county is derived from the Butte Mountains on the Sacramento River. Gold is found imbedded here in quarts rock. Cattle, wool, hay, grain, and dairy products are raised, and lumber is sawed. It is intersected by the Oregon division of the Central Pacific R. R. Capital, Oroville. Pop. 11,403.

Butte, a township of Colusa co., Cal. Pop. 604.

Butte, a township of Sierra co., Cal. Pop. 1182.

Butte, a township of Siskiyou co., Cal. Pop. 410.

Butte, a township of Sutter co., Cal. Pop. 1359.

Butte City, a post-village of Deer Lodge co., Mon.

But'ter [Ger. *Butter*; Fr. *beurre*; Lat. *butyrum*; Gr. βούτυρον, supposed to be from βοῦς, a "cow," and τυρός "cheese"] is the fatty substance extracted from milk. In ancient times the Hebrews made use of butter as food, but the Greeks and the Romans used it only as an ointment in their baths; and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, whilst the Romans obtained it from Germany. In Southern Europe, at the present time, butter is very sparingly used, olive oil often taking its place; and in Italy, Spain, Portugal, and Southern France it is sold by apothecaries as a medicinal agent for external application. In the East Indies the natives use *ghee*, which is butter clarified by boiling. Butter is usually made from cow's milk, which has the following average composition:

Fat (butter)	3.83
Caseine	3.88
Sugar (lactose)	4.08
Salts (alkaline and earthy)	0.76
Water	87.45
	100.00

The composition varies, however, with the breed, age, and food of the cow, the age of the calf, the time and frequency of milking, etc. The last milk drawn at a milking is richer in butter than the first. (See Milk.) The caseine, sugar, and most of the salts are in solution, while the fat is in suspension in the form of minute globules, which are readily seen by the aid of the microscope. They vary in size from $\frac{1}{300}$ to $\frac{1}{100}$ of an inch in diameter. They are quite transparent, refract light strongly, and give the milk its white color. It was formerly supposed that each globule was covered with a thin membrane or envelope, but this has been disproved by Von Baumhauer and F. Knapp.

Cream.—When milk is allowed to stand, the fat globules rise to the surface and form a layer of cream, while below remains a blue transparent fluid, serum, containing the other constituents of the milk. The separation of fat and serum is never complete; each retains a certain quantity of the other. Dr. Voelcker gives the composition of cream as follows:

Fat (butter)	33.43	25.40
Caseine	2.62	7.61
Sugar	1.96	
Salts	0.72	2.19
Water	61.67	64.80
	100.00	100.00

To allow the cream to rise for the manufacture of butter, the milk is placed in a cool cellar, at a temperature of 55° to 59° F. If much cooler than this, the cream rises too slowly; if warmer, the milk sours rapidly. The pans for holding the milk should be perfectly clean and dry. Two inches is considered the best depth for the milk. In from twenty-four to thirty-six hours the separation of the cream will be complete, when it is skimmed off and put into a stone pot, or, if a sufficient quantity is at hand, it may be churned at once. Owing to a kind of fermentation (see Fermentation) that takes place in milk on standing, it becomes somewhat sour before all the fat globules have separated, and as it thickens or partially coagulates the further separation of cream is prevented. In zinc pans it remains sweet four or five hours longer than in wooden or earthen vessels, and consequently yields a somewhat larger proportion of cream; but the poisonous character of zinc salts makes the use of such pans dangerous. Glass vessels are really the best, but tin (tinned iron) is the material usually employed. When the cream is to be kept for a few days before churning, it is poured into a clean stoneware vessel; and some butter-makers add a little saltpetre, which prevents moulding and keeps the cream free from a cheesy taste.

Churning.—The butter is obtained from the cream by the process of *churning*—violent agitation in a wooden vessel,

a churn. The fat-globules are thus caused to unite in larger masses, and finally to separate entirely from the watery liquid, called buttermilk. The temperature of the cream when it enters the churn should be between 53° and 55° F. During the churning it rises several degrees. If the cream is too cold, the fat is hard and will not coalesce; if it be too warm, the fat is semi-liquid and will not unite. The time at which the butter separates, as well as its quantity and the quality, depends largely upon the temperature. From forty-five minutes to one hour should be occupied in churning; if the butter comes much sooner, it is generally soft and frothy; if a much longer churning is required, it is badly flavored. The butter is separated from the liquid, thoroughly washed with cold water, and kneaded or *worked* to expel the buttermilk as completely as possible. It is then fashioned into rolls or moulded into forms for immediate use, or it is packed in stone jars or wooden firkins for winter use. A little salt is generally added to improve the flavor—about a quarter of an ounce to a pound if the butter is intended for immediate use, but when it is to be packed for winter use as much as an ounce to the pound is used. Great care is necessary in selecting the salt for this purpose, as even minute quantities of the chlorides of calcium and magnesium, which are common impurities of salt, give the butter a bitter, disagreeable taste. The English *Ashton* and the Syracuse *factory-filled dairy* salt are specially adapted for dairy use. The buttermilk is never completely expelled from the butter, and although it gives an agreeable taste to the butter, it also causes it to rapidly become rancid unless some means are adopted to prevent this result. The caseine of the buttermilk acts as a ferment both upon the sugar and the butter. The former is changed to lactic acid; a little of the latter to free fatty acids and glycerine. The pure fat of butter may be kept for months without becoming rancid. To protect the butter from rancidity it is generally salted as above mentioned, or, in addition to salt, white sugar and saltpetre are added. Two tablespoonfuls of a mixture of 3 pounds of salt, 1 pound of sugar, and 1 pound of saltpetre to a pound of butter is sufficient to keep it sweet and good for a year. Butter may be completely purified, though with a serious loss of flavor, by melting it at as low a temperature as possible and allowing the buttermilk to settle out.

The average yield of butter is about one pound from twenty-four pounds or twelve quarts of milk, or about a pound of butter from two quarts of cream. It is computed that a cow will give 1800 quarts of milk per annum, producing 140 pounds of butter. In the same time she will eat 8000 pounds of hay, which contain, as shown by analysis, 168 pounds of fat. Butter is made in many localities from the whole milk, which is allowed to stand till it becomes sour. The churning is more laborious, owing to the large quantity of material and the longer time required to bring the butter. The yield is greater, however, than when cream is used, and the butter is very good. Great success has attended the establishment of butter and cheese factories in some parts of the U. S., which receive the milk daily from the farmers and manufacture butter or cheese, or both, on a large scale in the most approved manner. It is claimed that owing to the possibility of regulating temperatures with more certainty on a large scale, to the advantage of steam for cleansing vessels, and to the ability of large establishments to employ more skilful labor, the products are obtained of better quality and at less cost than when each farmer handles the milk of his own farm. At the factory of the "Wallkill Milk Association," in Orange co., N. Y., the milk is set in tin pails twenty-two inches deep and eight inches in diameter. These pails are placed in running spring-water at 48° to 56° F., where they remain over night. The cream is then skimmed with a conical cup having an upright handle. The cream is put immediately into the churns, and the skimmed milk is made into cheese. Each churn receives fifty quarts of cream and one pail of cold spring-water. The temperature is always between 56 and 64° F. The churning is effected by horse-power, and is continued forty-five to sixty minutes. The butter is then taken out, washed with spring-water, salted with 18 ounces of salt to 22 pounds of butter, and well worked. It stands till evening, when it is worked again, then packed in sixty-pound pails and sent to New York. For winter butter a small teaspoonful of pulverized saltpetre and a large tablespoonful of white sugar is added to every twenty-two pounds. The butter is worked on an inclined slab with a wooden lever. The yield was—

		Milk, qts.	Butter, lbs.	Cheese, lbs.
May 18,	from	3512	213	560
May 25,	"	3300	210	550
Sept. 12,	"	3128	200	546
Oct. 14,	"	2027	120	407

The "Orange County Milk Association" find that it requires an average of 14 quarts (wine) or 28 pounds of milk to make 1 pound of butter and 2 pounds of cheese.

When newly prepared, butter is of a yellow color, which is deeper as the pasture on which the cow is fed is richer. Hence the poorer kinds of butter are often colored with annatto, turmeric, infusion of calendula flowers, or the juice of carrots.

Butter differs very much in composition according to the care taken in working it. The pure fat varies from 77 to 95 per cent., the buttermilk from 5 to 23 per cent. The fat is a mixture of several neutral fats or glycerides, chiefly the liquid, oily fat oleine and the solid fats palmitine and stearine, with smaller quantities of myristine, butyrine, caproine, capryline, and caprine. To these latter bodies the peculiar odor and flavor which distinguish butter from other fats are due. Prof. E. N. Horsford has detected phosphorus in butter. Butter melts at from 85° to 90° F. It is generally harder and less fusible in winter than in summer, owing to the relative increase in summer of the oily constituent, oleine.

The *adulterations* most frequently found in butter are excess of water and salt. They may be detected and estimated by melting a weighed quantity of the butter and allowing them to settle out. Lard is said to be added to butter. Lactate of zinc, derived from the zinc pails and pans used in the dairy, has been reported; when present in sensible quantities, it produces violent vomiting.

Butter powders for largely increasing the yield of butter are advertised to some extent in the U. S. One of these, the "Star Butter Powder," is a mixture of equal parts of alum and sugar. The directions for its use are: "To one quart of milk, twelve hours old, add one pound of butter; warm by setting the churn in blood-warm water. Add one teaspoonful of the powder, and churn as usual. You will have two and a half pounds of delicious fresh butter." The effect of this and similar powders is to coagulate the milk and enable the operator to mix it with the butter, forming a frothy mixture (emulsion) of butter and sour milk, which is anything but *fresh and delicious*.

Artificial Butter.—Mège-Mouriéz, investigating the production of milk, noticed that cows deprived of food continued to give milk in some quantity, and that the milk continued to contain butter. This led him to infer that the fat of the animal was changed to butter, and, acting upon this hint, he succeeded in extracting from beef tallow (suet) a fat having the consistence of butter, which he converted into an excellent substitute for genuine butter. As already mentioned, butter consists chiefly of oleine, palmitine, and stearine. The same is true of suet, but the oily oleine is not present in so large a proportion as in butter. Mouriéz, therefore, removes such a proportion of the palmitine and stearine as to leave a mixed fat having the consistence of butter. His process is as follows: Fresh suet is cut very fine, placed in a vessel containing water, a little carbonate of potash, and fresh sheeps' stomachs cut in pieces are added. The whole is warmed to 112° F. Under the influence of the heat and the pepsin of the stomachs the fat separates from the cellular tissue. This fat is allowed to cool till it solidifies, when it is subjected to pressure in a hydraulic press, when it separates into two portions—a hard white stearine and palmitine, suitable for the manufacture of candles, and a liquid oil, which on cooling further solidifies into a white fat having the consistence of butter. Mouriéz calls this *oleo-margarine*, from the old idea, now disproved, that a fat margarine existed in butter and suet.

To produce butter, the oleo-margarine is poured into a churn while still liquid with about half its volume of fresh milk and nearly as much water. A little annatto is added for color, and a little water in which pieces of cows' udder and milk glands have been soaked. The mixture is then churned, yielding a sweet, palatable butter which may be salted as usual. As nothing unwholesome is used in the manufacture of this butter, its use in place of real butter is a mere matter of taste. As it can be made for from one-fifth to one-third the cost of real butter, and does not readily become rancid, it bids fair to become an important article of manufacture. It is certainly a good substitute for the olive oil so freely used in Southern Europe, or the lard which is used on bread in place of butter in many families in Germany. Mr. Alfred Paraf has simplified the process, and erected a large factory for making this butter in New York, under the name of the "Oleo-margarine Company."

Vegetable Butters.—The name "butter" is applied to several vegetable fats, such as palm, cacao, cocoanut, nutmeg, and shea butter. The latter is made from a nut like the olive, and is used in Africa as a substitute for butter.

Metallic Butters.—In chemistry the name butter was formerly applied to certain oily compounds which resembled melted butter; as the butter of antimony, bismuth, zinc, and tin, which were the chlorides of the respective metals. *Bog butter* is a fossil butter found occasionally in the Irish

peat-bogs. It is believed to have been made by man. *Rock butter* is an iron alum which appears as a pasty exudation on alum slates. C. F. CHANDLER.

Buttercup. See RANUNCULUS.

But'terfield (DANIEL), born in Oneida co., N. Y., in 1831, was educated at Union College. Soon after the breaking out of the civil war he was made brigadier-general of volunteers, and took part in many actions under Generals McClellan, Pope, and Burnside, and was chief of General Hooker's staff at Lookout Mountain, and afterwards. He was brevetted major-general for gallant and meritorious conduct.

Butterfield (JOHN), born at Helderberg, N. Y., about 1783, became an extensive proprietor of passenger stages, and after the construction of railroads and telegraphs was largely interested in the railroad, express, and telegraph business. He removed to Utica, N. Y., in 1822, and died there Nov. 15, 1869. He was one of the founders of the American Express Company.

But'terfly, the name of the Papilionidæ, diurnal lepidopterous insects, forming many genera in the recent entomological systems. Butterflies exhibit a great similarity in most respects to other lepidopterous insects. They are distinguished in most cases without difficulty by their knobbed antennæ, and by brilliancy of coloring, which in butterflies belongs to both sides of the wings, whilst the beauty of moths appears chiefly on the upper side. The abdomen is shorter and smaller than in other families. Butterflies, at rest, hold their wings erect, the under side being thus chiefly exhibited: while the other lepidopterous insects hold their wings in a horizontal or inclined position, and some have them wrapped round the body. Butterflies are the only insects of their order which have no sockets, spines, bristles, or hooks by which the second wing on each side can be attached to the first, but both when flying and at rest have all their wings quite separate. Their caterpillars have always sixteen feet, ten of which are abdominal. The pupa or chrysalis is angular, especially on the thorax, is seldom enveloped in a cocoon, is generally suspended by the tail by means of a silky substance, but is sometimes supported by bands around the middle, and generally exhibits more or less of that golden color from which both the names *aurelia* (from the Lat. *aurum*, "gold") and *chrysalis* (from the Gr. *χρυσός*, "gold") are derived.

Some species of butterflies possess no small power of flight. Short-lived as they are generally believed to be, some of the tropical species perform wonderful migrations. The number of species is very great; not less than 5000 species being known, and the number will doubtless be increased. There are probably 1000 species in North America. Their arrangement is difficult, on account of the similarity which prevails among them.

Some butterflies measure almost a foot across the expanded wings. The largest species are tropical. Some species are widely distributed: *Cynthia cardui* is found throughout nearly all the world. The geographical limits of other species are restricted. Caterpillars of some species are furnished with spines, those of others have fleshy prominences, horny at the tip, perhaps intended as means of defence. The hinder wings of many butterflies are prolonged into tail-like appendages, one or more on each wing, which vary in form.

These insects are objects of admiration, associated with the most lovely scenes, but they are also a cause of annoyance and vexation by the ravages of their caterpillars. There is, however, one species, the bugong (*Euplæa hamata*), which affords food to the aborigines of Australia. Butterflies of this species congregate in such vast numbers in rocky crevices that they are collected by simply making fires under the rocks, in the smoke of which they are suffocated. Bushels of them are thus procured, and baked by placing them on the heated ground, the down and wings removed, and the bodies made into cakes which resemble lumps of fat. It is probable that the oil of this species may become commercially important. As an article of food it is irritant and nauseating, even to the natives. REVISED BY C. W. GREENE.

But'terfly-Weed, a common name of the *Asclepias tuberosa*, an herbaceous plant which is indigenous in many parts of the U. S., and is sometimes called **Pleurisy Root.** It has nearly sessile leaves, varying from linear to oblong-lanceolate, and has showy orange-colored flowers. The root is diaphoretic and expectorant, and has been used in medicine. (See ASCLEPIAS.)

But'termilk, the part of milk that remains after the butter has been separated from it. It contains casein, sugar, water, and all the original ingredients of milk, except the oily matter. It is a nutritious beverage, and is extensively used in many places as food.

Buttermilk Falls, a cataract in Le Roy township, Genesee co., N. Y. The Oatka Creek falls 90 feet over a cliff of limestone. Also a series of cascades on Bog Meadow Creek in Cornwall township, Orange co., N. Y., below West Point, and near the Hudson River.

But'ternut, or **White Walnut,** a name given to the *Juglans cinerea*, and its fruit, which is indigenous in the U. S. The tree grows to the height of from thirty to fifty feet, and has oblong-lanceolate leaflets, which are serrate, pointed, and rounded at the base. The fruit is oblong and clammy, and contains an oily, edible kernel. The wood is valuable in the arts.

But'ternuts, a post-township of Otsego co., N. Y. It contains four churches and several manufacturing establishments. Pop. 2174.

Butternut Valley, a post-township of Blue Earth co., Minn. Pop. 590.

Butter Tree, a name given to several tropical trees, the fruits of which yield concrete fixed oils which are similar to butter and used as food. The butter trees of India and Africa belong to the genus *Bassia* and the order Sapotaceæ. Those of Brazil and Guiana belong to the genus *Caryocar*.

But'terwort (*Pinguicula*), a genus of herbaceous plants of the natural order Lentibulariaceæ, distinguished by a 2-lipped calyx, the upper lip trifid, the lower bifid; and a spurred corolla, 2-lipped and gaping, the upper lip arched. The *Pinguicula vulgaris* is a small stemless perennial, growing in marshes and on wet rocks in Europe and the U. S. It has the power of coagulating milk, and is used for that purpose by the Laplanders.

But'terworth (JOHN), well known as the author of a concordance and dictionary of the Scriptures, born in Lancashire Dec. 13, 1727. He was pastor of the Baptist church at Coventry for fifty-two years. Died in 1803.

Butt Hinge, a hinge of iron or brass, the flaps of which close like a book. It is usually let in flush with the bead of a joint left for the purpose of concealing it. Such hinges are commonly used for doors.

Butt'mann (PHILIPP KARL), an eminent and profound German philologist, born at Frankfort-on-the-Main in Dec., 1764. He was appointed secretary of the Royal Library of Berlin in 1796, and chief librarian of the same in 1811. He was a friend of Niebuhr, and an excellent Greek scholar. He edited several Greek classics, and published, besides other works, a "Greek Grammar for Schools" (1792), a large "Greek Grammar" ("Ausführliche Griechische Sprachlehre," unfinished), and "Lexilogus, or Explanation of the Greek Words" (1818). Died June 21, 1829.

But'ton [Fr. *bouton*, a "button:" originally, a "bud"], a well-known appendage to dress used for fastening or for ornament. Buttons are of various kinds and materials. Military buttons are for the most part of brass. Circular disks, called "blanks," are cut from sheet brass by machines, which cut a row of eight or ten blanks at once, the machine itself pushing the metal forward. The edges are trimmed, and the blank planished by stamping with a die. The shanks are made by a machine which is fed with wire, which it pushes in short lengths to a pair of shears. The pieces of wire are forced into a vice which bends them to the required shape, the ends are made flat with a hammer, the shanks soldered to the blanks, and the buttons finished in the lathe and lacquered or gilded. "Shell" buttons are made of two blanks, that forming the face being larger than the back to which the shank is attached. These blanks are pressed into the required shape by dies, and then, by another die, the edge of the larger blank is lapped over the smaller, and thus attached without soldering. Common metal buttons are cast in moulds in which the shanks are previously placed, and are thereby attached without soldering. When the body of the button is of pearl-shell, bone, or wood, the blanks are cut by means of a tubular saw. The shanks are fixed by cutting a hole half through the blank; this is enlarged as it deepens, and after inserting the shank a blow spreads it out, so as to fill up the inner and larger part of the cavity. Buttons with holes, when of shell, wood, bone, or ivory, are cut with the tubular saw, and drilled. Covered buttons are often made by sewing cloth upon "moulds"—*i. e.* flat bone or wooden disks with a hole in the middle. These have been to a great extent superseded by various patented buttons. Many of these are made of combinations of metal and cloth.

Many buttons are now made of plastic materials, like vulcanized rubber, papier maché, etc. which are pressed in moulds to the shape required. Horn buttons are made by pressure, the horn having been softened by heat. A very cheap substitute for pearl buttons is made by forcibly com-

pressing clay into moulds. There are several compositions of this kind used. Buttons of horn, vegetable ivory, bone, mother of pearl, the coquilla nut, hard wood, glass, etc. are largely manufactured.

REVISED BY C. W. GREENE.

Button, a township of Ford co., Ill. Pop. 610.

Button (Sir THOMAS), an English sailor who in 1614 sailed to discover the N. W. passage, wintered in Hudson's Bay, which he called "Carey's Swan's Nest," and named many places on its shores. For these services he was knighted.

Button-bush (*Cephalanthus occidentalis*), a common American shrub of the Cinchona family, has a white flower in globose heads, whence its name. When in flower it is much frequented by bees.

But'tonwood, a common name of the *Platanus occidentalis*, a tree which is a native of the U. S., and is also called PLANE TREE (which see).

But'tress [Fr. *arc-boutant*], in architecture, a projection for the purpose of giving additional support or strength to a wall; a mass of masonry or brickwork built to resist the horizontal thrust of another mass. In the classical style no buttresses were used, their place being to some extent supplied by pilasters, antæ, etc.; but in Gothic architecture they are much used to counteract the outward thrust of the arches or of the vaulting which covers the naves and aisles of cathedrals. The different stages of Gothic architecture are marked by the form of the buttresses employed almost as distinctly as by the form of the arch. The Norman buttress was broad, often semicircular, never projecting from the wall to any great extent. Early English buttresses project more boldly, and are narrower than the Norman. They are frequently broken into stages, which diminish in size as they ascend. Buttresses of which the upper portion or the whole upright part is detached from the wall (with which they are connected by an arch) are called flying buttresses or arch-buttresses.

Butts, a county in Central Georgia. Area, 180 square miles. It is bounded on the E. and N. E. by the Ocmulgee River, and drained by Tussahaw and Sandy creeks. The surface is nearly level; the soil is fertile. Corn, cotton, and wool are produced. Capital, Jackson. Pop. 6941.

Butts Road, a township of Norfolk co., Va. P. 2039.

Butyl. See TRITYL.

Butyr'ic [from the Lat. *butyrum*, "butter"] **Acid,** $HC_4H_7O_2$, may be obtained by saponifying butter with potash, adding dilute sulphuric acid, and distilling about one half of the mixture, adding water, and continuing the distillation till the residue is not acid. Butyric acid may also be obtained by allowing a small quantity of milk-curd to act upon a solution of sugar at a temperature of 77° to 86°. Chalk is added to take up the butyric acid when produced. The butyrate of lime is left in the vessel, and on acting upon that by dilute hydrochloric or sulphuric acid, and distilling, the free butyric acid passes over, and is condensed. Butyric acid is a transparent, thin, oily liquid, with a most persistent rancid odor. It is miscible in all proportions in water, alcohol, ether, and sulphuric acid; has a specific gravity of .973, boils at 314°.

Butyr'ic E'ther, or **Ethyl'ic Bu'tyrate,** $C_2H_5.C_4H_7O_2$, an exceedingly fragrant liquid obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. Butyric ether is mixed with alcohol, and sold as artificial pineapple oil. There is little doubt that pineapples owe their flavor to the presence of natural butyric ether. A small quantity is also found in rum. The artificial variety is used for flavoring various articles and for sophisticating bad rum. Butyric ether alone cannot be used in perfumery, as, when inhaled in even a small quantity, it tends to cause irritation of the lungs and intense headache, but it is employed in the manufacture of compound perfumes. Other butyric ethers are the methylic, butylic, propylic, amylic butyrates, etc.

Buxbaum'ia [named in honor of J. C. Buxbaum, a German botanist], a genus of mosses, of which only one species is known, *Buxbaumia aphylla*, a rare European and American plant, apparently destitute of leaves. The part of it visible above the ground is merely a little conical bulb, with minute scales, which are its leaves.

Bux'ton, a town and watering-place of England, in Derbyshire, is situated in a deep valley near the source of the Wye, 32 miles N. W. of Derby, and 160 miles N. N. W. of London. Here are calcareous and chalybeate springs, which are annually visited by about 14,000 persons. Buxton is surrounded by beautiful scenery, has several good hotels, and baths which are regarded as among the finest in Europe. One of the dukes of Devonshire expended £120,000 here in the erection of a pile of stone buildings called the Crescent. Buxton was once the residence of Mary queen of Scots, then a captive. Near this town is Diamond Hill, famous for its crystals. Pop. 1877.

Buxton, a post-township of York co., Me., on the Portland and Rochester R. R., 17 miles W. of Portland. It has a savings' bank, and manufactures of lumber, furniture, woollen goods, etc. Pop. 2546.

Buxton (Rev. JARVIS BARRY), born at Newbern, N. C., Jan. 17, 1792, was ordained pastor of a Protestant Episcopal church at Elizabeth City, N. C., in 1827, and removed in 1831 to Fayetteville, N. C., where he was distinguished for his devotion to his work as a minister. Died May 30, 1851. A volume of his "Discourses," with a memoir of his life, was published by his son in 1853.

Buxton (JEDIDIAH), an Englishman, born near Chester in 1705. Though below mediocrity in respect of intellect, he possessed such marvellous powers of arithmetical calculation that he was regarded as one of the wonders of his time. His insight into the relations of numbers was so far intuitive that he never could explain the processes by which he arrived at his conclusions, which were almost always correct. Died about 1774.

Buxton (Sir THOMAS FOWELL), an English philanthropist, born in Essex April 1, 1786, was the son of opulent parents. He married in 1807 Hannah Gurney, a sister of Joseph John Gurney and of Mrs. Fry, and was elected a member of Parliament in 1818 by the voters of Weymouth, which he represented nineteen years. He was an eminent advocate of the abolition of slavery and other humanitarian measures, and had much influence in public affairs. Died Feb. 19, 1845. (See "Life of T. F. Buxton," by his son, Sir CHARLES.)

Bux'torf [Lat. *Buxtorfius*], (JOHANN), an eminent German scholar, born at Kamen, in Westphalia, Dec. 25, 1564. He was well versed in the Hebrew language and rabbinical literature. In 1591 he became professor of Hebrew at Bâle. His chief works are a "Lexicon Hebraicum et Chaldaicum" (1607) and "Biblia Hebraica Rabbinica" (1618). Died Sept. 13, 1629.

Buxtorf (JOHANN, JR.), a son of the foregoing and father of the following, was born Aug. 13, 1599, became in 1630 professor of Hebrew at Bâle, where he later held other professorships. Died Aug. 16, 1664. He published various learned works, among which are a treatise on the Hebrew vowel-points and a Chaldee and Syriac lexicon.

Buxtorf (JOHANN JAKOB) was born Sept. 4, 1645, and died April 1, 1704. He also was a good Hebraist, but published nothing except a preface to his grandfather's "Tiberias" (1665), and a revised edition of his "Synagoga Judaica" (1680). He was professor at Bâle from 1669.

Buxtorf (JOHANN, TERTIUS), nephew of the preceding, was born Jan. 8, 1663, became professor at Bâle in 1704, and died June 19, 1732. His principal work is the "Catalecta Philologico-theologica," etc.

Buxus. See BOX.

Buyck'ville, a township of Elmore co., Ala. Pop. 806.

Buzançais, a town of France, department of Indre, on the river Indre, 46 miles S. E. of Tours. Here are extensive iron-works. Pop. in 1866, 5145.

Buz'zard (*Buteo*), a genus of birds of the order Raptores and family Falconidæ, having a small bill, which bends from the base and is not notched. They resemble the eagle and falcon in form, but are inferior in size and courage. The common buzzard (*Buteo vulgaris*), a native of Europe and North America, measures nearly four feet from tip to tip of the wings. It is sluggish and inactive compared with other birds of prey. The prevailing color of its plumage on the upper parts is brown, with a mixture of black. The rough-legged buzzard (*Buteo lagopus*) is similar to the *Buteo vulgaris*, but it may be distinguished by its having the tarsi feathered to the toes. It is widely distributed in Europe and Africa, and is found in North America. Among the other species of this genus is the red-tailed hawk of the U. S. (*Buteo borealis*), which often kills poultry. The American bird called turkey-buzzard belongs to the genus CATHARTES (which see).

Buzzard's Bay, in the S. part of Massachusetts, is 30 miles long, has an average width of 7 miles, and contains the harbors of New Bedford, Fairhaven, and Wareham. It is sheltered from the ocean by the Elizabeth Islands.

By-bidding, bidding at an auction sale by a person on behalf of the owner of the property sold, and with no intent of purchasing it. It may be for either one of two purposes—either to prevent the property from being sold below its value, or to raise its price beyond its value. The former act is supposed to be lawful; the latter is illegal, and the buyer may make use of it to avoid the sale. By-bidders are sometimes called "puffers." (See AUCTION.)

Byb'los, or Byblus [Gr. Βύβλος], an ancient city of Phœnicia, on the Mediterranean, about 22 miles N. N. E. of Berytus, was called *Giblah* by the Hebrew writers. It was near the base of Mount Lebanon, and was said to be the native place of Adonis or Thammuz. This site is occupied by the modern town of Jubeil, and ruins of a Roman theatre.

Byblos [Gr. Βύβλος], an ancient town in the delta of Egypt, was celebrated for its manufacture of papyrus, the chief writing-material of the civilized world. It stood in a marshy tract which produced in abundance the byblus or papyrus plant (*Cyperus antiquorum*).

By'ford (William Heath), M. D., was born at Eaton, Preble co., O., Mar. 20, 1817, was self-educated, became an active practitioner in Chicago, president of faculty and professor of clinical surgery in the Woman's Hospital Medical College, was twice president of the American Medical Association, author of "Philosophy of Domestic Life," "Chronic Inflammation of the Unimpregnated Uterus," "Practice of Medicine and Surgery applied to Diseases and Accidents peculiar to Women," "Theory and Practice of Obstetrics," etc.

By-laws, regulations made by a corporation for its own government or that of its members. It is a general rule that the power to make by-laws is incidental to the existence of a corporation. It is sometimes conferred expressly in the charter upon the corporation, or vested in a select body of persons, such as directors. Where the charter is silent, the power appertains to the corporation itself. By-laws must be reasonable and consistent with law. If a penalty for breach of a by-law be imposed, it may be collected by action. The by-laws of municipal corporations are usually termed "ordinances." A city in making such an ordinance usually acts in a *quasi* legislative character. It would not, for example, be responsible if the ordinance should be broken by one of the citizens and a person should suffer damage by the breach. Thus, if there were an ordinance that no owner of swine should allow them to run at large, yet if an owner did so permit them to run to the injury of his neighbor, an action would not lie against the city, but only against the wrong-doer.

Byles (Mather), D. D., born in Boston, Mass., Mar. 26, 1706. His father was a native of England; on his mother's side he descended from the Rev. Richard Mather and the Rev. John Cotton. He graduated at Harvard College in 1725, and was ordained first pastor of Hollis street church, Boston, 1733. He soon attained eminence in his profession, and also attracted considerable attention by his poetical talents. He continued happily with his parish till the excitement preceding the Revolution created a distrust against him, and he was accused of being a Tory, and separated from his parish. Charges were afterwards made against him that he prayed for the king and received visits from British officers, and in May, 1777, he was publicly denounced in town-meeting. On the 2d of June following he was placed on trial, pronounced guilty and ordered to be confined on a guardship, and in forty days to be sent to England with his family: this sentence, however, was not executed, but he was confined to his own house, where a guard was placed over it, which was afterwards removed, but again replaced and again dismissed, causing him to say that he was "guarded, reguarded, and disregarded." His literary talent was recognized by many men of genius in England, and among his correspondents were Pope, Swift, Lansdowne, and Watts. He continued to reside in Boston, but was not again connected with any parish, till his death, which occurred July 5, 1788.

Bynæ'us (Anthony), a Dutch Orientalist, born at Utrecht Aug. 6, 1654, became a Protestant minister and a proficient in Hebrew and Syriac literature, and published a treatise on Hebrew vowel-points and several sermons and commentaries. Died at Deventer Nov. 8, 1698.

Byng (John), an admiral, a son of Lord Torrington, was born in 1704. He gained the rank of admiral of the red in 1748. In 1756 he commanded an expedition sent to relieve Minorca, then blockaded by the French. He failed, and was accused of cowardice by the ministers, who sought to divert attention from their own inefficient measures by sacrificing him to the public indignation. He was tried by a court-martial and shot Mar. 14, 1757.

Byng Inlet, a port of entry of the province of Ontario (Canada), on the N. side of Georgian Bay, Lake Huron, has very extensive saw-mills, whence 20,000,000 feet of lumber are yearly sent to the U. S. It is visited in winter by dog-sledges, and in summer by regular steamers. Pop. about 200.

By'ram, a township of Sussex co., N. J. Pop. 1332.

Byrd, a township of Cape Girardeau co., Mo. P. 2112.

Byrd, a township of Brown co., O. Pop. 1251.

Byrd, a township of Goochland co., Va. Pop. 3216.

Byrd (William), F. R. S., born at Westover, Va., Mar. 28, 1674, studied law in London, and long held important offices in Virginia. He was a patron of literature, and laid out in 1733 the towns of Petersburg and Richmond. He wrote many valuable sketches of his travels in Virginia. Some of his writings were published by Edmund Ruffin as "The Westover Manuscripts" (1841). Died Aug. 26, 1744.

By'rom (John), F. R. S., an English writer, born near Manchester in 1691, was educated at Cambridge. He wrote prose and verse, contributed to Addison's "Spectator," and invented a system of shorthand. Died Sept. 28, 1763.

By'ron, a post-village of Shiawassee co., Mich.

Byron, a post-township of Ogle co., Ill. Pop. 1093.

Byron, a township of Buchanan co., Ia. Pop. 1195.

Byron, a post-township of Oxford co., Me. It has manufactures of lumber. Pop. 242.

Byron, a township of Kent co., Mich. Pop. 1326.

Byron, a township of Wauseca co., Minn. Pop. 253.

Byron, a post-township of Genesee co., N. Y., contains several mineral springs. Pop. 1734.

Byron, a post-township of Fond du Lac co., Wis. Pop. 1441.

Byron (George Gordon Noel), Lord, an eminent English poet, was born in London the 22d of Jan., 1788. He belonged to an ancient Norman family whose name was variously written Burun, Biron, and Byron. John Byron, the poet's grandfather, was a noted English admiral. Captain Byron, the son of the admiral, married Catherine Gordon, a Scottish heiress, who had only one son, the subject of this notice. Captain Byron was distinguished for nothing but his vices. Having squandered a large portion of his wife's property, he deserted her, after which she retired to Scotland, and resided for some time at Aberdeen, where young Byron received the first rudiments of his education. Before he was seven years old, with his mother he visited the Highlands, the picturesque beauty of which, even at that age, made, it is said, a powerful impression on his mind. When he was ten years old he succeeded to the estate and title of his grand-uncle, William, fifth Lord Byron, who had resided at Newstead Abbey, where he died in 1798. The poet had a congenital deformity of his feet, which rendered him lame, and which was during his whole life a bitter mortification to him. When he was about twelve years old he was sent to school at Harrow. While here he became acquainted with Miss Chaworth, for whom he conceived a romantic and passionate love. She was the heiress of Annesley, which was adjacent to Newstead, the estate to which Byron had succeeded. This appears to have been one of the truest and deepest attachments of his life, and he seems to have fully persuaded himself that if he had married Miss Chaworth he would have been a far better as well as a happier man. He went in 1805 to Cambridge, which he left two years afterwards without taking a degree. While at the university he published (1807) a volume of poems, "Hours of Idleness," which was criticised in the "Edinburgh Review." This critique was written by Mr. (afterwards Lord) Brougham, but Byron always supposed that Jeffrey was the author. In retaliation he wrote "English Bards and Scotch Reviewers," which may be said to have laid the foundation of his fame. This satire, though evincing great talent in its way, is in many parts egregiously unjust, as, for example, where the satirist speaks of Scott. It is but just to add that Byron himself afterwards deeply regretted the publication of the poem, and did everything in his power to suppress it.

In 1809, in company with his friend Mr. Hobhouse, Byron commenced his travels through different parts of Europe, Spain, Portugal, European Turkey, and Greece. After an absence of about two years, he returned to England and published the first two cantos of "Childe Harold's Pilgrimage," which were received with extraordinary favor, so that, as he himself informs us, he "awoke one morning and found himself famous." He soon after took his seat in the British House of Peers. At one time it would appear that he thought seriously of giving himself up to politics, but he soon changed his purpose and turned his attention again to poetry. Within the next two or three years he produced several minor poems of exquisite beauty—namely, "The Giaour," "The Bride of Abydos," "The Corsair," "Lara," "The Siege of Corinth," "Parisina," and "The Prisoner of Chillon." On the 2d of Jan., 1815, he was married to Miss Isabella Millbanke, only daughter of Sir Ralph Millbanke, afterwards Noel. She was regarded as a great heiress. But, if Byron may be believed, his fortune was but little improved by this marriage. He says, "All

I have ever received or am likely to receive (and that has been twice paid back, too) was £10,000." The union was a very unhappy one, as well on account of Lord Byron's licentious habits as the incompatibility of temper of the two parties.

Lady Byron gave birth to a daughter, Ada, who became afterwards the countess of Lovelace. She was Lord Byron's only legitimate child; he addresses her in "Childe Harold" as "sole daughter of my house and heart."

Not long after the birth of Ada, his wife left him, and, taking the child with her, went to her father's. He left England early in 1816, resolved never again to return to his native land. Passing through Belgium, he visited the field of Waterloo; he subsequently went to Switzerland, and resided near Geneva. Here he wrote the third canto of "Childe Harold." He afterwards abode some time in Venice. He next visited Ravenna, where he formed a *liaison* with the countess of Guiccioli, whose sprightly and imaginative character, no less than her personal beauty, powerfully attracted him. While at Pisa in 1822 he experienced a great sorrow in the tragic death of his friend, the poet Shelley. Early in 1822, Byron, Shelley, and Leigh Hunt were associated in the publication of a journal styled "The Liberal," but Byron and Hunt quarrelled soon after the death of Shelley, and "The Liberal" was discontinued.

While in Italy, Byron wrote several of his most admired poems, including the fourth canto of "Childe Harold," "Mazeppa," "Manfred," "Cain, a Mystery," "Marino Faliero," "The Two Foscari," "Sardanapalus," "Werner," and "Don Juan." He espoused with enthusiasm the cause of Greek independence, and in 1823 passed over from Italy to Cephalonia, where he spent several months. In the early part of 1824 he arrived at Missolonghi. He took, April 9, a severe cold, which caused his death on the 19th of April, 1824.

Byron's poetic genius was of a very high order, but he was more distinguished for the clearness and intensity of his intellect (if we may use this expression) than for its breadth or versatility. It has been said that Brougham's galling article in the "Edinburgh Review" "stung Byron into a poet," but this expression of course implies that he previously possessed the potentiality of genius. But whether the above remark be true or not, it is certain that Byron's intellect partook in a remarkable degree of the character of his emotional nature. It was only under the influence of intense feeling or passion that he could put forth his poetical powers with any success. And hence it is that everything he has written is so strongly colored with his own personal feelings. He was perhaps the most intensely subjective of all the great poets that ever lived. This explains why he had no genius for dramatic composition. He could only represent successfully those characters which resembled his own. His soul was not capacious nor calm enough to reflect without distortion the infinitely varied pictures presented by the comedy and tragedy of human life. But in his own department he has probably never been equalled—certainly never surpassed—by any poet either in ancient or modern times. His two most remarkable characteristics are, first, his power of expressing intense passion, particularly of the darker and fiercer kinds. "Never," says Macaulay, "had any writer so vast a command of the whole eloquence of scorn, misanthropy, and despair." Again, no poet ever displayed a more exquisite taste in the choice of his expressions, or a more admirable art in his manner of presenting to the imagination of his readers any subject, whether of the delightful or of the opposite kind. (See MOORE's "Life of Byron;" "Recollections of the Last Days of Shelley and Byron," by E. J. TRELAWNEY, 1858.) J. THOMAS.

Byron (HENRY JAMES), an English writer of burlesque dramas, is a lawyer by profession, and has contributed much to "London Fun," of which he was for a time the editor. His principal works are travesties of various popular and standard dramas and operas, but he has produced several comedies, pantomimes, and novels. He has also acquired distinction as an actor in London.

Byron (JOHN), VICE-ADMIRAL, grandfather of the poet and son of the fourth Lord Byron, born at Newstead Nov. 8, 1723, entered the navy, served in Anson's expedition of 1740, served against Louisburg in 1760, circumnavigated the globe (1764–66), and fought D'Estaing off Granada July 6, 1779, in the American war. Died April 10, 1786. He was familiarly known as "Foulweather Jack," and was a popular hero.

Bys'sus [Gr. βύσσος], a Greek word which occurs in the New Testament, and is translated "fine linen." (See Luke xvi. 19; Rev. xviii. 12.) Some suppose it was cotton or silk.

Byssus, a name given to a bundle of silky or shining, semi-transparent, horny filaments by which many bivalve mollusks attach themselves to rocks or other fixed substances. These filaments are secreted by a gland at the base of the foot of the animal. They are guided to their place by the foot, and expand into a sort of disk at the point of attachment. An example of the byssus may be seen in common mussels. The *Pinna* of the Mediterranean produces long and strong filaments of a silky lustre, which can be woven into cloth. This cloth is highly prized, but the *Pinna* has become so rare that it cannot be produced in large quantities.

By'ström (JOHAN NILS), a Swedish sculptor, born at Philippstad Dec. 18, 1783, studied at Rome. He became a resident of Stockholm in 1816. Among his works are "Pandora Combing her Hair," a statue of Linnæus, and a colossal statue of Gustavus Adolphus. Died at Rome Mar. 13, 1848.

Byttneria'ceæ [from *Byttneria*, one of the genera], a natural order of exogenous plants, closely allied to the Malvaceæ, consists of trees and shrubs, mostly tropical or sub-tropical, with simple leaves and monadelphous stamens, the anthers of which are turned inward. The order comprises nearly 400 species, many of which have beautiful flowers. Florida has a few unimportant species. The *Guazuma ulmifolia*, a native of Brazil, bears an edible fruit. The fibrous bark of this and other species is used in the manufacture of cordage. The *Abroma augustum*, an East Indian tree, is commended as worthy of cultivation for its fibre, which is beautiful, fine, and strong, and is produced in abundance. This tree bears beautiful purple flowers. Among the other species of the order is *Theobroma Cacao*, from the seeds of which chocolate and cacao are obtained. Several others are useful, as yielding fibres, fruits, or medicines.

Byz'antine, or **Bezant** [from Byzantium, the old name of Constantinople], in numismatics, is a term applied to a coin of the Byzantine empire. These coins were of gold, silver, and bronze, bore impressions distinct from the earlier Roman coins, and were copied in several countries. They were current in the north of Europe, and even in India. The silver bezant was worth about 10*s.* sterling. The gold bezant was worth at one time fifteen pounds sterling.

Byzantine Art, in ornament and architecture, is that symbolic system which originated at Byzantium (or Constantinople), and was developed by the Greek artists out of the Christian symbolism. During the Dark Ages, after Rome had been conquered by the Goths and Huns, and the fine arts had been nearly extinguished by the influx of barbarism, many Western artists retired to Constantinople, and founded a school by which the traditions of antique and classical art were cherished, and modified by whatever was new and peculiar in the Christian system. The great features of this style are the circle and dome, the round arch, and all the various details of form which are derived from the lily, the cross, the nimbus, and other symbols. Among the finest specimens of this style of architecture are the mosque of St. Sophia at Constantinople and the church of St. Mark at Venice.

At the Renaissance, Italian and other artists in every department derived from living Greek or Byzantine artists the technical rudiments of their respective arts, which could scarcely have been learned by a mere examination of ancient works. The school of Byzantine art, as modified by Christian ideas and symbols, commenced in the time of Justinian, and continued to flourish until 1200 or later. After it had been banished from Constantinople by the Turks, who captured that city in 1453, it was cherished by the Greek Church to form the basis of artistic life in Russia.

Byzantine Empire, also called the **Eastern** or **Greek Empire,** is the name of a former empire of Europe which came into existence in 395 A. D., upon the death of the Roman emperor Theodosius the Great, who divided his empire between his two sons, Arcadius and Honorius. While the latter received the western half as his portion, Arcadius became ruler of the Eastern empire, then comprising Syria, Asia Minor, Pontus, Egypt, Thrace, Mœsia, Macedonia, Crete, and Greece, with the capital, Constantinople. The history of the Byzantine empire extends from 395 A. D. to 1453. During the reign of Arcadius ambitious politicians wielded an unlimited power, and oppressed the people to satisfy their rapacity. Arcadius was followed by his seven-year-old son, Theodosius II. (408–450), for whom a prefect ruled with wisdom and strength. In 415 he took his sister Pulcheria as co-regent, who from that time took charge of the entire administration. Peace and prosperity reigned during Theodosius's rule, and were only interrupted by a short war with Persia in 422, which led to the acquisition of a part of Armenia. But peace with Attila, king of the Huns, could only be purchased by large tracts of land on the Danube and large sums of money. Upon the death

of Theodosius he was succeeded by his sister Pulcheria. She married the senator Marcianus, who reigned until 457. Under Justinian (527–565), who became famous by his legislation and the victories of his generals, Belisarius and Narses, the Byzantine empire gained great influence and power among the other nations, while in the interior the dissensions of the parties were quelled effectually. Under the nephew and successor of Justinian (Justinus II., 565–578) the empire suffered from invasions of the Lombards and Persians. In 718, Leo III. ascended the throne, and continued to sustain himself in spite of the contest concerning the worship of images, which continued for over a century, and the attacks of the Arabs. He died in 741. He conquered Phrygia from the Arabs, but lost the last remnant of territory in Italy. Basilius I. Macedo, the founder of the Macedonian dynasty, ascended the throne in 867. He introduced reforms in all branches of the administration, and revised the laws of Justinian. He was succeeded by his son, Leo VI., who called upon the Turks to aid him against the Saracens, and thus opened the way for the Turks. After the extinction of the Macedonian dynasty, in 1057, Isaac Comnenus was raised to the throne by the unanimous vote of the army. He introduced many reforms, and entered a monastery in 1059. Among his successors, Alexius I., who began to rule in 1081, was the most important. He increased the area of the empire considerably. The dynasty of the Comnenian emperors continued to rule until 1204. In 1204, Constantinople was taken by the French and Venetians (called the Latins), who then became masters of the whole empire. They divided it into four parts, giving the first, with the capital, to Baldwin, count of Flanders, who was made emperor, and whom the other participants in the expedition recognized as their sovereign. The Venetians received as their share the countries bordering on the Adriatic and Ægean Seas, a part of the Morea, together with several islands; Bonifacius, count of Montferrat, Macedonia and part of Greece; dukedoms, countships, principalities, etc. were established at various places; while a number of Greek princes maintained their independence. Under Theodorus Lascaris, who had been elected emperor at Constantinople, an empire was formed at Nicæa (Nice), and in Trebizond Alexius Comnenus ruled with absolute power. One of his successors, John Comnenus, became emperor of Trebizond. Neither Baldwin nor his successors could do anything to avert the impending ruin. Baldwin was taken prisoner by the Bulgarians, and died in 1206. His brother Henry ruled bravely and wisely till 1216, when the empire became a prey to utter anarchy.

The dynasty of the Palæologi began with Michael VIII. Palæologus, who, by the help of the Genoese, captured Constantinople in 1261. Michael, the first of the Palæologi, was an able prince, but offended both clergy and people by an attempt to unite the Greek and Latin churches. Andronicus III., a great-grandson of Michael, became emperor in 1328. During his reign the Turks took Nicæa and Nicomedia and devastated the European coasts. In the reign of his son, Johannes V., the Turks began to gain ground in Europe, and in 1362 Sultan Amurath had made Adrianople his capital. Under the following rulers the empire rapidly declined, giving way more and more to the advancing forces of Turks, until on May 28, 1453, with the capture of Constantinople by Mohammed II. and the death of Constantine XI., the Byzantine empire came to an end, and the Turkish rule was, after centuries of fierce warfare, firmly established in Europe. A. J. Schem.

Byzantine Historians are those Greek writers who have treated of the history of the Byzantine empire. They are divided into three classes: 1. Those whose works refer exclusively to Byzantine history; 2. Those who professedly occupy themselves with universal history, but at the same time treat Byzantine history at disproportionate length; 3. Those who write on Byzantine customs, antiquities, architecture, etc. The most interesting and instructive among them are those who confine their attention to a limited number of years, and to the events which transpired under their own observation or in which they took part. The Byzantine historians flourished from about 300 A. D. to 1453, the date of the capture of their city by the Turks. Among the most eminent of these very numerous writers we may reckon Procopius (about 500–565 A. D.), an excellent historian; Acropolita (1220–83), whose chronicle is but short; Cinnamus (twelfth century), an able but strongly prejudiced writer; Georgius Pachymeres (1242–1310), one of the best of the later Byzantines; Anna Comnena (1083–1148), a romantic and untrustworthy writer; Nicephorus Bryennius (died 1137), the husband of the last named, and one of the most accomplished historians of his age; the emperor John (V.) Cantacuzenus (about 1300–55), a very partial historian; Nicephorus the patriarch (758–828), one of the best of all; Nicetas (twelfth and thirteenth centuries), whose writings are highly valued; and Nicholas Chalcocondyles (who was alive late in the fifteenth century), one of the latest, treating of the history both of his own people and of the Turks. Of some of these, and of others, there are many writings yet unpublished, so that this field of historical research contains much fresh, if perhaps unproductive, soil. As a class, the Byzantine writers are turgid and bombastic, full of prejudice and conceit, and the proper estimation of their value requires much labor and discrimination. The principal Byzantine histories were collected and published at Paris in 36 vols., with Latin translations, under the editorship of P. Philippe Labbé, a Jesuit, and his successors (1648–1711). This magnificent collection was reprinted, with additions, at Venice (1727–33). In 1828, Niebuhr, assisted by Bekker, the two Dindorfs, Schopen, Meinecke, and Lachmann, began a new "Corpus Scriptorum Historiæ Byzantinæ," the forty-eighth volume of which appeared in 1855.

Byzantine Rescension is a Greek text of the New Testament, which was used in Constantinople after it became a metropolitan see in the Eastern Church. It is cited by several Greek Fathers, and was used as the basis of the old Slavic version. It corresponded quite nearly with the present "received text" and with many existing MSS.

Byzan'tium [Gr. Βυζάντιον], an ancient Greek city, situated on the Thracian Bosporus and on the site of the modern Constantinople. It is said to have been founded by a colony of Megarians in 667 B. C. It increased rapidly, and soon became an important commercial city. Few cities could boast so magnificent a position. Commanding, as it did, the two shores of both Europe and Asia, at the same time secure and advantageously situated for commerce, it had at its command the choicest gifts of nature and the most charming scenery. Byzantium was very anciently the site of extensive tunny-fisheries, the fishes visiting the port periodically in immense numbers, as they do at the present day. The fish were salted and exported. The name "Golden Horn," still applied to a part of the channel of Constantinople, was probably derived from the great revenue flowing from this fishery. The Byzantines also levied a considerable toll on vessels passing from sea to sea. The levying of these tolls once involved them in war with the Rhodians. They also derived much profit from their rich corn-fields, not far from the city. On the S. it was bathed by the Propontis (Sea of Mármora), and on the N. by the waters of the Golden Horn. Having been captured by a general of Darius Hystaspis, it was liberated by Pausanias about 478 B. C. A few years later Byzantium became an ally or tributary of Athens, against which it revolted in 440 B. C. It was besieged and taken by Alcibiades in 408. Philip of Macedon besieged it in 340 B. C., but Demosthenes persuaded the Athenians to send a fleet which compelled him to raise the siege. This repulse of Philip was one of the proudest feats of the great orator, who often recurs to it in his speech "On the Crown." Byzantium was for ages especially exposed to the attacks of barbarians, but the long wars did not beget much valor in the people. From their great commercial prosperity they early became corrupted, and they were proverbially indolent, cowardly, and luxurious. Byzantium was probably either a kingdom or the seat of a tyrannus; afterwards it became an aristocracy, and later a crude democracy.

The Byzantians suffered much from the predatory incursions of the Gauls, and being unable to resist them in battle, agreed about 279 B. C. to pay them an annual tribute. This city supported Pescennius Niger in the civil war against Septimius Severus, who captured it in 196 A. D., after a brave resistance of three years' duration. He then reduced it almost to ruin, but afterwards relented and partially restored it. The name of *Augusta Antonina* was given to it in his time. The Greek Christians ascribe the foundation of the Byzantine Church to the labors of Saint Andrew the apostle, but this statement is unsupported by trustworthy evidence. It is, however, certain that soon after 200 A. D. there were numerous Christians in the city. In 330 A. D. Constantine the Great selected this place as the capital of his empire, and founded a new city, to which he gave the name of New Rome. This city of Constantine was much more extensive than Byzantium, which occupied in all probability only the most eastern of the seven hills on which the modern capital is built. (See Constantinople.)

Revised by C. W. Greene.

Bzo'vius, or **Bzowski** (Abraham), a Roman Catholic historian, born at Proczovic, Poland, in 1597. He was a zealous Dominican prior, and was called to Rome by Pius V., where he wrote nine volumes of a continuation of the "Annals of Baronius," an "Ecclesiastical History" (3 vols. folio, 1817), and other historical works, besides numerous sermons and biographies of several popes. Died Jan. 31, 1637.

C.

C, the third letter of most European alphabets, is in English either a palatal mute, with the sound of *k*, a sound which it has before *a*, *o*, *u*, and the consonants (except *h*), unless marked with the cedilla, thus, *ç*, as in *façade* and other words, mostly from the French and Portuguese. When marked with the cedilla, or when occurring before *e*, *i*, or *y*, it has the sibilant sound of *s*. *Ch* has (1) the Spanish sound, as in the word *church*; (2) the French sound (equivalent to *sh*, the German *sch*), as in *chaise*; and (3) the hard sound, equivalent to *k*, as in *chord*. The German guttural *ch* is never used in English. C in music is the first note of the natural diatonic scale. C in Latin stood for 100, and also for the prænomen Caius. In chemistry it is the symbol of carbon; and *c. c.* is an abbreviation for "cubic centimètre."

Caa'ing Whale [Scottish for "driving whale"], the *Globiocephalus deductor*, a large porpoise which abounds in large herds on the coasts of Great Britain, North America, Iceland, etc. It takes its name from the fact that when one of the herd is stranded, the rest all follow it, sometimes as many as 100 at once rushing to their own destruction in this manner. They are the source of rich booty to fishermen. Other species of the genus inhabit the Mediterranean, the Pacific, etc. It is one of the "bottle-head" whales of North America, and is most frequently caught in Scotland.

Cabal', a secret council formed under the reign of Charles II. (1667), consisted of the following members: Sir Thomas, afterwards Lord Clifford, Lord Arlington, the duke of Buckingham, Lord Ashley, afterwards earl of Shaftesbury, and the earl of Lauderdale. The Cabal was dissolved in 1674. The prevailing opinion, that the word was formed from the initials of the names of its members, is perhaps erroneous, as it had been used before to denote a secret cabinet, and is said to be derived from the Hebrew (see CABBALA), but this accidental association of the initial letters may have suggested this particular application of the name.

Cabanel (ALEXANDRE), a French historical painter, born at Montpellier Sept. 28, 1823, obtained a first medal at the Paris exhibition of 1855. Among his masterpieces we may name "The Florentine Poet" and "The Lost Paradise."

Cabanis (PIERRE JEAN GEORGE), an eminent French philosopher and physician, born near Saintes (Corrèze) June 5, 1757. He was a friend and political partisan of Mirabeau, whom he attended in his last illness. He was admitted into the Institute in 1796, and became professor of medicine in Paris in 1797. In the early part of his life he was an atheist. His principal work is the "Relations between the Physical System and Mental Faculties of Man" ("Rapports du Physique et du Moral de l'Homme," 1802), in which he maintained that "the brain secretes thought as the liver secretes bile." But he afterwards changed his opinions in this respect, and adopted theistic views. Died May 5, 1808.

Cabar'rus, a county in S. W. Central North Carolina. Area, 350 square miles. It is drained by branches of Rocky River. The surface is hilly; the soil in some parts is fertile. Gold and copper are found. Cattle, grain, cotton, and wool are the chief products. It is intersected by the North Carolina R. R. Capital, Concord. Pop. 11,954.

Cab'bage [Fr. *chou*; Ger. *Kohl*], a variety of the *Brassica oleracea*, a plant of the order Cruciferæ. Other varieties of this species are the broccoli, cauliflower, and kale. Cabbages are of many sorts, which are divided into common and Savoy cabbages, the latter being characterized by wrinkled leaves. They are also divided into early and late cabbages, which differ remarkably in their periods of growth. The cabbage requires a good soil and clean culture, and furnishes not only a cheap, palatable food for mankind, but is very useful as a forage plant. It may be remarked that although boiled cabbage occasionally acts as a poison on certain peculiar constitutions, uncooked cabbage in the form of a salad is generally very wholesome.

Cab'bage But'terfly, a name common to several species of butterfly, the larvæ of which devour the leaves of plants of the cabbage tribe, and are popularly known as cabbage worms. They belong mostly to the genus *Pieris*, are natives of Europe, but have been introduced into America. The excessive multiplication of these insects is generally prevented by small birds, which devour them and their caterpillars, and by insects of the ichneumon tribe, which lay their eggs in the caterpillars, that their own larvæ may feed on them.

Cabbage-Fly (*Anthomyia brassicæ*), a fly of the same family with the house-fly, flesh-fly, etc., of which the maggots often do injury to the roots of cabbages. It is of the same genus with the turnip-fly, onion-fly, etc. They are found in both continents, and are very destructive.

Cabbage-Palm, or **Cabbage Tree**, a name given to several species of palm, the great terminal bud of which is eaten like cabbage. The cabbage-palm of the West Indies is the *Areca oleracea*, which grows to the height of 130 feet or more. (See ARECA.) The palmetto (*Chamærops palmetto*) is sometimes called cabbage-palm.

Cab'bala [Heb., קבלה, "that which is received" (by tradition), from קבל (*kibbel*), to "receive"], an ancient Jewish system of religious philosophy or theosophy. Those who have studied the subject with the greatest care are not fully agreed among themselves as to its origin and character. The Cabbala attempted to explain the nature of God and of the universe. Some of the late writers of this school taught that God has neither will, intention, desire, nor action, but that ten *Sephiroth*, or intelligences, emanated from God. The first *Sephirah* is called the *Inscrutable Height* (from which the second was derived, as the third from the second, and so on). The names of the other intelligences in order are wisdom, intellect, grace, power, beauty, firmness, splendor, foundation, and authority. As God became active in these *Sephiroth*, so these become externally manifested in the universe.

The psychology of the Cabbala teaches the doctrine of the transmigration of souls, but as the literature of the system is immense, and its teachings recondite and often puerile, it is difficult and unnecessary to state exactly what this philosophy taught. It probably influenced and was influenced by the philosophy known as Neo-Platonism. According to Hallam, the Cabbala originated with the Alexandrian Jews near the beginning of the Christian era.

Cab'balists, the name given to those Jews who believe in the Cabbala, or traditional interpretation of the Pentateuch, said to have been received by Moses from God on Mount Sinai. (See preceding article.)

Cab'ell, a county in the W. part of West Virginia. Area, 448 square miles. It is bounded on the N. W. by the Ohio River, and intersected by the Guyandotte. The surface is hilly or uneven; the soil is partly fertile. Tobacco and grain are the chief products. Capital, Cabell Court-house. It is intersected by the Chesapeake and Ohio R. R. Pop. 6429.

Cabell (JAMES LAWRENCE), A. M., M. D., LL.D. See APPENDIX.

Cabell (ROBERT H.), M. D. See APPENDIX.

Cabell Court-house. See BARBOURSVILLE.

Cabet (ÉTIENNE), a French socialist, born at Dijon Jan. 2, 1788. He was a radical democrat in politics and a leader of the Carbonari. In 1842 he published a romantic work called "Travels in Icaria," which was very popular among the workingmen of Paris. He planted in 1846 a colony on the communist system in Texas, from which he and his followers removed in 1849 to Nauvoo, Ill., after that town had been deserted by the Mormons. Died Nov. 9, 1856. His colony was broken up in 1857.

Cabe'za del Buey, a town of Spain, in the province of Badajos, on the northern slope of the Sierra Pedregoso, 112 miles by rail E. S. E. of Badajos. It has manufactures of linen and woollen goods. Pop. 6294.

Cab'in [Fr. *cabane*], a small room or enclosure; a cottage, small house, or rudely-built temporary residence. Also an apartment in a ship or steamboat for the use of the officers and passengers. These apartments in steamboats are often called saloons. In ships of war the rooms of the admirals and captains are called state cabins, and are fitted up with much elegance, with a gallery or balcony projecting at the stern. All cabins of a ship of war are enclosed by panelling, so that the partitions are readily removed when it is necessary to clear the decks for action.

Cabin Creek, a township of Kanawha co., West Va. Pop. 2437.

Cab'inet, a closet; a small room or retired apartment, a private room in which consultations are held; a piece of furniture, consisting of a chest or box with drawers and

doors; a small room used as a repository for works of art, antiquities, medals, specimens of natural history, etc. The term cabinet is also applied to a collection of such objects. A cabinet picture is a painting suitable for a cabinet or small room. These are generally of small dimensions and finely finished.

Cabinet, in politics, a select council of an executive chief; a committee of ministers or the governing council of a country, so called from the cabinet or apartment in which the ruler assembles his privy council. In the U. S. the cabinet is composed of seven heads of departments—namely, secretary of state, secretary of the treasury, secretary of war, secretary of the navy, secretary of the interior, postmaster-general, and attorney-general. In England a variable number of ministers (usually about fifteen) are by official usage members of the cabinet, and are called cabinet ministers, but they have no recognized legal character. The names of the members who compose the cabinet are never officially announced; no record is kept of its resolutions or meetings, nor has its existence been recognized by any act of Parliament. The British cabinet always includes the first lord of the treasury (who is prime minister), the lord chancellor, the chancellor of the exchequer, the president of the council, and five secretaries of state.

Cabin Run, a township of Mineral co., West Va. Pop. 822.

Cabi'ri, or **Cabeiri** [Gr. Κάβειροι], ancient divinities worshipped in Samothrace, Phœnicia, Greece, and other countries. The myth of the Cabiri is obscure, and not well explained by ancient writers. Their worship was performed with much solemnity and mystery.

Ca'ble, a rope or a chain, employed on shipboard to suspend and retain the anchors, and for other purposes. The name is often applied to wire ropes, especially such as are used in suspension bridges, to submarine telegraph lines, etc. Rope cables are made of the best hemp, of manilla, or of coir. The circumference varies from about three inches to twenty-six. A number of yarns are twisted to form a *lissum;* three lissums, twisted in an opposite direction, form a *plain-laid* or *strand;* and three or four strands twisted in the direction of the yarns in a lissum form a *cable.* The strength of a cable eighteen inches in circumference is about sixty tons; the strength varies according to the cube of the diameter. On shipboard, cables receive the names of *chief* cables, *bower* cables, etc., according to the anchor to which they are attached. Hempen cables are now generally spun by the wonderfully ingenious machinery invented by the late Prof. Treadwell of Harvard College.

Chain cables consist of links, the length of each of which is about six diameters of the iron of which it is made, and the breadth about three and a half diameters. The stay-pins, to strengthen the links, are of cast-iron. The sizes of chain cables are denoted by the thickness of the rod-iron for the links.

The defects in chain cables as compared with those of hemp are the greater weight, the less elasticity, and the greater care required in management; but the advantages more than counterbalance these defects, and have led to the very extensive adoption of chain cables. Wire cables are sometimes used for the standing rigging of ships.

Cable City, a post-township of Deer Lodge co., Mon. Pop. 280.

Cabochiens, a number of journeymen butchers who took their name from their leader, Jean Caboche. They were partisans of John, duke of Burgundy, whose cause they maintained against the Armagnacs. Their outrages in Paris caused the citizens to rise against them in 1418.

Ca'bo Fri'o (*i. e.* "cool cape"), a city and seaport of Brazil, is on the Atlantic, near a cape of its own name, 75 miles N. E. of Rio Janeiro. It is at the S. E. extremity of Lake Araruama.

Cabomba'ceæ [from *Cabomba,* one of the genera], a small natural order of exogenous aquatic plants, allied to the Nymphæaceæ. They are indigenous in North and South America and Australia, and are distinguished by their distinct carpels, abundant albumen in the seeds, and the absence of a torus. They are included in the order Nymphæaceæ by some botanists.

Cabool', or **Cabul,** a fortified city of Afghanistan, on the Cabool River, here crossed by three bridges, is 80 miles N. N. E. of Ghuznee, and is elevated about 6400 feet above the level of the sea; lat. 34° 30′ N., lon. 69° 6′ E. The climate in winter is very severe. The citadel, called Bala Hissar, includes the palace of the khan, the government offices, royal gardens, and numerous dwellings. The streets are narrow; the houses are two or three stories high, and have flat roofs. The public buildings are not remarkable. Cabool is widely celebrated for the variety and excellent quality of its fruits, apples, pears, pomegranates, grapes, etc. It has an extensive trade as an entrepôt between India and Toorkistan. The people of Cabool are Mohammedans and a mixture of several races. Under the emperor Bäber, Cabool was the capital of the Mogul empire. It was taken by Tamerlane about 1400, and by Nädir Shah in 1738. The British captured it in 1839, but in Jan., 1842, the Afghans revolted and massacred the British army. Pop. estimated at 60,000.

Caboose, or **Camboose** [Ger. *Kabuse*], a name of the kitchen or cook-room in a merchant-ship. In coasting-vessels the term is applied to a portable cast-iron cooking-stove on the deck.

Cab'ot, a post-township of Washington co., Vt. It has manufactures of lumber, woollens, etc. Pop. 1279.

Cabot (George), a statesman and Federalist, born at Salem, Mass., Dec. 3, 1752. He was elected to the Senate of the U. S. in 1790, and was president of the Hartford Convention in 1814. He was distinguished for sound judgment, and was well versed in political economy. Died April 18, 1823.

Cabot (John), a foreign merchant of Bristol who after the discovery of America by Columbus was placed in command of a fleet of five vessels, which sailed in the spring of 1497. They reached the coast of Newfoundland June 24, and were in England again in August.

Cabot (Sebastian), an eminent navigator, a son of the preceding, was born in Bristol about 1477. He commanded a ship in his father's voyage, and in 1499 conducted another expedition, and visited the Gulf of Mexico. Having entered the service of Ferdinand, king of Spain, in 1512, he commanded an expedition which examined the coasts of Brazil and La Plata in 1526. He returned to England in 1548, after which a pension was granted to him by Edward VI. Died about 1557. (See Richard Biddle, "Memoir of Sebastian Cabot," 1831.)

Ca'bra (anc. *Ægabrum*), a town of Spain, in the province of Córdova, 30 miles S. S. E. of the city of Córdova. It has a college, a cathedral, a convent, and manufactures of linens, hats, soap, bricks, etc. The neighboring region is volcanic, and produces excellent wine. Pop. 11,500.

Cabral' (Pedro Alvarez), a Portuguese navigator noted as the discoverer of Brazil, was born about 1460. He commanded a fleet which Emmanuel of Portugal sent to the East Indies in 1500. Having been carried out of his course by a westward ocean current, he discovered Brazil in April, 1500. He afterwards pursued his voyage to Calicut, and made conquests in India, where he founded the first Portuguese factory. He returned to Lisbon, where he arrived in June, 1501. Died about 1526.

Cabre'ra (Ramon), a Spanish general and Carlist, noted for his cruelty, was born at Tortosa Aug. 31, 1810. In the civil war which began about 1834 he fought for Don Carlos against the Christinos, and became a leader of guerillas. He gained a victory at Buñol in Feb., 1837, and took Valencia, but he was driven out of Spain by Espartero in 1840, and retired to France. He returned in 1848 and renewed the contest, but he was defeated and went into exile in Jan., 1849.

Caca'o, the fruit of the *Theobroma Cacao,* a tree of tropical America, of the order Byttneriaceæ. Chocolate is made of the roasted oily kernels of the cacao nut, which also yields cacao butter. This tree should not be confounded with the cocoanut tree nor with the coca of Peru.

Cacao Butter, a fixed oil, hard and solid at ordinary temperatures, which is yielded in large quantities by the fruit of *Theobroma Cacao.* It is extracted by heat and pressure. It contains a very large proportion of stearin, with some olein and palmitin. It is largely used in the preparation of cosmetics, and is especially useful in pharmacy in the preparation of suppositories. The mafurra tallow which is brought from Madagascar closely resembles the above in chemical and physical properties. Cacao butter is not to be confounded with cocoa butter, which is a kind of palm oil, used in the manufacture of soap.

Cac'apon, or **Great Cacapon,** a river of West Virginia, rises near the S. extremity of Hardy county, flows nearly north-eastward through Hampshire and Morgan counties, and enters the Potomac. Length, about 140 miles.

Cacapon, a township of Morgan co., West Va. P. 958.

Cacca'mo, a town of Sicily, in the province of Palermo, about 18 miles W. of the city of Palermo. P. 7253.

Cáceres, a province of Spain, bounded on the N. by Salamanca, on the E. by Avila, Toledo, and Ciudad Real, on the S. by Badajoz, and on the W. by Portugal. Area, 8014 square miles. It is intersected by the river Tagus. The surface is diversified by several ranges of mountains. Capital, Cáceres. Pop. 303,700.

Cáceres (anc. *Castra Cæcilia*), a town of Spain, capital of the above province, is situated on high ground 25 miles W. by N. from Trujillo. It contains an old castle, an episcopal palace, several convents and hospitals, a theatre, a Jesuits' college, and a bull-ring which is one of the largest in Spain. It has manufactures of linens, woollen goods, hats, soap, wine, etc. Interesting Roman and Moorish antiquities are found here. Pop. 13,466.

Cá'ceres, Nue'va (*i. e.* "New Cáceres"), a town of the Philippine Islands, in Luzon, on its S. E. coast, 184 miles S. or S. E. of Manila, a seat of a bishop. Pop. including suburbs, about 12,000.

Cachalot, kasha-lot, or **Sperm Whale** (*Catodon*

Cachalot, or Sperm Whale.

macrocephalus), one of the largest of all the Cetacea, is much sought after, not only on account of the oil, but also for the spermaceti and ambergris which it yields. Unlike the right-whale family, it affords no whalebone. The cachalot belongs to the family of Cetacea called Physeteridæ, of which there are three or four existing genera. The common cachalot has a very wide geographical range. It may be said to inhabit all seas, except those near the poles, although most abundant in the southern hemisphere. The cachalot sometimes attains the length of seventy or eighty feet. The head is enormous, forming about one-half of the entire bulk of the animal, and more than one-third of the length. The body tapers from the head to the tail. The color is dark gray, nearly black on the upper parts, but lighter beneath. Old males, or bull-whales, have a large gray spot on the front of the head. The muzzle is obtuse, as if suddenly cut off in front. In a protuberance on the front surface of the head is the blow-hole, which is single, and situated a little on the left side. The mouth is very large; and the throat, unlike that of the Greenland whale, is sufficiently wide to admit the body of a man. The upper jaw projects beyond the lower, and is destitute of teeth and whalebone, though rudimentary teeth exist within the gums; the lower jaw has from twenty to twenty-five teeth on each side, according to the age of the animal. The teeth are conical, projecting about two inches from the gum. The lower jaw is very narrow, the two branches being in contact throughout the greater part of its length. The cervical vertebræ, except the first, are consolidated into one. The dorsal fin is represented by a protuberance halfway between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal. The pectoral fins are small, and seem scarcely to aid in progression, which is accomplished by the large and powerful tail-fin, which is very broad, and is divided into two lobes, called flukes.

The head is in part occupied by a cartilaginous cavity in front of and above the skull, called by whalers *the case*, which is the chief receptacle for spermaceti. This substance being light, the animal in swimming raises its head above the surface of the water, which it also does even when at rest. The case frequently holds as much as ten large barrels of spermaceti. It is divided into compartments communicating with each other. The substance which it contains is a semi-fluid, but hardens on cooling; it consists of spermaceti and oil; the oil is separated by draining and squeezing. What purpose the spermaceti serves is not well known, except that of giving buoyancy to the fore part of the body; it is distinct from the brain, which is small. Cavities filled with spermaceti are distributed over the body and through the external fat or blubber. The blubber of the cachalot is not nearly equal in thickness to that of the Greenland whale, being only from eight to fourteen inches thick. It is removed from the body in great strips, and is heated in large pots, the skin of the whale serving for fuel. The *junk*, a thick elastic mass which lies immediately under the case, yields also considerable oil.

Squids and cuttle-fishes appear to be its chief food. Its herds are called *schools* or *pods* by whalers. Five hundred or more have been seen in a single herd. Large herds generally consist of females, with a few males; herds of young males also occur; solitary individuals are almost always old males. Terrible conflicts take place among the males, and it is not unusual to find the lower jaw dislocated or broken in consequence of these fights.

REVISED BY C. W. GREENE.

Cache, kåsh, a French word signifying a "hiding-place," is a name given in the Western U. S. to subterranean holes in which travellers and trappers hide provisions and other property, to preserve them from the depredations of the Indians and wild animals. They are carefully covered with sods, and the surface is made closely to resemble the surrounding earth, care being taken to leave no trace of the work.

Cache, a county of Utah, bordering on Idaho. Area, about 2000 square miles. It is intersected by Bear River, and bounded on the W. by the Wasatch range of mountains. The soil is partly productive. Some wool is raised. Capital, Logan. Pop. 8229.

Cache, a township of Green co. Ark. Pop. 766.

Cache, a township of Jackson co., Ark. Pop. 377.

Cache, a township of Lawrence co., Ark. Pop. 128.

Cache, a township of Monroe co., Ark. Pop. 1452.

Cache Creek, a post-township of Yolo co., Cal. Pop. 3067.

Cache River of Arkansas rises near the N. E. extremity of the State. It flows in a S. S. W. direction, and enters the White River near Clarendon. Length, about 150 miles.

Cachet, Lettres de, lêtr dẹh kȧ'shȧ', was a term applied in France under the old régime to letters or orders signed with the private seal of the king and used as instruments of despotic power. Before the seventeenth century they were not often employed, but in the reign of Louis XIV. they became very common. Many persons were arrested by such warrants and imprisoned without trial in the eighteenth century. It is stated that in the reign of Louis XV. lettres de cachet were sold by one of the mistresses of the king to any one who would pay money for them. About twenty-two of these warrants were issued against the famous Mirabeau. They were abolished in Jan., 1790.

Cachex'ia [from the Gr. καχεξία, a "bad habit" of body], in medical practice, a diseased or abnormal condition of the body. Cullen having given extensive circulation to the word as indicating a large group of chronic diseases, cachexia has come to be chiefly employed with reference to conditions in which the general nutrition of the body is at fault. Thus, cancerous cachexia indicates the state of ill-health associated with the growth of cancer in various parts of the body; gouty cachexia, the state of the general system in gout, as opposed to the mere local attack. All cachexias are associated with constitutional diseases, and most of them tend to become hereditary. The term is nearly synonymous with dyscrasia.

Cachica'ma, called also **Tatou-pe'ba,** the "nine-banded armadillo" (*Dasypus novem-cinctus*), an edentate mammal found from Texas to Paraguay. It is sixteen inches long, and has a long tail. Both body and tail are covered with plates, those of the tail in horny rings, and

those of the body (in part) disposed in nine bands, so united as to admit of some motion. This animal can be

Cachicama.

readily tamed. Its food is principally ants, but it also is fond of vegetables and of carrion.

Cach'olong, a beautiful mineral, sometimes called **Pearl Opal,** is a milk-white variety of opal, nearly allied to hydrophane. It is opaque and pearly, has a conchoidal fracture, and sometimes has a reddish tinge. The name is derived from the river Cach, in Bucharia, where it was first discovered.

Cac'odyle, or **Arsendimethyl,** is an extremely poisonous organic substance containing carbon, hydrogen, and arsenic ($C_4H_6As_2$). It has been proposed to employ the oxide of cacodyle as a deadly agent in war. This compound, known as *Cadet's fuming liquor,* has the property of taking fire spontaneously when exposed to the air, evolving abundant deadly fumes. Thus, a shell filled with it would, on bursting, cover the deck of a man-of-war with a liquid which would take fire of its own accord, and would likewise spread death by its fumes. The term *cacodyle* is from the Greek κακός, "bad," ὄζω, to "smell," and ὕλη, "matter" or "stuff." (See KAKODYLE.)

Cacou'na, a post-village and parish of Temiscouata co., province of Quebec (Canada), on the S. E. bank of the St. Lawrence, is the terminus of the Rivière du Loup division of the Grand Trunk Railway, and is a place of summer resort for salt-water bathing and for fishing and hunting. Pop. of village in 1871, 641; of parish, 1335.

Cacta'ceæ (named from *Cactus,* one of the genera), a natural order of exogenous plants remarkable for their gay and large flowers, and for the grotesque forms of some of the species, which are nearly all succulent. It comprises about 500 species, all natives of America, growing in hot climates and arid situations, to which they are well adapted by their thick skins, almost impervious to moisture. The so-called cactuses of the Old World are often Euphorbiaceæ; or, if they are really cactaceous, they are naturalized plants. The Cactaceæ for the most part are easily naturalized, and hence some species abound in Southern Europe and Asia. Most of them are leafless, and instead of leaves have clusters of hairs or prickles. Among their characteristic features are the numerous undistinguishable sepals and petals, the scattered stamens, the confluent styles, and the exalbuminous seeds. Their curious and vastly diversified forms constitute a remarkable feature in the vegetation of the warm regions of America. In some species, as the melon cactus or melon thistle, the stem swells into a globe. Other species have long creeping or trailing stems. This order comprises the night-blooming cereus, the *Opuntia* or prickly pear, which bears an edible fruit, and the nopal, on which the cochineal insect feeds. The stems of the Cactaceæ abound in a juice which affords a wholesome and valuable beverage to men and animals in the long dry season which prevails where they grow. Many species occur as epiphytes on forest trees. The Cactaceæ are extensively cultivated in greenhouses and hothouses in England and the U. S. Most of them are easily propagated by branches, which are allowed to dry a little before they are planted. Numerous species are natives of the U. S., especially in the extreme S. W.

Cactus. See CACTACEÆ.

Ca'cus, in classic mythology, an Italian robber and giant, said to be a son of Vulcan. He stole some oxen of Hercules, and dragged them by their tails into the cave which he usually inhabited, so that they could not be discovered by their tracks. Hercules, however, heard them bellow, and killed Cacus.*

Cadam'ba, or **Kudum'ba,** the wood of several species of *Nauclea,* a genus of East Indian trees of the order Cinchonaceæ. The *Nauclea Cadamba* is a noble tree which bears orange-colored fragrant flowers, and is highly prized for its shade. The wood, which is yellow, soft, and fine-grained, is useful for several purposes. The wood of *Nauclea cordifolia,* a large tree which grows in the mountains of Hindostan, is used for flooring-planks.

Ca'da Mos'to, da (LUIGI), a navigator, born at Venice in 1432. Having entered the service of Prince Henry of Portugal, he explored in 1455–56 the W. coast of Africa as far as the mouth of the Gambia. He wrote a narrative of his voyage (1507). Died in 1464.

Cadas'tral Sur'vey [Fr. *cadastre*], a term recently adopted by the English and other European nations, is used to denote a survey on a large scale. A cadastral as opposed to a topographical map may be defined as one on which the objects represented agree as to their relative positions and dimensions with the objects on the face of the country, while a topographical map, usually drawn on a small scale, exaggerates the dimensions of houses and the width of roads and streams, for the sake of distinctness. The usual scale of cadastral maps is nearly twenty-five inches to a mile.

Caddett's Pass, a township of Lewis and Clarke co., Mon. Pop. 71.

Cad'dice-fly, or **Caddis-fly** (*Phryganeidæ*), a family of insects of the order Neuropters, considered by Mr. Kirby a distinct order, Trichoptera. The caddice-flies differ in important particulars from the other neuropterous insects, and exhibit points of intimate resemblance to the Lepidoptera. These insects are most interesting, however, on account of their larvæ, of which the larger kinds are the caddice-worms or cad-bait of British anglers. The species of caddice-fly are numerous in the U. S., and they are more so in the north than in the south of Europe. The angler looks for cad-bait about the edges of streams and under stones, or on the stalks of aquatic plants. As a bait, the caddice is almost as deadly as the May-fly, and more so, in running streams, than the ordinary worm.

Cad'do, a parish which forms the N. W. extremity of Louisiana, has an area of 1200 square miles. It is bounded on the E. by the Red River and the Great Raft, and is partly occupied by Caddo and Soda lakes, which are navigable and communicate with Red River. Cotton and corn are the chief crops. It is intersected by the Texas and Pacific R. R. Capital, Shreveport. Pop. 21,714.

Caddo, a township of Clarke co., Ark. Pop. 2717.

Caddo, a township of Montgomery co., Ark. Pop. 234.

Cade (JACK), an Irishman who called himself MORTIMER, the leader of an insurrection which broke out in Kent in June, 1450. He marched with about 16,000 insurgents towards London, and encamped on Blackheath. Among their motives for rebellion was oppressive taxation. Having defeated a royal army which was sent against him, he entered London, in which he maintained strict order, but he caused Lord Say, a royal favorite, to be put to death. Many of his followers were induced to disperse by a promise of pardon. Cade fled, but was pursued and killed July 11, 1450.

Cade, Oil of [Fr. *huile de cade*], a thin tar distilled from the wood of *Juniperus oxycedrus,* is used in the medical treatment of diseases of the skin.

Ca'dence [from the Lat. *cado,* to "fall"], a fall, a decline, a state of sinking; a fall of the voice at the end of a sentence; a sound or tone. In horsemanship, an equal measure or proportion observed by a horse in all his motions.

CADENCE, in music, the conclusion of a song or of some parts in certain places of the piece, dividing it into so many numbers or periods. The cadence takes place when the parts fall on a note or chord naturally expected by the ear, just as a period completes the sense in a discourse. A cadence is either perfect or imperfect—the former, when it consists of two notes sung after each other, or by degrees conjoined in each of the two parts, the harmony of the fifth preceding that of the key-note; and it is called perfect, because it satisfies the ear. It is imperfect when the key-note with its harmony precedes that of the fifth without its

* It has been suggested that this name is from the Greek κακός, "bad," having been given in contradistinction to Evander (Εὔανδρος), i. e. "good man." (See VIRGIL, "Æneid," book viii.)

added seventh. A cadence is said to be broken or interrupted when the bass rises a major or minor second, instead of falling a fifth.

Ca'dency [from the Lat. *cado*, to "fall" or "descend"], in heraldry, the marks by which the shields of the younger members of families are distinguished from those of the elder and from each other. No distinction is usually made between marks of cadency, differences, distinctions, or brisures, though the last term is used to include not only differences in general, but also the so-called abatements. There is convenience in the practice followed in Scotland, of appropriating the marks of cadency to distinguishing the sons from the father, and from each other during the father's lifetime, and of adopting other distinctions after the death of their father. Another mode of differencing the shields of brothers in early times was by changing the tinctures, but this is now regarded as too extensive a change.

The differences used by the British royal family are found in some peerages. The label of the prince of Wales is plain, whilst those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures for the sake of distinction. Labels, crescents, mullets, martlets, etc. are the usual marks of cadency, and the rules governing their use are complicated and fanciful.

Caden'za, in music, an ornamental succession of notes introduced at pleasure at the end of a phrase.

Cadet' (fem. *cadette*), [a French word signifying "younger," "junior"]. Cadet as a noun means younger son, younger brother: a military officer who is junior to another is a cadet in respect to him. The term is also applied in France and other countries to a student of the art of war and military science. The students of the Military Academy at West Point, N. Y., are called cadets, as are those of the Naval Academy at Annapolis. There are also medical cadets, recognized as of a distinct rank in the U. S. "Army Regulations." (See MILITARY ACADEMY (U. S.), by PROF. GEORGE L. ANDREWS.)

Cadet, Naval, is the lowest grade of officer in the British navy. Cadets enter the naval service at twelve to fourteen years of age. Every captain on being appointed to a ship has a right to nominate a cadet, and every flag-officer can nominate two on receiving his flag. The others are nominated by the first lord of the admiralty, subject to the regulations for competitive examination. They first pass three months on a training-ship in port to learn the rudiments of seamanship, and are thence transferred to sea-going ships. After the cadet has served fifteen months at sea he is eligible for promotion to the rank of midshipman. (See NAVAL ACADEMY, by PROF. R. S. SMITH.)

Ca'di, an Arabic word signifying judge or jurist, is the title of an inferior judge among the Turks and other Mohammedan nations. They must be chosen from the ranks of the priesthood, as the precepts of the Koran constitute their code of laws.

Ca'dion, a township of Van Buren co., Ark. Pop. 587.

Cā'diz, a province which forms the S. W. extremity of Spain, is bounded on the N. by Seville, on the E. by Málaga, on the S. by the Strait of Gibraltar, and on the W. by the Atlantic and Huelva. Area, 2809 square miles. The soil is fertile, and the province contains large forests. Capital, Cadiz. Pop. 417,346.

Cadiz (anc. *Gades*), an important city and seaport of Spain, capital of the above province, is situated on the Atlantic Ocean and on the N. W. extremity of the isle of Leon, about 94 miles by rail S. by W. of Seville; lat. 36° 32′ N., lon. 6° 18′ W. Its site is a long narrow isthmus or tongue of land surrounded by water on three sides, having on the N. and N. E. an inlet called the Bay of Cadiz, which forms a good and capacious harbor. It is accessible from the mainland only by a tongue of land, which in some places is only 200 yards wide, and is strongly defended by several forts. The houses, built of white freestone, present a bright appearance from the sea. The streets are narrow, but well paved and regular. Among the principal edifices are two cathedrals, an old and a new, the lighthouse of San Sebastian, 172 feet high, and a hospital called Casa de Misericordia. The convent of the Capuchins possesses two excellent pictures by Murillo. The city contains two theatres, a medical school, a botanic garden, and an academy of fine arts. Cadiz is one of the first commercial cities of Spain, but is probably inferior to Barcelona in the value of its imports. The chief articles of export are sherry wine, olive oil, salt, metals, and fruits. Among the imports are tobacco, sugar, coffee, hides, indigo, cotton, dyewoods, fish, and coal. The commerce of this port is much less extensive than it was formerly. Cadiz is the southern terminus of a railway which connects it with Seville. The isle of Leon is separated from the mainland by a narrow channel, which is crossed by a bridge. Here are manufactures of mantillas, fans, glass, soap, cotton and silk stuffs, hats, etc. Cadiz, which is one of the most ancient towns of Europe, was founded by the Phœnicians, probably before the foundation of Rome. The Carthaginians became masters of it during the first Punic war, but the Romans obtained possession of it in 206 B. C., after which it became a city of great wealth and importance. It was taken and pillaged by the earl of Essex in 1596, and was blockaded in 1656 by Admiral Blake, who captured two rich galleons. It was besieged by the French from Feb., 1810, until Aug., 1812. Pop. 61,750.

Cadiz, a post-village, capital of Trigg co., Ky., on Little River, 230 miles W. S. W. of Frankfort. It has one weekly paper. Pop. 680.

Cadiz, a post-village, capital of Harrison co., O., is about 22 miles N. W. of Wheeling, and 120 miles E. N. E. of Columbus. A branch railroad, six miles long, connects it with the Pan Handle route from Pittsburg to Cincinnati. It has two national banks, two private banks, two newspapers, and is the commercial centre of a great wool-growing district. Pop. 1639. ED. "REPUBLICAN."

Cadiz, a post-township of Green co., Wis. Pop. 1401.

Cad'mium, a white metal having a slight bluish cast, discovered in 1817 by Stromeyer, and also independently by Hermann, named from *cadmia fossilis*, a name given to an ore of zinc mentioned by Dioscorides and Pliny. The name is said by some to have come from that of Cadmus. Symbol, Cd; atomic weight, 112; sp. gr. after fusion, 8.6; hammered, 8.7, nearly. Cadmium is lustrous, takes a fine polish, and possesses a fibrous fracture. It tarnishes very slightly in the air, and only burns at a high heat. It is more tenacious than tin, though, like that metal, a bar of it gives a "cry" when bent. It melts below 260°, and volatilizes at about 360° C. It occurs in nature as the sulphide "greenockite" at Bishopstown, Renfrewshire, Scotland, and incidentally as a constituent of various zinc ores, as the carbonate, silicate, etc., as well as the sulphide in several localities. The zinc flowers in the flues of zinc-reducing furnaces contain even as much as 11 per cent. of cadmium. Commercial English zinc often contains cadmium. The metal is readily soluble in nitric acid, and but slightly so in other acids, except at a boiling temperature. It forms two oxides, CdO and Cd_2O, of which the former (the monoxide) is the basis of a series of salts. The suboxide is greenish. The monoxide varies in color from brownish to blackish yellow, according to the mode of preparation. It is infusible and not volatile. Its salts are mostly colorless, and when taken into the stomach act as emetics; their taste is disagreeably metallic. The cadmium chloride forms double salts with hydrochlorates of many of the alkaloids. Cadmium is prepared by collecting the first products of distillation from the zinc ores containing it, and subjecting them, when mixed with charcoal, to two successive distillations in iron retorts at a low red heat. Instead of the last distillation, solution in acid and purification in the wet way is resorted to. The demand for cadmium is, however, so small that the working up of the furnace products containing considerable amounts of that metal has been discontinued in some places in Silesia. It is necessary, however, to remove it from the zinc, as it renders that metal brittle when 3 per cent. or more is present. Cadmium finds its chief application in the arts in the form of the sulphide, which has an intense yellow color, and is used for coloring soaps, and in paints, etc. It is known as cadmium yellow and jaune brillant. The iodide and bromide of cadmium are used in photography. The metal is used for forming a fusible with lead, tin, and bismuth for filling teeth. This element is recognized in the laboratory by being the only one which affords a yellow sulphide, insoluble in ammonium sulphide.

C. F. CHANDLER.

Cad'mus [Gr. Κάδμος], in classical mythology, was a son of Agenor, king of Sidon, and a brother of Europa. After Europa had been carried off by Jupiter, Cadmus was sent in quest of her. According to tradition, he founded the city of Thebes, in Bœotia, and invented sixteen letters of the Greek alphabet, or introduced them from Phœnicia into Greece.

Cad'ron, a post-township of Conway co., Ark. P. 502.

Cadu'ceus, in classic mythology, the symbol and winged staff of Mercury (Hermes), to whom it was presented by Apollo. From this staff Mercury derived the surname of *Caducifer*. The term caduceus was also applied by the ancients to a staff or rod of laurel or olive which was carried by ambassadors and heralds as a symbol of peace. It had the figures of two serpents twisted around it. Among the moderns the caduceus is used as an emblem of commerce, over which Mercury was supposed to preside. Still more frequently it is the emblem of health and of the healing art.

Cadwal'ader (Gen. George), a native of Philadelphia, where he practised law, served as a brigadier-general in the Mexican war, and was brevetted major-general for services at Chapultepec. He was major-general of Pennsylvania troops 1861–62, and in 1862 became major-general of U. S. volunteers.

Cadwalader, or **Cadwallader** (John), an American general, born in Philadelphia in 1743. He served as a brigadier-general at the battles of Princeton, Brandywine, and Monmouth (1778). Died Feb. 10, 1786.

Ca'dy (Albemarle), an American officer, born in 1807 in New Hampshire, graduated at West Point 1829, and Oct. 20, 1863, colonel Eighth U. S. Infantry. He served chiefly at frontier posts 1829–61; on engineer duty 1834–37; in Florida war 1838–42; in war with Mexico 1846–48, engaged at Vera Cruz, Cerro Gordo, Amazoque, San Antonio, Churubusco, and Molino del Rey (wounded and brevet major); on Sioux expedition 1855, engaged at Blue Waters, Dak.; and superintendent of general recruiting 1857–59. In the civil war was in command of the district of Oregon 1861–62; acting inspector-general of the department of the Pacific 1863, and in command of draft rendezvous at New Haven, Conn., 1864–65. Brevet brigadier-general U. S. A. Mar. 13, 1865, for long and faithful services; and retired from active service May 18, 1864.

George W. Cullum, *U. S. Army.*

Cæcil'ia [from the Lat. *cæcus*, "blind"], a genus of batrachians formerly placed among serpents on account of their form, although breathing by gills when young and undergoing a metamorphosis. The body is almost cylindrical, the head small, the eyes very small, and in some species imperfect or wanting; on which account the name was given. The skin is viscous and annularly wrinkled, appearing naked, although minute scales are found between its wrinkles. The vertebræ are articulated as in fishes and not as in serpents, and the skull is united to the first vertebra by two condyles. The ribs are short. The original genus has been subdivided, now forming a family, Cæciliadæ. The species are inhabitants of marshy or moist places, chiefly in Africa and South America.

Cæcil'ius Sta'tius, a Roman comic poet of high reputation, was a native of Milan and a friend of Ennius. He wrote nearly forty comedies, of which only small fragments are extant. Died in 168 B. C. He was regarded by ancient critics as a comic poet of the first rank.

Cæci'na Alie'nus (Aulus), or **A. Licinius Cæcina,** a Roman general who entered the service of Vitellius in 68 A. D., and obtained command of an army. In the year 69, Cæcina and Valens defeated the army of Otho at Bedriacum. He soon deserted Vitellius, and became an officer of Vespasian, but he formed a conspiracy against the latter, and was put to death in 79 A. D.

Cæ'cum [the neuter gender of the Lat. adjective *cæcus*, "blind"], literally, the "blind intestine," applied to a sac or branch of an intestine having only one opening. In man there is only one cæcum, not very large, at the extremity of the small intestine, where it terminates in the colon. In the herbivorous Mammalia it is comparatively large, and secretes an acid fluid, perhaps supplementing the gastric juice in completing digestion. The cæcum is wanting in bats and in the bear and weasel families. Birds have two cæca, generally long and capacious in those that are omnivorous or granivorous. Reptiles seldom have a cæcum. Fishes have the cæca attached to the intestine at its uppermost part. The number of these is extremely various; sometimes there are only two, and sometimes more than a hundred. The number is different even in nearly allied species. In some fishes, as the cod, the cæca divide into smaller branches. The intestinal canal of some of the infusoria is furnished throughout its length with cæca.

Cæd'mon, an ancient Anglo-Saxon poet, was originally a cowherd attached to the monastery of Whitby, in England. He afterwards became a monk, and composed, professedly under divine inspiration, poems on religious subjects, which are thought to have suggested to Milton his "Paradise Lost." Some of these are the oldest extant specimens of Anglo-Saxon metrical composition. Died about 680 A. D.

Cæ'lius Aurelia'nus, an eminent medical writer who belonged to the sect of Methodici, was born at Sicca, in Africa. He is supposed to have lived between 100 and 300 A. D. He wrote two Latin works, "De Morbis Chronicis" ("On Chronic Diseases"), and "De Morbis Acutis" ("On Acute Diseases"), which are extant and are highly prized.

Caen [Lat. *Cadomus* or *Cadomum*], a city of France, capital of the department of Calvados, is situated on the river Orne, 10 miles from the sea, and 148 miles by rail W. N. W. from Paris; lat. 49° 11′ 12″ N., lon. 0° 21′ W. It was formerly the capital of Lower Normandy. It has wide, regular, and clean streets, several fine public squares, and many noble specimens of ancient Norman architecture. The houses are generally built of an excellent cream-colored freestone which is quarried in the vicinity, and is called Caen Stone (which see). Caen is connected with Paris by a railway, and with the sea by a navigable canal. Among its remarkable edifices are the cathedral of St. Étienne, founded by William the Conqueror; the church of La Trinité, or Abbaye-aux-Dames, founded by Queen Matilda in the eleventh century; and the church of St. Pierre, the tower or spire of which is much admired. The castle, commenced by William the Conqueror and finished by his son, Henry I., was partially destroyed in 1793. This city contains a large public library, a museum, a botanic garden, a custom-house, the hôtel of the prefecture, an academy of arts and sciences, a medical school, a normal school, and an asylum for deaf-mutes. It has manufactures of lace, crape, linens, cotton fabrics, porcelain, cutlery, flannel, hats, and gloves. Caen has long been celebrated for its manufacture of Angora and woollen gloves. This was an important place as early as 912, when it became subject to the Normans. It was the residence of William, duke of Normandy, before he conquered England. In 1346 it was taken and pillaged by Edward III. of England. The poet Malherbe and Auber the composer were born here. Pop. 41,564.

Caen Stone, a fine cream-colored or light yellow building-stone which is exported from Caen to England and the U. S. It is an oolite or sandstone, and is easily worked. It was extensively used in England in the fifteenth and sixteenth centuries. The cathedrals of Winchester and Canterbury are built of this stone.

Caerle'on (anc. *Isca Silurum*), an old town of England, in Monmouthshire, on the river Usk, here crossed by a bridge, 2 miles N. E. of Newport. It is supposed to have been the capital of the Roman province *Britannia Secunda* (modern Wales), and, according to tradition, was a residence of King Arthur. Many Roman antiquities and relics have been found here, as baths, altars, statues, coins, inscriptions, and aqueducts. Here is also a ruined amphitheatre 222 feet in length. Pop. 1281.

Caernarvon, a township of Berks co., Pa. Pop. 927.

Caernarvon, a township of Lancaster co., Pa. Pop. 1566.

Cæsalpin'ia, a genus of trees of the order Leguminosæ, the type of the sub-order Cæsalpinieæ. This sub-order is characterized by irregular flowers which are not papilionaceous, and comprises numerous species, some of which have purgative properties, as senna (*Cassia*). Others bear edible fruits, as the tamarind and the carob. Among the products of the sub-order are Copaiba, Logwood, and Camwood (which see). They are mostly natives of warm climates. The genus *Cesalpinia* has pinnate or bi-pinnate leaves, and ten stamens in each flower. The red dyewood called sappan-wood is obtained from the *Cæsalpinia Sappan*. Other species yield the Brazil-wood of commerce. Among the species of the above sub-order that grow wild in the U. S. are the *Cercis Canadensis*, the *Gleditschia triancanthos* and *monosperma* (honey locust).

Cæ'sar, the cognomen of a patrician Roman family of the Julia gens, which was one of the most ancient in the state, and claimed a descent from Iulus, a son of Æneas. The first member of the family mentioned in history is Sextus Julius Cæsar, who was prætor in 208 B. C. After the family had become extinct (at the death of Nero), the succeeding emperors of Rome assumed the name of Cæsar as a title. It subsequently became the title of the heir-presumptive to the throne.

Cæ'sar (Julius), or, more fully, **Caius Julius Cæsar,** one of the most remarkable men that ever lived, was born on the 12th of July, 100 B. C. He belonged to the Julian tribe (gens Julia), which boasted its descent from Iulus (or Julus), the son of Æneas. In 83 Cæsar divorced Cossutia and married Cornelia, the daughter of Cinna. This act offended Sulla (then in the height of his power), who commanded Cæsar to divorce the latter. On his refusal to obey he was proscribed. He was under the necessity of concealing himself for a time, but on the intercession of mutual and influential friends the dictator reluctantly pardoned him. Sulla is reported to have said to some of his friends who interceded for him, that Cæsar would some day be the ruin of the aristocracy, adding, "In that young man there are many Mariuses." (Marius had proved himself the most formidable enemy that the aristocratic party had ever encountered.) Soon after, Cæsar went to Asia Minor, and served with distinction in the Roman army. Afterwards, while on his journey to Rhodes with a view to study oratory under Apollonius Molo, he

was taken by pirates. While detained by them he often threatened (in jest, as they supposed) that he would put them to death when he got his liberty. The required ransom having at last been paid, he manned some vessels, pursued and took the pirates, and crucified them all.

Having returned to Rome, he became a candidate for popular honors. He was elected quæstor in 68 B. C. This same year his wife Cornelia died, and the next he married Pompeia, a relative of Pompey the Great and a granddaughter of Sulla. This was done to ingratiate himself with Pompey, who, since the death of Sulla, was all-powerful at Rome. He was made an ædile in 65 B. C., and sought to render himself popular by the exhibition of public games which are said to have surpassed in magnificence everything of the kind ever before seen at Rome. He was elected pontifex maximus in 63 B. C. In 63 occurred the conspiracy of Catiline, and many suspected Cæsar of being accessory to it. When Cicero asked the opinion of the senate respecting the punishment which ought to be inflicted on the conspirators, all the senators gave judgment in favor of their death, until it came to Cæsar's turn to speak. He maintained that it was contrary to justice and highly inexpedient to put men of their rank to death without a full trial. His argument had great weight with the senators. But Cato followed in a powerful speech, accusing Cæsar of complicity with the conspirators, and carried a large majority of the senate with him. The conspirators were condemned to death; Cæsar himself narrowly escaped.

In 62 B. C. he was made prætor, and was sent the next year as proprætor to Spain, where he greatly distinguished himself both as a magistrate and general, and was saluted as *imperator* by the army. In 60 he was elected consul, L. Calpurnius Bibulus being his colleague. One of his leading measures was to propose an agrarian law, by which a considerable tract of the public land was to be divided among the poorer citizens, particularly those who had a number of children. This measure was carried, in spite of the opposition of Bibulus. With a view to strengthen his interest with Pompey, Cæsar gave him in marriage his daughter Julia, though she had already been affianced to S. Cæpio. He formed in 60 B. C., with Pompey and Crassus, a secret alliance known in history as the first triumvirate. Supported by such powerful influence, Cæsar was enabled to carry through the senate whatever laws or measures he pleased. The government of Cisalpine and Transalpine Gaul having been decreed to him for five years, he left Rome in the spring (of 58 B. C.), and before the ensuing winter he had ended successfully two important wars in Transalpine Gaul—one with the Helvetii, a nation inhabiting what is now Switzerland; the other with Ariovistus, the king of a powerful German nation who had a few years before crossed the Rhine and established themselves in Gaul. In the next seven years he not only subdued the greater part of Gaul, but crossed over (55 B. C.) into Britain, defeated Cassivelaunus, one of the kings of that country, took hostages, and fixed the tribute the Britons were to pay to Rome.

Cæsar's daughter Julia, whom he had given in marriage to Pompey, had died in 54 B. C. The triumvir Crassus had been killed in the war with the Parthians. A coolness gradually arose between Cæsar and Pompey. The latter appears to have become jealous of the new favorite of fortune, since all his own exploits, splendid and unparalleled as they were at the time they were performed, had been eclipsed by the more recent and more glorious achievements of his great rival. Pompey had succeeded to the position of Sulla as the leader of the aristocracy, while Cæsar's policy had been from the first to cultivate the favor of the common people. The two parties became more and more hostile to each other. Some of the more violent of the patricians were determined to crush Cæsar at all hazards. It was at length proposed in the senate, in 50 B. C., by Marcellus, that Cæsar, the Gallic war having been brought to an end, should lay down his command and disband his army; but Curio, a tribune whom Cæsar had gained over to his interests, vetoed the decision of the senate; Cæsar, however, was deprived of two of his legions. But desirous, by the moderation of his conduct, to fasten upon his opponents the responsibility and odium of beginning the quarrel, he sent a proposition to the senate that he would agree to dismiss his army if Pompey would do the same. But the senate even refused to consider the proposal. It was afterwards decreed that Cæsar should disband his army by a certain day or be considered a public enemy. This was virtually a declaration of war, for no one could believe that Cæsar would thus tamely abandon the contest. On learning the decision of the senate, Cæsar assembled his army, and in an eloquent harangue inspired them with his own indignant spirit. Accompanied by only 5000 infantry and 300 cavalry (for his other troops were beyond the Alps), he advanced to the river Rubicon, which then marked the limit between Italy and Cisalpine Gaul. After revolving in his mind for some time his perilous enterprise, he at length exclaimed, "The die is cast!" He instantly crossed the river, and proceeded with rapid strides through Ariminum, Arretium, and Ancona towards Rome. Every town seemed ready to open its gates as he approached. In the general consternation, Pompey, with the two consuls and many of the senators, fled from the city towards Brundisium, closely pursued by Cæsar. He passed over into Greece, whither Cæsar, for want of ships, was unable to follow him. Cæsar soon after set out for Spain, where Afranius and Petreius, Pompey's lieutenants, had a formidable army under their command. Having compelled them to sue for and accept peace on his own terms, and captured Massilia (Marseilles), he returned to Rome, whence he proceeded to Brundisium. After some delay he evaded the vigilance of Pompey's fleet, and succeeded in transporting his army into Greece. In his first engagement with Pompey, near Dyrrhachium, Cæsar was worsted, and was obliged to retreat. He withdrew, pursued by Pompey, to Thessaly. At length the two armies met on the plains of Pharsalia. Cæsar had only 22,000 foot-soldiers and 1000 horse, while the army of Pompey amounted to 45,000 infantry and 7000 horse. The latter sustained a disastrous defeat; 15,000 men fell in battle, and upwards of 24,000 were taken prisoners. Pompey escaped to Egypt, where he was basely assassinated. (See POMPEY.) The power of his enemies having been utterly broken in Greece, Cæsar followed Pompey to Egypt, where he was detained for a time, captivated by the charms of Cleopatra, whose pretensions to the throne of Egypt he supported against those of her brother Ptolemy. He next marched against Pharnaces, a son of Mithridates the Great, king of Pontus. Having defeated and destroyed the army of Pharnaces, he wrote to the senate his celebrated letter of three words only—*Veni, vidi, vici*. He next turned his arms against the Pompeians in Africa, who were under the command of Cato and Scipio, whose forces were defeated and almost exterminated at Thapsus, not far from Carthage (46 B. C.). Cæsar returned to Italy the undisputed master of the Roman world. But he had scarcely time to celebrate his recent triumphs when word was brought that the sons of Pompey, Cneius and Sextus, had collected a formidable army in Spain. Cæsar advanced to meet them with his usual celerity. After a severe and bloody battle he gained a complete victory. He said afterwards to his friends that he had often fought for victory, but then only for his life.

Having thus risen to power on the ruins of the republic, Cæsar appears sincerely to have sought to promote the true interests of his country. He procured the enactment of several salutary laws. One of the subjects which claimed his earnest attention was the regulation of the calendar. His improvements have been adopted, with some modifications, by all the European nations. (See CALENDAR.) He is said to have contemplated the preparation of a complete digest of the Roman laws, the draining of the Pontine Marshes, and other important public works, when death put an end to all his schemes. The senate had conferred upon him the title imperator (whence our "emperor"), for life; he was also made dictator and præfectus morum ("chief or ruler of manners or customs"), and pontifex maximus. To these dignities he wished to add that of king, that he might transmit his power to his successor. Having no legitimate children of his own, he had adopted his grand-nephew, Octavius, the son of Attia, who was a daughter of Cæsar's sister Julia. On a certain public festival, the Lupercalia (sometimes called in English the Lupercal), Antony, a zealous adherent of Cæsar, publicly offered him a regal crown, but he, perceiving that it displeased the people, refused it, but very reluctantly, according to some accounts. From the time of Tarquin the Proud the name of king had always been particularly odious to Romans of every class. Cæsar's evident desire to be a king stimulated the hostility of his enemies, who were encouraged to hope that the taking of his life would be approved even by many of the people. A conspiracy in which sixty persons were implicated was formed. Cæsar had many warnings, it is said, of his approaching fate, but as he scorned to live in constant terror of death, he disregarded all the admonitions of his friends, saying it was better to die at once than to suffer the anguish of death many times by constantly fearing it. It had been planned that when Cæsar came into the senate on the ides of March, Cimber, one of the conspirators, should present a petition to him, and that while the paper was being read the others should crowd around, as if very anxious that Cimber should obtain his request, and make an attack upon their victim all at once. At first Cæsar resisted with great spirit, but when he perceived the number of his enemies he resigned himself to his fate, and, wrapping his toga about him, fell at

the foot of Pompey's statue, the base of which was bathed in Cæsar's blood. One account states that he resolutely defended himself until he saw the dagger of M. Brutus among those of the other conspirators, when, exclaiming "Thou too, Brutus!" he yielded without any further struggle. He was assassinated 44 B. C., in the fifty-sixth year of his age. In person, Cæsar was tall and of a commanding presence. His constitution was naturally delicate, but by exercise and exposure he became so hardy that none of his soldiers could better bear the fatigues and privations incident to a military life. He was sometimes, though rarely, subject to attacks of epilepsy.

As a general, Cæsar was probably superior in genius to every other commander of whom history makes mention, excepting, perhaps, Hannibal alone. (See HANNIBAL.) In the fertility of his resources, indeed, he appears to have surpassed all other generals that ever lived. It has been said that Napoleon taught his enemies how to conquer him, but Cæsar's enemies never learned how to conquer him, because he had not a mere system of tactics, but a new stratagem for every new emergency. But he was not only a great general, but a pre-eminent statesman, and the greatest orator of his age except Cicero. Cæsar was also distinguished as a historian; he wrote the first seven books of the commentaries treating of the Gallic war, and three books relating to the civil war. His style is remarkable for ease, clearness, and simplicity.

Referring to those remarkable men in history who have compelled "nations unaccustomed to control" to bow obedient to their will, Macaulay observes: "In this class three men stand pre-eminent—Cæsar, Cromwell, and Bonaparte; the highest place in this remarkable triumvirate belongs undoubtedly to Cæsar. He united the talents of Bonaparte to those of Cromwell, and he possessed also what neither Cromwell nor Bonaparte possessed—learning, taste, wit, eloquence, the sentiments and manners of an accomplished gentleman."

WILLIAM JACOBS.

Cæsare'a [Gr. *Καισαρεία*; anciently called *Turris Stratonis*], an ancient city and seaport of Palestine, now in ruins, was situated on the Mediterranean, about 37 miles N. of Jaffa, and 55 miles N. N. W. of Jerusalem. It was founded by Herod the Great (22 B. C.), who erected here several magnificent edifices, and protected its port by a semicircular mole, which is said to have been one of the most wonderful works of antiquity. Cæsarea was the scene of several events recorded in the book of Acts. (See Acts, chaps. x., xxiii., xxv.) It was taken by the crusaders in 1101. The site is now covered with shapeless ruins.

Cæsarean Operation. See HYSTEROTOMY.

Cæsare'a Philip'pi, or Pa'neas, an ancient town of Palestine, situated about 20 miles N. of the Sea of Galilee and 45 miles W. S. W. of Damascus. It is mentioned in Matthew xvi. 13. This site is now occupied by the village of Banias, in which some ancient ruins are visible.

Cæsar's Creek, a township of Greene co., O. Pop. 1114.

Cæ'sium (symbol Cs; atomic weight, 133), an alkali metal discovered with the spectroscope by Bunsen and Kirchhoff in 1860 in the water of some saline springs in Germany. The salt spring of Dürkheim contains 0.17 parts of the chloride in 1,000,000. The hot spring of Wheal Clifford was found to contain 0.12 grains of the chloride in a gallon. Cæsium is widely diffused in nature, though in exceedingly small quantities; it has been found with rubidium in lepidolite, petalite, and some felspars. The mineral *pollux* of Elba is reported to contain 34 per cent. of cæsium. In its chemical relations cæsium is closely analogous to potassium, though it is more electro-positive, being, indeed, the most electro-positive element known. A fused mass of cæsium chloride may be decomposed by the electric current, but the cæsium rises to the surface and burns with a reddish flame. Bunsen obtained it as an amalgam with mercury, but oven in amalgam or alloy it absorbs oxygen with great rapidity. The platin-chloride is more insoluble than that of potassium, and this fact has formed the basis of its separation from that element. The spectrum of cæsium is characterized by two blue lines.

C. F. CHANDLER.

Caffraria. See KAFFRARIA.

Caf'feine, an alkaloid existing in coffee, tea, Paraguay tea (*Ilex Paraguayensis*), and guarana (*Guarana officinalis*, or *Paullinia sorbilis*), called also **Theine** and **Guaranine.** Chemical formula, $C_8H_{10}N_4O_2$. It was discovered by Runge in 1820, and almost simultaneously by Pelletier, Caventou, and Robiquet. Oudry in 1827 extracted an alkaloid from tea which he supposed to be a distinct compound, and called it theine, but in 1838 Jobst proved caffeine and theine to be identical. Stenhouse extracted caffeine or theine from the leaves and twigs of Paraguay tea, while Martius extracted it from the dry pulp of the *Paullinia sorbilis* or guarana, and called it guaranine, but afterwards proved the alkaloid to be identical with caffeine. Van Corput first showed that the leaves of the coffee-plant, as well as the berries, contained caffeine. It probably also exists in other plants.

Caffeine occurs in the raw and also in the roasted coffee, the amount varying with the variety of coffee, the ripeness of the sample, the season of the harvest, etc. The mean amount of caffeine, as determined by Stenhouse in samples of various coffees, was 0.8 to 1 per cent. Domingo coffee contains the least and Martinique coffee the most caffeine. Tea contains somewhat more caffeine than coffee, 2.5 to 3.4 per cent. having been found in hyson tea, 2.2 to 4.1 in gunpowder tea, and 0.9 to 2.1 per cent. in various black teas. (*Stenhouse.*) Mean, about 2 per cent. The Paraguay tea used in several South American countries to prepare the drink known by the natives as "maté" contains 1.1 to 1.2 per cent. of caffeine. The guarana, which is a sort of chocolate, the seeds of the plant being roasted and ground to a paste with water, contains about 5 per cent. of caffeine. Guarana is used by the Brazilians to counteract dysentery, retention of urine, etc. Caffeine is supposed to exist in coffee-berries and tea-leaves, combined with tannic acid and potassa—*i. e.* as potassium caffeo-tannate.

Several methods of extraction have been practised, as precipitating the infusion of tea or coffee with basic lead acetate, freeing from excess of lead salt by hydrosulphuric acid, and then crystallizing out from the solution, precipitating by milk of lime, and extracting the caffeine from the precipitate by water or alcohol. Another process is based on the volatility of the alkaloid.

When pure, caffeine appears in white silky needles having no odor, containing 8.4 per cent. of water of crystallization, which it parts with at 150° C.; sparingly soluble in cold water, and much more so in hot, less soluble in alcohol, and still less so in ether. It acts as a weak base, dissolving in acids, from which it may be crystallized by evaporation. Boiled with fixed caustic alkalies, it decomposes, giving methylamine. Heating with basic hydrate alters it to a stronger base—caffeidine. Boiled with an excess of nitric acid and then evaporated at a gentle heat, it gives a red color, resembling that obtained from murexide, on the addition of ammonia, which is quite characteristic.

C. F. CHANDLER.

Ca'gliari, one of the two provinces into which the island of Sardinia is divided, is bounded on the N. by the province of Sassari, and on the E., S., and W. by the Mediterranean Sea. Area, 5224 square miles. The ground is marshy and the climate unhealthy. The chief articles of export are grain, oil, almonds, sugar, molasses, and wine. Chief town, Cagliari. Pop. in 1871, 392,958.

Cagliari (anc. *Calaris* or *Caralis*), a city of Sardinia, the capital of the above province, is situated on a spacious bay on the S. coast; lat. 39° 13′ N., lon. 9° 7′ E. It has a large and secure harbor, which is defended by several forts, and is the emporium through which nearly all the foreign trade of the island passes. It contains a cathedral, about thirty churches, numerous convents, a public library, several hospitals, an arsenal, a mint, and a college. Here are manufactures of cotton fabrics, soap, gunpowder, leather, and furniture. Among the articles of export are grain, wine, oil, salt, saffron, and rags. Pop. in 1871, 32,834.

Cagliari (PAOLI), an eminent Italian painter of the Venetian school, often called PAUL VERONESE, was born at Verona 1530. He was a pupil of his uncle, Antonio Badile, and he worked successively in Venice, Rome, and other cities of Italy. He was an excellent colorist, and was distinguished by the richness and fertility of his imagination. Among his masterpieces are "The Marriage at Cana" (which is now in the Louvre), "The Calling of Saint Andrew to the Apostleship," "The Rape of Europa," and "The Presentation of the Family of Darius to Alexander." He was a contemporary of Titian. Died April 19, 1588.

Caglios'tro (ALEXANDER), COUNT, a famous Italian charlatan and impostor, whose proper name was GIUSEPPE BALSAMO, was born at Palermo June 2, 1743. He learned a little chemistry and medicine in a monastery, where he was assistant apothecary. Having assumed the title of count and become a Freemason, he travelled through many countries, professing to be a physician and alchemist, and raising money by quackery and other forms of imposture. In some of his adventures he was attended by his wife, and travelled in his own coach in an ostentatious style. About 1780 he visited Paris, where he made many dupes among the higher classes, and revived an old Egyptian Masonic order, of which he became grand kophta. He was patronized by Cardinal de Rohan, with whom he was implicated in the affair of the "diamond necklace," and was impris-

oned in the Bastile in 1785. Having been liberated in 1786, he visited England, where he obtained little success. He afterwards went to Rome, where he was arrested in 1789 as a Freemason, and condemned to imprisonment for life. Died in 1795. (See CARLYLE, "Miscellanies," vol. iv.)

Cagno'la (LUIGI), MARQUIS, an eminent Italian architect, born in Milan June 9, 1762. He became president of the Institute of Milan. His greatest works are two triumphal arches of Milan—viz. the Porto del Ticino (once called Porta di Marengo) and the Arco della Pace or Porta del Sempione, commenced in 1807 and finished about 1837. The latter is built of white marble, and is seventy-eight feet high. Died Aug. 12, 1833.

Cagots [Fr.], a despised race of social outcasts (resembling in some respects the gypsies) who have wandered over parts of France for centuries, and were considered descendants of the Visigoths, whom Clovis nearly annihilated in battle in the fifth century. Before the great French Revolution they were bound by law to wear a peculiar dress, to live apart, to labor in none but menial occupations, and only to enter churches by a special door in each. The Revolution relieved them from all legal disabilities, but could not release them at once from social outlawry and general detestation. Vulgar prejudice still regarded them with abhorrence as foul and depraved, and they were still objects of aversion and loathing. Of late, however, they would seem to have sunk out of sight, being either absorbed into the lower class of the peasants or dwindled to a handful. In 1872 they were reported to number 5000. (See MICHEL, "History of Outcast Races," 1847.)

Cahaw'ba, a river of Alabama, rises in the N. central part of the State, flows in a general S. S. W. direction, and enters the Alabama at Cahawba, in Dallas co. Length, estimated at 150 miles.

Cahawba, a post-village, capital of Dallas co., Ala., is on the Alabama River just below the mouth of the Cahawba, about 8 miles S. W. of Selma. Cotton is shipped here in steamboats. Pop. of Cahawba township, 1859.

Cahier, kȧ'yȧ', a French word signifying primarily a copy-book; a bundle of writing-paper or manuscript; a number of sheets of paper loosely tied together. The term is also applied to the memorial or report of a public assembly or body, and the official instructions of the electors to the deputies who were sent to the States-General in 1789.

Caho'ka, a post-village of Clark co., Mo. It has one weekly newspaper.

Caho'kia, a post-village of St. Clair co., Ill., on the Mississippi River, 10 miles N. W. of Belleville. It was settled by the French about 1683, and its present inhabitants are of French descent, and preserve many of their old ancestral customs. Coal is found in the neighborhood. The name is derived from a tribe of Indians long extinct.

Cahors (anc. *Divona*), a town of France, the capital of the department of Lot, is on the river Lot, 57 miles N. of Toulouse. The site is a rocky eminence enclosed on several sides by the river. It contains a large cathedral, a college, a theatre, a public library, and a normal school; and has manufactures of glass, paper, woollen goods, cotton yarn, etc. Here are remains of a magnificent Roman aqueduct. Pop. 13,846.

Cailliaud (FRÉDÉRIC), a French traveller, born at Nantes Mar. 17, 1787. He discovered in Mount Zabarah, in Egypt, the emerald-mines which were worked in ancient times. He published a "Journey to the Oasis of Thebes" (1821), and "Researches into the Arts and Trades and the Civil and Domestic Customs of the Ancient Egyptians, Nubians, and Ethiopians" (1831). Died May 1, 1869.

Caillié, or **Caillé** (RENÉ), a French traveller, born in Deux-Sèvres Sept. 19, 1799. He gained a prize of 10,000 francs which the Geographical Society of Paris offered to the first traveller who should visit Timbuctoo. He performed the journey from Sierra Leone to Timbuctoo in 1827–28, and published a narrative of his adventures (1830). Died May 25, 1838.

Cain, a township of Fountain co., Ind. Pop. 1802.

Cain'ites, or **Cain'ians,** a Gnostic sect of the second century, who maintained that Cain was superior to Abel, since the latter was easily overcome by him. They also professed reverence for Judas and all the worst characters mentioned in the Bible.

Cainozo'ic, Kainozo'ic, or **Cænozo'ic** [from the Gr. καινός, "new," and ζωός, "living"], a geological term synonymous with tertiary, and applied by some writers to rocks which were formed after the mesozoic.

Cain's, a township of Marion co., S. C. Pop. 1007.

Caique, a small boat for conveying passengers, used principally on the Bosphorus near Constantinople.

Caird (JOHN), an eloquent Scottish pulpit-orator and Presbyterian, was born at Greenock in 1823. He was ordained a minister in 1845, and became pastor at Errol, Perthshire, in 1849. He gained a wide reputation by a sermon on "Religion in Every Day Life," preached before Queen Victoria in 1855. He removed to Glasgow in 1858.

Cairn, a Celtic word signifying a "heap or pile," is applied to artificial and conical heaps of unhewn stones which are frequently found in Europe on tops of hills. Many cairns are found near the circles of unhewn stone pillars which are sometimes called Druidical. In some cases the heaps of stones are girdled round by large unhewn stones set upright in the ground. It appears that the majority of them were raised as sepulchres and monuments for the dead. Human bones are often found buried under them, together with stone hammers, flint arrow-heads, flint axes, bronze weapons, etc. In Scotland and Ireland occur large cairns called "chambered cairns." The most remarkable of these is at New Grange, on the river Boyne, near Drogheda. It is 400 paces in circumference, about eighty feet high, and is supposed to contain about 180,000 tons of stones. It presents the appearance of a grassy hill partially wooded, but on examination the coating of earth is found to be superficial. An opening accidentally discovered is the external entrance of a gallery leading to a large cruciform chamber containing three granite basins or urns. The sides or walls of the chamber are formed of immense blocks of stone, some of which are covered with carved figures, supposed to be symbolical. In countries where stones are scarce the place of the cairn is supplied by the barrow or earthen mound, which differs from a cairn only in the material of which it is made.

Cairngorm Stones, a name given by jewellers to brown or yellow quartz or rock-crystal found at Cairngorm, in Aberdeenshire, Scotland. The color is produced by a little oxide of iron or manganese. They are used as ornamental stones, and the yellow variety is often called topaz, but it is inferior to the true topaz in hardness and brilliancy.

Cairns (HUGH **McCalmont**), LORD, a distinguished orator and lawyer, born near Belfast, Ireland, in 1819. He was returned to Parliament for Belfast in 1852, and was appointed attorney-general by Lord Derby in 1866. He was lord chancellor of England from Feb., 1868, until December of that year, and was leader of the Conservative party in the House of Lords in 1869.

Caï'ro [called by the Arabs *Al Masr* or *Musr;* also *Al Kahireh* (or *Qahera*), *i. e.* "the victorious"], a famous city, the capital of modern Egypt, is situated in a sandy plain on the right (E.) bank of the Nile, 5 miles S. of the commencement of the Delta; lat. 30° 3′ N., lon. 31° 18′ E. Elevation, forty feet above the level of the sea. The climate is warm, dry, and healthy, with a mean annual temperature of about 72° F. The mean temperature of summer is 85°, and that of winter, 58°. Cairo is bounded on the E. by the ridge of Mokattam, and is surrounded by stone walls with antique battlements. The streets are narrow, crooked, and ill-paved. The houses, which are mostly built of brick, are substantial, have flat roofs, and two or three stories. The city is divided into quarters, which are appropriated to the several religious sects, and occupied respectively by the Mussulmans, the Jews, the Christians, etc. These quarters are separated by gates that are closed at night. Cairo is connected with Alexandria by a railway.

The most remarkable edifices of Cairo, which comprise many of the finest remains of Arabian architecture, are the mosques and minarets; the latter, which are very lofty, and built of alternate layers of red and white stone, are considered the most beautiful in the Levant. The city contains about 350 mosques, one of which, the great mosque of Sultan Tooloon, was built 879 A. D. It exhibits the oldest specimens of the pointed arch. The magnificent mosque of Sultan Hassan has two very high and graceful minarets. The majestic "Tombs of the Caliphs," which are in the environs without the walls, are beautiful specimens of Saracenic architecture. Here are handsome public gardens with groves of orange, citron, and palm trees. Among the remarkable objects in the vicinity of Cairo are the palace of the viceroy, the obelisk of Heliopolis, and the old and celebrated Nilometer, on the island of Rodah, which is a graduated column indicating the height of the inundations of the Nile. The Great Pyramid is about 10 miles S. W. of this city. Cairo has long been celebrated as a seat of Oriental learning and Mohammedan theology. It has a university or college which is attended by nearly 2000 students. Here are numerous iron-foundries, calico-printing works, and extensive manufactures of cotton and silk fabrics. The Arabs are the most numerous of the races which compose the population. Cairo, which is supposed to occupy the site of the ancient *Latopolis,* was founded by the

Arabs about 970 A. D., and was ruled by the Fatimite caliphs until 1171, when Saladin became master of Egypt. It was the capital of the sultans of Egypt until it was captured by the Turks in 1518. Pop. in 1871, 353,851.

Cairo, kā'ro, a river-port of Illinois, capital of Alexander county, situated at the southern extremity of the State, upon the point formed by the junction of the Ohio and Mississippi rivers, 175 miles below St. Louis. It is the terminus of the Illinois Central, Cairo and St. Louis, Mississippi Central, and Cairo Arkansas and Texas R. Rs., and a market for the supply of a large portion of Southern Illinois, South-east Missouri, and Western Kentucky. It is an important dépôt for the products of Northern Illinois, Iowa, and Wisconsin seeking southern markets. Over 4000 steamboats land at its wharf annually. It has a considerable manufacturing industry, costly public-school buildings, and a fine custom-house. It has two national banks and three daily and three weekly papers. The low site of the city necessitated the construction of a levee to protect it from inundations. Pop. in 1870, 6267; local census of 1873, 8315.

M. B. Harrell, Ed. "Gazette."

Cairo, a township of Renville co., Minn. Pop. 326.

Cairo, a post-village and township of Greene co., N. Y., has four churches and some manufactures, and contains the county poorhouse. Pop. of township, 2283.

Caisse, a French word, the primary meaning of which is a "chest," "box," "case," or "coffer." It has important applications in commerce, finance, etc. In mercantile business it signifies "cash" or "cash-box." In anatomy, caisse is the drum of the ear. In financial affairs the term is applied to a fund; also to the pay-office. "Caisse d'Epargne" signifies a savings fund or savings bank.

Caisson, a French word which in architecture signifies a coffer, a sunken panel in a flat or vaulted ceiling or in the soffit of a cornice. In civil engineering the term is applied to an enclosure or large vessel in which the foundations of the piers of a bridge are built and gradually lowered to the bottom of a stream. Caisson is also a name given to a tumbril or ammunition-cart used in the artillery service. In maritime affairs it is applied to an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure which contains an air-chamber, and is sunk by letting water into it. After it has been placed under the vessel the water is pumped out, and the caisson rises with the vessel. (See Foundations.)

Caith'ness, the northernmost county of Scotland, is bounded on the W. by the county of Sutherland and by the ocean on the other three sides. Area, 712 square miles. The sea-coast is bold and rocky, with many inlets or bays. The surface is nearly level, except a mountain-range formed of granite and gneiss, which extends along the western border, and rises to the height of 2300 feet. A large part of the county is moorland, destitute of trees. The staple products of the soil are oats, potatoes, and turnips. Many of the inhabitants are employed in the herring, cod, and salmon fisheries, and over 150,000 barrels of cured fish are annually exported from this county. Chief towns, Wick and Thurso. In the Middle Ages the kings of Norway ruled over this part of Scotland. Pop. in 1871, 39,989.

Caithness, Earls of, and Barons Berriedale (1455, in Scotland), Barons Barrogill (1866, in the United Kingdom), and baronets (1629, in Scotland).—James Sinclair, the fourteenth earl, was born Dec. 16, 1821, and succeeded his father in 1855.

Caithness Flagstones are dark-colored bituminous schists, slightly micaceous and calcareous, found in Caithness, Scotland. Their great toughness and durability render them valuable for pavements, cisterns and other purposes. They belong to the old red sandstone formation.

Ca'ius [the Latinized form of *Kaye, Key,* or *Cay*], (John), M. D., a learned English physician, born at Norwich Oct. 6, 1510. He practised medicine at Cambridge and in London, and was appointed physician successively to Edward VI., Queen Mary, and Elizabeth. In 1557 he founded Caius College, Cambridge. He wrote, besides other works, a "Treatise on the Sweating Sickness" (1552). Died July 29, 1572.

Caivano, a town of Italy, in the province of Naples, 8 miles N. of Naples, was fortified in the Middle Ages. It has remains of its old walls and towers. Pop. 9411.

Caj'etan [It. *Cajetano* or *Caietano;* Lat. *Caëtanus*], the surname of Thomas de Vio, an Italian prelate, born at Gaeta (Caieta) Feb. 20, 1470. He became the general of the Dominican order in 1508, and a cardinal in 1517, soon after which Leo X. sent him as legate to Germany in order to induce Luther to recant. In 1519 he became bishop of Gaeta. He was one of the first who maintained without reserve the infallibility of the pope. Died Aug. 9, 1534.

Caj'uput, or **Cajeput** (*Melaleuca Cajeputi*), a tree of the order Myrtaceæ, sub-order Leptospermeæ, from the leaves of which the pungent, aromatic volatile oil of cajuput is obtained by distillation. The cajuput is common on the Moluccas and in the southern part of Borneo. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood (whence the name cajuput, properly *kayuputi,* signifying white wood), and terminal spikes of white flowers. The greater number of the species of this genus are natives of Australia, some of them very beautiful ornaments of hothouses. Much of the oil of cajuput of commerce is prepared in the island of Banda, and at Amboyna and Bouro. Several other species yield this oil. Two sackfuls of leaves yield scarcely three drachms of the oil, which is green, transparent, limpid, with a strong odor, agreeable only when much diffused. It is sometimes used as a stimulating aromatic in medicine, and is considered very efficacious in rheumatism.

Cal'abar Bean, the seed of the *Physostigma venenosum,* a twining, half-shrubby leguminous plant, a native of Western Africa. It belongs to the sub-order Papilionaceæ, and is nearly allied to the kidney bean. The bean is used as an ordeal among the Africans. It is very poisonous; fifteen of the beans have produced death in an hour. It is used by surgeons, in small amounts, to cause contraction of the pupil of the eye, the opposite of the effect of belladonna. It is also sometimes given in tetanus and some other diseases. It is a powerful depressant to the nervous action.

Cal'abash Tree (*Crescentia Cujete*), a tree of the order Bignoniaceæ, is a native of the tropical parts of America. It bears a large fruit, sometimes one foot in diameter, the hard shell of which is used as a substitute for bottles and other vessels. These shells are so hard that water may be boiled in them. They are sometimes polished, carved with figures, and converted into ornamental vessels. The wood of this tree is tough and flexible, and a suitable material for coaches. The term calabash is also applied to the fruit of the gourd, which is used for holding water.

Calabo'zo, a town of Venezuela, in the province of Guarico, on the Guarico River, 106 miles S. S. W. of Caracas. It has considerable trade with the interior. The valley in which it is situated is subject to great inundations. The city is the residence of many wealthy cattle-graziers (*hatos*), and has a fine church. Pop. 10,000.

Cala'bria, the ancient name of the south-eastern part of Italy, coinciding nearly with the modern province of Lecce. It was bounded on the N. E. by the Adriatic, on the S. W. by the Sinus Tarentinus (Gulf of Taranto), and on the N. W. by Apulia. Among its chief towns were Brundisium and Tarentum.

Calabria (anc. *Bruttium*), a region of Southern Italy, forming the southern part of the former kingdom of Naples, is a long peninsula enclosed by the sea on all sides except the N., and separated from Sicily by the Strait of Messina. Area, 6663 square miles. It is divided into three provinces, Cosenza, Reggio Calabria, and Catanzaro. It is traversed by the Apennines through its whole extent. These mountains, which are here nearly 4000 feet high, are partly covered with forests of pine, oak, and beech trees. Between the Apennines and the sea are fertile and beautiful valleys, which produce wheat, cotton, rice, sugar, oranges, figs, grapes, and olives. This region is subject to earthquakes. Chief towns, Cosenza, Reggio, and Catanzaro. Pop. in 1871, 1,209,315.

Cal'ahan, a post-township of Davie co., N. C. Pop. 1232.

Calahor'ra (anc. *Calagurris*), a town of Spain, in the province of Logroño, on the river Ebro, 19 miles E. S. E. of Logroño. It has an old cathedral and some ancient remains. It is the seat of a bishop. Quintilian was born here. *Calagurris* was taken by Pompey or Afranius about 78 B. C., after a long and famous siege. The sufferings of the inhabitants were extreme: hence the Romans gave the name "Calagurritan famine" to any severe famine. Pop. 7104.

Calais [Lat. *Caletum,* from the ancient tribe *Caleti*], a fortified seaport-town of France, department of Pas-de-Calais, on the Strait of Dover, 122 miles by rail N. N. E. of Amiens, 19 miles N. E. of Boulogne, and 26 miles E. S. E. of Dover; lat. of the lighthouse, 50° 57′ 45″ N., lon. 1° 51′ 18″ E. The town and harbor are defended by a castle and several forts, and can be rendered inaccessible by land by flooding the adjacent ground, which is low and marshy. The harbor, which is formed by two moles, is nearly dry at ebb-tide. The town is regularly built, mostly of brick, and has wide, well-paved streets. It has a Gothic cathedral, a public library, and a theatre. A large portion of the English tourists who visit the Continent pass through

Calais, which has daily communication with Dover by steamboats. The number of persons who arrived here from England in 1865 is said to have been 133,562. Calais is the terminus of a railway which connects it with Amiens and Paris. Here are flourishing manufactures of bobbinet, hosiery, soap, leather, etc. In 1347 this town was taken after a long siege by Edward III. of England, who was then persuaded by his queen, Philippa, to spare the lives of six devoted citizens of Calais. It remained in the power of the English until 1558, when it was taken by the duke of Guise. Pop. in 1866, 12,934.

Calais, kā'lis, a city and port of Washington co., Me., is on the St. Croix River, at the head of navigation, 28 miles N. by W. from Eastport, and 264 miles N. E. of Portland. It is the S. E. terminus of the St. Croix and Penobscot R. R. Bridges across the river connect it with St. Stephen's, in New Brunswick. Calais derives its prosperity from the lumber-trade and shipbuilding. It has one national bank, nine churches, a savings bank, a public library, thirteen school-houses, one academy, an opera-house, a dry dock, two marine railways, a planing-mill, a sash-and-blind factory, three machine-shops, two foundries, ten shipyards, and two weekly papers. The river, which affords water-power, is part of the eastern boundary of the U. S. Pop. 5944. ED. "ADVERTISER."

Calais, a post-township of Washington co., Vt. Pop. 1309. It has some manufactures.

Calaman'der Wood, a valuable cabinet-wood which resembles rosewood, but is far more beautiful and durable. It is produced by the *Diospyrus hirsuta*, a tree of the order Ebenaceæ, a native of Ceylon and Southern Hindostan, which belongs to the same genus as the ebony and persimmon tree. This wood is very dense, takes an exquisite polish, and exhibits great richness and variety of colors, among which is chocolate or fawn-color. It is said to be so hard that it cannot be worked with edge tools. The tree has become rare in consequence of the wasteful operations of the Dutch and English. Several similar species are found in the Indian Archipelago.

Calamary. See SQUID.

Calamat'ta (LUIGI), a French engraver of Italian birth and of great merit, born at Cività Vecchia in 1802. Died in 1869.

Calambu'co, a valuable timber tree which grows in the northern part of the island of Luzon. It is an excellent material for shipbuilding, and resembles the teak in appearance. It is very durable, and is never eaten by the white ant, which is so destructive in the Malay Archipelago. Calambuco-wood is also used in the manufacture of farming-implements and other articles. It is also a name of aloes-wood.

Calamia'nes, a group of islands in the Malay Archipelago, about midway between Mindoro and Palawan; lat. 12° N., lon. 120° E. Calamianes, the largest of the group, is about 35 miles long and 15 miles wide. It is fertile, and has a Spanish settlement.

Calamich'thys [Gr. *κάλαμος*, a "rush," and *ἰχθύς*, "fish"], a ganoid fish found in the rivers of Western Africa. It takes its name from its slender, cylindrical form. It is closely allied to the *Polypterus* of the Nile.

Cal'amine (*Lapis calaminaris*), an important and abundant ore of zinc, a native carbonate, containing, when pure, 52 per cent. of zinc. Crystals of this mineral are rare. It is opaque or translucent, has a vitreous lustre, and occurs in kidney-shaped, botryoidal, cellular, and other imitative forms. It is found in veins, beds, and large deposits termed *pockets* in metamorphic limestone and in the Devonian and carboniferous formations. Large quantities of it are exported from Spain. This ore is called Smithsonite by Dana and other mineralogists, who apply the term calamine to the silicate of zinc, the primary form of which is a rhomboid.

Cal'amint (*Calamintha*), a genus of plants of the order Labiatæ. The common calamint (*Calamintha officinalis*) is indigenous in England. It has serrated leaves, with an agreeable aromatic odor, and is used in domestic practice as a pectoral medicine. The U. S. have several species.

Cal'amis [Κάλαμις], an eminent Greek sculptor and embosser who worked at Athens about 450 B. C. He reproduced the forms of horses with success, and executed a bronze statue of Apollo, which Lucullus transported to Rome. Among his works was a marble statue of Apollo, which some persons identify with the Apollo Belvedere.

Cal'amite, an extinct genus (*Calamites*) of great plants, perhaps of the order Equisetaceæ, approaching in character (in the opinion of some observers) the dicotyledonous plants and the conifers. The remains of nearly sixty species have been observed, chiefly in carboniferous strata (none later than the Jurassic) in both continents. These plants must have contributed largely to the production of coal.

Cal'amus [Gr. *κάλαμος*], a Latin word signifying a "reed," a "stalk" (of a plant), was used by the ancient Romans to denote an arrow, a musical pipe, and a pen which was made of a reed. This reed is supposed to have been the *Arundo donax*. Calamus also denotes the golden tube through which, in some church services, the eucharistic wine is taken.

Calamus, a name of the sweet flag. (See ACORUS.)

Calamus, a genus of Palmaceæ, yields a great part of the canes and rattans of commerce, which are used in Europe and the U. S. for the seats of chairs and other purposes. Among the species of this genus are *Calamus Rotang* and *Calamus viminalis*, which are natives of the warm or tropical parts of Asia. The *Calamus rudentum* has been found 500 feet long (Humboldt). *Calamus Draco* yields the best dragon's blood. Several species are climbers.

Calamus, a township of Dodge co., Wis. Pop. 1140.

Cal'amy (EDMUND), an English divine, born in London in Feb., 1600. He became an eloquent Presbyterian minister, and preached for many years in London. In the civil war he sympathized with the royalist party. He was one of the authors of a famous treatise against episcopacy called "Smectymnuus" (1641). Died Oct. 29, 1666.

Cal'and (PIETER), an engineer of Holland, born in Zierikzee in 1826. His father, A. Caland, was an engineer-in-chief of the "Waterstaat" of Holland, and author of a work on dyke-construction, embracing the methods of Dutch engineering as exhibited in the works of protection against the encroachments of the ocean and the inundations of rivers, etc. The son above named was educated at the Royal Military Academy at Breda, was appointed a sub-engineer of the "waterstaat" in 1845, and passing through successive grades became engineer-in-chief of the second class in 1867, then in 1873 promoted over the intermediate grade to be inspector (the highest grade, of which there are but two) of the "waterstaat."

He is author of a work (in French), "Étude sur l'Effet des Marées dans la partie maritime des fleuves;" also (in Dutch) of a work on the protection of the coast against the encroachments of the sea, and of numerous reports. Knight of the order of the Netherlands Lion, and vice-chairman of the Royal Institution of Engineers of Holland. As a member of a commission upon the "improvement of the water-communication from Rotterdam to the sea," and as the executive engineer of the work by which an existing mouth of the combined Rhine and Meuse has been closed and another made, and a channel navigable for ships of the greatest draught (600 passing per month) created where before naught but light-draught vessels (10 to 12 feet) could under favorable circumstances of wind and tide venture, M. Caland's highest claim to fame as an engineer will be founded on the great seaport of Rotterdam, through the works with which he is thus identified in giving an easy and direct water-communication with the sea, in place of the tedious and circuitous ones (see "Prof. Papers Corps of Engineers," No. 22) before available. For this important work M. Caland received from the Vienna Exposition the first prize—a certificate of honor.

J. G. BARNARD, *U. S. Army.*

Calan'do, an Italian musical term, signifies diminishing gradually from forte to piano. It differs from *decrescendo* and *diminuendo*, as the tempo at the same time is slightly retarded, but not so much as in *ritardando*.

Cala'nus [Gr. Κάλανος], an ancient Hindoo philosopher, was one of those whom the Greeks called Gymnosophists. According to Plutarch, his proper name was SPHINES. He passed some time in the camp of Alexander the Great in India. Having become sick at Pasargadæ, he was at his own request burned alive.

Calas (JEAN), a French Protestant and victim of fanaticism, born in Languedoc in 1698, lived at Toulouse. He was condemned and executed Mar. 9, 1762, by eight judges of Toulouse on a false charge that he had murdered his own son. Voltaire exposed the iniquity of this outrage, and induced the king to give 30,000 livres to the family of Calas. (See COQUEREL, "Jean Calas et sa famille," Paris, 1869.)

Calascibet'ta, a town of Sicily, in Caltanisetta, about 60 miles S. E. of Palermo, is on an isolated hill which rises nearly 2500 feet above the sea. It is said to have been founded in 1080. Pop. 5255.

Cala'tabello'ta, a town of Sicily, province of Girgenti, 25 miles N. W. of the city of Girgenti. It is very near the site of the ancient *Tricala*, and is on the ancient river *Crimisus*. Here is a fine mediæval church. Pop. 5572.

Calatafi'mi, a town of Sicily, province of Trápani, is

in a fertile valley 5 miles S. W. of Alcamo. Here in 1860 Garibaldi defeated the royalist troops. Pop. 8731.

Calatanazor', a small town of Spain, in Old Castile, 10 miles S. W. of Soria. Here Al-Mansoor gained a great victory over the Christians in 1101.

Calatayud', a town of Spain, province of Saragossa, on the river Jalon, 45 miles S. W. of Saragossa. It has an episcopal palace, a noble old castle, and several churches, convents, and hospitals; also manufactures of linen and woollen fabrics, paper, leather, etc. About 2 miles E. of this place is the site of the ancient *Bilbilis*. Pop. in 1860, 9823.

Calatra'va (José Maria), a Spanish statesman and eloquent lawyer, born at Mérida Feb. 26, 1781. He was a leader of the liberal party and a member of the Cortes. He passed many years in exile between 1814 and 1830. Died Jan. 24, 1846.

Calatra'va, the Order of, was founded in 1158 by Sancho III. of Castile, and confirmed by Pope Alexander III. in 1164. After the death of Sancho the knights elected as grand-master Don Garcías de Redon. For a long period the war against the Moors was carried on almost entirely by the Knights of Calatrava. The influence exercised by the grand-master on public affairs at length excited the jealousy of the king, and in 1487 the grand-mastership was united to the crown.

Calave'ras, a small river of California, rises in Calaveras county, flows nearly south-westward, and enters the San Joaquin River about 15 miles below Stockton.

Calaveras, a county in N. Central California. Area, 1100 square miles. It is bounded on the N. W. by the Mokelumne River, and on the S. E. by the Stanislaus. It is also drained by the Calaveras River. The Sierra Nevada extends along the eastern border. The surface is finely diversified with mountains and valleys. Cattle, barley, and wool are the chief products. It has rich copper-mines. Gold is found here imbedded in quartz rock. In the eastern part is the famous grove of mammoth trees, in which was found a *Sequoia gigantea* about thirty feet in diameter and 300 feet high. Capital, Mokelumne Hill. Pop. 8895.

Calbur'ga, or **Kulbur'ga,** a town of India, in the Nizâm's dominions, on an affluent of the Beemah, 110 miles W. of Hyderâbâd. It is now unimportant, but was formerly the capital of several Hindoo and Mohammedan sovereigns.

Calca'reous [Fr. *calcaire*, from Lat. *calx*, gen. *calcis*, "lime"], containing much lime. The term "calcareous" is applied to rocks which are chiefly composed of lime—*i. e.* to limestone, marble, and chalk, which are carbonates of lime. They are sedimentary and stratified rocks, and consist chiefly of shells of marine animals, corals, and encrinites. The presence of lime in rocks can easily be detected by the application of nitric or hydrochloric acid, which produces an effervescence in any of the various forms of carbonate of lime. Calcareous soils are derived from the disintegration of limestone, chalk, etc., but they often contain a portion of clay, which increases their fertility. The term calcareous is applied to springs and to water which hold in solution carbonate or sulphate of lime. Such water is commonly called *hard*, and is not so good for washing as soft water.

Calcareous Spar, or **Calc Spar,** a common name of crystallized carbonate of lime, composed, when pure, of 44 per cent. of carbonic acid and 56 of lime. It is one of the most abundant of all minerals, and is found in all geological formations and in every part of the world. The primary form of its crystals is a rhomb or rhombohedron. Its secondary forms are more numerous than those of any other mineral, and are said to amount to 700 or more. In a pure state this mineral is colorless and transparent, but it often contains impurities which render it red, green, brown, yellow, etc. The purest and most limpid variety of this crystal is called Iceland spar, which is found in Iceland, and exhibits double refraction in a remarkable degree.

Calcasieu, kal'ka-shu, a river of Louisiana, rises in the western part of the State, flows in a general S. S. W. direction through Calcasieu parish, and enters the Gulf of Mexico. At its mouth stands an iron lighthouse 53 feet high; lat. 29° 45′ N., lon. 93° 17′ E. Length, estimated at 200 miles, including Calcasieu Lake, which is an expansion of the river. The lake is about 18 miles long and 5 wide, and the foot of it is nearly 5 miles from the Gulf of Mexico.

Calcasieu, a parish in the W. of Louisiana. Area, 1500 square miles. It is bounded on the W. by the Sabine River, and is intersected by the Calcasieu River. The surface is nearly level, and occupied by extensive savannas or grassy plains. Corn and rice are the chief products. Capital, Lake Charles. Pop. 6733.

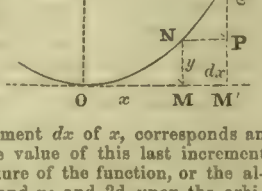
Calceola'ria [from Lat. *calceolus*, a "little shoe," a "slipper"], a genus of plants of the order Scrophulariaceæ, comprises numerous species, natives of South America. They mostly grow on that part of the Andes which is more than 9500 feet above the level of the sea, and are herbaceous plants or shrubs with beautiful flowers. The corolla is 2-lipped, and the lower lip is inflated, so as to form a bag which has some resemblance to a slipper. They are so abundant in some parts of Chili and Peru as to give a peculiar aspect to the scenery. They are cultivated by florists in Europe and the U. S.

Cal'chas [Κάλχας], a celebrated Greek soothsayer who was present at the siege of Troy. He was consulted by the Grecian chiefs in the most important affairs during that siege.

Cal'cite [from *calx*, "lime"], a general term under which are comprised all the varieties of carbonate of lime.

Cal'cium (symbol Ca), the metal present in lime, discovered in 1808 by Sir Humphry Davy. Its atomic weight or equivalent is 20. Combined with oxygen it forms lime or oxide of calcium, which consists of 20 parts of calcium + 8 of oxygen. It is a yellowish-white malleable metal, having a specific gravity of 1.578. It does not occur naturally in a separate state, but may be obtained by passing a powerful current of voltaic electricity through fused chloride of calcium, when the metal separates in minute globules. When brought into contact with water, it rapidly decomposes the water and is converted into lime. At a red heat it melts and burns with a dazzling white light and with scintillations.

Cal'culating Machine, a machine for performing arithmetical operations, or for computing logarithmic or other mathematical tables in which the successive results are to be obtained by substituting, in an invariable formula, the consecutive numbers of a simple series, uniformly increasing. The two kinds of work here mentioned are essentially different, and require different machinery. For simple arithmetic the most successful machine yet constructed is that of M. Thomas of Colmar in France. For tabular numbers, the computations are made by the "method of differences;" and the machines are called "difference-engines." Such are those of Babbage (which was never finished) and of the Messrs. Scheutz of Stockholm, of which there is an example at the Dudley Observatory, Albany, and another in the office of the registrar-general, London. (See Mechanical Calculation.)



Cal'culus [Lat. a "little stone" or "pebble"]. The term is derived from the ancient use of pebbles as *counters* or for making computations, and it, in general, denotes some particular method of performing mathematical investigations. Those, *e. g.*, of arithmetic, algebra, logarithms, etc., have received the name of *calculus*, as the *Arithmetical*, the *Algebraic*, the *Exponential*, the *Trignometrical* (which latter, according to De Morgan, "contains that of *undulating magnitude;*" or of *Circular Functions*); but the term applies, in modern usage, more appropriately to mathematical methods of peculiar power involving unusual refinements of reasoning, or reference to relations of magnitude, which may be styled "transcendental." Among such are the "Antecedental Calculus" of Mr. Glenie,* the "Calculus of Derivations" of M. Arbogast, the "Calculus of Probabilities" (see this head), and the more modern creation of Sir Wm. Rowan Hamilton, "Quaternions." But, pre-eminently, by the word calculus is denoted the Differential Calculus, including under this head the complementary branches of "Differential and Integral," of the Leibnitz system of symbolization, or the "Fluxions" and "Inverse Method of Fluxions" of the Newtonian. The calculi of Leibnitz and Newton are essentially the same, though the logical basis on which Newton places his method is generally considered more satisfactory than that of Leibnitz. The method of Leibnitz was first to make its appearance before the public in 1684; but Newton's method of drawing tangents (wherein the method of fluxions was sufficiently explained) was communicated in a letter to a Mr. Collins in 1682. Upon the allegation that Leibnitz had seen this letter was based the charge (sustained by the Royal Society of London) that Leibnitz had plagiarized therefrom. This charge is now considered unfounded, and the glory is conceded to him of having been a contemporaneous discoverer of a calculus that has been styled "one of the greatest, most subtle, and sublime dis-

* Jas. Glenie, F. R. S. of London and Edinburgh, invented this calculus in 1774; it was published in 1794. According to the writer in Ree's Encyclopædia, "both the differential and fluxional calculi may be derived from the doctrine of proportions (therein expounded) in a manner altogether unexceptionable."

coveries of this or, perhaps, of any age: opening a new world to us, and extending our knowledge, as it were, to infinity; and carrying us beyond the bounds that seemed to have been prescribed to the human mind; at least infinitely beyond those to which ancient geometry was confined."

The Continental mathematicians usually defined the calculus as the arithmetic or analysis of *infinitely*, or rather indefinitely *small* quantities. ("*Analyse des Infiniment Petits.*") Sir Isaac Newton and the English authors styled these infinitely small quantities *moments*—*i. e.* the *momentary* increments of variable quantities; *e. g.* of a line considered as generated by the movement (*flux*) of a point, or of a surface by the "flux" of a line. Although it may have been impracticable to expound the rationale of the calculus, or of fluxions, without allusion to "infinitely small" or "indefinitely small" or "vanishing" quantities; nevertheless, all the mystification attending these subjects and nearly all the contests about the logical basis have had their *raison d' être* in the use of these words. There can be nothing "small," nothing "great," except *relatively*. "The expression *infinitely little magnitude*," says Mr. Glenie, author of the "Antecedental Calculus," "implies a contradiction, since what *has* magnitude cannot be infinitely little." And furthermore, it may be said that the relations of *magnitude* (which form the subjects of all mathematical reasonings) can be of but *one kind:* we must either discard the infinitely little, or treat it quantitatively (if we assign it magnitude), as we treat other quantities. No elaborate discussion of the differential method can be attempted here, but most briefly I think it can be defined as the method by which, from the *law of growth*, the "full stature," that is, the complete expression for the value of a function, is obtained; or *vice versâ*. A quantity or magnitude is said, in mathematics, to be a *function* of another quantity when it depends for its value upon the value of that other quantity. Thus, the particular ordinate, y, of a parabola, at any point of which the abscissa is x, depends for its actual value or magnitude, upon the arbitrary value we may give to x, and (referred to its axis of ordinates and vertex) the expression for y in terms of x is $py = x^2$, or $y = \frac{1}{p}x^2$. The ordinate, y, is here a *function* of the arbitrarily assumed magnitude x (hence called, as well as y, which varies with it, a *variable*) and of the parameter, p, which, remaining the same for the same parabola, is called a *constant*. As distinguished from y (the *function*), x is an *independent* variable.

If ONN′ be a branch of the parabola, let $x = \mathrm{OM}$, then y is represented by MN. If we add the magnitude MM′, which we will call dx (alluding thereby to the *difference* between the original and the new abscissa), to OM (or x), the ordinate corresponding, M′N′, will *differ* from MN by the magnitude PN′, which we will call dy.

Thus, to an arbitrary increment dx of x, corresponds an increment dy of y; and the value of this last increment depends—1st, upon the nature of the function, or the algebraic relation between y and x; and 2d, upon the arbitrary value of dx.

In the equation $y = \frac{1}{p}x^2$ we substitute $y + dy$ for y and $x + dx$ for x, develop and subtract y and its value from the two members respectively, then divide by dx, we have $\frac{dy}{dx} = \frac{1}{p}(2x + dx)$; which gives the *ratio* of the increment dy of the function y to that of the variable x; and this ratio depends upon the value we may assign to dx, which, so far, may have been any lineal magnitude whatever. In fact, from the curvature of the line ONN′ to which the ordinates are drawn, it is clear that the ratio of dy to dx must vary with the greater or less distance of M′ from M. Let us suppose that the point M′ is moved towards M until MM′ or dx becomes *indefinitely small* (compared with OM or with our unit of linear dimension or with some dimension to which we attribute ordinary magnitude, such as that of the *parameter*), "smaller than any assignable quantity," "infinitely small," or *zero;* that is, "vanishes." So must also dy; but the value of the *ratio*, $\frac{dy}{dx}$, *does not vanish*, but becomes (as its algebraic expression shows) $= 2\frac{1}{p}x$; that is, it has a finite determinable value which depends upon the *form of the function alone*. Had y been given as a multiple of some other power, say $= px^n$, we should have found the limiting value of $\frac{dy}{dx}$ to be npx^{n-1}, etc. etc. By this it is seen that the *ratio* of two mutually dependent variable quantities does not necessarily vanish, nor even *necessarily* become *small*, as the quantities themselves diminish; but that it approaches more and more nearly a determinate limit, just as in algebra and geometry the expression $\frac{0}{0}$ takes (generally) a finite and determinable value. Although it is, in general, with this *limit*, called the *differential coefficient*, that we have to deal, yet the symbols dy, dx, etc. (styled *differential* of y, etc.) are often met with separately and treated as *real*, though indefinitely small, quantities.* It is also to be remarked that in the exemplar expressions $\frac{dy}{dx} = 2\frac{1}{p}x$, $\frac{dy}{dx} = nx^{n-1}$ etc., $\frac{dy}{dx}$ is *itself* a function of the variable x, and would yield (by the repetition of the same process) $2\frac{1}{p}$ and $n(n-1)x^{n-2}$, as *their* differential coefficients; styled *second* differential coefficients of the original function, and expressed, by reference to its symbol y, as $\frac{d^2y}{dx^2}$, implying a *second* differentiation of y, as a function of x. The process may be continued (to a third and fourth, etc.) so long as the resulting expression continues to be a function of the variable.

Geometrically, the idea of *limit* may be illustrated by supposing, in the figure, a secant to be drawn through the given point N of the curve, cutting it again in some other point N′. The nearer this second point is made to approach the first, the more nearly will the secant approach to coincidence with the tangent drawn at N. Thus, "the tangent to a curve is the right line which limits the position of all the secants which can be drawn through the point of contact, though, strictly speaking, it be no secant; so, also, a *ratio* may limit the variable ratio of increments, though it cannot be said to be the ratio of any real increments." In fact, the limit of the ratio $\frac{dy}{dx}$ is the trigonometrical tangent of the angle which the tangent line at N makes with the axis of abscissas. Newton's "method of drawing tangents" of 1682, in which the method of fluxions is said to be "sufficiently explained," is founded on this relation of tangents to this limit-ratio of increments. This ratio, now known as the "Differential Coefficient," is really the expression for what I have styled the *law of growth* of the function as depending upon the growth or increase (or decrease) of the variable. To determine the differential coefficients, knowing the integral expression for the function, and to deduce by aid of them unknown properties of the functions themselves, is the object of the "Differential Calculus." On the other hand, given this law of growth, the integral expression for the function is determined by the methods of the "Integral Calculus." The peculiar power of the calculus as an instrument of mathematical investigation depends upon this, that the more difficult problems of pure Mathematics, and far the greater proportion of those of Mechanics or Physico-Mathematics (in which the action of *forces* is concerned), can only be stated in terms involving not merely relations between integral quantities known and sought, but between their simultaneous and mutually dependent *increments*—*i. e.* the data involve *besides*, perhaps, the quantities themselves, their *law of growth*, in the form of their differential coefficients; and, *hence*, can only be solved by the processes of the Calculus.

Thus, in mechanics, the velocity generated by a constant or uniformly accelerating force is proportional to the time it acts, whether finite or indefinitely small, or $v = gt$ or $\frac{dv}{dt} = g$ (if the force be gravity). Also the distance traversed is proportional to the velocity; and this, though the velocity constantly increases, is the *law of growth*, as a function of the time; hence, $\frac{dy}{dt} = v = gt$, and hence (by integration) y (the distance fallen in the time t) $= \frac{1}{2}gt^2$, the well-known expression for the height of fall in terms of the time. The expression can be arrived at without the use or even the knowledge of the formal methods of the calculus, but it will be found that its fundamental principles are involved in such solutions.

These fundamental principles are in much more common

* In the modern improved system these illogical symbols are wholly discarded (*e. g.* Prof. Peirce's "Analytic Mechanics"), and the real element of the calculus—the differential coefficient—is symbolized by the letter D, with the independent variable sub-fixed; followed by the symbol of the function; *e. g.* $D_x y$, instead of $\frac{dy}{dx}$.

use than is supposed. When we assign, for example, a specified velocity to a cannon-ball at a given instant of time or at a certain point of its trajectory, we speak of a thing which has no permanent—indeed, I might almost say no *real*—existence; for there is no portion of that trajectory, *however minute*, which the ball really traverses at the supposed rate. It *would* travel, *e. g.*, 1000 feet per second, if at the given instant its variable velocity were made invariable; and *this* is what we mean. The resulting direction would be the *tangent* to the actual trajectory; the invariable velocity, the *differential coefficient* of the space traversed as a function of the time. The practical measurement of the velocity involves the same conceptions. We place two screens along the path of the ball, and by skillfully-devised instrumental agencies, measure the minute *time* of transit. The quotient of the distance apart of the screens, divided by the time, gives us the required velocity. If this distance were "infinitely small," the quotient would be the true "differential coefficient." The *nearer* we place the screens (and we place them as near as the practical difficulties of measuring the time will permit), the more nearly do we approximate to that coefficient. Even with a very measurable (*finite*) distance, we obtain results of error less than we can assign any expression for.

If, instead of placing screens very close together, they were many hundred feet apart, the distance divided by the time of transit would still give us the *mean* velocity between the screens, but evidently not (accurately) the velocity at any one point; for the variation or differential of velocity from one screen to the other is considerable, compared with its *total* value. Hence, by diminishing *indefinitely* the distance, this variation becomes less and less appreciable, and the ratio of the indefinitely diminished *space* and *time* becomes the *ultimate* ratio—the *differential coefficient*—which (in this particular case) is the velocity sought. We have then, in this practical operation, an illustration of peculiar notions and fundamental principles of the calculus: *indefinitely small*—*vanishing*, or *infinitesimal*, quantities; *ultimate ratios*, *limits*, or (what is equivalent) *differential coefficients*.

Besides the direct solution of problems, the calculus has been the most effective and indispensable of agents in widening the sphere of mathematical investigation, and in enhancing the power of its instruments. Scarce one of the modern methods of analysis but depend on it for their development. The CALCULUS OF VARIATIONS, originating with Lagrange, is but an extension of the methods of the calculus to the discovering of functions, in cases in which, instead of the law of growth, some condition (such as that of producing a maximum or minimum under certain conditions) which the function when found must fulfil, is given. The CALCULUS OF OPERATIONS is but an extension of algebra to the *symbols of operation* of the calculus: algebra itself being really a calculus of operations, since it deals only with symbols with a view to reduce the operations they indicate to their simplest expression. Modern "Higher Algebra" might with propriety be so styled. (See DETERMINANTS, INVARIANTS.)

The mathematical method (another development of the Differential Calculus), commonly referred to by English writers as that of LAPLACE'S COEFFICIENTS, is, generalized and enlarged, now termed "Spherical Harmonic Analysis," and is a *calculus* of great power for a large class of physical problems involving arbitrary data over a spherical surface. Hence its applicability to the calculation of the "tides" and other problems connected with the "figure" and "attraction" of the earth; also to certain problems relating to the distribution of electricity and magnetism, etc.

Sir William Rowan Hamilton's "Calculus of Quaternions," by many believed to be an invention of importance vieing with that of the calculus itself, has indeed a rationale, or logical basis, radically distinct from and independent of the calculus; yet for its full development it has recourse to the methods and principles of the CALCULUS.

Mr. Cauchy has shown that for the explanation of certain properties of functions, even for *real* values of the independent variable, it is indispensable to generalize the investigation by including the case of *imaginary* values for that variable (*i. e.* values involving the well-known expression of *impossibilty*, $\sqrt{-1}$). All geometricians are aware of the service which the consideration of imaginary quantities has rendered to Algebra. The theory of equations is dependent upon it, and it seems destined to render yet greater service to the theory of "functions." It would be impossible to attempt any explanation of the method or *Calculus* of Imaginaries, an outline of which may be found in Book I. of "Théorie des Fonctions Doublement Périodiques." Briot and Bouquet, Paris, 1859. Resulting from it is the *Residuary Calculus*, or Residuation by which (see the "Integral Calculus," of PROF. B. PEIRCE) developments are obtained for functions where Taylor's theorem fails in consequence of its first term becoming infinite.

In an antecedent paragraph we found the expression for the algebraic relation between the finite increments (or "differences") of the co-ordinates of the parabola when one of these is "any lineal magnitude whatever." The "Calculus of FINITE DIFFERENCES," invaluable in the practical application of analytic formulæ to numerical calculations, for the summation of infinite series, and for INTERPOLATION, results from such relations between finite increments or "differences," and is defined by Lacroix to have for its object "the determination of the values of increments, by deducing them not merely from the analytic expression of the functions, but also from their numerical (or particular) values, when that expression fails or is too complicated." Except a general similarity in notation and terms employed, it has little in common with the Differential Calculus: the fundamental element of which latter—the Differential Coefficient—having no place in it.

J. G. BARNARD, *U. S. Army*.

Calculus, or **Stone**, in medicine, a concretion formed within the body from the deposition of matters which normally remain in solution. The most important calculi are those formed in the kidneys or bladder (urinary calculus), and those formed in the gall-bladder or biliary ducts (biliary calculus, or gall-stone). Both of these give rise to intense pain, and may even threaten life. Calculi of less importance may form in the salivary ducts and elsewhere.

Biliary calculus may generally be assumed to exist when excessive pain suddenly arises in the right side beneath the ribs, and when in a few hours jaundice comes on. But absolute proof that these symptoms depend on calculus is often wanting. The pain is more severe while it lasts than almost any other form of suffering. It may be relieved by large doses of opium or by the inhalation of ether, but such a remedy requires to be cautiously given. Gall-stones impacted in the ducts sometimes have proved fatal, but much more frequently they find their way, sooner or later, into the intestines. They are, in the human subject, almost invariably composed of cholesterine, with coloring-matter and mucus arranged in layers. The Oriental bezoar-stone is a biliary calculus from an antelope. It consists chiefly of crystalline lithofellic acid.

Urinary calculus is a disease most common in advanced life and in the male sex. It is frequent in gouty persons, or among those who pursue sedentary occupations and live freely. Among sailors it is rare. Certain local conditions promote it, especially an excess of mineral matter in drinking-water. It is common in England, Ireland, Russia, France, Northern Italy, and Egypt. In the U. S. it is most frequent in Kentucky, Tennessee, West Virginia, Ohio, and Indiana. In its early stages the disease not unfrequently presents itself in the form of gravel, shown by the passage of numerous small gritty concretions, observed in the urine as a deposit like sand. When such deposits are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If in these circumstances there are pains of a dull character in the loins, with occasional twinges, no time should be lost in seeking medical advice. Calculus in the bladder is at first attended with little pain, as compared with that caused by the stone in its passage downward from the kidney; but unless removed the calculus is sure to enlarge, and it then becomes the cause of most intense distress. Perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound, is smarting and burning pain experienced after the bladder has been emptied, with occasional temporary stoppages of the urine.

The chief varieties of urinary calculus are—1. Uric acid, urates of ammonia, soda, lime, etc. (brick-dust sediment, red sand); 2. Phosphates of ammonia and magnesia, lime, etc. (the lime phosphate, mixed with ammonio-magnesian phosphate, constitutes the "fusible calculus," one of the commonest kinds); 3. Oxalate of lime (mulberry calculus); 4. Carbonate of lime (chiefly in domestic animals); 5. Cystine; 6. Xanthic oxide (very rare); 7. Very rarely indeed do leucine, tyrosine, and other disease-products form calculous concretions. 8. Calculi of fibrine, etc. are also reported. 9. Calculi are frequently composed of numerous layers, having perfectly distinct chemical composition. When calculus has once formed in the urinary organs no sure exists except the removal of it from the body (see LITHOTOMY and LITHOTRITY), but in the earlier stages much may be done to check the malady by careful regulation of the diet and mode of living, with the use of solvents adapted to the particular form of deposit found.

Urinary calculi have been often observed in horses, cattle, and pigs, and are very frequent in the common rat.

REVISED BY WILLARD PARKER.

Calcut'ta [Sanscrit, *Kalikâta*, "dwelling of Kali," an Indian deity], the capital of British India, situated in the province of Bengal, on the E. bank of the Hoogly, an arm of the Ganges, about 75 miles from the sea; lat. 22° 34′ N., lon. 88° 20′ E. The city extends along the river about 6 miles, and has an average breadth of 1½ miles. The river, here a mile wide, is constantly full of shipping. In the southern part of the city, called Chowringhee, are the residences of the Europeans, which in a great part are finely built in Grecian style, and many of them surrounded by groves of fruit trees. A quarter of a mile to the S. W. is Fort William, built at a cost of £2,000,000, the largest fortress in the British dominions, octagonal in form, requiring a garrison of 10,000 men and mounting 619 guns. Its usual garrison consists of one English and two native regiments. Between the fort and the city is the Maidân or glacis, a handsome park, and the Esplanade, on which is the Government House, a magnificent building surmounted by a dome, and in a line with it a row of handsome dwellings. Beyond Chowringhee is the native or "Black Town," consisting mostly of mud or bamboo cabins and narrow dirty streets. Here and there an idol of painted wood or plaster is set up in the street. The principal buildings of Calcutta are the Government House, the mint, the town-hall, the cathedral, the Hindoo college, and the hospital. On the other side of the river, opposite the citadel, is the botanic garden. Calcutta is the residence of an English bishop. The Asiatic Society have a valuable museum and library of Oriental MSS. There are several educational institutes, supported by the government—the Hindoo, the Madriassa or Mohammedan, the Sanscrit, and the Fort William Colleges. Calcutta has the largest commerce of any city in Asia, and commands the entire inland trade of Bengal. Ships of 1400 tons can anchor in the river. It has railway connection with Bombay, 1420 miles distant by rail, and with Delhi, and through the Punjâb with the Indus. The chief articles of export are opium, indigo, sugar, saltpetre, rice, raw cotton, raw silk, piece goods, hides, lac, etc. The exports in 1868–69 were estimated at £20,728,159, and the imports for the same year at £16,934,771. European society at Calcutta is very convivial and fond of amusement. Calcutta was founded by Job Charnock, agent of the East India Company, about 1690. In 1756 it was captured by Surajah Dowlah, who confined 123 prisoners in the horrible "Black Hole." Lord Clive retook it in 1757, and built the fortress. Pop. 616,249; of these 238,325 are in the suburbs. Of the 377,924 inhabitants in the inner city, 239,190 are Hindoos and 113,059 Mohammedans.

Calda'ni (Leopoldo Marco Antonio), an eminent Italian anatomist, born at Bologna Nov. 21, 1725. He succeeded Morgagni as professor of anatomy at Padua in 1771. He published several works on anatomy and physiology, and a series of accurate plates entitled "Icones Anatomicæ" (4 vols., 1801–14). Died Dec. 30, 1813.

Calda'ra (Polidoro), an Italian painter, born in the Milanese about 1495, was often called Caravaggio, from the name of his native place. He went to Rome, and was employed by Raphael to paint the friezes in the Vatican. He was a skilful painter of landscapes and historical pieces. He was murdered by his servants in 1543.

Cal'das, or **Calde'tas,** a Spanish term applied to warm springs, and forming part of the name of many places in Spain. Among these the most noted is Caldas de Mombuy, 18 miles N. of Barcelona. Here are thermal baths and some antiquities.

Calderon' de la Bar'ca (Pedro), the most eminent Spanish dramatic author, born in Madrid Jan. 17, 1600, was educated at the University of Salamanca. He began to write dramas about the age of thirteen, and having entered the army in 1625, served several campaigns in Italy and Flanders. After he had gained distinction as an author, he was patronized by Philip IV., who invited him to his court in 1636, and created him a knight of Santiago. He was a very prolific author, and produced about 500 dramas. In 1651 he entered the Church, and became chaplain in the royal chapel at Madrid 1663. Among his greatest works are a tragedy entitled "The Constant Prince" ("El Príncipe Constante"), "Love is no Joke," "Life is a Dream," and "The Physician of his Own Honor." In the latter part of his life he wrote many religious poems called "Autos Sacramentales." His imagination was brilliant, and not restrained by conventional rules. He is ranked among the greatest Spanish poets by native critics, and his dramas are popular in Germany. His works display great fertility of invention, and abound in beautiful passages, but are deficient in fidelity to nature. Died May 25, 1681. (See Richard C. Trench, "The Life and Genius of Calderon," 1836; Ticknor, "History of Spanish Literature.")

Cal'derwood (David), a Scottish Presbyterian minister and historian, born in 1575. He was banished for his opposition to episcopacy in 1619, and then retired to Holland, where he published a controversial work called "The Altar of Damascus" (1623). He returned to Scotland in 1636, and wrote a "History of the Kirk of Scotland." Died in 1651.

Cal'dicot (Thomas Ford), D. D., born at Buckby, England, in 1803, removed to Canada in 1824, held Baptist pastorates in Hamilton, Lockport, and Brooklyn, N. Y., Boston, Mass., and Toronto, Canada, where he died July 9, 1869. As a scholar, writer, and orator he was alike distinguished.

Caldie'ro (anc. *Caldarium*), a town of Northern Italy, where Napoleon I. was defeated by the Austrians under Alvinzi, Nov. 11, 1796. It is 12 miles by rail E. of Verona, and is noted for its thermal springs. Massena was repulsed here by the archduke Charles in 1805.

Cald'well, a county in the W. of Kentucky. Area, 275 square miles. It is bounded on the N. E. by the Tradewater Creek. The surface is nearly level; the soil is fertile. Grain, tobacco, cattle, and wool are raised. It is intersected by the Elizabethtown and Paducah R. R. Capital, Princeton. Pop. 10,826.

Caldwell, a parish in N. Central Louisiana. Area, 528 square miles. It is intersected by the Washita River, navigable for steamboats, and bounded on the E. by Bœuf Bayou. Wool and cotton are the chief products. Capital, Columbia. Pop. 4820.

Caldwell, a county in the N. W. of Missouri. Area, 435 square miles. It is intersected by Shoal Creek. The surface is nearly level; the soil is fertile. Grain, wool, and cattle are raised. The county is traversed by the Hannibal and St. Joseph R. R. Capital, Kingston. Pop. 11,390.

Caldwell, a county in the N. W. of North Carolina. Area, 450 square miles. It is bounded on the S. by the Catawba River, and drained by the Yadkin, which rises within its limits. The Blue Ridge extends along its N. W. border. The soil is mostly fertile. Corn, wheat, tobacco, and wool are raised. Excellent iron ore is found. Capital, Lenoir. Pop. 8476.

Caldwell, a county of the S. central part of Texas. Area, 535 square miles. It is bounded on the S. W. by the San Marcos River, and drained by several creeks. The surface is undulating; the soil is fertile. It is an excellent region both for farming and grazing. Corn and tobacco are the chief crops. Capital, Lockhart. Pop. 6572.

Caldwell, a township of White co., Ark. Pop. 451.

Caldwell, a post-township of Appanoose co., Ia. Pop. 1201.

Caldwell, a post-village in Caldwell township, Essex co., N. J., is about 10 miles N. W. of Newark. Pop. of the township, 2727.

Caldwell, the capital of Warren co., N. Y., is situated near the head of Lake George, 62 miles from Albany. It has two churches and four hotels, and is a place of summer resort. Steamers ply upon the lake. Fort William Henry and Fort George were situated within the limits of this township. Pop. of township, 2329.

Caldwell, capital of Noble co., O., on the Marietta and Pittsburg R. R., 35 miles N. of Marietta, is situated in the centre of the Duck Creek oil-region. The vicinity yields coal and iron. It has one national bank and two weekly newspapers. P. 318. Ed. "Noble County Republican."

Caldwell, a township of Newberry co., S. C. P. 1791.

Caldwell, a post-village, cap. of Burleson co., Tex., 85 miles E. by N. of Austin; has a male and female academy.

Caldwell (Charles), M. D., an American physician, born in Caswell co., N. C., May 14, 1772. He was for many years professor of medicine in Transylvania University in Kentucky. He wrote, besides other works, a "Life of General Greene" (1819). Died July 9, 1853. (See Appendix.)

Caldwell (Charles H. B.), U. S. N., born June 11, 1828, in Massachusetts, entered the navy as a midshipman Feb. 27, 1838, became a passed midshipman in 1844, a lieutenant in 1852, a commander in 1862, and a captain in 1867. In 1858, while attached to the sloop-of-war Vandalia, Caldwell had charge of an expedition against a tribe of cannibals inhabiting Wega, one of the Fejee Islands, which he conducted with ability, defeating the Wegans in a pitched battle and burning their town. While commanding the steamer Itasca he took part in the bombardment of Forts Jackson and St. Philip April 24, 1862, but was unable to pass the forts with the rest of the fleet, "owing to a 42-pound shot entering the boiler, the steam from which filled the fire and engine-room, driving every one up from below,

and almost suffocating those on the quarter-deck." He participated in the action with the Grand Gulf batteries, Mississippi River, June 9, 1862, and in command of the iron-clad Essex took part in all the operations at Port Hudson during the spring and summer of 1863.

FOXHALL A. PARKER, U. S. N.

Caldwell (JAMES), a patriot, born in Charlotte co., Va., in April, 1734. He graduated at Princeton in 1759, became pastor of a Presbyterian church at Elizabethtown, N. J., and efficiently promoted the popular cause during the Revolution. He served in the army as chaplain and also as a soldier. He was murdered by a sentinel June 6, 1780.

Caldwell (JOSEPH), D. D., born in Leamington, N. J., April 21, 1773, graduated at Princeton in 1791, became in 1796 principal professor in the University of North Carolina, and its first president in 1804. Died Jan. 24, 1835.

Caldwell (MERRITT), A. M., a distinguished author and educator in the Methodist Episcopal Church, was born at Hebron, Me., Nov. 29, 1806, graduated at Bowdoin College in 1828, became principal of the Maine Wesleyan Academy at Readfield in 1828, was elected professor of mathematics and vice-president of Dickinson College, Pa., in 1834, professor of metaphysics and English literature at Dickinson in 1837, visited England, and assisted in founding the Evangelical Alliance at the "World's Convention," London, 1846. Died June 6, 1848. He was a distinguished and able advocate of total abstinence, a gifted and industrious writer, and was author of a "Manual of Elocution" (1846), "Philosophy of Christian Perfection" (1847), "Christianity Tested by Eminent Men" (1852), "The Doctrine of the English Verb" (1857), and numerous reviews. He was a man of great talents and excellence of character.—His brother, ZENAS CALDWELL (born Mar. 31, 1800; died Dec. 26, 1826), was a brilliant and able instructor, whose early death was widely lamented. A volume of his writings has been published.

Cald'well's, a township of Catawba co., N. C. P. 1101.

Cal'edon, EARLS OF (1801), Viscount Alexander (1797), Baron Caledon (1789), all of the Irish peerage.—JAMES ALEXANDER, fourth earl, was born July 11, 1846, and succeeded his father in 1855.

Caledo'nia, the ancient name of Scotland, probably first given to that country by the Romans. It was inhabited by a rude and warlike people called Caledonii, who are supposed to have been a Gaelic race. The first Roman general who invaded Caledonia was Agricola, who defeated a chief named Galgacus in 84 A. D. Pliny is the first author who mentions Caledonia. Tacitus describes the natives as having red or sandy hair, as living in tents without cities, as addicted to predatory warfare, and fighting in chariots. The Romans made several unsuccessful efforts to subdue these barbarians, who not only repulsed the invaders, but harassed the Roman colonies in Britain by frequent inroads. To defend themselves against these inroads, the Romans built about 140 A. D. the Wall of Antonine from the Frith of Forth to that of the Clyde.

Caledonia, a village of Cape Breton co. and island, Nova Scotia, 10 miles from Sidney, has mines of coal. Pop. about 250.

Caledonia, a county in the E. N. E. of Vermont. Area, 650 square miles. It is bounded on the S. E. by the Connecticut River, and drained by the Passumpsic, Lamoille, and Wells rivers. The surface in the W. part is mountainous; the soil is fertile. Oats, wool, maple-sugar, and hay are the chief products. Lumber, carriages, saddlery, and a great variety of articles are manufactured. It is intersected by the Connecticut and Passumpsic Rivers and Portland and Ogdensburg R. Rs. Capital, St. Johnsbury. Pop. 22,235.

Caledonia, a village of Ontario, Canada, in Haldimand co., on Grand River and the Grand Trunk Railway, 59 miles W. N. W. of Buffalo, N. Y., and about 16 miles S. S. W. of Hamilton. Pop. in 1871, 1247.

Caledonia, a village and township of Boone co., Ill. The village is on a branch of the Chicago and North-western R. R., where it is crossed by the Kenosha and Rockford R. R., 13 miles S. E. of Beloit. Pop. of township, 1345.

Caledonia, a post-village, capital of Pulaski co., Ill., on the Ohio River and on the Cairo and Vincennes R. R., 14 miles above Cairo. Pop. 222.

Caledonia, a post-twp. of Kent co., Mich. Pop. 1599.

Caledonia, a township of Shiawassee co., Mich. P. 891.

Caledonia, a post-village, capital of Houston co., Minn., is 14 miles W. of the Mississippi River and 20 miles S. W. of La Crosse. It has four churches, one academy, two public schools, and one plough and two wagon manufactories. It has one weekly newspaper. Pop. of township, 1628. J. L. CHRISTIE, ED. AND PROP. "JOURNAL."

Caledonia, a post-village and township of Livingston co., N. Y., on the Attica branch of the Erie Railway, 17 miles E. by S. of Batavia. The township yields excellent lime and limestone for building purposes. Caledonia Spring, two acres in area, affords good water-power. Pop. 597; of township, 1813.

Caledonia, a township of Halifax co., N. C. P. 2118.

Caledonia, a post-village of Marion co., O., on the Whetstone River, and on the Atlantic and Great Western R. R., 94 miles N. E. of Dayton. Pop. 419.

Caledonia, a township of Columbia co., Wis. P. 1180.

Caledonia, a township of Racine co., Wis. P. 2800.

Caledonia, a twp. of Trempealeau co., Wis. P. 507.

Caledonia, a township of Waupaca co., Wis. P. 661.

Caledo'nian Canal', The, in Scotland, connecting the Atlantic Ocean with the North Sea near Inverness, was built by Telford, and opened in 1823. It is 61¼ miles in length, and is formed by cuts 120 feet broad at the surface, 50 feet at the bottom, and 17 feet deep, connecting the Lochs Ness, Oich, Lochy, and Eil. The combined length of the artificial portions is 23 miles. This canal saves vessels the stormy passage by the Hebrides, which takes nine or ten days longer. Ships of 600 tons can pass through. The highest part is Loch Oich, 94 feet above the sea-level.

Caledo'nia Springs, in Caledonia township, Prescott co., province of Ontario (Canada), are 40 miles from Montreal and 9 miles S. W. of L'Orignal. They are resorted to especially for the cure of cutaneous, scrofulous, and rheumatic diseases. There are four principal springs, all strongly alkaline, one with considerable iodine and bromine in its waters.

Cal'endar [Lat. *calendarium*, the "money-lender's account-book," because interest was payable on the calends; hence, a register of times and seasons—an almanac], a term applied to any systematic and comprehensive method of dividing, distributing, and reckoning time, or to a book or table exhibiting such a method. There are two natural divisions of time, or regularly recurring periods, which all calendars must recognize—the day and the year. The month seems to have been suggested by the period of the moon's revolution (29½ days nearly), to which in some calendars (as the Jewish and the Greek) it has been made closely conformable. The week is, approximately, one quarter of a lunation. It is found in the Oriental and Egyptian calendars, and in that of the Israelites, from whom we have received it, but it was not known to the Greeks or the Romans. The Greeks instead employed *decades* of ten days each, and the Romans periods of *eight* days, the last of which was called *nundinæ* (*novem*, "nine;" *dies*, "day"), or ninth day; the count including both the nundine at the beginning and that at the end of the period. In the ancient calendars the nundine periods were distinguished by setting opposite the successive days the first eight letters of the alphabet (A to H inclusive), repeating these letters throughout the year. From this usage was derived that of the Christian calendar of marking the days by the first seven letters (A to G), similarly repeated. The manner of denoting days of the month was peculiar. The first day was always called *kalendæ*, "calends;" the fifth or seventh, *nonæ*, "nones;" and the thirteenth or fifteenth, *idus*, "ides." The nones were the seventh, and the ides the fifteenth in March, May, July, and October, the first, third, fifth, and eighth months of the Roman year (easily remembered by associating them with the notes of the common chord in music); in the remaining months they fell on the fifth and thirteenth. Any other day was denoted by its distance counted backward from one of these points of reference, the reference-day itself counting one. Thus, the 31st day of March is *Pridie* Kal Apr., or II. Kal Apr.; the 30th day of March is III. Kal Apr.; the 6th of July is Pridie Non. Jul.; the 5th, III. Non. Jul., etc. It is difficult to understand how so cumbrous a system as this could have maintained itself for centuries among a cultivated people.

In the regulation of the year we find the calendars of different peoples materially differing. The Egyptian year had 12 months of 30 days each, and counted five unallotted days at the end. It was too short by nearly a quarter of a day; and hence the beginning of the year went backward through the seasons once in 1460 natural years or 1461 Egyptian years. This was known as the SOTHIC PERIOD (which see). Because of this incessant movement the Egyptian year is called *vague* or wandering. The Greek year consisted of 12 lunar months of 30 and 29 days alternately. This made the length of the year 354 days, or 11¼ days too small. To compensate for the deficiency, an intercalary month of 30 or 29 days was introduced every alternate year, which made the average length seven days too great; for which reason the intercalary

month was omitted once in about eight years. The earliest Roman year, attributed to Romulus, had only ten months, of which the first, third, fifth, and eighth (those in which, as above mentioned, the nones fell on the ninth and the ides on the fifteenth) had 31 days, and the rest 30 each. This year of only 304 days was shorter than the natural year by about one-sixth. Each Romulian year therefore began two months earlier in the season than the last, and the sixth came to an end at the same time with the fifth natural year. This circumstance, according to Niebuhr, determined the period of the lustrum. (See LUSTRUM.)

The months of the original Roman year were named Martius, Aprilis, Maius, Junius, Quintilis, Sextilis, September, October, November, December. Numa Pompilius, second king of Rome, added, according to Solinus, Januarius to the beginning and Februarius to the end of the year. This year was a lunar year of 354 days, but it was made a day longer, or 355, because there was supposed to be luck in odd numbers. To prevent displacement, an intercalary month of 22 and 23 days, alternately, was introduced every second year. This made the year to consist in effect of 366¼ days. About the year 450 B. C. the decemviri regulated the calendar once more, and placed February between January and March, both at the end of the year. The months were now—whether so settled by Numa or the decemvirs is uncertain—Martius, 31 days; Aprilis, 29; Maius, 31; Junius, 29: Quintilis, 31; Sextilis, 29; September, 29; October, 31; November, 29; December, 29; Januarius, 29; Februarius, 28. The intercalary month was inserted between the 23d and 24th days (as we count them) of February, or, in the Roman manner of speaking, before the sixth calends of March. The reason for so placing it was, that the seventh calends of March, or the 23d day of February, was the last day of a round year of 360 days, and was celebrated as the festival of Terminus, the god of limits, under the name Terminalia. The Romans, like the Egyptians, seem to have regarded the remaining five days as hardly belonging to the year, but as being a sort of interval between two years. The odd day added to the 354 for luck was not, however, intercalated in this place, but was introduced wherever it might be necessary to prevent the *nundinæ* from falling on the calends of January or the nones of any month—such a coincidence being deemed inauspicious. The year on this system being, as we have seen, a day too long, added twenty-four days too much in twenty-four years. It was provided, therefore, that during the last eight years of this period these twenty-four days should be deducted in making the intercalations. The pontiffs, however, who had the control of the intercalation, used their power capriciously for personal ends—sometimes to lengthen or shorten the term of a magistrate, sometimes to benefit or injure the farmer of the public revenues. As a natural consequence, the calendar fell into extreme confusion; so that in the time of Julius Cæsar the civil differed from the astronomical equinox by nearly three months. This powerful ruler resolved on a thorough reform. Under the advice of the astronomer Sosigenes he abolished the lunar year. He readjusted the months to their proper seasons by making the year 708 A. U. C. 445 days long, extending from October 13, inclusive (according to our present count), to the 31st day of the second ensuing December. This year is known in chronology as the year of confusion. He reconstructed the months, giving 31 days each to the first, third, fifth, seventh, ninth, and eleventh, and 30 days each to the rest, except February, which had 29 only, but every fourth year received an intercalary day, making 30. The intercalation took place, for a reason already given above, immediately after the feast of Terminalia, and was made by repeating the *sexto Kalendas Martius;* whence the year in which it occurred came to be called bissextile. Finally, the beginning of the year was transferred from the first of March to the first of January. To flatter the vanity of Octavius after he had secured the supreme power and had received the title of Augustus, a day was taken from February by a sycophantic senate and given to August, which had been named from him, for the frivolous purpose of giving to his month no less dignity in point of numbers than July, which had received its name from the first Cæsar. The lengths of the later months were then altered to prevent three long months from occurring consecutively.

The Julian year consisted of 365¼ days, and consequently differed in excess by 11 minutes 13.95 seconds from the true solar year, which consists of 365 days 5 hours 48 minutes 46.05 seconds. In consequence of this difference the equinox, in the course of a few centuries, fell back sensibly towards the beginning of the year. In the time of Julius Cæsar it corresponded to the 25th of March; in the sixteenth century it had retrograded to the 11th. The correction of this error was one of the purposes sought by the reformation of the calendar effected by Pope Gregory XIII. in 1582. By suppressing ten days in the calendar, Gregory restored the equinox to the 21st of March, the day on which it fell at the time of the Council of Nice in 325. This council determined that the Eastern churches should celebrate Easter at the same time as the Western—*i. e.* on the Sunday following the Paschal full moon, and not on the fourteenth day of the Paschal moon. The Gregorian rule of intercalation may be expressed as follows: Every year of which the number is divisible by 4 without a remainder is a leap year, excepting the centesimal years, which are only leap years when divisible by 4 after suppressing the two zeros. Thus, 1600 was a leap year; 1700 and 1800 were common years; 1900 will be a common year, 2000 a leap year, and so on. The length of the mean year thus fixed is 365.2425 days, or 365 days 5 hours 49 minutes 12 seconds, which exceeds the true solar year by 25.95 seconds, an error which amounts only to one day in 3325 years. The intercalations might be so made as to make the calendar year correspond even more closely than it does now with the solar year, but no other method could be as convenient as the Gregorian.

The new calendar was received immediately or shortly after its promulgation by all Roman Catholic countries. The Protestant states of Germany and the kingdom of Denmark adhered to the Julian calendar till 1700; and in England the alteration was successfully opposed by popular prejudices till 1752. In that year the Julian calendar, or *old style*, as it was called, was abolished by act of Parliament, and the date used in all public transactions rendered coincident with that followed in other European countries, by enacting that the day following the 2d of Sept., 1752, should be called the 14th of that month. When the alteration was made by Gregory it was only necessary to drop ten days; the year 1700 having intervened, which was a common year in the Gregorian, but a leap year in the Julian calendar, it was now necessary to drop eleven days. The old style is still adhered to in Russia and the countries following the communion of the Greek Church; the difference of date in the present century amounts to twelve days. For fuller information on this subject, see DELAMBRE, "Astronomie Théorique et Pratique," tom. iii., chap. xxxviii.; IDELER, "Lehrbuch der Chronologie;" and ANTHON, "Greek and Roman Antiquities."

Ecclesiastical Calendar.—The adaptation of the civil to the solar year is attended with no difficulty, but the church calendar for regulating the movable feasts imposes conditions less easily satisfied. The festival of Easter commemorates the resurrection of our Lord, which momentous event having occurred near the time of the Jewish Passover, was naturally associated in the minds of the early disciples with that anniversary, and its annual returns were made dependent upon the same calendar regulations. The Passover was observed on the fourteenth day of the moon—that is, near the full moon. The question what day is most proper for the observance of Easter became early a subject of warm controversy. In order to put an end to an unseemly contention, the Council of Nice ordered that Easter should be celebrated on the Sunday which immediately follows the full moon that happens upon or next after the vernal equinox. In order to determine Easter according to this rule for any year, it is necessary to reconcile three periods—namely, the week, the lunar month, and the solar year. To find the day of the week on which any given day of the year falls, it is necessary to know on what day of the week the year began. In the Julian calendar this was easily found by means of a short period or cycle of twenty-eight years, after which the year begins with the same day of the week. In the Gregorian calendar this order is interrupted by the omission of the intercalation three times out of four in the last year of the century. But to render calculation unnecessary, a table is given in the prayer-books, showing the correspondence of the days of the year and the week for the current century. The connection of the lunar month with the solar year is an ancient problem, for the resolution of which the Greeks invented cycles or periods, which remained in use with some modifications till the time of the Gregorian reformation. See, on this subject, DELAMBRE, "Histoire de l'Astronomie Moderne," tom. i., liv. i.; also DE MORGAN, "Companion to the British Almanac," 1845; also, BARNARD, "How to Find the Church Festivals," New York, 1872.

A new reform of the calendar was introduced in France during the period of the Revolution. The commencement of the year was fixed at the autumnal equinox, which nearly coincided with the epoch of the foundation of the republic. The names of the ancient months were abolished, and others substituted having reference to agricultural labors or the state of nature in different seasons of the year. But the alteration was found to be inconvenient and impracticable, and after a few years was formally abandoned.

F. A. P. BARNARD.

Cal'endering [a corruption of the word *cylindering*].

the process of finishing by pressure the surface of linen, cotton goods, or paper, by passing the material between cylinders pressed together with force; the domestic processes of starching and ironing afford simple illustrations of the object and result of calendering. The mangle effects the same object as the flat-iron, and is a near approach in construction to the calendering-engine. The calenders were originally of wood. Hollow iron and copper cylinders are used where heat as well as pressure is required, the cylinders being heated by steam passed through the interior or by red-hot heaters; but it is desirable that one of the cylinders shall be of material combining considerable hardness with a degree of elasticity; for this purpose solid paper cylinders are used.

Before the final calendering the fabric is finally smoothed by passing over warm cylinders. Cotton goods are starched with flour, thickened with plaster of Paris, porcelain clay, etc., to give an appearance of stoutness, which of course vanishes when the article is washed. The fabric is then simply passed between plain cylinders, which produces the desired effect by flattening the threads. When, by means of a cylinder with a pattern raised upon it, the amount of this flattening is unequal on different parts of the cloth, the effect known as *watering* is the result. *Glazing* is produced by the rollers being made to move with different velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater rapidity. A copper roller is used for glazing, so hot that if the machine stops it burns the goods. For glazing on a small scale a polished flint is rubbed over the fabric, which is laid upon a smooth wooden table.

Cal'ends [Lat. *calendæ*, from *calo* (Gr. *καλέω*), "I call"], the first day of each Roman month, because, according to Macrobius, before Cn. Flavius the scribe, against the will of the patricians, made the *fasti* (propitious days—days when courts were open) known to all the people (about 300 years B. C.), it was the duty of one of the minor priests, on the first appearance of each new moon, to summon the plebeians to a place in the Capitol near the Curia Calabria, and there to announce the number of days before the nones (always five or seven, *including the day of calling and the day of the nones itself*), by so many times repeating the word *calo*. If the part of this statement which makes the beginning of each month dependent on direct observation of the moon is correct, it is impossible that the months of the early Roman calendar should have had the fixed and rather arbitrary lengths usually assigned to them. As to this question historians differ, some asserting that the Roman months were strictly lunar down to A. U. C. 448; others, as Censorinus, that their lengths were fixed by Numa, the second king. (See CALENDAR, by F. A. P. BARNARD.)

Cal'enture [Sp. *calentura*, a "fever," a "heat"], a species of temporary delirium occurring on board ship in hot climates, and probably due to the effect of exposure to the direct rays of the sun. The descriptions of the disease seem rather fanciful and contradictory, and the term is nearly obsolete. It is said that persons having a calenture fancied the sea was a green field, and leaped overboard.

Cale'ra, a post-village of Shelby co., Ala., at the crossing of the Selma Rome and Dalton and South and North Alabama R. Rs., 10 miles W. by S. of Columbiana.

Calf Creek, a post-township of Searcy co., Ark. Pop. 511.

Calhoun', a county in the E. N. E. of Alabama. Area, 700 square miles. It is bounded on the W. by the Coosa River. The surface is diversified by hills and fertile valleys. Cotton, corn, and wool are the staple products. It is intersected by the Selma Rome and Dalton R. R. Capital, Jacksonville. Pop. 13,980.

Calhoun, a county in the S. of Arkansas Area, 650 square miles. It is bounded on the E. by Moro River, and on the S. W. by the Washita. The surface is undulating and well timbered; the soil is fertile. Chief products, corn and wool. Capital, Hampton. Pop. 3853.

Calhoun, a county of Florida. Area, 464 square miles. It is bounded on the E. by the Appalachicola River, and on the S. W. by St. Joseph's Bay, a part of the Gulf of Mexico. The surface is low and nearly level. Tobacco, rice, and corn are the chief crops. Capital, Ocheesee. P. 998.

Calhoun, a county in the S. W. of Georgia. Area, 300 square miles. It is intersected by the Ichawaynochaway Creek. The surface is level; the soil is productive. Chief crops, cotton and corn. Capital, Morgan. Pop. 5503.

Calhoun, a county of Illinois, bordering on Missouri. Area, 260 square miles. It is a narrow peninsula, bounded on all sides except the N. by the Mississippi and Illinois rivers, which unite at the S. E. extremity of the county. The surface is uneven. Grain, wool, live-stock, and potatoes are largely raised. Capital, Hardin. Pop. 6562.

Calhoun, a county in N. W. Central Iowa. Area, 570 square miles. Grain and stock are raised. Capital, Lake City. Pop. 1602.

Calhoun, a county in S. W. Central Michigan. Area, 720 square miles. It is intersected by the Kalamazoo and St. Joseph rivers, and is also drained by Battle Creek. The surface is undulating; the soil is a rich sandy loam. It is intersected by the Michigan Central R. R. Quarries of sandstone occur here. Grain, dairy crops, wool, fruit, and potatoes are very extensively raised. Carriages and wagons, lumber sawed, flouring-mill products, clothing, cooperage, saddlery, and harness are chief manufactures. Capital, Marshall. Pop. 36,569.

Calhoun, a county in N. Central Mississippi. Area, 560 square miles. It is intersected by the Yallobusha River and Loosascoona Creek. The surface is undulating or nearly level; the soil is fertile. Corn, cotton, cattle, wool, and grain are the chief products. Flouring-mill produce is extensively manufactured. Capital, Pittsboro'. Pop. 10,561.

Calhoun, a county of Texas, bordering on the Gulf of Mexico. Area, 684 square miles. It is bounded on the N. E. by Lavacca Bay, and on the S. W. by Espiritu Santo Bay and the Guadalupe River. The surface is nearly level. Cattle and wool are largely raised. The county is traversed by the San Antonio and Mexican Gulf R. R. Capital, Indianola. Pop. 3443.

Calhoun, a county in Central West Virginia. Area, 300 square miles. It is intersected by the Little Kanawha River. The surface is hilly. Grain and wool are the chief products. Capital, Grantsville. Pop. 2939.

Calhoun, a post-village and township of Lowndes co., Ala., about 30 miles S. S. W. of Montgomery. Pop. 2781.

Calhoun, a post-village of Columbia co., Ark. P. 806.

Calhoun, a post-village, capital of Gordon co., Ga., on the Western and Atlantic R. R., 78 miles N. W. of Atlanta. It has one weekly newspaper. Pop. 427.

Calhoun, a township of Calhoun co., Ia. Pop. 263.

Calhoun, a post-township of Harrison co., Ia. P. 371.

Calhoun, a post-village, capital of McLean co., Ky., is on Green River, about 40 miles S. S. E. of Evansville, Ind.

Calhoun (JAMES M.), a nephew of J. C. Calhoun, was born in South Carolina, but removed to Alabama, where in 1831 he was elected a member of the House. He served for several years, then retired for fifteen years, but served once more in the Senate from 1857 to 1861.

Calhoun (JOHN CALDWELL), LL.D., an eminent American statesman, born in Abbeville district, S. C., Mar. 18, 1782. He graduated at Yale College in 1804, studied law, and was sent to Congress in 1811. He began his political career as a Democrat and a leader of the war-party. He supported the tariff of 1816 and the U. S. Bank. In Oct., 1817, he became secretary of war in the cabinet of President Monroe. He approved the Missouri Compromise of 1820, and was elected Vice-President of the U. S. in 1824, in which canvass he was supported by the friends of Jackson and those of Adams. Having joined the Jackson party, he was again elected Vice-President in 1828, when General Jackson was chosen President. About this time he became an advocate of free trade and of the doctrine of the sovereignty of the States. He was the author of the "South Carolina Exposition," which affirmed that any State can nullify unconstitutional laws of Congress. Calhoun and Van Buren having become aspirants for the office of President of the U. S., Gen. Jackson, by promoting the nomination of the latter, incurred the enmity of Calhoun. He resigned the office of Vice-President in 1832, and was then elected a Senator of the U. S. for South Carolina. A convention held in South Carolina near the end of 1832 adopted what was known as the Nullification ordinance. Its object was to test the constitutionality of the protective tariff policy through the instrumentality of the State instead of the Federal courts, and to prevent the collection of duties on imposts in that State under the act of Congress of 1832, levied, as was alleged, with a direct view rather to the protection of American manufactures than the collection of revenue, until the protective principle, so-called, should be so tested and decided by the State courts. This was in pursuance of Mr. Calhoun's peculiar doctrines, known as nullification. He held that under the Federal system the judiciary of each State had the reserved sovereign right to decide in the last resort upon the extent of the powers delegated under the Constitution by the States respectively. This ordinance was to go into effect on the 12th of Feb., 1833. The determined attitude of Gen. Jackson against these nullification doctrines caused

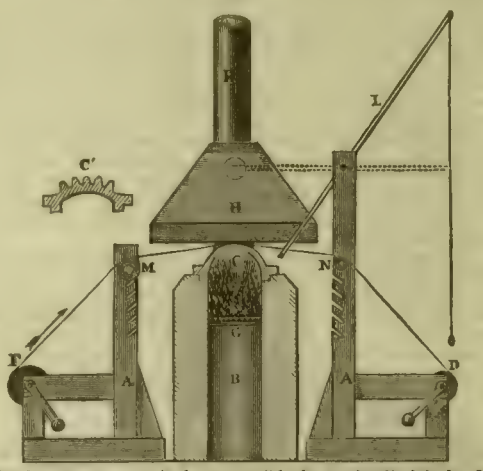
general and serious alarm lest a conflict of forces should ensue between the Federal and State authorities. It was in this condition of affairs that Mr. Clay, as a mediator, came forward with his famous "tariff compromise" of 1833, which was founded upon the avowed principle of an abandonment of the protective policy after 1843. To this measure Mr. Calhoun gave his cordial support, and in this way the anticipated perils of the crisis were averted.

As a debater, Mr. Calhoun occupied the foremost rank among the American Senators, and was scarcely equalled by any of his contemporaries, except Mr. Clay and Mr. Webster. These three were known as "the Great Trio." The debate between Mr. Calhoun and Mr. Webster on the nature of the Federal government and the doctrine of nullification, so-called, in Feb., 1833, was one of the most noted for ability and eloquence in the annals of this country. Mr. Calhoun retired from the Senate in Mar., 1843, and was appointed secretary of state by Mr. Tyler in Mar., 1844. It was under his auspices that the "Tyler treaty," as it was called, for the annexation of Texas, was negotiated in the same year. He was re-elected to the Senate in 1845, and opposed the Mexican war in 1846. He continued in the Senate until his death, which occurred 31st of Mar., 1850. His mind was eminently metaphysical, and his private character was without reproach. Among his writings are two posthumous works—one, a "Disquisition on Government," and the other, "A Discourse on the Constitution and Government of the U. S." These are both held in high estimation by his admirers and men of his school of politics. ALEX. H. STEPHENS.

Calhoun (WILLIAM BARRON), LL.D., born at Boston, Mass., Dec. 29, 1795, graduated at Yale in 1814, became a prominent lawyer of Springfield, Mass., was speaker of the Massachusetts house of representatives (1834–35), member of Congress (1835–43), president of the Massachusetts senate (1846–47), and State secretary 1848–51, besides holding other important offices. Died Nov. 8, 1865.

Calhoun Mills, a post-village and township of Abbeville co., S. C., about 87 miles W. of Columbia. Pop. 2208.

Ca'li, a town of the United States of Colombia, 70 miles N. by E. of Popayan, is on a western declivity of the Andes. It has two fine churches and an active trade. Pop. about 5000.



Cal'ibre, or **Caliber,** a French word which is also much used in English, signifies the diameter of the bore of a gun or any firearm. It is usually measured and described in inches or parts of inches. The cannon in which solid shot is used are often denoted by the weight of each shot, as a twenty-four pounder, but mortars which throw shells or hollow shot are usually designated by such terms as a thirteen-inch mortar, etc.

Cal'ico, a kind of cotton cloth, said to be so named from Calicut, a city of India, where it was first manufactured. It was imported into England by the East India Company in 1631.

Calico-Printing is the art of producing patterns on cotton cloth, either by printing in colors, or in mordants which become colors when subsequently dyed. Cloth made from cotton and wool, when similarly printed, is known as mousseline de laine. Calico-printing originated in India in very ancient times. Pliny describes the art as practised by the Egyptians. For a long time chintz counterpanes were imported into England from India. The art spread westward to Asia Minor and the Levant. It was imported into Holland by the Dutch East India Company, and spread into Germany. At the close of the seventeenth century Augsburg in Bavaria was noted for its printed linens and cottons. Calico-printing was introduced into England during the seventeenth century, but the development of the art was for a long time seriously retarded by the opposition of the silk and woollen weavers. At their instigation the importation of chints from Calicut was prohibited, and a heavy revenue tax was placed upon English calicoes. Finally, in 1720 a law was enacted prohibiting the wearing of any printed calicoes whatever, either of foreign or domestic origin. This law was repealed in 1736, but a duty of 6*d.* per yard was still levied. In 1831 all duties were repealed. England is now the largest producer of calicoes; the U. S. stand second. The finest calicoes are made in Alsace, at Mühlhausen. Calico-printing involves a variety of operations, some of which are peculiar to certain styles, while others are common to all.

Singeing.—The first operation is the removal from the surface of the cloth of the fibrous nap or down, which, if not removed, would seriously interfere with the uniform application of the colors. The removal of the nap is effected either by passing the cloth rapidly over a red-hot plate (Fig. 1) or between lines of gas-jets. A shearing-machine is also in use for this purpose.

FIG. 1.

Hot-plate Singeing.—G is the grate; C is the semi-cylindrical red-hot plate of iron or copper; F and D are rolls on which the cloth is wound; M and N are brushes for raising the nap; I, is a lever for raising the cloth from the plate, slots being made in the hood H to permit its being raised to the position indicated by the dotted line. *C'* is a ridged plate used in some establishments.

Bleaching is then effected by boiling the cloth with lime, souring with sulphuric acid, boiling with soda-ash and rosin, boiling with soda-ash alone, treating with bleaching-powder, souring again, and finally washing thoroughly with water. (See BLEACHING.)

Calendering is resorted to in order to make the cloth smooth and even. It is effected by passing it between very heavy rolls.

Fixing the colors upon the cloth is effected (1) by the aid of mordants, substances which have an affinity for both fibre and color, as madder, logwood, Brazil-wood, etc., fixed by alumina or oxide of iron; Persian berries, fixed by chloride of tin; aniline colors, fixed by gluten, etc. Sumach and cutch, which produce drabs and blacks with oxide of iron by the action of the tannic acid they contain, belong to this class. It is impossible to make a distinction between the action of true mordants and of agents which simply produce insoluble colors in the tissue of the cloth, as the two classes pass into each other by insensible gradations. These insoluble colors are produced by double or simple decomposition, by the successive treatment of the cloth with the necessary reagents. Thus, Prussian blue is fixed on the cloth either by first applying an iron salt and then treating it with ferrocyanide of potassium, or it is produced by the decomposition of ferrocyanide of potassium alone, under the influence of certain acids. Chrome yellow is produced by the successive application of a lead salt and bichromate of potassa. Indigo is fixed by applying it in solution as colorless reduced indigo, and developing it as insoluble blue pigment by oxidation in the air. Brown oxide of manganese is formed by applying sulphate of manganese, withdrawing the sulphuric acid by an alkali, and oxidizing to a brown oxide by hypochlorite of lime. Aniline black is produced by the oxidation of an aniline salt in the cloth. (2) Colors are fixed by agents which, being first mixed with the color, are applied to the cloth and then rendered insoluble, when they hold the color upon the fibres mechanically, as ultramarine blue, Guignet green, chrome yellow, madder lake, and aniline colors, fixed by albumen coagulated by heat.

Patterns are produced (1) by printing the mordant in figures, and subsequently producing the colors in the dye-liquors: *madder styles.* (2) By printing one component of the color, and then passing the cloth through a solution of the other component, or of the agent necessary to develop the color: *padding, bronzing, indigo, pencil blue,* and *China blue styles.* (3) By printing the color together with the mordant or fixing agent, and rendering it insoluble or developing it by air or steam. This is called topical or surface printing: *steam colors, spirit colors, aniline black, aniline colors by albumen, pigment printing, metallic printing.* (4) By printing resist or reserve pastes, which protect certain portions of the cloth, and prevent the fixing of the color in the subsequent dyeing operations: *resist styles.* (5) By discharging the color from portions of the cloth previously dyed: *discharge styles.*

The *colors* most frequently employed in calico-printing are (1) the dyestuffs proper—madder in the various forms of powdered root, garancine, extract, alizarine, etc.; log-

wood, Brazil-wood, sandal, cam, and bar wood, and fustic; queroitron bark, indigo, Persian berries, cochineal and aniline colors; (2) the astringents which contain tannic acid, catechu, sumach, nutgalls, etc.; (3) the pigments chrome yellow and orange, Prussian blue, Guignet green, ultramarine, Scheele's green, oxide of iron, oxide of manganese. (For details see each under its own name, also DYEING and DYESTUFFS.)

The *mordants* most frequently used are salts of alumina, iron, and tin, caseine, albumen, and gluten.

Thickenings.—In preparing the colors and mordants for printing it is necessary to thicken them to prevent spreading and running. The agents generally used for this purpose are wheat flour, starch, dextrine, gum-arabic, senegal, and tragacanth, and glue.

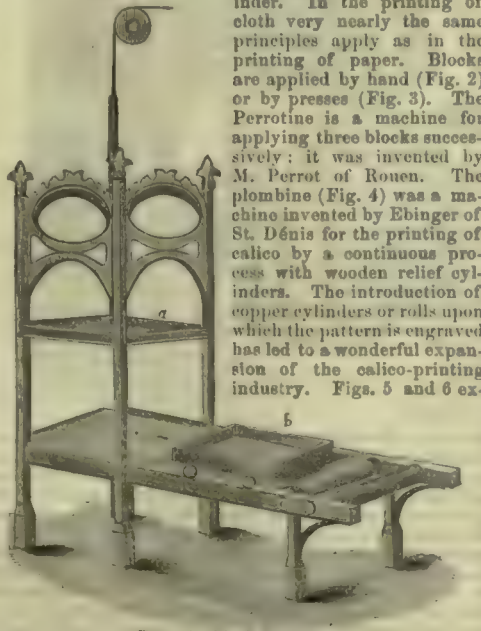


FIG. 2.

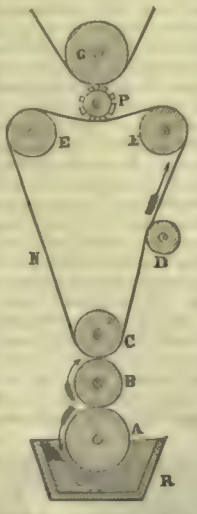
Block-printing by hand.



Printing Apparatus.—The mordants and colors are applied to the cloth either by wooden blocks or cylinders with raised patterns, or by copper plates or cylinders with sunken patterns; the copper cylinders being most generally used for common calicoes. Each color or tint requires a separate block, plate, or cylinder. In the printing of cloth very nearly the same principles apply as in the printing of paper. Blocks are applied by hand (Fig. 2) or by presses (Fig. 3). The Perrotine is a machine for applying three blocks successively: it was invented by M. Perrot of Rouen. The plombine (Fig. 4) was a machine invented by Ebinger of St. Dénis for the printing of calico by a continuous process with wooden relief cylinders. The introduction of copper cylinders or rolls upon which the pattern is engraved has led to a wonderful expansion of the calico-printing industry. Figs. 5 and 6 exhibit the disposition of the more essential parts in printing with engraved cylinders. The cloth F passes over a huge drum B, against which the rolls A are pressed. Each roll is supplied with thickened mordant or color by a wooden cylinder C, which dips into a vessel E containing it. A blunt knife D, called the *color doctor*, scrapes off the superfluous mordant or color from the unengraved portion of the roll; another knife, called the *lint doctor*, cleanses the roll as it leaves the cloth. By enlarging the drum the capacity of the machine may be increased from one to twenty colors by adding to the number of rolls. Fig. 7 exhibits a ten-color machine; Fig. 8 an eighteen-color machine. The pieces of cloth, measuring each about forty yards, are stitched together, and the process becomes continuous, miles of calico being printed without stopping the machine. A similar machine is now employed in printing wall-paper. As each roll prints only a portion of the pattern, it is of course very important to regulate the tension of the cloth to secure the proper location of the parts of the figure. It is found that the cloth stretches in length, and consequently diminishes in width, in the machine; so each roll must be made to print a slightly narrower pattern than those which precede it. To prevent the running of the mordants or colors, the cloth passes directly from the machine to a heated drying-room.

FIG. 3.

Press for Block Printing.

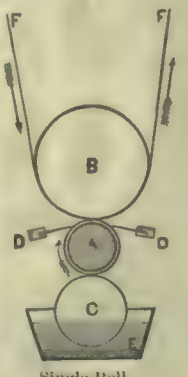


FIG. 4.

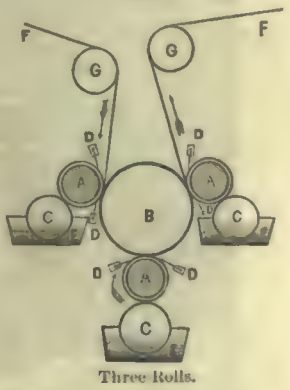
Plombine Printing.—R is the color-trough. The roll A applies the color to the roll B, which transfers it to the endless web N, by which it is applied to the relief cylinder P, which prints it upon the cloth as it passes over the drum G.



Madder Style.—This is the most important and extensively practised style of calico-printing, applicable not only to the coloring-matter from which it derives its name, but to nearly all organic coloring-matters which are soluble in water and capable of forming insoluble compounds with mordants. The thickened mordants are printed on the cloth, and the colors are produced by passing the cloth through the dye-beck, which contains the dyestuffs and water. For pinks the mordant employed is acetate of alumina;

for reds, the same, more concentrated, with an addition of chloride of tin; for purple, acetate of iron; for chocolate, acetate of alumina, with a little acetate of iron; for brown, catechu, with a little nitrate of copper; for drab, catechu, with a little nitrate of copper and chloride of iron; for black, a strong solution of acetate of iron; for orange, acetate of lead, chloride of ammonium, and chloride of tin. After the mordants have been printed on the cloth, it is run into the drying-room, and then exposed to the process of *ageing*. This has for its object the setting or rendering insoluble of the mordants. It is effected by hanging the cloth in a room where it is exposed to air, warmth, and a certain degree of moisture. The alumina loses most of its acetic acid, and passes into the condition of an insoluble basic salt; the iron loses acetic acid and takes up oxygen, passing into the condition of an insoluble basic salt of the sesquioxide. The goods are next exposed to a cleansing process called *dunging*. Formerly, cow-dung was used for this purpose; it was mixed with water, and the goods were passed through the mixture and subjected to a kind of scouring. Phosphate of soda, arseniate of soda, and silicate of soda have now almost entirely displaced the dung. The effect of the treatment is to remove the excess of mordant, render what is left quite insoluble, and clear the unmordanted portions of the cloth. The next step is the dyeing, which is effected in the dye-beck. Water and the proper coloring-matters are introduced, and by means of steam the whole is heated to the proper temperature. The dyestuffs employed depend somewhat upon the tints to be produced. Madder alone is used for pinks; for reds, purples, chocolates, etc., a portion of the madder is replaced by Brazil-wood. For orange Persian berries are added, with quercitron and fustic; for blacks, logwood. In order to brighten the colors, to render them more permanent, and to clear the whites, the cloth is next subjected to the *clearing* process. This consists in exposing it to a bath containing bran and soap, and then to a very weak solution of bleaching-powder, hypochlorite of lime. If the colors employed include Persian-berry orange, the cloth is passed through a very weak bath of chloride of tin. The cloth is then washed, starched, and calendered, when it is ready for market. Calico dyed in madder styles is the most durable, resisting the action of light and soap better than any other style. *Garancine styles* are mordanted in the same manner, but are dyed with garancine—madder which has been treated with sulphuric acid. (See MADDER.) This is a more economical way of using madder. It is preferred for dark, heavy colors where the cloth is much

FIG. 8.

Eighteen-color Machine.

covered. The soaping operation is omitted, and the colors are not as fast as those dyed with madder. Carbonate of lime, whiting, is added to the dye-beck, to neutralize the free acid in the garancine. Artificial alizarine madder red is now extensively manufactured from anthracene, a hydro-carbon obtained from coal-tar. It is employed as a substitute for the various preparations of the madder root, both in the dye-beck and in topical printing. (See ALIZARINE.) *Padded styles* are specially adapted to mineral colors. Sometimes padding is resorted to for the production of a ground of a uniform tint, the figures to be subsequently applied by topical printing. In this case the cloth is first passed through a mordant, then dried, and passed through the dye. To produce a pale blue ground the cloth is first passed through a weak iron solution, then dried, passed through chalk suspended in water to fix the iron, then through ferrocyanide of iron to produce Prussian blue. To produce a design in chrome yellow the cloth is printed with a thickened solution of acetate of lead, dried, passed through a carbonate-of-soda solution to fix the lead, and then through a solution of bichromate of potassa. A common padded style is iron buff, produced by passing through an iron solution and fixing by an alkaline bath. *Bronzes* were once a favorite style. They were prepared by padding with chloride of manganese, then through caustic soda, and finally through hypochlorite of lime. A uniform brown ground was thus produced. By printing figures with protochloride of tin mixed with pigments or decoctions, the brown color was discharged, and colored patterns on a brown ground were produced. *Topical printing* has displaced to a considerable degree the old madder styles. The colors and the mordant or fixing agent being applied to the cloth together, the operations of dunging and dyeing are rendered unnecessary, and a much greater variety of colors and shades can be employed; and as the colors do not come in contact with the whites, there is a great economy of materials. Woollen fabrics and de laines are always printed in this manner, as they are not well adapted for mordanting and dyeing in the madder style, owing to the affinity which wool possesses for most coloring-matters. *Steam colors* are produced by printing upon the cloth the madder and dyewood extracts, mixed with the mordants, to fix them and to produce the desired tints, and properly thickened. On exposing the dried and aged cloth to steam, an intimate union of the color, mordant, and fibre is effected. Such goods are very brilliant and permanent to light, but do not withstand hot soap solution, which alters the shades. For steam reds, prepara-

tions of madder, cochineal, and various dyewood extracts, especially Brazil-wood, are employed. Madder extract, nearly pure alizarine, prepared from madder root by various processes, is extensively used, not only for pinks and reds, but also for purples and chocolates. Artificial alizarine is now largely used in place of madder extract. For reds and pinks it is mixed, in the form of paste, with solutions of acetate of alumina and acetate of lime, and a thickening composed of wheat starch, acetic acid, gum tragacanth, and olive oil boiled to a paste with water. For purples, pyrolignate of iron is used in place of acetate of alumina. Cochineal is prepared for steam-printing by boiling the cochineal liquor with starch, and adding oxalic acid and protochloride of tin.

For steam yellows, either decoction of quercitron bark mixed with alum and gum senegal, or a decoction of Persian berries with alum, protochloride of tin, and gum senegal, is employed. Prussian blue is ground with chloride of tin and thickened for topical printing. To convert it into green the cloth, after rinsing, is passed through a solution of bichromate of potash. *Spirit colors* are extremely brilliant topical tints, obtained by the use of larger proportions of the spirits or metallic mordants. As they are applied very strong and acid, they cannot be steamed, but are simply dried in the air, aged, and rinsed with water. For a spirit purple a mixture of logwood liquor, thickened with starch, to which some perchloride of tin is added as a mordant, is employed. For chocolate, extract of Brazil-wood and extract of logwood, with the chlorides of tin and copper, properly thickened, is used. For red, peach-wood liquor, with starch, nitrate of copper, perchloride of tin, chloride of tin and ammonium, and oil. *Aniline black* is a topical style recently introduced, which has almost entirely displaced logwood and other blacks for certain kinds of patterns. It is produced by printing a thickened mixture of an aniline salt with a powerful oxidizing agent, such as chlorate of potassa, with chloride of ammonium, sulphate of copper, etc. The color is developed by steaming, and the goods are finally passed through a weak solution of carbonate of soda. When applied to large surfaces this black injures the strength of the fabric; its use is consequently restricted to light patterns showing a large proportion of white. It is also specially adapted for use with other topical styles. It is practically indelible. By substituting naphthylamine for the aniline salt the beautiful naphthylamine violet is produced.

Aniline Styles.—While the different aniline colors are more especially adapted to wool and silk dyeing and printing, they are nevertheless employed to some extent in calico-printing, either in the dye-beck or by topical application as steam colors. In the former case the cloth is printed with (1) albumen, caseine, gluten, or chloride of tin, followed by a nutgall decoction to produce insoluble tannates, and then passed through an acid solution of the aniline color; or the cloth is mordanted with either of the above-mentioned substances, the nutgall decoction printed on, and then passed through the acidulated color. Single tints are thus produced. For use as topical colors, to be fixed by steam, the aniline colors are mixed with albumen, gluten (either putrid or dissolved in soda-lye, weak acid or saccharate of lime), caseine in lye or weak acid, glue, tannate of glue, tannic acid, oleo-sulphuric acid, shell-lac in borax, arsenious acid in glycerine (method of Alfred Paraf), or with a solution of arsenite of alumina in acetate of alumina. The last process, devised by Perkin and Schultz, is more extensively employed than any other, except perhaps that with albumen. Of course in topical printing any desired number of aniline colors may be used at the same time. *Pigment printing* involves the application of the pigments used in painting to the surface of the cloth by means of some cementing agent. Caoutchouc dissolved in naphtha was first employed with excellent results, but the danger of fire attending the use of naphtha has caused the substitution of albumen, caseine, or gluten for the caoutchouc. The pigments generally used are ultramarine, chrome yellow and orange, Guignet green, and lampblack for drabs. *Metallic precipitates*, as tin precipitated by zinc, are sometimes printed on cloth.

Indigo Styles.—Indigo is in some respects a very peculiar dye; it is insoluble in its ordinary blue form, $C_{16}H_{10}N_2O_2$, but is changed by reducing agents, such as grape-sugar in soda-lye, or protoxide of iron, produced by the action of lime on copperas, to colorless, soluble, hydrogenized indigo, $C_{16}H_{12}N_2O_2$. By passing the cloth through such a solution, and exposing it to the air, the indigo is oxidized and becomes blue again, being fixed as an insoluble pigment in the fabric. By repeating the treatment any desired shade is obtained. By the use of reserve pastes or discharges, with topical printing, white or colored figures on a blue ground are produced. *Pencil blue* is a name given to a style of calicoes which were prepared by printing on by hand, with a piece of wood called a pencil, the colorless reduced indigo. On oxidizing it produced figures in fast blue. *The China blue or pottery style* (so called from its resemblance to old china) was once very popular, but, owing to its cost and the ease of imitating it with Prussian blue, is now almost obsolete. The blue indigo was printed on the cloth, forming blue figures on a white ground. To render the color fast, the indigo was worked into the cloth by treating it alternately with lime and copperas. *Resist styles* involve the use of a resist or reserve which protects the cloth in mordanting, dyeing, padding or covering, so that the mordant or color does not adhere. Some resists act mechanically, as clay, fat, oil, resin, wax, and sulphate of lead. Others act chemically, as citric, tartaric, or oxalic acid, or bisulphate of potassa, which are printed on cloth mordanted with alumina or iron to remove them and prevent the fixing of the color. Sulphate of zinc, sulphate and acetate of copper, and chloride of mercury are special resists used in indigo styles. *White resist*, for cylinder printing, consists of a mixture of acetate or sulphate of copper thickened with gum or dextrine. It is printed on the white cloth and allowed to dry. When the cloth is handled in the indigo vat containing the soluble colorless indigo, it is dyed a uniform blue, the insoluble indigo being precipitated as insoluble blue pigment in the fibres, except where the resist has been applied. Here the copper salt having been changed to oxide of copper by the alkali of the vat, the colorless indigo is oxidized by the oxide of copper (which becomes suboxide), and deposited on the surface. On subsequently passing the dyed goods through dilute sulphuric acid, the suboxide of copper is dissolved and the indigo detached, leaving white figures on a blue ground. Often the resist is mixed so as to contain a mordant for some other color; thus, the resist applied to cloth to be dyed in the indigo vat may contain an iron or alumina mordant; so that after the ground with the white figures is produced, the white becomes colored red, purple, or black in the dye-beck with madder, woods, or bark. This style is sometimes called *lapis*, from a remote resemblance to *lapis lazuli*.

Discharge Style.—After cloth has been uniformly dyed of one color, agents called discharges are sometimes employed to remove the color and produce a white pattern, or by adding to the discharge certain agents the original color is not only removed, but another color takes its place. By printing a mixture of tartaric acid with pipeclay and gum on a piece of cloth dyed red or purple with madder or wood, or blue with indigo, and passing it through weak hypochlorite of lime, the color will be discharged, leaving a white pattern. Were a salt of lead added to the mixture, it would be fixed by the hypochlorite of lime, and on subsequently passing the cloth through bichromate of potassa, would develop chrome yellow in place of the whites. A modification of this style is the well-known bandanna style for handkerchiefs. Several folds of cloth dyed Turkey red with madder are placed between perforated lead plates, and firmly squeezed together in a hydraulic press. A solution of chlorine is forced through the perforations, destroying the color. This is followed by water, and on removing the cloth from the press it is found to present white figures on a red ground. Indigo is oxidized to soluble isatine ($C_{16}H_{10}N_2O_4.H_2O$), which is removed by washing, by the action of chromic acid (applied in the form of bichromate of potash), or by a mixture of potash and ferricyanide of potassium. Reducing agents are also employed as dischargers, especially the protochloride of tin, or *tin salt*. When this compound comes in contact with oxide of iron, a soluble protochloride of iron is formed, which is readily removed by washing, while at the same time the sesquioxide of tin (SnO,SnO_2) is fixed upon the cloth, and is ready to fix red or yellow dyes on the spots treated.

Combination Styles.—By combining two or more of the above styles the greatest variety of result may be obtained. Some of the finest French and English *cretonnes* exhibit the most elaborate designs and most pure and brilliant colors, and are really works of art. (For further details see URE'S "Dictionary;" MUSPRATT'S "Dictionary," especially the last German edition, from which the cuts used to illustrate this article were obtained; SCHUTZENBERGER'S "Traité des Matières Colorantes," especially the German edition; O'NEILL'S "Dictionary of Dyeing and Calico-Printing," and KRIEG'S "Theorie und Practische Anwendung von Anilin in der Färberei und Druckerei;" the annual volumes of WAGNER'S "Jahresbericht ueber die Fortschritte der Chemischen Technologie." The following periodicals are especially devoted to dyeing and calico-printing: "Moniteur de la Teinture;" "Bulletin de la Société Industrielle de Mulhouse;" REIMANN'S "Färberzeitung;" "Die Musterzeitung für Färberei, Druckerei," etc. See also MOUSSELINE DE LAINE, SILK-PRINTING, and WOOL-PRINTING.)

C. F CHANDLER.

Cal'icut, or **Kalikat,** a seaport-town of British India, presidency of Madras, on the Indian Ocean, 102 miles S. W. of Seringapatam, and about 570 miles S. S. E. of Bombay; lat. 11° 15′ N., lon. 75° 46′ E. It was the first place in India visited by Vasco da Gama, who arrived here in May, 1498. It was then a populous and important city, and it continued to be for nearly two centuries a flourishing emporium. Its prosperity afterwards declined, partly because its harbor became filled with sand. Pop. about 24,000.

Califor'nia, one of the Pacific States of the American Union, lying between the parallels of 32° 28′ and 42° N.

California Seal.

lat., and between the meridians of 114° 30′ and 124° 45′ W. lon., from Greenwich. It formed a part of the cession and purchase from Mexico after the Mexican war, and is bounded on the N. by Oregon, E. by Nevada and Arizona, the Colorado River being the dividing-line between it and Arizona, S. by Lower California, and W. by the Pacific Ocean, which along the whole California coast trends from N. W. to S. E. Its area is 188,981 square miles, or 120,947,840 acres, or somewhat more than the combined area of New England, New York, and Pennsylvania. Its length is 700 statute miles, and its average breadth more than 200 miles.

Face of the Country.—The mountain-system of California, vast in extent, diversified in character, abounding in mineral wealth, and unsurpassed in beauty and grandeur of scenery, deserves our first attention. It may be classed under two grand divisions: the Sierra Nevada, extending along the eastern border, and the Coast Range, along the western—near the sea, as its name implies. These ranges, uniting on the S. near Fort Tejon, in latitude 35° N., and again in latitude 40° 35′, form the extensive and fertile valleys of the San Joaquin and Sacramento. These divisions embrace many separate groups of mountain-chains differing in geological formation and mineral character. The Sierras, or Snowy Mountains, comprise a series of ranges 70 miles in width, while the several chains of the Coast Range aggregate 40 miles in width, and extend from the northern to the southern limits of California. The Sierras may be traced in regular order for a great distance in two lines of culminating crests, but there is no apparent order in the position and direction of the peaks of the Coast Range, and many of the high mountains in close proximity to each other are remarkably different in their mineral composition. The peaks of this range rise to a height of 1500 to 8000 feet above the level of the sea. The peaks of the Sierra Nevada—Mount Shasta, Lassens Butte, Spanish Peak, Pyramid Peak, Mounts Dana, Lyell, Brewer, Tyndall, Whitney, and a number of others—reach from 10,000 to 15,000 feet above the sea. E. of the culminating crest of the Sierras is situated a series of lakes—of which Klamath, Pyramid, Mono, and Owens lakes, wholly E. of the mountains, and Lake Tahoe—occupying an elevated valley at a point where the range separates into two summits. The southern limit of the depression in which these lakes are located is at the confluence of the Colorado and Gila rivers. A similar depression exists on the western slope of these mountains, about 50 miles in width, also containing a series of lakes.

The section of country lying E. of the range of culminating peaks of the Sierras is termed the Eastern Slope. The depression between the foot-hills of the Sierras and the Coast Range is called the California Valley, while the Coast Range forms still another section. A further geographical division is made by drawing an E. and W. line across the State in the latitude of Fort Tejon, that part lying S. of this line being termed Southern California. The country between this line and one extending E. and W. through Trinity, Humboldt, Tehama, and Plumas counties, is called Central California; all N. of this is considered as Northern California. Central California contains nearly seven-eighths of the known wealth and population of the State.

The most thoroughly explored division of the Coast Mountains is the Mount Diablo Range, about 150 miles in length by 50 in width. The peak from which this range takes its name was selected as one of the three initial points governing the public surveys in the State, its isolated position rendering it a marked feature of the landscape, whether viewed by land or sea, while from its summit may be had a more extended view than from almost any other point in the State. On the N., E., and S. may be seen a large portion of the magnificent valleys of the Sacramento and San Joaquin, with the numerous flourishing towns and villages, surrounded by highly cultivated farms. Stretching away in the distance are the verdant plains and hill-sides, dotted with ranches and teeming with countless flocks and herds. Bordering this extensive vista on the E., and stretching along the horizon for more than 300 miles, rise the Sierras, range above range, their rugged peaks extending upward to the regions of perpetual snow. On the W. are the beautiful valleys of the Coast Range; the busy city of San Francisco, with its broad bay, in which the ships of every commercial nation ride at anchor, and in the distance the blue waters of the Pacific, flecked with the white sails of numerous vessels plying to and fro on the peaceful errands of commerce.

The most interesting and picturesque feature of California mountain-scenery is the Yosemite Valley, six or eight miles in length, with an average width of not more than half a mile, enclosed by perpendicular walls of granite rising from 3000 to 5000 feet. Over these walls pour streams of water from the narrow valleys above, some of them passing into mist long before they reach the bottom of the valley; others leaping by a series of falls from 400 to 600 feet each; the Yosemite Fall is 2600 feet in height, or fifteen times that of Niagara. Through the centre of the valley, among verdant meadows, groves of majestic oaks and pines, and thickets of willow, birch, and bay trees, winds the Merced River, which enters the valley by a descent of 2000 feet in two miles. This valley has been ceded by Congress to the State of California, to be held as a place of public resort.

On the whole coast of California but one navigable river, the Salinas, connects directly with the ocean; but a number, navigable for steamers, flow into San Francisco, San Pablo, and Suisun bays, and are hence equally important for the purposes of trade and commerce as if they emptied directly into the ocean. Of these the principal are the Sacramento and San Joaquin, the former navigable for steamers and sailing vessels as far as Sacramento City at all seasons of the year, and by small steamers far beyond, into the interior of the country. The San Joaquin, which traverses one of the most beautiful and fertile regions in all California, is navigable for moderate-sized steamers within a few miles of Fort Miller, near the foot of the Sierras. N. of the Golden Gate are a number of rivers of considerable magnitude, but their rapid descent from the interior precludes their use for the purpose of navigation.

Of the harbors of California, that of San Francisco ranks first—indeed it is the most commodious on the Pacific coast—being 50 miles in length and 9 in width, securely landlocked, protected by surrounding hills from the violent winds of every quarter, and approached by the Golden Gate, 5 miles in length, with a width of 1 mile, in which, notwithstanding the rapid outward current at ebb tide, there is never less than 30 feet of water. Next in importance is San Diego, 456 miles S. of San Francisco, and near the southern boundary of the State. It is protected on all sides from violent winds, easily approached through a channel half a mile in width, and of sufficient depth to float the largest vessels at all times. It has not, however, the advantages of San Francisco for inland traffic, though, if connected with the East by a continental railway, it might prove a formidable rival. The harbor of San Pedro, 370 miles S. of the Golden Gate, is formed by a spur from Point St. Vincent and Deadman's Island. This harbor is sheltered from all but southerly winds, yet the water for several miles from the mainland is very shallow, vessels being compelled to anchor two miles from the shore, and to receive and discharge their cargoes by means of lighters. The other harbors are San Luis Obispo, 200 miles, Monterey Bay, 92 miles, Santa Cruz Harbor, 80 miles, and Half Moon Bay, 46 miles, S. of San Francisco; and Drake's, Tomales, Bodega, and Trinidad bays, and Crescent City Harbor, N. of the Golden Gate. These are all more or less exposed to gales from certain points of the compass, and

in order to render them perfectly secure breakwaters and other improvements are needed.

There are a number of islands off the coast of California, varying in size from a few acres to 150 square miles, the smaller ones being extremely rugged, and inhabited only by seals, sea-lions, and aquatic birds, while several of the larger are adapted to grazing; and on Santa Catalina Island several of the small valleys are under cultivation.

The arable lands of the State, including those which only need irrigation to make them largely productive, and the reclaimed *tulé* or swamp-lands, which when reclaimed and protected from overflow yield the largest crops in the world, comprise nearly 60,000,000 acres, or almost one-half the area of the State; while those adapted to grazing and viniculture are estimated at nearly 40,000,000 more. The remainder of the surface is covered by lakes, rivers, bays, salt lakes, etc., and by mountain-ranges, which, too steep for cultivation, are often covered with heavy timber. Still, the State has but a very small proportion (only 477,880 in farms, and but 9,604,607 acres in all; only about one-thirteenth of her territory) in woodland, and this is rapidly diminishing.

Geology.—The Coast Range and its foot-hills belong in general to the tertiary formation, but at San Pedro Bay the cretaceous rocks come to the coast, and these in turn, from the mouth of the Margarita River southward, are replaced by the recent alluvial formation, which extends S. E. to the head of the Gulf of California. At two points of the Coast Range there crop out beds of tertiary coal or lignite—viz. at the Monte Diablo coal-mines, in Contra Costa co., in the vicinity of the San Joaquin River, though about 800 or 900 feet above it; these are the only coal-mines as yet worked to any extent in the State, and yield about 120,000 tons annually; and a second and more recently discovered outcrop of similar character in Mendocino co., not yet exploited. The valley, or rather succession of valleys, already described as lying between the Coast Range and the Sierras are mostly of the cretaceous formation, though in the extreme S. they rise into the alluvial sands. But a small portion of these valleys contain gold, except in placers washed down from the mountains; but occasionally there have been found considerable quantities of gold and silver in metamorphic rocks belonging as high up in the series as the cretaceous. Still, the greater portion of the auriferous and argentiferous rocks of the State belong to the triassic and Jurassic strata, which form the surface-rocks of the Sierra Nevada, and extend from the Columbia River nearly to the head of the Gulf of California. It is in the rocks of these strata that the greater part of the gold and silver deposits of the region, from the foot-hills of the Rocky Mountains to the Pacific, occur. W. of the Sierras, in the vicinity of the upper waters of Kern River and its tributaries, is a volcanic region, where basaltic and porphyritic rocks, sulphur and chalybeate springs, deposits of sulphur, and extensive tracts of lava and lava-ashes are found. A somewhat similar region exists in Sonoma co., in what are known as the Geysers. Much of the region E. of the Sierras is of recent formation, and is sterile and forbidding to the last degree. The lakes or sinks, often very deep, are always salt and bitter, and often without water most of the year, but the beds of the lakes are covered with alkaline deposits. The famous Death Valley, the Dry Lakes, Dry Salt Lake, Owen's Lake, and other sinks of this region give striking evidence of its former volcanic character, and of the great changes which have taken place, some of them within modern times, in this part of the State. The earthquakes of 1871 were most violent in this section.

Mineralogy.—Gold is found pure in scales, nuggets, crystals, and in combination with cinnabar, bitumen, tellurium, iridosmine, etc. The yield of the California gold-mines has been immense. Silver is found native, though rarely, but largely in combination with copper, as copper glance, with galena, as pronstite, or red silver ore, kuargyrite, etc. Copper exists native at various localities, as malachite, copper glance, cubescite, azurite, chalcopyrite, and chrysocolla, and in combination with sulphur, etc. Mercury in the cinnabar ore is very abundant throughout the Coast Range, as coccinite in Santa Barbara, and native in the "Pioneer Claim" and elsewhere. Lead is abundant as galena ore all over the State, and the molybdate of lead (wulfenite) is found at one or two localities. Tin, in the form of cassiterite or binoxide of tin, is found in the Temescal Range, about 60 miles from Los Angeles. Arsenic occurs pure in Monterey co., and as arsenilite in one or two localities; iron as chromic iron, as hematite; tellurium, native, and in combination. Diamonds are found in several localities; graphite in Tuolumne co. and elsewhere; borax and boracic acid, salt as rock-salt, sulphur, carbonate of soda, gypsum, barytes, antimony, ochre, alabaster, fluor spar, corundum and cobalt, in the form of erythrine, abound in various parts of the State. Magnesite, iridosmine, magnetite, limonite, tourmaline, pyrolusite (binoxide of manganese), sircon, garnets, chrysolite, and haysine are the other principal minerals. Coal, as has been already mentioned, occurs in two or more localities. Petroleum and bitumen are found all along the coast counties.

Vegetation.—There are 48 genera and 105 species of forest trees in California, the greater part not only indigenous, but peculiar to the Pacific slope. Of these, 40 species are evergreens, found mostly on the mountains of the Coast Range and the Sierras. Most remarkable of these are the two species of *Sequoia* (the *Sequoia gigantea* or mammoth tree), of which there are seven or eight groves known in the State. Some of these trees have attained a height of 450 feet, with a circumference near the ground of 120 feet or more. The largest now standing is said to be 376 feet in height and about 106 feet in circumference. This tree seems to belong to the cedar family; its wood is soft, elastic, straight-grained, light when dry, and red in color. The *Sequoia sempervirens*, or California redwood, is a very stately tree, attaining a height of 300 feet and from 75 to 80 feet in circumference. This is the most valuable timber-tree of California, though confined to the upper portion of the Coast Range, not appearing below San Luis de Obispo, and but sparingly below San Francisco. When felled, it is replaced by other trees. The sugar-pine (*Pinus Lambertiana*) is the peer of the redwood in size and commercial value. Its wood is white, straight-grained, clear, and free-splitting. Its height is sometimes 300 feet and its circumference 45. It has cones eighteen inches long and four thick; a sweetish resinous gum exudes from the harder portion of the wood, tasting much like manna and having cathartic properties. There are fifteen other species of pine, of which the *Pinus ponderosa*, or yellow pine, 225 feet high, the *Sabiniana*, or Sabine's pine, 140 feet, and the *insignis*, or Monterey pine, 100 feet, are the most remarkable. The yellow and Monterey pine are similar to our yellow or pitch-pines at the East, and are in demand for flooring purposes. Sabine's pine is the nut-pine, having an edible cone or nut, much valued by the Indians. The other species rise from 30 to 100 feet in height, but are not so much prized as those we have named. There are six species of true fir, one of them (*Abies Douglasii*, Douglas's spruce) 300 feet in height, and three of the others stately trees 100 feet or more in height; the Western balsam fir (*Picea grandis*) grows to the height of 150 feet. The California white cedar (*Libocedrus decurrens*) is a very stately tree, 140 to 150 feet in height. There are also four species of cypress, three of juniper, two of arborvitæ, and one of yew (*Taxus brevifolia*), which attains to the height of 75 feet. The wild nutmeg (*Torreya Californica*), the California laurel (*Oreodaphne Californica*), the *Arbutus Menziesii*, or madrona, and the *Arctostaphylos glauca*, or manzanita, are all beautiful and remarkable evergreens. There are twelve species of oak, two of them live-oaks or evergreens, the rest deciduous. The burr-oak is the largest and stateliest, but its wood, like most of the others, is principally valuable for fuel. The *Quercus Garryana*, sometimes called white oak, though not a large tree, has a dense, fine-grained wood, used for making agricultural implements. There is one member of the chestnut family, the Western chinquapin, which is a fine tree, sometimes attaining a height of 125 feet. There are four acacias, none of them remarkable; three poplars or cottonwoods, one of them a fine shade-tree; two alders; the Mexican sycamore; one species of walnut (*Juglans rupestris*), a fine tree; three species of cornel or dogwood, all differing from the Eastern cornels; four of the wild lilac; two of the wild cherry, both shrubs rather than trees: two maples, *Acer macrophyllum*, here called white maple, a stately and beautiful tree, and *Acer circinatum*, or vine maple, a smaller tree, found only in the mountains. There are three yuccas, two species of willow, a box elder, an Oregon ash, and the flowering ash, which is not a true ash; a species of buckeye, one of ironwood, a Parkinsonia or greenwood, small but elegant; two species of cactus, a persimmon, the pistachio-nut, and many species of semi-tropical trees which are unknown elsewhere. The shrubs and small fruits are numerous. There is but one species of native grape, which is found in Southern California, but most of the European and Eastern vines flourish well in the foot-hills, and the culture of the vine is becoming one of the great industries of California. The edible berries and fruits of California are very abundant, though in the wild state most of them are inferior in size and flavor to those of the Atlantic coast. Medicinal plants and shrubs abound, and many of them possess very valuable qualities. Grasses are very numerous, and many of them highly nutritious, but except in the foggy regions along the coast there are hardly any native grasses which will make a sod or which are adapted for hay. The wild oat (*Avena fatua*) is the principal dependence of the farmer (except cereals sown expressly for that purpose) for fodder. There are twenty-six known species

of these indigenous grasses and grains, but not more than four or five of them are of much value for pasturage. Alfalfa, a species of lucerne clover from Chili, has been largely introduced, and is regarded as the best plant for pasture and fodder found in the State. The native clovers are good, but do not grow very freely or abundantly. Wild flowers abound in California, most of them remarkable for their beauty of form and color, and a few of them exceedingly fragrant. The lily and syringa families, many of them shrubs and even trees, are conspicuous both for beauty and fragrancy, filling the air for long distances with their perfume. Of cryptogamous plants the quantity and variety is simply boundless. More than 100 species of mosses have been described, while the mushrooms, sea-weeds, lichens, and fungi are still more abundant.

Zoology.—There are 115 species of mammals in California, of which twenty-seven are carnivorous, including the grizzly, black, and brown or Mexican bear, the raccoon, badger, two species of skunk, the wolverine fisher, American sable or marten, mink, and yellow-cheeked weasel, California otter and sea-otter, the cougar, jaguar, wild-cat or red lynx and banded lynx, raccoon fox or mountain cat, gray wolf, coyote or barking wolf, five species of fox, three or four species of sea-lion, two species of seal, and the sea-elephant. Of the insect-eaters there are two species of mole and two of shrew; of the bats, sixteen species. Of the rodents there are the beaver, the sewellel or mammoth mole, five species of ground-squirrels, and five of tree-squirrels. Of the mouse family there are eighteen species, including three naturalized ones; the muskrat, jumping mouse, four species of kangaroo mice, and five of gophers; the yellow-haired porcupine; six species of hares and rabbits, and a coney or rat-rabbit. Of ruminants there are the elk, the white-tailed, black-tailed, and mule deer, the American antelope, and the mountain-sheep or bighorn. Of the Cetacea, there are the right and California gray whale, the humpback and finback, two of the beaked whales, the sperm whale, the black-fish, and three species of porpoise. Of birds there are 350 species recognized as native to California. There are twenty species of climbers, fifteen of them woodpeckers; of birds of prey there are thirty-seven species, including five of the eagle family, ten species of buzzard-hawks, four hawks, and four falcons; twelve species of owls; the king of the vultures, and the turkey-buzzard or turkey-vulture. Of the perchers there are eleven species in the first group, including the crows, ravens, magpies, jays, and kingfishers; in the second and third groups, the insectivorous and granivorous perchers, there are 148 species, including the flycatchers, humming-birds, swallows, waxwings, shrikes, tanagers, robins and thrushes, wrens, chickadees, grosbeaks, finches, linnets, larks, orioles, and sparrows. The pigeon tribe has but three species in the State—the band-tailed pigeon and the turtle and ground doves. The grouse family are more numerous—blue grouse, sage-fowl, prairie-hen, and ruffed grouse, and three species of quail, all distinct from the quails of the Atlantic coast. Of the waders there is a great variety, fifty-one species having been described. These include cranes, herons, bitterns, ibises, plover, kill-deer, avocets, snipes, sandpipers, curlews, rails, and coots. The swimmers are still more numerous, ninety species having been described, including a great variety of geese, brants, teal, ducks, scooters, coots, shel-drakes, mergansers, pelicans, cormorants, albatrosses, fulmars, petrels, gulls, terns, loons, dippers, auks, sea-pigeons, and murres. Of the reptiles there are great numbers, though there are no true saurians (alligators or crocodiles) in the State, and the rattlesnake is the only poisonous serpent. There are three tortoises, thirty-one lizards, five rattlesnakes, twenty-five species of harmless snakes, twenty-three frogs, toads, salamanders, etc. One hundred and ninety-four species of fish had been discovered in the lakes, bays, rivers, and on the sea-coast of California in 1868, and since that time the number has been greatly increased. About 180 species are edible. These include nine species of the salmon family, four of the cod family, a dozen eels, seven species of mackerel, numerous species of the perch family, and its congeners; two tautogs—viz. the redfish and kelp-fish; thirteen flatfish and flounders; seven species of shad, herring, and anchovies; twenty-two carps, and thirty-two species of cartilaginous fishes, sturgeons, sharks, rays, sun-fish, etc. etc. There are fifty-five species of mollusks, including a great variety of clams, oysters, mussels, scollops, whelks, limpets, sea-snails, cuttle-fish, squids, nautiluses, etc. Of crustaceans there are seven species, including crabs, lobsters, shrimps, and crawfish.

Climate.—Extending over almost ten degrees of latitude, the climate of California is too varied to be regarded as a whole. It may be divided, in the first place, into the land climate and the sea climate. W. of the Coast Range, and extending to the sea-shore, the climate is governed by the temperature of the ocean. The cold current of water which flows out from Behring Strait, and hugs the W. coast of the American continent inside of the Kuro-sievo or Pacific Gulf Stream, has a temperature of from 52° to 54° the year round. From April to October, inclusive, N. or N. W. winds prevail, and almost daily during this period a deluge of cold damp air, of nearly the same temperature as the ocean over which it has passed, is poured upon the land. It is mostly laden with mist in dense clouds, which it deposits at the foot-hills and on the slopes of the highlands, or carries a short distance into the interior wherever there is a break in the mountain-wall which shuts off these mists from the sunny valleys of Middle California. The land climate is as nearly as possible the opposite of this in every respect. It is modified by the configuration of its surface. In summer and autumn it is hot and dry. Even the mountains, which retain the snow till a late period in the season, have a high temperature in the middle of the day, and the presence of snow on their summits in June is due rather to the great mass which has accumulated on them than to the lowness of the temperature at this season. The great interior valleys, as of the Sacramento and San Joaquin, have a most torrid temperature in summer. The thermometer in June, July, and August marks at 2 or 3 P. M. from 104° to 117° F., sometimes for several successive days. Yet this intense heat is not as prostrating as a considerably lower temperature on the Atlantic coast, for two reasons: 1st, the heat is dry, and accompanied by a considerable breeze: during those three months the aggregate rainfall is seldom more than $\frac{25}{100}$ of an inch; and 2d, the nights and mornings are always cool, the average of the nights never rising above 70°, and in June not above 65° F. In South-eastern California, in the valley of the Colorado and its vicinity, there is still more intense heat, the mean for the month of July for twelve years being upwards of 100° at noon, and 91.5° at 9 P. M. The maximum temperature of these twelve years was 130° in the shade at 12 M. to 3 P. M.—a heat unsurpassed, we believe, in any part of the torrid zone. In San Francisco, on the contrary, and in most of the towns on the coast N. of that port, the summer temperature is almost too cool for comfort, from the cause we have already assigned. A table of the temperature and rainfall in that city for each day of July, 1872, from the signal service bureau, gives the monthly average temperature as only 58°, and the highest mean daily thermometer, that of July 13, was only 63.2°, while on several days of the month it was as low as 54°. The entire rainfall for the month was only one one-hundredth of an inch. It should be said, however, that the range of the thermometer in San Francisco during the year is very small. The mean temperature of the year is 56.6°; the mean temperature of the year at sunrise is 49.5°; and the mean at noon 63.7°. The minimum temperature of the year is seldom below 32°, and in some years not below 40°; in the average of seventeen years the mercury rose to 90° only six times, and but two of these were in the summer months. Usually, the maximum is not above 82° or 83°, and the entire range of the thermometer for the year seldom exceeds 50°. This small range and uniform mean of the thermometer characterizes the climate of the whole coast-region lying W. of the Coast Range. In the nine degrees of latitude between the mouth of the Columbia River and Monterey the mean temperature of the year varies not more than three or four degrees at most, but the summers are hotter and the winters cooler in the northern part than in the S. In Yreka, in the extreme northern portion of the State, an elevated district, the winters are very severe; in Jan., 1868, the mercury stood below zero for several days in succession, and sometimes twelve to fifteen degrees below. Between the coast and the interior valleys there is a large district under the joint influence of the two climates, and consequently enjoying the most delightful climate in the world. This is composed chiefly of valleys surrounding the Bay of San Francisco and penetrating into the interior in every direction. The sea-breeze, with its clouds and abundant moisture, prevents these valleys from being parched with drought, tempers the fierceness of the heat, and moderates the cold of winter. Except in the northern counties there is nothing which can legitimately be called winter, the year being divided into the rainy and the dry seasons. The rainy season commences in November and lasts through April, and the dry season, beginning with May, continues to the end of October. These terms, however, are not used in any absolute sense. During the rainy season, even in San Francisco and on the coast generally, no more rain falls than in the Atlantic States during the summer. The mean rainfall of each of the rainy months for seventeen years (1850–67) in San Francisco was November, 2.74 inches; December, 5.37 inches; January, 4.51 inches; February, 3.08 inches; March, 2.76 inches; April, 1.74 inches. The dry season for the same term of years showed the following mean: May, 0.82 inch; June, .05

inch; July, .02 inch; August, .01 inch; September, .09 inch; October, 0.57 inch; or for June, July, August, and September, $\frac{17}{100}$ of an inch, and for the whole six months 1.56 inches. The mean rainfall of the year was 20.79 inches. In many of the interior towns the yearly average is less than this. At Sacramento the yearly mean was 18.23 inches; at Benicia, 22.86 inches; at Monterey, 12.20; at San Diego, 10.43; at Fort Yuma, 3.24. On the other hand, among the foot-hills of the Sierras the precipitation was very great. At Red Dog, Nevada co., the average mean of three years was 64 inches; at South Yuba the rainfall of 1866 67 (not an exceptional year) was 81.56. Klamath co., in the N. of California, seems to partake of the characteristics of the Oregon climate. In 1861–62, which was a year of remarkable rains all over the Pacific coast, the rainfall in Hoopa Valley, Klamath co., was 129.15 inches, or almost thirteen feet. The following table gives the average temperature and rainfall for each quarter and the whole year in several widely separated towns of the State for a period of from twelve to seventeen years:

Places.	Spring.	Sum'r.	Aut'n.	Winter.	Year.	Rainfall.
San Francisco....	56.5°	60.0°	59.0°	51.0°	56.6°	20.79 in.
Sacramento	56.0°	[illegible]	61.0°	46.5°	58.0°	18.23 "
Benicia	56.5°	67.0°	60.5°	49.0°	58.0°	22.86 "
Monterey	54.0°	59.0°	57.0°	51.0°	55.5°	12.20 "
San Diego	60.0°	71.0°	64.5°	52.5°	62.0°	10.43 "
Fort Yuma.....	72.0°	90.0°	75.5°	57.0°	73.5°	3.24 "
Humboldt Bay....	52.0°	57.5°	53.0°	43.5°	51.5°	57.24 "

Agricultural Products.—The assessors of the counties of the State reported to the surveyor-general the following as the agricultural products of the State in the year 1872:

Turnips	2,324 tons.	Oats, 88,056 ac.	2,152,047 bushels
Pumpkins and squashes.....	24,535 "	Rye, 2899 ac....	35,955 "
Silk cocoons ...	106,168 pounds.	Corn, 39,996 ac.	1,356,372 "
Broom corn....	917 acres.	Buckwheat, 464 acres	7,598 "
Butter.....	7,734,469 pounds.	Peas, 2258 ac...	91,164 "
Cheese.....	2,711,198 "	Beets.....	9,647 tons.
Wool.....24,255,468 "		Onions, 1645¼ acres	143,966 bushels
Honey	400,922 "	Hay, 352,867 ac	411,420 tons.
Apple trees.....	1,370,971 number	Flax, 4287 ac. (seed)	2,052,200 pounds.
Peach	882,338 "	Hops, 534 ac...	445,036 "
Pear.....	297,841 "	Tobacco, 151¼ acres	53,050 "
Plum.....	249,464 "	Peanuts, 442 ac	435,648 "
Cherry	144,120 "	Beans, 7275 ac.	137,438 bushels
Nectarine	43,776 "	Castor beans, 765 acres.....	642,800 pounds.
Quince	38,940 "	Potatoes, 31,035¼ acres	1,067,256 tons.
Apricot	92,326 "	Sweet potatoes 897¼ acres ...	5,267½ tons.
Fig	52,550 "	Brandy.....	147,135 gallons.
Lemon	8,973 "	Wine	4,542,879 "
Orange	5,156 "	Breweries, 137	3,770,464 "
Olive.....	13,282 "	To which are to be added,	
Prunes	15,325 "	Wheat.....13,360,302 bushels	
Mulberry.....	553,032 "	Barley.....	528,494 "
Almond	484,868 "	Cotton.....	360,000 pounds.
Walnut	127,615 "		
Gooseberry bushes.....	21,187 "		
Raspberry bushes.....	79,084 "		
Strawberry vines	7,524,688 "		
Grape vines....30,889,366 "			

The arrivals of wheat at San Francisco from July to Dec., 1872, were 7,069,600 centals = 11,782,666 bushels; which indicates what is probably true, that these returns of the assessors are considerably below the actual production. Four counties made no return of agricultural products.

The assessors' report of live-stock for the year 1872 was as follows:

	No.		No.
Horses	237,280	Total neat cattle.....	816,897
Mules	24,176	Sheep	3,158,193
Asses.....	1,356	Cashmere and Angora goats	18,073
Cows	260,145	Hogs	219,057
Calves.....	200,726	Hives of bees	23,118
Beef cattle.....	218,454		
Oxen	7,529		

The estimates of some kinds of live-stock by the agricultural department at Washington for Jan., 1873, were: horses, 250,000, valued at $11,037,500; mules, 25,000, valued at $1,776,500; oxen and other cattle, 442,200, valued at $10,042,362; milch cows, 270,000, valued at $11,728,800; sheep, 4,002,800, valued at $11,888,316; and 427,300 hogs, valued at $2,610,803.

The agricultural products of the State, as was to be expected from its varied climate and its very rich and deep soil, are many of them very different from those of other portions of the country. In some sections there are extensive vineyards, and the best of European grapes have been planted here and yield bountifully; in the valleys of the interior there are vast crops of the cereals; and the culture of the mulberry and rearing of silkworms have become a prominent industry. The culture of cotton is also becoming very popular. In Southern California the best-paying crops are oranges, lemons, olives, almonds, English walnuts, figs, prunes, nectarines, apricots, and pomegranates. The culture of the sugar-beet is also becoming an important industry, and a successful beginning has been made in the cultivation of tea and in the raising of coffee. In the northern counties butter, cheese, and the hardier fruits are produced, and large flocks of sheep are kept, over 24,000,000 pounds of wool being grown in 1872. In short, in one part of the State or another, all the trees, fruits, vegetables, and shrubs of the tropical, sub-tropical, and temperate regions can be cultivated with success.

Manufactures and Mining Industry.—The assessors' returns on these topics are very incomplete, and we are under the necessity of taking those of the census of 1870, except on a few points, though these are known to be imperfect and under-estimated. The manufacturing statistics of California, according to the census, are: manufacturing establishments, 3984; steam-engines, 604, of 18,493 horse-power; water-wheels, 271, of 6877 horse-power; operatives employed, 25,392, of whom 24,040 were men, 873 women, 479 children; capital employed, estimated at $39,728,202; wages paid, $13,136,722; raw material used, $35,351,193; annual product, $66,594,556. More than four-sevenths of the entire manufactures ($21,170,956 capital, $7,238,528 wages, $20,046,321 raw material, and $37,410,829 annual product) belonged to San Francisco. The heaviest item was flouring and grist-mill products, $9,036,386 of annual product; the next largest were those of lumber, sawed and planed, and sash doors and blinds, yielding a product of $7,066,924. The quartz-mills were either understated or have greatly increased since 1870. The census reports 114, the assessors 311; the census reports the annual product at $3,405,708, while the assessors report 572,913 tons crushed, which, at the very low rate of $25 per ton (which is below probability), would yield $14,322,800. Refined sugar was produced, according to the census, in three refineries, to the annual amount of $3,904,645. Of liquors, distilled, malt, and vinous, there were produced $3,342,934 worth in 1870. The production of wines and brandy from wines has greatly increased each year since, and in 1872 these two items alone amounted to $3,944,287. Boots and shoes were reported as manufactured to the value of $2,214,807 in 1870; tobacco and cigars of the value of $1,967,717 were reported in 1870, doubtless an under-estimate, as the import of unmanufactured tobacco in 1872 was valued at over $2,000,000, aside from that grown in the State, and the expense of manufacture. Printing and publishing yielded an annual product in 1870 of $2,279,339; machinery of various kinds was produced to the value of $3,814,817; iron and iron castings and wares to the value of $1,715,141; carriages and wagons, $1,309,443; carpenter work and building, $1,391,163; gas, $1,356,753; brick, $1,185,820; blacksmithing, $1,161,790; clothing, $1,828,609; woollen goods, $1,102,754—an evident under-estimate, as in 1872 the seven mills reported by the assessors used 4,191,000 pounds of wool, which, at the ruling price, 32 cents, made the cost of raw material $1,341,120, and the annual product nearly double that sum; and yet this did not include all the woollen mills of the State. The only other considerable manufactures of the State were cordage and twine, $850,000; gunpowder, $526,487; drugs and chemicals, $617,870; and bags other than paper, $501,310.

The census of 1870 reports the mining industry of California as employing 7589 persons and a capital of $20,079,975, producing $8,281,623. Of this amount, $817,700 is said to be yielded by cinnabar and other quicksilver ores, gold in placer, hydraulic, and quartz mining, $7,365,833, and silver, $98,100. How far below the truth these statistics are will appear from the production of these metals in 1872. Gold and silver were produced in California in that year to the known value of $19,049,098; the export of quicksilver that year was $861,795, which was less than one-half the yield; copper ores were exported to the value of $120,261. There is also a very considerable amount of lignitic coal obtained from the mines already mentioned. The greater part of the coal-supply of the State is from the lignitic mines of Oregon, British Columbia, Washington Territory, and Wyoming. It is of very fair quality, but is generally quite inferior to true coal of the carboniferous period. The amount raised is unknown.

Railroads.—On the 1st of Jan., 1873, there were 1102 miles of completed railroad in the State in actual operation, nearly all of it controlled, either by lease or purchase, by the Central Pacific R. R. Company. The following summary shows the length of each line and its present termini. Of the 882 miles of the Central Pacific R. R. proper, 276 are comprised between the State line of Nevada and San Francisco. The other lines under its control are:

San Francisco to Holister	94 m.	Roseville Junction to Redding	153 m.
Gilroy to Salinas	37 "	Donahue to Cloverdale	56 "
Niles to San José	18 "	San Quentin to San Rafael	4 "
Lathrop to Tipton	167 "	Wilmington to Los Angeles	22 "
Stockton to Milton	30 "	Sacramento to Folsom	23 "
Peters to Oakdale	19 "	Folsom to Shingle Springs	26 "
Sacramento to Vallejo	60 "	Marysville to Oroville	26 "
Davisville to Yuba City	50 "	Total	1102 "
Vaca to Vacaville	7 "		
Napa Junction to Calistoga	34 "		

These roads do a fair though not a large passenger traffic—the through passengers arriving in California from the East over the Central Pacific and Western Pacific in 1872 being 34,040, and those returning to the East numbering 21,645—but their principal business is a freight traffic. The through freight sent eastward over the Central Pacific in 1872 was 60,120,497 pounds; the westward-bound through freight weighed 160,370,044 pounds; while the local freight amounted to 1,676,436,753 pounds, making a grand aggregate of 948,463.65 tons moved over these roads. This is wholly independent of the express freight, a large proportion of it bullion and ores, sent over these lines by Wells, Fargo & Company's express.

Ocean Steamers and Sailing Vessels.—The number of passengers arriving in California by ocean routes (Panama and China lines) in 1872 was 17,651; the number leaving the State by ocean steamers was 11,305. The freight landed at San Francisco in 1872 by the two lines was—from Panama, 27,071 tons; from the China line, 26,850 tons. Notwithstanding the existence of the Pacific R. R. and the Panama steamers, there is still considerable freight business done by sailing-vessels from New York by way of Cape Horn. The freight money received for cargoes of all inward-bound vessels, sail and steam, for the year, was $5,331,762.

Finances.—The funded indebtedness of the State Jan. 1, 1873, was $3,372,500, bearing 7 per cent. interest, payable semi-annually, a reduction of $750,000 since 1871. In 1870 the total assessed valuation of personal and real estate in California was $269,644,068; the estimated true valuation by the U. S. marshal was $638,767,017. In Jan., 1873, the assessed valuation of real and personal estate liable to taxation for the year 1872 was $636,907,181. Including property not subject to taxes, and the low valuation, the real amount of real and personal property in the State must be more than double this amount. The funded debt of the counties at the close of 1872 was $5,701,000, and the floating debt $1,448,000. The taxes of all classes for 1872 were in round numbers, $9,500,000.

Commerce and Navigation.—We have no returns of entries or departures of vessels from the smaller ports of California, but as these must have been mostly coasting-vessels, and as the district of San Francisco covers the entire California coast, the following statement may be relied upon as accurate so far as *arrivals* in 1872 were concerned. The clearances of coasting-vessels sailing under a coasting license are not reported at the custom-house.

	Arrived.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.

Totals	3,670	1,237,257	876	729,981

The freights on inward cargoes were thus distributed, as between American and foreign vessels:

American vessels from American ports were paid for freight	$1,938,383
American vessels from foreign ports were paid for freight	1,616,973
Foreign vessels from foreign ports were paid for freight	1,776,406
Total paid for freights	$5,331,762

The total domestic exports by sea, except coin and bullion, were as follows, showing the great variety of the productions of the State:

Articles.	Quantity.	Value.	Articles.	Quantity.	Value.
Albalones, sks.	1,573	$16,123	Lumber, M. ft.	16,517	$309,325

			Total		$18,466,495

The following statements show the articles and amount of through and local freight shipped by railroad from California in 1872, but not its value:

Number of pounds through freight moved west-bound over the Central Pacific Railroads during the twelve months ending Dec. 31, 1872:

Agric'l implements	4,810,145	Lumber	1,947,522
Bullion	1,903,898	Mowers	77,607
Butter	1,127,662	Machinery	1,445,138
Cheese	858,898	Meats	12,968,313
Coal	6,868,135	Merchandise	100,799,291
Crude metal	903,606	Oil	3,369,184
Cartridges	24,436	Oysters	658,266
Corn meal	414,546	Ore	6,349,132
Car (street)	21,818	Paper	757,135
Eggs	287,291	Staves	987,272
Engines	220,364	Spokes	21,818
Furniture	702,545	Shovels	161,673
Fish	1,342,974	Sheep	109,090
Game	21,818	Spirits	1,091,684
Hogs	2,315,476	Stock	785,455
Hides	376,740	Tobacco	2,430,185
Ice	283,637	Whisky	390,993
Iron, bar	332,411	Wagons	2,694,927
Iron, sheet	87,611	Wool	76,256
Lard	823,374	Yeast powders	21,818
		Aggregate	160,370,044

The tonnage for the month of December is estimated.

Number of pounds local freight forwarded over the Central Pacific Railroads during the twelve months ending Dec. 31, 1872:

Bark	21,818	Ore	12,121,295
Brick	70,909	Posts	6,627,897
Base metal	14,560,949	Powder	458,181
Broom corn	30,448	Pig iron	3,490,590
Coke	216,000	Railroad iron	57,271,646
Charcoal	2,487,273	Scrap iron	21,818
Coal	18,882,302	Sand	271,691
Fruit	1,081,985	Salt	4,311,385
Flour	519,107	Stone	16,117,304
Grain	311,039,069	Shingles	5,955,774
Hay	6,882,459	Shakes	2,926,067
Ice	14,613,341	Stave bolts	6,024,677
Lime	6,282,356	Stock	63,980,000
Lumber	201,887,950	Telegraph poles	329,090
Laths	1,492,367	Ties	37,392,916
Mill-stuff	1,153,964	Wine	110,480
Machinery	145,611	Wool	7,321,305
Merchandise	807,263,935	Wood	62,692,694
		Total	1,676,436,753

The number of pounds for December estimated.

The shipments of coin, bullion, gold-dust and ores of the precious metals from California in 1872, by express and other conveyances, except that sent by mail, was $19,049,048. The custom-house duties in 1872 were $8,184,481.

Banks, Savings Banks, Insurance Companies, etc.—There were in the State in Nov., 1872, three national gold banks and nine State banks; the national banks had an aggregate capital of $2,800,000; nine State banks, one, the Bank of California, having a capital of $5,000,000, and the other eight an aggregate of $3,100,000. There were 20 savings banks, ten of them in San Francisco, and the other ten in the interior towns. The ten savings banks of San Francisco had on the 1st of Jan., 1873, 46,060 depositors; the amount of the deposits was $42,474,935, their gross earnings were $2,091,113, the reserve fund $1,852,771, the amount of their dividends $1,818,406, and the average rate of dividend between 9 and 10 per cent. The ten interior savings banks had 18,441 depositors; the amount of deposits was $8,956,391, the gross earnings were $642,991, the reserve fund was $1,870,212, the amount of dividend $469,898, and the rate of dividend an average of a little more than 11 per cent. There are about sixty private banking-houses and agencies of banking companies in the

State. There are seven fire and marine insurance companies in the State, with an aggregate capital of $2,304,725 capital and about $3,968,000 of assets. There is one mutual life insurance company, the Pacific Mutual Life, at Sacramento, with $100,000 capital and $1,064,320 assets. There are numerous mining and other incorporated companies, of which a part pay regular dividends.

Education.—Much attention is paid to education in California. The following table gives a summary of the latest report of the superintendent of public instruction, so far as public and private schools are concerned, in 1871 and 1872. The State has a State superintendent, and county superintendents of schools for each county:

School Children.	1871.	1872.	Increase.
White boys between 5 and 15	65,359	68,840	3,481
White girls between 5 and 15	62,549	66,368	3,819
Total whites between 5 and 15	127,908	135,208	7,300
Negro boys between 5 and 15	480	489	9
Negro girls between 5 and 15	421	385	dec. 36
Total negroes between 5 and 15	901	874	dec. 27
Indian boys between 5 and 15	765	708	dec. 57
Indian girls between 5 and 15	542	571	29
Total Indians between 5 and 15	1,307	1,279	dec. 28
Total children between 5 and 15	130,116	137,361	7,245
Whites under 5 years	65,799	69,222	3,423
Negroes under 5 years	249	254	5
Indians under 5 years	254	247	dec. 7
Total children under 5 years	66,302	69,723	3,421
Whites between 5 and 15 at public school	83,039	92,265	9,226
Negroes between 5 and 15 at public school	449	385	dec. 64
Indians between 5 and 15 at public school	140	144	4
Total bet. 5 and 15 at pub. school	83,628	92,794	9,166
Number of children in Chinese schools	1,800	1,850	50
Whites between 5 and 15 at private school	15,452	13,677	dec. 1,775
Negroes between 5 and 15 at private school	58	90	32
Indians between 5 and 15 at private school	14	20	6
Total bet. 5 and 15 at pri. school	15,524	13,787	dec. 1,737
Whites between 5 and 15 at no school	28,587	29,266	679
Negroes between 5 and 15 at no school	270	399	129
Indians between 5 and 15 at no school	602	1,115	513
Total bet. 5 and 15 at no school	29,459	30,780	1,321
Total number enrolled	91,332	94,720	3,388
Average number belonging	72,031	72,972	941
Average daily attendance	64,286	65,700	1,414
Percentage of attendance on average number belonging	89	90	1
Total number of schools	1,550	1,612	62
Total male teachers	820	881	61
Total female teachers	1,232	1,420	188
Total number of teachers	2,052	2,301	249
New school-houses erected	125	124	dec. 1
Number of school-houses	1,326	1,450	124
Number of schools maintained nine months and over	388	421	33
Number of volumes in teachers' libraries	10,570	11,380	810

Receipts.	1871.	1872.	Increase.
State apportionment *	$423,550 89	$424,021 85	$470 96

Rent, fuel, etc.	204,094 19	277,900 99	73,806 80
Total expenditures	$1,727,833 49	$1,881,332 82	$153,499 33
Value of property	$3,362,580 18	$3,822,663 15	$460,082 97

The number of inhabitants of all races 10 years old and over, unable to write, in 1870, was 31,716, including 2853 Chinese and 1789 Indians. Of these, 22,196 were of foreign birth. Of 1941 white illiterates from ten to fifteen years of age, 1092 were males and 849 females; of 2018 white illiterates between the ages of fifteen and twenty-one, 1179 were males and 839 females; and of 22,199 white illiterates twenty-one years old and over, 12,362 were males and 9837 females: making 26,158 white illiterates in all. Of the colored illiterates, 24 males and 21 females were under fifteen, 30 males and 34 females between fifteen and twenty-one, and 468 males and 339 females over twenty-one; making 916 colored illiterates in all.

California is very well supplied with universities, colleges, academies, and seminaries for superior and secondary instruction. The State Normal School at San José is in reality a teachers' college, and is liberally sustained by the State government. It has 6 teachers and 181 students, and has graduated 270 teachers. There are about twenty institutions bearing the name of college or university in the State, some of them as yet unorganized, except in the preparatory departments, but others institutions of a high grade. The University of California, formerly at Oakland, but now permanently established at Berkeley, is already an institution of great merit, and with some claims to the high title of a university. Its president, D. C. Gilman, LL.D., is an able and distinguished scientist, and its corps of eighteen professors contains many eminent names. It had in 1872, 355 students. It is liberally endowed by the State, and has also a grant of 150,000 acres of land from the U. S. government. The Agricultural College, also situated at Berkeley, is to be a department of the university, which has a well-endowed professorship of the languages of Eastern Asia—a professorship eminently appropriate for a California university, since through its Golden Gate the nations of Eastern Asia are probably to enter the Western World. The California Military Academy at Oakland, under the charge of President David McClure, has 10 professors and 125 students. The other colleges of the State are the Missionary College of St. Augustine at Benicia (Protestant Episcopal), with 8 instructors and 94 students; St. Vincent's College, Los Angeles (Roman Catholic), with 4 instructors and 45 students; St. Ignatius College at San Francisco (Roman Catholic), with 19 professors and 450 students; St. Mary's College at San Francisco (Roman Catholic), with 12 professors and 218 students; University College (Presbyterian), also at San Francisco, with 28 instructors and 180 students; Franciscan College (Roman Catholic), at Santa Barbara, with 9 professors and 40 students, all in the preparatory departments; Santa Clara College (Roman Catholic), at Santa Clara, with 16 professors and 80 students, all in the preparatory department; University of the Pacific (Methodist Episcopal), at San José, for both sexes, with 7 instructors; Pacific Methodist College (M. E. Church South), at Santa Rosa, with 9 professors and 160 students of both sexes; College of Our Lady of Guadalupe (Roman Catholic), at Santa Ines, with 5 instructors and 20 students, all in the preparatory department; California College (Baptist), at Vacaville, with 4 professors and 68 students; Hesperian College (Disciples), at Woodland (female), with 6 professors and 193 students; College of Notre Dame at San José (Roman Catholic, female), with 25 professors and 486 students; Female College of the Pacific at Oakland, now, we believe, merged in the State university; Washington College at Washington, for both sexes, with 80 students. Of Petaluma College at Petaluma, Union College at San Francisco, San Rafael College at San Rafael, and Sonoma College at Sonoma, we have no recent information. In addition to the agricultural and scientific departments of the University of California, which receives the Congressional land-grant, there is a scientific department to St. Mary's College, San Francisco, which has 5 instructors and 32 students. There are two theological seminaries in California—the Pacific Theological Seminary at Oakland (Congregational), with 3 professors and 5 students, and an endowment of $75,000; and the San Francisco Theological Seminary (Presbyterian), with 4 professors and 6 students, and 7000 volumes in its library. Some of the Roman Catholic colleges have also seminaries of theology connected with them. There are two medical colleges in the State, both at San Francisco—Toland Medical College, with 10 professors and many students, and the Medical College of the Pacific, connected with University College, with 10 professors and 28 students. The California Institution for the Deaf, Dumb, and Blind, at Oakland, has 23 instructors and employés, 37 blind and 59 deaf-mute pupils. Its property is valued at $250,000, and its annual receipts from the State $30,000, and from other sources $1000. There are four or five orphan asylums in the State, all in a prosperous condition. There is an industrial school or reformatory for boys at San Francisco, with 243 inmates. The Mechanics' Institute at San Francisco is a very efficient institution, having a library of 19,000 volumes, a cabinet, a reading-room, and scientific apparatus, and holds biennial

* 10 cents on every hundred dollars of taxable property.

exhibitions, which have always been successful. Its property is estimated at $150,000.

Libraries.—The colleges, schools of higher instruction, professional and scientific schools have libraries amounting to about 32,000 volumes; and beside these there are the following public and society libraries, not including school or Sunday-school libraries:

Location.	No.	Vols.	Location.	No.	Vols.
Sacramento	1	42,000	Stockton	5	8,500
Oakland	4	8,000	Redwood City	3	800
Jackson	1	1,200	Woodside	1	600
Pacheco	1	300	San José	2	2,800
Oroville	1	1,500	Santa Clara	2	13,300
Crescent City	1	300	Santa Cruz	2	850
Placerville	1	1,800	Watsonville	1	500

San Francisco	18	94,000	Totals	88	202,450

Newspapers and Periodicals.—The census of 1870 states the entire number of newspapers and periodicals in California at that time as 201, having an aggregate circulation of 491,903, and issuing annually 47,472,756 copies. Of these, 33 were dailies, having 94,100 circulation; 4 were tri-weeklies, having 9500 circulation; 4 semi-weeklies, with 2700 circulation; 140 weeklies, having an aggregate circulation of 298,603; 1 semi-monthly, with 300 circulation; 17 monthlies, with 82,200 circulation; 2 quarterlies, with 4500 circulation. Four of these papers (1 weekly and 3 monthlies) were advertising sheets, having an aggregate circulation of 26,000, and issuing 432,000 copies annually; two (1 weekly and 1 monthly) were agricultural and horticultural, with a circulation of 3800, and issuing 165,600 copies annually; four (3 weeklies and 1 monthly) were the organs of benevolent or secret societies, and had a circulation of 18,000, and issued 536,000 copies annually; fifteen (2 dailies, 2 tri-weeklies, 8 weeklies, 2 monthlies, and 1 quarterly) were commercial and financial, with an aggregate circulation of 31,600, and issuing 2,906,600 copies annually; six (4 weeklies and 2 monthlies) were illustrated literary or miscellaneous periodicals, having a circulation of 47,000, and a total annual issue of 2,084,000 copies; seven (2 dailies, 1 tri-weekly, 2 semi-weeklies, and 2 weeklies) were devoted to the different nationalities represented in California; these had a total circulation of 13,950, and an annual issue of 2,697,800 copies. One hundred and forty-one (viz. 28 dailies, 1 tri-weekly, 2 semi-weeklies, 108 weeklies, and 2 monthlies, the whole having a circulation of 239,253, and an annual issue of 33,849,556) were political and the organs of the great parties. Fourteen (11 weeklies, 1 semi-monthly, and 2 monthlies) were religious; these had a circulation of 93,400, and a total annual issue of 3,968,400 copies. There was one weekly sporting paper with a circulation of 4000, and an annual issue of 208,000 copies; there were seven technical and professional journals (1 daily, 1 weekly, 4 monthly, and 1 quarterly), with a circulation of 14,900, and a total annual issue of 624,800.

Churches.—The census of 1870 reports 643 churches of all denominations in the State, 532 church edifices, 195,558 sittings, and $7,404,235 of church property. Of these, there are reported 60 Baptist churches, 44 church edifices, 16,775 sittings, and $271,600 church property. The Baptist "Year Book" for 1873 reports, in 1872, 5 associations, 82 Baptist churches, 74 ordained ministers, and 3628 members; 62 Sabbath schools, 1240 teachers, 3200 scholars; $34,318 of benevolent contributions. The census reports 30 "Christian" churches, 22 church edifices, 6380 sittings, $34,160 of church property. It also reports 40 Congregational churches, 36 church edifices, 11,915 sittings, $282,400 church property; the "Congregational Quarterly" for Jan., 1873, reports, in 1872, 55 churches, 55 ordained ministers, 2577 members, 5274 children in Sabbath schools; church property, $378,270; benevolent contributions, $44,616. The census reports 45 Episcopal churches, 38 church edifices, 13,095 sittings, $398,200 of church property. The "Episcopal Almanac" for 1873 reports, in 1872, 41 parishes and missions, 53 clergymen, 2741 communicants, 357 S. S. teachers, 3398 S. S. scholars, $50,460 of benevolent contributions. There was in 1870 one church and one church edifice of the Evangelical Association, with 200 sittings and $5000 property. There were the same year 2 societies and 2 meeting-houses of Friends, with 500 sittings and $16,000 property. There were also 7 Jewish congregations and 7 synagogues, with 3610 sittings and $314,600 of church property. There were 6 Lutheran churches, with 6 church edifices, 5350 sittings, and $54,000 church property. The census reported 184 Methodist churches, 155 church edifices, 43,035 sittings, $677,625 of church property. In 1872 the Methodist Episcopal Church North reported 147 churches, 134 travelling and 109 local preachers, 6242 members, $679,950 of church property, 133 Sunday-schools, 1417 teachers, 9730 scholars, and about $7200 in benevolent contributions. The Methodist Episcopal Church South the same year reported 60 travelling and 69 local preachers, 63 churches, 3749 members, and $2340 collections for benevolent objects. The census reports 7 Chinese congregations, with 5 temples, sittings 2600, property $22,500; two congregations of the Greek Church, 2 church edifices, $6000 of property; 4 Mormon societies, 3 edifices, 550 sittings, $3100 property; 1 New Jerusalem (Swedenborgian) congregation, 1 church edifice, 400 sittings, $12,000 property; 79 Presbyterian (regular) churches, 59 church edifices, 21,798 sittings, $453,050 of church property. In 1872 the "Presbyterian Almanac" gave in the Synod of the Pacific (General Assembly of the Church North), which embraces somewhat more than the limits of California, 89 ministers, 83 churches, 5292 communicants, 7157 S. S. scholars, and $140,400 benevolent contributions and church support. The census reported, in 1870, 160 Roman Catholic churches, 144 church edifices, 66,640 sittings, $4,692,200 of church property. The "Catholic Almanac" for 1873 gives, in 1872, 181 churches, chapels, and stations, 161 church edifices, 173 priests, and over 100,000 estimated adherent Catholic population. The census also reports 3 Second Advent churches, 3 church edifices, 300 sittings, $4000 of church property; 6 Spiritualist organizations, with 2 edifices, 750 sittings, and $3300 of property; two Unitarian societies, with 2 church edifices, 1400 sittings, $151,000 church property; 3 churches of United Brethren in Christ (German Methodists), with 1 church edifice, 100 sittings, $500 of church property; 1 Universalist society, with 1 church edifice, 160 sittings, $3000 of property.

Population.—The true population of California in 1870, including nomadic Indians and Indians sustaining tribal relations, was 582,031. The Indians in the State number 29,025, of whom 21,784 sustain tribal relations, and are not usually reckoned among the population of the State. As the State came into the Union in 1848, the census of 1850 was the first in which it appeared; its population was then 92,597, of whom 91,635 were whites, 962 colored, and no enumeration was made of the Indians. In 1860 the population was 379,994, of whom 323,177 were whites, 4086 colored, 34,933 Chinese, 17,798 Indians. In 1870 there were, excluding tribal Indians, 560,247 inhabitants, of whom 499,424 were whites, 4272 colored, 49,310 Chinese and Japanese, and 7241 civilized Indians. The density of the population to the square mile in 1850 was .049; in 1860, 2.01; in 1870, 2.29. Of the 560,247 inhabitants in 1870, 349,479 were males and 210,768 females; 350,416 (199,421 males and 150,995 females) were native born; 209,831 (150,058 males and 59,773 females) were of foreign birth. Of the 499,424 whites, 297,648 were males and 201,776 females. Of the 4272 colored, 2514 were males and 1758 females. Of the 49,310 Chinese and Japanese, 45,429 were males and 3881 females; 487 of these (290 males and 197 females) were born in California. Of the 7241 civilized Indians, 3888 were males and 3353 females; of these, 6895 were natives and 346 of foreign birth. Of the entire population, 71,086 males and 66,043 females were between five and eighteen years of age; of these, 64,203 males and 62,083 females were native born, and 6883 males and 3960 females of foreign birth; 66,446 males and 64,340 females were white; 484 males and 464 females colored; 3123 males and 449 females Chinese; and 1033 males and 790 females Indians. There were 194,935 males of all races between eighteen and forty-five years of age; of these, 77,828 were natives, 117,107 foreigners, 154,200 whites, 1264 colored, 37,800 Chinese, 1671 Indians. There were 227,256 males of all classes of twenty-one years old and upward; of these, 145,802 were citizens, 1812 Indians, 36,890 Chinese, and the remainder foreigners not naturalized.

Constitution, Courts, etc.—The constitution of the State was adopted in 1850, and, though it has been modified and amended in a few particulars, is still the organic law of the State. By its provisions all legal distinctions between individuals on religious grounds are prohibited; the utmost freedom of assembling, of speech, and of the press is allowed, subject only to restraint for abuse; in trials for libel the jury are required to judge upon the law and the fact, and proof of the truth of the charges and of the good intentions of the writer is made a bar to damages; foreigners who are actual residents have the same rights in regard to property as citizens; there is to be no imprisonment for debt, except where fraud can be proved; slavery and in-

voluntary servitude, except for crime, were prohibited; wives were secured in their separate rights of property beyond their husbands' control; the exemption of a part of the homestead and of other property of heads of families from forced sale was recognized; no public debt was to be created exceeding at any time the sum of $300,000, except upon a specific vote of the people, and then only within certain specified limits (this provision was subsequently modified by vote of the people); no divorce could be granted by the legislature; lotteries and the sale of lottery-tickets were prohibited; corporations and joint-stock companies were to be organized only under general laws, and the stockholders were to be individually liable for corporate debts; no charters for banking purposes were ever to be granted (this was subsequently modified), and the circulation of paper money in any form was prohibited (this, too, has been modified, though the circulating medium of the State has always been gold and silver); the credit of the State was not to be loaned to any individual or corporation, nor was the State ever to become a stockholder in any corporation. On the qualifications of electors the constitution provides that every white male citizen of the U. S., and every white male citizen of Mexico who shall have elected to become a citizen of the U. S. under the treaty of peace exchanged and ratified at Queretaro May 30, 1848, of the age of twenty-one years, who shall have been a resident of the State six months next preceding the election, and of the county or district in which he claims his vote thirty days, shall be entitled to vote at all elections which are now or hereafter may be authorized by law. The ratification of the fourteenth and fifteenth amendments to the Constitution of the U. S. led to such a modification of this provision as permitted the negroes to vote, but the elective franchise has not yet been permitted to the Chinese. Convicts and idiotic persons are excluded from the franchise. The legislative department of the State government consists of a senate of 40 persons, elected for four years, one-half being elected every second year; and a House of Representatives, 80 in number, elected for two years. All citizens who have resided for one year in the State, and for six months in the district, are eligible for membership. The executive department consists of a governor, lieutenant-governor, comptroller, treasurer, attorney-general, surveyor-general, and superintendent of public instruction, all of whom are chosen for the term of four years, commencing with the first Monday in December after the election. The judiciary consists—1st, of a supreme court, with a chief-justice and four associate justices, having appellate jurisdiction in all cases in equity, in all cases at law involving the title or possession of real estate, or the legality of any tax, toll, fine, etc., or in which the matter in controversy exceeds $300; also in all cases arising in the probate courts, and in all criminal cases amounting to felony on questions of law alone. It has power to issue writs of mandamus, certiorari, prohibition, and habeas corpus, and all writs necessary and proper to the exercise of its appellate jurisdiction. 2d, of district courts, of which there are now fourteen, one to each judicial district. These courts have original and co-ordinate jurisdiction in all cases in equity and law in which the supreme court has appellate jurisdiction. They have criminal jurisdiction in criminal cases not otherwise provided for. 3d, of county courts, having original jurisdiction of actions of forcible entry and detainer, insolvency, nuisance, and of all such special cases as are not otherwise provided for. A justice of the supreme court may issue writs of habeas corpus in and to any part of the State; a district judge in and to any part of his district; and a county judge in and to any part of his county. The justices of the supreme court are elected by the qualified electors of the State at special elections for judicial officers, and no others, except the superintendent of public instruction, for a term of ten years; judges of district courts by the qualified electors of their district, at similar elections, for six years; and judges of county courts by the qualified electors of their county, at similar elections, for four years. California has four representatives in Congress under the new apportionment law.

Objects of Interest.—California has numerous natural wonders, so remarkable that they attract visitors from all parts of the world. We have already alluded to the Valley of the Yosemite. This valley, one of the wonders of the world, is elsewhere more fully described. (See YOSEMITE.) It is sufficient to say here that it is a deep valley 8 miles long by 2 wide, with walls averaging nearly 4000 feet in height; that there are seventeen sentinel peaks keeping guard over the valley, and ranging from 1800 to 6034 feet in height, while the outlying summit-mountains, Lyell, Dana, and Cathedral, rise to the height of over 13,000 feet; and eleven waterfalls, the lowest 350 feet in height, and the highest 3000 feet; and in the various scenery of mountain-peak and valley, of the gentle flowing river and the endless variety of cataract, rapid, spray, and mist, of the precipitous mountain-spires and gentle grassy slopes, nature seems to have exhausted all forms of the beautiful. Near this wondrous valley are two of the groves of the sequoias or monster trees—the Calaveras and the Mariposa groves. These are visited by many tourists. The Geysers or hot springs of Calistoga, at the head of Napa Valley, are in a narrow valley or cañon which is filled with flowing (not spouting) hot springs, and the whole soil is covered with a crust of sulphur, iron-rust, and other mineral deposits, and filled with steam from the boiling water. The surface of the ground is so hot as to render walking over it uncomfortable. There has recently been discovered another of these deep valleys with its surrounding peaks and waterfalls, N. W. of Yosemite, which has a larger volume of water and falls equally lofty, and bids fair to rival the Yosemite Valley. The natural bridges and the Coyote caves in Calaveras co., with their bell-sounding rocks, the beautiful Lake Tahoe, and the smaller but romantic Donner Lake, on the boundary-line of Nevada, Mono (salt) Lake, near Yosemite; the wild volcanic region with its horrors in Mono, Fresno, and Kern counties, and the terrible Death Valley in the last-named county; Tulare Lake and the tulé swamps and lakes of the southern counties, some of them covered with bitumen; and the wild and waterless region bordering on the Colorado River in S. E. California,—all have their attractions for those who desire to witness Nature in her unknown haunts and in her strangest attire.

Counties.—There are now 51 counties in the State, the last, Ventura, having been organized from the southern part of Santa Barbara in Jan., 1873. The table appended gives the population in 1860 of each county then organized, the population of each race, and the entire population of each county in 1870, and the population as estimated by the assessors and surveyor-general at the close of 1872:

COUNTIES.	Population in 1860.	White, 1870.	Colored, 1870.	Indian, 1870.	Asiatic, 1870.	Totals, 1870.	Estimated total population 1872.

Principal Towns.—San Francisco, the principal seaport and commercial metropolis of our Pacific coast, has a pop-

* New county, organized from Santa Barbara in 1873.

ulation of 149,473; Sacramento, the capital of the State, in the Sacramento Valley, has 16,283 inhabitants; Oakland, across the bay from San Francisco, 10,500; and Stockton, in the San Joaquin Valley, 10,066, are the only other towns of the State which had over 10,000 inhabitants in 1870. San José, 9089; Los Angeles, 5728; Marysville, 4738; Santa Cruz, 2561; and San Diego, 2300, were the only other towns having more than 2000 inhabitants.

History.—By the treaty of Feb. 2, 1848, with Mexico, the territory comprising the present States of California and Nevada and the Territories of Utah, Arizona, and New Mexico (except the strip S. of the Gila River), part of Colorado and part of Texas, were ceded to the U. S. Of all this region California was best known, and, though its mineral wealth was as yet undiscovered, it had long been celebrated as the El Dorado of the Pacific. Originally, the name California embraced the long peninsula now called Lower or Old California (which still belongs to Mexico) and an indefinite extent of territory northward along the coast, to which the name of Upper or New California was given. The Spaniards claimed to the Arctic Circle, but their settlements never extended N. of San Francisco. The origin of the name is involved in doubt. It is first found in an old Spanish romance published at Seville in 1510, entitled the "Sugas of Esplandian, the son of Amadis of Gaul." It is twice named in the book, as follows: "Know that on the right hand of the Indies there is an island called California, very near to the Terrestrial Paradise, which was peopled by black women, without any men among them, because they were accustomed to live after the manner of the Amazons. They were of strong and hardened bodies, of ardent courage, and of great forces. The island was the strongest in the world, from its steep rocks and great cliffs. Their arms were all of gold, and so were the caparisons of the wild beasts they rode." Another passage reads: "In the island called California are many griffins, on account of the great savageness of the country, and the immense quantity of wild game to be found there."* The present State of California (not the peninsula—that was discovered considerably earlier) was first discovered and partially described by Juan Rodriguez Cabrillo in the year 1542. Cabrillo was a Portuguese by birth, but was a navigator in the Spanish service. The highest latitude reached by him was 40° 30′, where he encountered the great western headland which he called Cape Mendoza, now known as Cape Mendocino. He also discovered and named the Farallones Islands, from his pilot Farallo. In 1578, Sir Francis Drake passed along this coast, landed at what is now known as Drake's Bay, N. lat. 37° 59′ 5″, and, ignorant of any previous discovery, took possession of it in the name of Queen Elizabeth, calling it New Albion. In 1602, General Sebastian Viscayno, under orders from Philip III. of Spain, explored the coast from San Diego northward as far as the Bay of Monterey and the islands which form the Santa Barbara channel. There is no record of any successful attempt to plant a colony on this territory for 167 years after this exploration of Viscayno. There had been numerous unsuccessful expeditions prompted by the thirst for gold, for there was a strong though vague impression that there were gold, silver, and precious stones among its mountains, but in every case they had failed miserably.

In 1767 the Jesuit missionaries were expelled from Lower California (the peninsula) by order of Charles III. of Spain, and their missions and property granted the Fathers of the order of St. Francis. These zealous propagandists began the next year to take measures for extending their missions into Upper or New California, and in the winter and spring of 1769 organized expeditions, both by sea and land, to found colonies and missions in that hitherto unknown region. After great suffering and heavy loss by scurvy and starvation, two of the three vessels reached San Diego—one April 11th, the other May 1st. The land expedition was in two divisions, the first of which reached San Diego May 15, and the second on the 1st of July. From San Diego a new party was organized, which proceeded northward along the coast to find Monterey. Missing this, they continued northward and discovered the Bay of San Francisco (which till then had been unknown to white men) on the 25th of Oct., 1769. They gave it its present name after their patron saint, but presently returned to San Diego, which they reached Jan. 24, 1770. It was not until Oct. 9, 1776, that these Fathers founded a mission at San Francisco—the Mission Dolores, as it is now called. It was the sixth they had founded within the present limits of the State. Within about fifty years they had founded twenty-one of these missions, the farthest N. being that of San Francisco de Solano de Sonoma, in lat. 38° 30′ N. These missions, at first instituted for the conversion and civilization of the Indians, soon became the means of reducing these hapless aborigines to a condition of slavery for the benefit of the Franciscan Fathers and their dependents. Within fifty-five years from the time of the planting of the first mission at San Diego the Fathers had accumulated enormous wealth. They owned all the land along the coast, the landed estate of one mission joining another, though they were twenty-five to thirty miles apart; according to the report of Rev. Calvin Colton, who made very thorough investigation of their condition in 1825, they had more than 1,200,000 head of cattle, over 100,000 horses and mares, from 12,000 to 15,000 mules, more than 1,000,000 sheep, many thousand hogs, and not less than $1,000,000 in specie and bullion, besides the rich gold and silver ornaments, statues, crucifixes, etc. in their churches. They carried on a thriving trade in hides and tallow, wool and wine, with the Russians and other traders who came to Yerba Buena (now San Francisco), Monterey, and San Diego in ships, for their produce. Nearly 20,000 Indians were domesticated at the missions, whipped and tortured if they did not perform the work allotted to them, and in the most abject condition of fear and degradation. Only a very few of these were taught to read, or even instructed in the elements of Christianity. They were merely farm-slaves. They were to defend the missions, which were strong, walled villages, and to prevent any free settlers from coming into the territory. The Indians of the interior, at that time numbering 100,000 or more, were left to their ignorance and heathenism, and no efforts were made to civilize or convert them.

With the downfall of the Spanish power in Mexico in 1822, the missions began to wane, and after years of decay they were at last formally abolished and their property confiscated in 1845. For fifteen or twenty years previous to this time a large and constantly increasing number of settlers had been pouring into California—Mexicans, attracted by the fine climate and fertile soil; trappers and hunters, who had emerged from the deserts E. of the Sierras, and who found game abundant, the lands fertile, and the Indians less warlike and ferocious than those they had before encountered; Russians from Russian America; sailors and adventurers of all nations, who had escaped from merchant-ships or had been left here at their own request; and now and then citizens of the Eastern States, who had come in search of health. Between 1840 and 1845 more than 5000 persons crossed the Plains and scaled the mountains to make their homes in California, some of the parties, like that of Captain Donner in 1846, perishing by the way from encountering terrific snow-storms, or, as in other instances, from drought and starvation in S. E. California. Great numbers, too, came by sea. In Oct., 1842, Commodore Jones, U. S. N., under the impression that there was actual war between Mexico and the U. S., entered the harbor of Monterey, captured the fort, hoisted the Stars and Stripes, and declared California a territory of the U. S., greatly to the satisfaction of most of the inhabitants; but finding himself in error, he next day hauled down his colors and apologized to the Mexican authorities for his conduct. The expeditions of Lieut. (since Major-Gen.) John C. Fremont to the Pacific aroused great interest in this region, and, in spite of the hardships to be endured, led thousands of emigrants to undertake the perilous journey. Before the close of 1846 there were 2000 American citizens in California, about 3000 foreigners who were friendly to them, and about 3000 more who were neutral or hostile. In Mar., 1847, Col. Stevenson's picked regiment of California volunteers, nearly 1000 strong, was added to this number, and other U. S. troops came in soon after. On the 7th of July, 1846 (war having already commenced between the U. S. and Mexico), Commodore John D. Sloat took possession of Monterey, and issued a proclamation as governor of the territory. Two days later, the U. S. troops took possession of San Francisco, July 10th of Sonoma, and July 12th of Sutter's Fort. Commodore Sloat acted as governor until Aug. 17, 1846, when Commodore Robert F. Stockton was proclaimed his successor. Commodore Stockton gave his immediate attention to fighting the Mexican forces under Flores, who had recaptured Los Angeles and Santa Barbara, and whom he defeated in two battles—at Rio San Gabriel and on the plains of Mesa, Jan. 8 and 9, 1847—and drove out of the country. In Jan., 1847, Commodore Stockton appointed Col. John C. Fremont governor. This was a blunder, as Gen. Stephen W. Kearney, as commander of the forces, was rightfully governor, and assumed command Mar. 1, 1847. Fremont was afterwards tried by court-martial for this offence, but was cleared, it being proved that he had acted in good faith and without a knowledge of Gen. Kearney's rights in the matter. Col. Richard B. Mason was appointed governor May 31, 1847, and held office till April 13, 1849; Capt. (afterward Maj.-Gen.) Henry W.

* Cronise's "Natural Wealth of California," page 2.

Halleck was secretary of the territory under Col. Mason, and rendered great services to the country then and subsequently. On the 13th of April, 1849, Gen. Bennet Riley was appointed military governor, and on the 3d of June following called a convention to meet at Monterey on the 1st of Sept. to frame a State constitution. This convention, consisting of forty-eight members, assembled at the time appointed, and after six weeks of deliberation reported, adopted, and signed a constitution (Oct. 13, 1849), which was submitted to the people for ratification on the 13th of Nov., 1849, when 12,064 votes were polled in favor of its adoption, 811 against it, and 1200 were set aside for informality. In Dec., 1849, Peter H. Burnett was elected governor under this constitution, and application was made in due form for the admission of the State into the Union. After a long and acrimonious struggle in Congress between the advocates of slavery and free soil, which lasted from Dec. 22, 1849, to Sept. 7, 1850, California was admitted into the Union as a State Sept. 9, 1850.

In Feb., 1848, gold was discovered on the estate of Gen. Sutter in Coloma co., and as the news of its discovery spread the gold-hunters flocked in from all parts of the world, and in a very short time (in 1852) California had a population of over 250,000, a large proportion of them energetic, daring, reckless men, capable of almost any crime, and mad in their pursuit of gold. Gambling and its concomitant vices bore almost universal sway. Whole squares were devoted to gambling-houses in San Francisco, and theft and murder were rife in its streets. It was found that the courts protected instead of punishing rogues and ruffians, and in 1851 a "vigilance committee" of some of the best citizens was formed, which seized, tried, and hanged in the streets some of the worst villains. This alarmed the dangerous classes for a time, but the courts and civil authorities were all thoroughly corrupt, and some of the worst men in the community were occupying high offices, upon which they had seized by the most open and unblushing frauds. The vigilance committee was revived in May, 1855, and for eight months held sway in San Francisco, arresting, trying, hanging, and banishing those whose crimes had rendered them obnoxious to the community. It was a desperate remedy, and one fitted only to a desperate condition of affairs; but it is the universal testimony of the best citizens that the committee used their absolute powers wisely and well, and disbanded as soon as the occasion for which they were called into action had passed. They executed four, one of their prisoners committed suicide while they were deliberating on his case, and nearly twenty were banished from the State. One of their prisoners, who was at the time one of the justices of the supreme court of the State, was released by them after trial, but his subsequent course verified their judgment of his ruffianly character. The State has passed through many vicissitudes, the succession of excitements in regard to new gold-fields depopulating some districts and causing a rapid growth of others. Of late years, however, it has been developing its other resources—the culture of grain and the production of wine, of silk, and semi-tropical fruits, and of some descriptions of manufactures; and though the yield of gold in the State has partially fallen off, it has been much more than made up in the increase of the crops and manufactured goods, and these afford a better and more certain return to the producer than mining products. During the late war California contributed her full share both in men and money towards achieving the success of the Union arms; her magnificent gifts to the Sanitary Commission and to all organizations for the welfare of the soldiers will never be forgotten. By the completion of the Union and Central Pacific R. Rs. the State was brought into closer connection with the Eastern States, and all danger of the creation of a separate Pacific empire, if such danger ever existed, was for ever removed from the thoughts of its people.

Gold Product of California.—Mr. T. F. Cronise, in his "Natural Wealth of California," gives the following table of the gold product of California, which we have brought down to the beginning of 1873. It is in round numbers, but is the closest approximation to the truth:

Year.	Amount.	Year.	Amount.
1848	$10,000,000	1861	$40,000,000
1849	40,000,000	1862	34,700,000
1850	50,000,000	1863	30,000,000
1851	55,000,000	1864	26,000,000
1852	60,000,000	1865	28,500,000
1853	65,000,000	1866	26,500,000
1854	60,000,000	1867	25,000,000
1855	55,000,000	1868	28,000,000
1856	55,000,000	1869	27,800,000
1857	55,000,000	1870	28,500,000
1858	50,000,000	1871	25,000,000
1859	50,000,000	1872	20,000,000
1860	45,000,000		
Total for 25 years			$990,600,000

Governors of the State, Territory, and Province.—California has been within the past 106 years under the government of four different powers—viz. 1st, the Spanish rule from 1767 to 1823 (previous to 1767 it was parceled off among numerous tribes of Indians, some of them Pueblos or dwellers in towns and villages, and others nomadic); 2d, the Mexican rule; 3d, the American territorial and military government; 4th, the State government.

Spanish Rule.

Gaspar de Portala	1767–71	José J. de Arrillaga	1792–94
Felipe de Barri	1771–74	Diego de Borica	1794–1800
Felipe de Neve	1774–82	José J. de Arrillaga	1800–14
Pedro Fajés	1782–90	José Arguello	1814–15
José Antonio Romen	1790–92	Pablo Vicente de Sola	1815–22

Mexican Rule.

Pablo Vicente de Sola	1822–23
Luis Arguello	1823–25
José Maria de Echeaudia	June, 1825–Jan., 1831
Manuel Victoria	Jan., 1831–Jan., 1832
Pio Pico	Jan., 1832–Jan., 1833
José Figueroa	Jan., 1833–Aug., 1835
José Castro	Aug., 1835–Jan., 1836
Nicolas Gutierrez	Jan., 1836–April, 1836
Mariano Chico	April, 1836–Aug., 1836
Nicolas Gutierrez	Aug., 1836–Nov., 1836
Juan B. Alvarado	Nov., 1836–Dec., 1842
Manuel Micheltorena	Dec., 1842–Feb., 1845
Pio Pico	Feb., 1845–July, 1846

American Military and Territorial Rule.

Com. John D. Sloat	July 7, 1846–Aug. 17, 1846
Com. Robert F. Stockton	Aug. 7, 1846–Jan., 1847
Col. John C. Fremont	Jan., 1847–Mar. 1, 1847
Gen. Stephen W. Kearney	Mar. 1, 1847–May 31, 1847
Col. Richard B. Mason	May 31, 1847–April 13, 1849
Gen. Bennet Riley	April 13, 1849–Dec., 1849

State Government.

Peter H. Burnett	Dec., 1849–51	John G. Downey	1860–62
John McDougall (acting)	1851–52	Leland Stanford	1862–63
John Bigler	1852–56	Frederick F. Low	1863–68
J. Neely Johnson	1856–58	Henry H. Haight	1868–72
John B. Weller	1858–60	Newton Booth	1872–75
Milton S. Latham	1860–60		

Electoral Vote for President and Vice-President.—The first presidential election in which California participated was that of 1852, and her electoral votes have been cast from that time as follows:

Year.	Candidates.	Electoral vote.
1852	Pierce and King	4
1856	Buchanan and Breckenridge	4
1860	Lincoln and Hamlin	4
1864	Lincoln and Johnson	5
1868	Grant and Colfax	5
1872	Grant and Wilson	6

Popular Vote for President and Vice-President.

Elec. year.	Candidates.	Popular vote.	Candidates.	Popular vote.	Candidates.	Popular vote.	Candidates.	Pop. vote
1852	Scott and Graham	35,407	Pierce and King	40,626	Hale and Julian	100		
1856	Fremont and Dayton	20,691	Buchanan and Breckenridge	53,365	Fillmore and Donelson	36,165		
1860	Lincoln and Hamlin	39,173	Douglas and Johnson	38,516	Breckenridge and Lane	34,334	Bell and Everett	6817
1864	McClellan and Pendleton	43,841	Lincoln and Johnson	62,134				
1868	Seymour and Blair	54,077	Grant and Colfax	54,583				
1872	Greeley and Brown	40,718	Grant and Wilson	54,020				

(For the recent statistics of this article we are indebted to the Hon. Drury Melone, secretary of state of California.)
L. P. Brockett.

California, a township of Madison co., Ark. Pop. 313.

California, a township of Starke co., Ind. Pop. 251.

California, a township of Coffey co., Kan. Pop. 645.

California, a post-township of Branch co., Mich. Pop. 803.

California, a city, capital of Moniteau co., Mo., on the Missouri Pacific R. R., 150 miles W. of St. Louis. It is the geographical centre of the State, and has fine county buildings, seven churches, four hotels, graded schools, bank, public library, and two weekly papers, and is surrounded by a rich agricultural district, abounding in lead and other minerals. R. E. Huntington, Ed. "Moniteau Journal."

California, a township of Pitt co., N. C. Pop. 3626.

California, a post-borough of Washington co., Pa. Pop. 659.

California, Gulf of, or **Sea of Cortes** [Sp. *Mar Bermejo*], an arm of the Pacific Ocean, separates the peninsula of Lower California from the Mexican provinces of Sinaloa and Sonora. It is about 700 miles long, and varies in width from 40 to 100 miles. It encloses many islands. The river Colorado enters it at the N. extremity. This gulf was once famous for its pearl-fisheries, and mother-of-pearl is still obtained here.

California, Lower or **Old,** a long, narrow peninsula, a territory of Mexico, is bounded on the N. E. by the Gulf of California, and on the S. W. by the Pacific Ocean. It is about 750 miles long, and varies in width from 30 to 150 miles. Its most southern point, Cape Lucas, is in lat. 22° 52′ N., from which it extends in a N. N. W. direction to lat. 32° 30′ N. It is a mountainous, arid region of volcanic formation, having a sparse population. Capital, La Paz. This peninsula was discovered by Grijalva in 1534. Pop. in 1868, 21,645.

California, University of, was established by an act of the State legislature, approved Mar. 23, 1868. It was an outgrowth of the College of California, which was chartered in 1855, and maintained on a non-sectarian basis. Prof. Henry Durant opened its preparatory school at Oakland, and thus became one of the earliest pioneers of education in the State. In 1860 the college admitted its first class, and it graduated classes yearly from 1864 to 1869. It had no president. From 1863 to 1869, Rev. S. H. Willey was vice-president. Finding the college fettered by its want of endowments, and wishing to see a larger and stronger institution, the trustees in 1867 offered all their property to the State. This included a new, unoccupied site of 160 acres at Berkeley, 5 miles N. of Oakland, and 9 miles from San Francisco. The State had accepted the Congressional provision for an agricultural college. It was now proposed to unite all interests in a university adequate to the wants and worthy of the name of the State. The proposition was agreed to. The first board of regents, appointed in 1868, kept the college in existence another year. In 1869 the university was organized for instruction, and received its first class. That class graduated in the summer of 1873. The classes have steadily increased, and the university now numbers 180 students. The university has already two large buildings at Berkeley.

The first president of the university, elected in 1870, was Henry Durant, LL.D., formerly of the College of California. The present president is Daniel C. Gilman, late of Yale College. DANIEL C. GILMAN.

Calig'ula (CAIUS CÆSAR), a Roman emperor, born at Antium in 12 A. D., was a son of Germanicus. His mother was Agrippina, a granddaughter of the emperor Augustus. He succeeded to the throne 37 A. D., at the death of Tiberius, against whose cruel jealousy he had guarded himself by habitual dissimulation. His reign was at first mild and popular, with an ostentation of generosity, but he soon showed himself a monster of cruelty, and indulged his vicious propensities without restraint. He expressed a wish that all the Roman people had but one head, that he might decapitate them at one blow. He ordered that sacrifices should be offered to himself as a god. In 41 A. D. he was assassinated by conspirators, and was succeeded by his uncle Claudius.

Ca'liph [Arab. *khalifah*, a "successor"], the "commander of the faithful," the spiritual and temporal head of orthodox Mohammedanism—so called as being the "successor" of Mohammed. The caliphs are usually classed as follows: (1) The four "Arabian caliphs" of Medina, A. D. 632–661; (2) the fourteen "Ommyiades" of Damascus, 661–750; (3) the twenty-seven "Abbasides" of Bagdad, 750–1258; besides these there were rival caliphates; (4) in Egypt the "Fatimites," fourteen in number, 909–1171; and (5) in Cordova, 756–1031, there were twenty-seven successive caliphs (Ommyiades) who had authority in Spain and N. W. Africa. The later Moorish dynasties, such as the "Almoravides" (1050–1145) and the "Almohades" (1129–1269), are not usually reckoned as caliphs, that term being, in strict language, only applicable to sultans of the family of Mohammed. Nevertheless, the Turkish sultans have long claimed the caliphate, and the claim is generally admitted by orthodox Mohammedans. The Shiite Mohammedans recognize of the above only Ali, the fourth Arabian caliph, as the lawful heir of the prophet, and from him the present royal house of Persia claims a lineal descent.

Calisthenics. See CALLISTHENICS.

Calisto'ga, a beautiful post-village of Napa co., Cal., the N. terminus of the Napa Valley R. R., 42 miles from Vallejo, is celebrated for its warm springs and its picturesque scenery. The town is supplied with water from the adjacent mountains, and is a place of considerable business. Five miles to the S. E. is a famous petrified forest.

Cali'tri, a town of Italy, in Principato Ulteriore, near the Ofanto, 23 miles S. E. of Ariano. Pop. 6208.

Calix'tines, the name given to a party of the Hussites, because they insisted on giving the cup (calyx) in the Eucharist to all who were not guilty of mortal sins. They defeated the Taborites (the other branch of the Hussites) in a battle at Lippau (1434). The Calixtines had been reconciled to the pope in 1433. The term Calixtines has also been applied to the adherents of G. Calixtus, a Lutheran professor of theology at Helmstedt. (See CALIXTUS.)

Calix'tus, originally **Callisen** (GEORGE), an eminent Protestant theologian, born at Medelbye, in Sleswick, Dec. 14, 1586. He became professor of theology at Helmstedt in 1614, and wrote several treatises against the doctrines of the Roman Catholics. He was distinguished for his learning and tolerance as well as his talents. Among his works are an "Epitome of Moral Theology" (1634) and "De Tolerantia Reformatorum" ("On the Tolerance of Reformers," 1658). He was accused of heresy and cryptopapism by some Lutherans, but his doctrines were accepted by many followers, who were called Calixtines. Died Mar. 19, 1656. (See W. C. DOWDING, "Life of Calixtus," 1864.)

Calixtus I. (POPE), SAINT, succeeded Zephyrinus 219 A. D. Died 223.—CALIXTUS II. succeeded Gelasius II. in 1119. He concluded the concordat of Worms with the emperor Henry V., which ended the difficulty with respect to investitures. Died Dec. 12, 1124.—CALIXTUS III. (ALONZO BORGIA), born in 1379 in Valencia, succeeded Nicholas V. in 1455. He attempted to institute a crusade, without success. Died Aug. 6, 1458.

Cal'ken, a village of Belgium, in East Flanders, on the Scheldt, 8 miles E. of Ghent. Pop. 5227.

Calk'ing, or **Caulking,** the process of filling with tarred oakum the seams between the planks of ships, in order to render the joints impervious to water. The oakum is driven into the seams by a wedge-shaped tool called a calking-iron. The seams are finally payed over or coated with melted pitch or resin. The quantity of oakum used in a ship of the largest size is about thirty tons.

Call, a military musical term, signifies a signal given by a trumpet, bugle, or drum.

CALL, a metallic whistle used on shipboard by the boatswain and his mate. Various kinds of sounds denote signals or orders for hoisting, lowering, veering, etc.

CALL TO THE BAR is the formal expression by which the admission of students of law to the rights and privileges of the degree of barrister in England and Ireland is publicly announced. In Scotland the corresponding expression is "passing advocate."

Cal'la, a genus of plants of the natural order Araceæ. The genus is characterized by a flat spathe, within which is a cylindrical spadix covered with naked flowers, appearing as a mere mixture of stamens and pistils, and a 1-celled ovary. The *Calla palustris* is a native of Europe and the U. S., growing in swamps and bogs. It has cordate leaves, a white spathe, and very acrid rhizomes, which are cooked for food by the Laplanders. The *Calla Æthiopica* or *Richardia Æthiopica* is prized for the beauty of its flowers.

Cal'lahan, a county in the N. of Texas. Area, 900 square miles. It is drained by several affluents of the Colorado and Brazos rivers. The surface is hilly or mountainous. Here are two peaks, called the East Caddo and West Caddo. Timber is scarce. Stock-raising is the only pursuit. Returned as having no population by U. S. census of 1870.

Cal'land's, a post-village and township of Pittsylvania co., Va., 45 miles S. W. of Lynchburg. Pop. 2848.

Calla'o, a fortified town of Northern Peru, on the Pacific Ocean, 6 miles W. of Lima, of which it is the port; lat. 12° 4′ S., lon. 77° 13′ W. It is connected with Lima by a railway, and has a commodious quay and a fine fortress. The harbor or roadstead, which is sheltered by the island of San Lorenzo, is the best on the coast of Peru. The chief exports are specie, copper, cotton, hides, and bark. The town was destroyed by an earthquake in 1746. Pop. about 10,000.

Cal'lao, a post-village of Macon co., Mo., on the Hannibal and St. Joseph R. R., 9 miles W. of Macon City. Pop. of Callao township, 1643.

Cal'laway, a county of Kentucky, bordering on Tennessee. Area, 450 square miles. It is bounded on the E. by the Tennessee River, and is drained by Clark's River. The surface is hilly, except the extensive river-bottoms;

the soil is fertile. Tobacco, corn, wheat, and wool are staple products. Capital, Murray. Pop. 9110.

Callaway, a county in E. Central Missouri. Area, 743 square miles. It is bounded on the S. by the Missouri River, and on the W. by Cedar Creek. The surface is undulating; the soil is very fertile. About one-third of it is prairie-land. Bituminous coal, iron, fictile clay, and fine limestone are abundant here. Tobacco, grain, wool, and cattle are extensively raised. Capital, Fulton. Pop. 19,202.

Callaway, a township of St. Charles co., Mo. P. 1745.

Callaway (Elisha). See Appendix.

Call'cott (Sir Augustus Wall), an English landscape painter, born at Kensington (London) Feb. 20, 1779. He was chosen a member of the Royal Academy in 1810, was knighted in 1837, and became conservator of royal pictures in 1844. Among his works are "Morning," "Evening," and "Harvest in the Highlands." Died Nov. 25, 1844.

Callcott (John Wall), Mus. Dr., an eminent English composer, a brother of the preceding, was born at Kensington in 1766. He composed many anthems, glees, and other pieces of music. He published a "Musical Grammar" (1805). Died in May, 1821.

Calle'ja (Don Felix del Rey), a Spanish general, born in 1750. He commanded the royal army in Mexico against the insurgents who revolted in 1810, and he became viceroy of Mexico in 1813. Died in 1820.

Cal'lender (John), born in Boston, Mass., in 1706, graduated at Harvard in 1723, became pastor of the Baptist church of Swansey, Mass., in 1728, and in 1731 of the church at Newport, R. I. His best-known work is a centennial historical discourse, delivered in 1738, which is of great value in the early history of Rhode Island. Died Jan. 26, 1748.

Cal'lensburg, a post-village of Licking township, Clarion co., Pa. Pop. 255.

Cal'licoon, a post-township of Sullivan co., N. Y., has manufactures of lumber and leather. The soil is good. Sand for glass-making has been procured here. Jeffersonville, which is partly in this township, has a weekly paper. Pop. of township, 2763.

Callic'rates [Gr. Καλλικράτης], an eminent Greek architect who flourished about 440 B. C. Among his works was the Parthenon of Athens, in which he was assisted by Ictinus. It was adorned with sculptures by Phidias, and was surrounded by forty-six Doric columns.

Callicrat'idas [Gr. Καλλικρατίδας], a Spartan general who obtained command of the fleet in 406 B. C. He defeated the Athenian general Conon, and blockaded him at Mitylene. The Athenians soon sent to the relief of Conon another fleet, which defeated the Spartans at Arginusæ in 406 B. C. Callicratidas was killed in this action.

Callig'onum, a genus of plants of the order Polygonaceæ, having a quadrangular fruit (*achenium*) winged at the angles. The *Calligonum Pallasia*, a succulent shrub, is found in the sandy steppes near the Caspian Sea. Its acid fruit and shoots serve to allay the thirst of travellers. From its root exudes a nutritious gum which is similar to tragacanth, and is used as food by the Calmucks.

Callig'raphy [Gr. καλλιγραφία, from κάλλος, "beauty," and γραφή, "writing"], the art of beautiful writing. The scribes who copied manuscripts before the invention of printing have been termed calligraphers or calligraphists. Their art consisted not merely in writing, but also in embellishing their work with ornamental devices. (See Illumination.) Some extant manuscripts, written in the early part of the Middle Ages, exhibit admirable specimens of the art, with letters of gold, vermilion, etc.

Callim'achus, a Greek sculptor and architect who is supposed to have lived about 450–400 B. C. His statues were finely finished. The invention of the Corinthian capital is ascribed to him.

Callimachus [Gr. Καλλίμαχος], a celebrated Greek poet and grammarian, was born at Cyrene, and flourished about 260–240 B. C. He was patronized by Ptolemy Philadelphus, and was appointed chief librarian of the great Alexandrian library. He was a prolific writer and an eminent teacher; among his pupils was Eratosthenes. He wrote an epic poem entitled "Galatea," several important prose works, and tragedies, elegies, comedies, etc. His works are nearly all lost, except his epigrams and hymns. Quintilian regarded him as the best of the Greek elegiac poets.

Calli'nus [Καλλῖνος] **of Ephesus,** the earliest of the Greek elegiac poets, is supposed to have lived about 600 or 650 B. C. Only small fragments of his poems are extant.

Calli'ope [Gr. Καλλιόπη], one of the Nine Muses, presided over epic poetry, and was said to be the mother of Orpheus and Linus. She was represented as holding a tablet or closely-rolled parchment in her hand.

Calliope, a post-village, capital of Sioux co., Ia., is on the left bank of the Sioux River (which is here the western boundary of the State), about 38 miles N. of Sioux City. Pop. 40.

Callip'pic Period, a correction of the Metonic cycle, proposed by Callippus. The Metonic cycle was a period of nineteen solar years, at the end of which the new moons return again on the same days of the year. The period contained exactly 6940 days. Now, 6940 days exceed 235 lunations by only seven hours and a half. At the end of four cycles, or seventy-six years, the accumulated excess of seven and a half hours amounts to one day and six hours. Callippus proposed to quadruple the period of Meton, and to deduct a day at the end of it.

Callip'pus, or **Calippus** [Gr. Κάλλιππος or Κάλιππος], an ancient Greek astronomer, born at Cyzicus, lived about 330 B. C. at Athens. He associated with Aristotle. He invented a new cycle of seventy-six years, which was adopted by astronomers, and was called the "Callippic Period." It began 331 B. C.

Callis'thenes [Gr. Καλλισθένης], an historian, born at Olynthus, in Thrace, about 365 B. C., was a relative and pupil of Aristotle. He accompanied Alexander the Great in his expedition against Persia in 334 B. C., and gained the favor of that prince, but afterwards offended him by his boldness of speech, and was put to death on a charge of treason in 328 B. C. He left a history of Alexander's expedition against Persia, which is not extant.

Callisthen'ics, or **Calisthenics** [from the Gr. κάλλος, "beauty," and σθένος, "strength"], a system of exercises designed to promote beauty and strength; in other words, to impart grace of movement and physical strength at the same time. These exercises are better adapted to girls than ordinary gymnastics, as they do not subject the muscles to so violent a tension. The apparatus used in these exercises consists of a light wooden staff about four feet long, a pair of light dumb-bells, parallel bars, two square weights, and a short roller fixed in sockets near the top of an open doorway. Good substitutes for this apparatus may be found in the game of battledoor, in swimming, riding on horseback, etc.

Callis'tratus [Gr. Καλλίστρατος], an eloquent Athenian orator who lived about 380–360 B. C. His eloquence and the applause which he received excited the emulation of Demosthenes, and induced him to cultivate the art of oratory. Callistratus was banished from Athens in 361 B. C. Having returned without permission, he was put to death.

Cal'litris, a genus of trees of the order Coniferæ. The cones consist of four to six woody scales, which separate one from another, each scale having from three to six winged seeds. *Callitris quadrivalvis*, a large tree of Barbary, called arar, yields a very hard, almost indestructible, fragrant wood, and the aromatic gum-resin called sandarach. The timber is highly prized, and is used for the floors of mosques.

Callot (Jacques), a French engraver, born at Nancy in 1592 of a noble family, who greatly opposed his pursuit of art as a profession. He studied at Rome, and attained great excellence, chiefly as an etcher and designer; was patronized by Richelieu and Louis XIII., for whom he executed battle-pieces. The best of his numerous plates are small, and deal with familiar and grotesque subjects. Among his works is notable the series of etchings "Les Misères de la Guerre." His drawings are highly esteemed, and were executed with great care. He was a man of most generous sentiments. Died Mar. 24, 1635.

Calluna. See Heath.

Cal'lus [Lat.], the exuded material by which fractured bones are consolidated together. If the broken ends are accurately adjusted, there is merely a slight deposition of callus between the two surfaces; if, however, the adjustment is not accurate, it is effused in such quantity as often to form a considerable hard swelling round the seat of the fracture; any excess is, however, usually absorbed during the last stage of the repair of a fracture. The term callus is also applied to the thick skin formed on hands or feet which are exposed to much rubbing and pressure.

Calmar. See Kalmar.

Cal'mar, a post-village of Winneshiek co., Ia., on the Milwaukee and St. Paul R. R., 43 miles W. by N. from Prairie du Chien. It is the eastern terminus of a branch of the same railroad. Pop. of Calmar township, 1864.

Calmet (Augustine), a learned French Benedictine and commentator on Scripture, was born near Commercy, in Lorraine, Feb. 26, 1672. He became in 1728 abbot of Senones, where he resided for many years. He published,

besides other works, a "Commentary on the Bible" (23 vols., 1707–16), and a "Historical and Critical Dictionary of the Bible" (2 vols. folio, 1720), which was translated into several languages. Died Oct. 20, 1757.

Calms. *Equatorial Calms.*—A belt of calms, variable winds, sudden squalls, and tornadoes, and almost daily thunder-showers, situated about and somewhat N. of the equator, 4° to 6° of latitude in breadth, and separating the two bodies of N. E. and S. E. trade-winds. This is the region where the heated air at the equator ascends to return from the height of the atmosphere towards the poles. (See Winds, General Circulation of.)

Calms of the Tropics of Cancer and Capricorn.—Two belts of calms and light winds, almost rainless, situated in the neighborhood of, but outside, the tropics. They are found at the polar limit of the trade-winds, which they separate from the region of variable winds of the temperate zones. Each belt occupies but a few degrees in latitude, but the position and limits of both are less defined than those of the equatorial belt. The region of the calms of Cancer, in the Atlantic, is called by American mariners the *horse latitudes*. It is said that in colonial times the numerous vessels freighted with horses from New England for the West Indies were often long detained in these dreaded calms, under the burning rays of the sun of these latitudes, causing a great mortality among their living freight. Hence the name. (See Winds, General Circulation of.) Arnold Guyot.

Cal'mucks, called by the Tartars *Khalimick* ("renegades"), the largest of the Mongolian peoples, inhabiting large regions of the Chinese and also Russian dominions. They are divided into four tribes: the Choshots, ruled by descendants of Gengis Khan; the Soongars, in the seventeenth and eighteenth centuries the masters of the other races; oppressed by the Chinese, they migrated in great numbers in 1758 to Russia, but, finding the new yoke still more grievous, returned in 1770 to Soongaria; the Derbets, who dwell in the valleys of the Don and Ili; the Torgots, formerly united with the Soongars. The former in 1616 removed to the plains of the Volga, but a large part sought their native regions again. The Calmucks are a nomadic race. Their wealth consists in herds of horses, camels, sheep, and cattle. In Russia there are at present about 120,000, the greater part of whom are found in Astrakhan. The European Calmucks are mostly Booddhists, but some are Mohammedans and some are Christians.

Caln, a post-township of Chester co., Pa. Pop. 984.

Calomar'de (Francisco Tadeo), Count, a Spanish minister of state, born at Villel in 1775. He studied law, joined the absolutist party, and became in 1823 minister of grace and justice. He persecuted the liberals, favored the Jesuits, and abused his power with cruelty. In 1833 he was disgraced and exiled in consequence of his abortive intrigues to raise Don Carlos to the throne. Died in 1842.

Cal'omel [from the Gr. καλός, "beautiful," "good," and μέλας, "black," perhaps so named because it was supposed to be good for black bile] is one of the compounds of mercury (Hg) and chlorine (Cl), known to chemists as the subchloride of mercury, or, according to the new nomenclature, mercurous chloride (Hg_2Cl_2). It is prepared by taking two equal portions of mercury, dissolving one portion in hot sulphuric acid, which forms sulphate of mercury, then adding the second part, and triturating the whole in a mortar till the metal becomes incorporated with the sulphate. This mixture is added to one-half its weight of common salt, and heated in a retort, when calomel condenses in the cool part of the receiver as a white powder. It is also sometimes prepared by precipitation. A minute quantity of corrosive sublimate which accompanies it is removed by washing. Calomel is very heavy. It is not soluble in water, and sparingly so in acids. It turns black on the addition of lime-water, potash, soda, or ammonia. When heated it sublimes unaltered, and readily condenses again on any cool surface held near it. Its medicinal properties are of a decided character, and though capable of being misused, and thus doing great harm, it is still of great value in the treatment of certain diseases. Revised by Willard Parker.

Calonne, de (Charles Alexandre), a French courtier, born at Douay in 1734. He was appointed controller-general of finances in 1783, at a time when the public revenue was not equal to the expenses of the state. He was profuse in the expenditure of the public money, and supplied the deficit by loans, extraordinary taxes, and other temporizing expedients, in which he showed himself fertile. In 1786 he advised the king to convoke an assembly of the Notables, in order to devise some remedy for the financial crisis. He was removed from office in 1787. Died Oct. 30, 1802.

Calophyl'lum [from the Gr. καλός, "beautiful," and φύλλον, a "leaf"], a genus of trees of the order Guttiferæ, natives of warm climates. Some of the species produce edible fruits and valuable timber. The resin called East Indian tacamahac exudes from the trunk of *Calophyllum Inophyllum*, a beautiful tree, which has large shining leaves and fragrant white flowers. This is one of the most valuable timber trees of the South Sea Islands. The timber is very durable, and resembles mahogany, but is of a lighter color. It is used for building and for the masts of vessels. The fruit of this and the other species is a drupe.

Caloric. See Heat, by Prof. W. P. Trowbridge.

Caloric Engine. See Hot-Air Engine, by F. A. P. Barnard.

Calorimo'tor [from *calor*, "heat," and *moveo*, *motum*, "to move"], a name given to a peculiar form of the voltaic apparatus, invented by Dr. Hare, composed of one pair of plates, which have great extent of surface, the electricity of which, when transmitted through good conductors, produces intense heat.

Calottistes (*Le Régiment de la Calotte*), an association of wits and satirists under the reign of Louis XIV. They were so called from their custom of sending to a public character who had made himself ridiculous a "patent," authorizing him to wear the *calotte*, a small cap, to protect the weak part of his head. The society was dissolved under the ministry of Cardinal Fleury.

Caloy'ers (*i. e.* "good old men"), [from the Gr. καλός, "good," and γέρων, an "old man"], a name applied to the monks of the Greek Church. They mostly follow the rule of Saint Basil, but those at Mount Sinai and Mount Lebanon follow the rule of Saint Anthony; from the caloyers the bishops and patriarchs are chosen. Among their numerous monasteries those of Mount Sinai in Asia and Mount Athos in Europe are the most celebrated.

Cal'pee, or **Kalpee,** a city of India, in Bundelcund, is on the right bank of the Jumna, in lat. 26° 7′ N., lon. 97° 28′ E. It is 46 miles S. W. of Cawnpore. Paper and refined sugar of superior quality are made here. Calpee was conquered by the British in 1803. In May, 1858, it was captured by Gen. Rose from the mutinous Sepoys, of whom Calpee was one of the head-quarters. Pop. 21,812.

Calpel'la, a township of Mendocino co., Cal. P. 807.

Calpur'nia, the fourth wife of Julius Cæsar, was married to him in 59 B. C. She was a daughter of L. Calpurnius Piso, who was consul in 58 B. C. She urged her husband not to leave home on the day of his assassination, the ides of March, 44 B. C.

Calpur'nius (Titus Julius), a Latin poet, surnamed Siculus, is supposed to have lived about 280–300 A. D. The events of his life are unknown. Several of his eclogues are extant, and have some merit.

Caltagiro'ne (anc. *Calata Hieronis?*) a city of Sicily, in the province of Catania, on the slope of a hill about 32 miles S. W. of Catania. It is the see of a bishop, and has a college, a hospital, and several convents; also manufactures of cotton fabrics and pottery. The inhabitants are esteemed the best workmen in Sicily in the useful arts. Pop. in 1872, 25,978.

Caltaniset'ta, an Italian province, bounded on the N. by Palermo, on the E. by Catania and Siracusa, on the S. by the Mediterranean, and on the W. by Girgenti, in the central part of Sicily. Area, 1455 square miles. Pop. in 1872, 226,156.

Caltanisetta, a fortified town of Sicily, capital of the above province, in a fertile plain near the Salso, 23 miles N. E. of Girgenti. Here are mineral springs and extensive sulphur-works. This place is supposed to be the site of the ancient *Nissæ*. Pop. in 1872, 26,156.

Caltavutu'ro, a town of Sicily, province of Palermo, 30 miles S. E. of the city of Palermo, is of Saracenic origin. Jasper is found in this vicinity. Pop. 5119.

Cal'tha, the Latin name of the marigold. *Caltha palustris* is the systematic name of the marsh marigold, often called in America "cowslip," a plant of the natural order Ranunculaceæ, which grows in swamps and wet meadows in Asia, Europe, the U. S., and even in Alaska. It is boiled and eaten in the spring as a potherb, the poisonous properties which it is said to possess being destroyed by cooking.

Cal'trop, or **Calthrop,** a low herb of the genus *Tribulus*, growing in the S. of Europe; its burs are armed with strong spines, which inflict wounds upon the feet of men and beasts if trodden upon. This name is also applied to a four-pointed piece of steel, so shaped that one prong always points upward. It is used in military operations to annoy an advancing enemy.

Caluire-et-Cuire, a village of France, in the department of Rhone, a suburb of Lyons, on the Saône, 3 miles N. N. E. of that city. Pop. 9182.

Cal'umet [said to be of French origin], the pipe of peace used by the North American Indians in the ratification of treaties. It is a tobacco-pipe, having a long stem made of hollow reed and ornamented with feathers. Some tribes of the aborigines appear to think that a treaty is not valid or complete until both parties have smoked the calumet together.

Calumet, a county in the E. of Wisconsin. Area, 300 square miles. It is bounded on the W. by Winnebago Lake, and is drained by the sources of Manitoowoc River. The rocks which underlie this county are limestone and sandstone. Grain, wool, and dairy products are largely raised. Capital, Chilton. Pop. 12,335.

Calumet, a post-township of Cook co., Ill. Pop. 1253.

Calumet, a post-township of Houghton co., Mich. Pop. 3182.

Calumet, a township of Pike co., Mo. Pop. 5185.

Calumet, a township of Fond du Lac co., Wis. Pop. 1460.

Calvados, a maritime department of France, formed of part of the old province of Normandy, is bounded on the N. by the English Channel, on the E. by Eure, on the S. by Orne, and on the W. by Manche. Area, 2181 square miles. The southern part is hilly, but extensive plains occur in other portions. The soil is fertile. The chief rivers are the Orne, Dromme, and Vire. Among the mineral productions are iron, coal, marble, and slate. Many horses, cattle, and sheep are raised here. Capital, Caen. Pop. in 1866, 474,909.

Cal'vary, Mount, the scene of our Saviour's crucifixion, is commonly thought to be an eminence which lay at the north-west, and just on the outside, of the ancient city of Jerusalem, but the locality is by no means certainly known. Calvary, or Calvaria, is a translation into Latin of the Hebrew word Golgotha, signifying a "skull," either because the mount was a place of public execution, or because it was shaped like a human skull. The word occurs but once in our authorized version of the New Testament (Luke xxiii. 33); the term in the Greek being Κρανίον. It was not improbably so named from its shape.

Calvary, a township of Clarendon co., S. C. P. 1152.

Calvel'lo, a town of Italy, in the province of Basilicata, 12 miles S. of Potenza. It has two convents. P. 5172.

Cal'vert, a county in the S. of Maryland. Area, 250 square miles. It is bounded on the E. by Chesapeake Bay, and on the W. by the Patuxent River, which enters that bay at the S. extremity of the county. The soil is fertile. Tobacco, corn, wheat, and wool are the chief products. Capital, Prince Fredericktown. Pop. 9865.

Calvert, a township of Grant co., Ark. Pop. 476.

Calvert, a city, the capital of Robertson co., Tex., on the Houston and Texas Central R. R., 130 miles N. N. W. of Houston. It has a weekly newspaper.

Calvert (George and Cecil). See Baltimore, Lord, by Hon. Henry Stockbridge.

Calvert (George Henry), born at Baltimore, Md., Jan. 2, 1803, is a descendant of Lord Baltimore and of the painter Rubens. He graduated at Harvard in 1823, studied at Göttingen, and became a journalist of Baltimore. Besides many dramas, translations, and poems, he has published "Scenes and Thoughts in Europe" (1846–52), "An Introduction to Social Science (1856), "The Gentleman" (1861), and other works. Since 1843 he has been a citizen of Newport, R. I.

Calvert (Leonard), younger brother of Cecil, second Lord Baltimore. He was the first governor of Maryland, whither he led the first colony in 1634. He was a Roman Catholic, and appears to have been a man of liberal views, but existing details of his life are few. Died June 9, 1647.

Cal'vi, a seaport and fortified town of Corsica, on a peninsula of its N. W. coast, 38 miles W. S. W. of Bastia. It has a good harbor and a strong citadel. Calvi was besieged and taken by the English in 1794. Pop. 2069.

Calvi (anc. *Cales*), a decayed town of Italy, 7½ miles N. N. W. of Capua, is a bishop's see. It was formerly important, and was celebrated for its baths.

Calvin, a post-township of Cass co., Mich. Pop. 1788.

Cal'vin, written also **Cauvin,** and **Chauvin** (John), the great Protestant Reformer, was born at Noyon, in Picardy, July 10, 1509. When Calvin was about sixteen years old he was made curé of Marteville, and subsequently of Pont l'Évêque. He began early to preach openly the doctrines of the Reformed religion. In 1532 he published a commentary on Seneca's treatise "De Clementia." Having incurred the displeasure of the Sorbonne, he withdrew from Paris to Angoulême. For a brief period he was protected by Margaret of Navarre, a sister of Francis I., but was soon obliged to fly to Bâle, where he published in 1536 his most important work, "Christianæ Religionis Institutio," the object of which is to explain and vindicate the doctrines of the Reformers. The same year, with a view to promote the cause of the Reformation, he visited Ferrara, where he was kindly received by the duchess Renata, a daughter of Louis XII. of France, and consort of Ercole d'Este. But she was unable to protect him against the power of the Inquisition, and he again sought safety in flight. Having sold his patrimonial estate, with his sister, his brother, and some devoted friends, he escaped to Switzerland in Aug., 1536, expecting to proceed to Germany. But Farel prevailed on him to remain at Geneva. In conjunction with Farel, he composed a confession of faith and a system of ecclesiastical discipline. But Calvin and Farel were in 1538 banished from the city. Calvin retired to Strasburg, and founded there a church which was regarded as a pattern for all Protestant churches. After the banishment of Calvin, Cardinal Sadolet made great efforts to bring Geneva back to his Church. A letter of Calvin's, designed as a refutation of an epistle by Sadolet, made a powerful impression on the Genevese, and in 1540 he received from the senate of Geneva a pressing invitation to return. Although reluctant to leave Strasburg, he appears always to have regarded the church of Geneva as especially his care. In Sept., 1541, he returned to Geneva, and was received by all classes with every demonstration of affection. The rest of Calvin's life was spent in efforts to establish the church and civil government of Geneva. The effects of his exertions in promoting learning and morality (not to speak of religion) are visible in Geneva after a lapse of more than three hundred years. At Strasburg he had married (in 1539) a widow named Idelette de Bures, a woman of rare virtues. Their only child, a son, died in infancy. Calvin died in 1564. Nothing perhaps in the history of this great man is more admirable than the self-denying simplicity of his life. He received what was barely sufficient to support him with the utmost parsimony, and yet he would never accept a present except for the poor. The central doctrine in Calvin's system of theology was unconditional election and reprobation. (See Calvinism.) As a writer on theology he is distinguished for his clearness, method, scientific precision, and logical acuteness. Scaliger regarded him as the greatest of all theologians, using this forcible language: "Solus inter theologos Calvinus." The literary influence of Calvin's writings, especially of his admirable French translation of his own "Institutes," was great and salutary.

Calvin has been much censured, and not without cause, for the part he took in the condemnation and death of Servetus. Calvin regarded Servetus as a dangerous man, not merely on account of his heresies, but also of his arrogant and reckless spirit, joined as these were with abilities of no common order; he exerted his utmost influence to prevent his being burned; for, though he deemed Servetus worthy of the punishment of death, he wished to save him from a death so dreadful as that by fire. (See Henry, "Life of Calvin;" Théodore de Bèze, "Histoire de la Vie et la Mort de Calvin." J. Thomas.

Cal'vinism. Calvinism, as also Pelagianism and Lutheranism, is a term used to designate, not the opinions of an individual, but a mode of religious thought or a system of religious doctrines, of which the person whose name it bears was an eminent expounder. There have from the beginning coexisted in the Christian Church three, and only three, generically distinct systems of doctrine, or modes of conceiving and adjusting the facts and principles understood to be revealed in the Scriptures. One of these is the Pelagian, which denies the guilt, pollution, and moral impotence of man, and makes him independent of the supernatural assistance of God. At the other pole is the Calvinistic system, which emphasizes the guilt and impotence of man, exalts the absolute justice and sovereignty of God, and refers salvation absolutely to the undeserved favor and the new creative energy of God. Between these comes the manifold and elastic system of compromise once known as Semi-Pelagianism, and in modern times as Arminianism, which admits man's original pollution, but denies his guilt, regards redemption as a compensation for innate and consequently irresponsible disabilities, and refers the moral restoration of the individual to the co-operation of the human with the Divine energy, the determining factor being the human will. The system to which this article is devoted was known originally, and is now designated more generally and indefinitely, by the title *Augustinianism*, from its earliest champion, the illustrious Augustine, bishop of Hippo Regius in Northern Africa (395–430 A. D.); while the more modern and specific title is Calvinism, from the fact that it was developed into a perfect form, and infused into the creeds

of all Protestant churches, and into the life of modern nations, through the instrumentality of John Calvin, the Reformer of Geneva (1509–1564). The authentic statement of its constituent doctrines is not to be drawn exclusively from the writings of either of the great men mentioned, but from the public confessions of those churches which have professed this form of doctrine, and from the classical writings of their representative theologians.

It is proposed in this article to present, in necessarily meagre outline, a statement (1) of the fundamental characteristics of the system; (2) of the history of its development and prevalence both before and after Calvin; and (3) of its practical moral influence upon individuals and upon communities.

A. *Statement of Principles.*—Calvinism, as a system of doctrines, derives its character from the following fundamental positions or foci of organization:

I. *The Relation of the Creator to the Creation.*—There are three generically distinct views as to the relation of the Creator to the creation, each, of course, embracing many specific varieties under it.

1st. The Deistical view, which admits a creation *ex nihilo*, and an original endowment of the elements with their active powers, and the subjection of the whole system of things to certain general laws, adapted to the evolution of certain fixed plans. The general plan and order of the creation is attributed to the Creator, and all events are referred to Him in a general sense as the indefinitely remote First Cause, who inaugurated the ever-onflowing line of second causes. This view, however, denies the continued immanence of the Creator in the creation, and the momentary dependence of the creature on the Creator for the continuance of its substance, the possession of its properties, and the exercise of its powers.

2d. The opposite extreme is the Pantheistic mode of thought, which identifies God and the universe as His existence-form, or at least so confines Him to it as to deny His transcendence beyond the universe as an extra-mundane Spirit and conscious Person whose actions are rationally-determined volitions.

3d. Between these extremes stands Christian Theism. It emphasizes at once the transience of God beyond, and the immanence of God within, the world. He remains over a conscious personal Spirit, without and above the world, able, in the exercise of His free volitions, sovereignly to exercise a supernatural influence (*potestas libera*) upon any part of that system of nature which He has established, ordinarily working through second causes, "yet free to work without, above, and against them at His pleasure." At the same time He continues to interpenetrate the inmost being of every element of every creature with the infinite energies of His free intelligent will, and His creatures momentarily continue absolutely dependent upon the energy of that will for substance and for the possession of the powers communicated to them as second causes in all their exercises.

All Christians, of course, are Theists in the sense thus defined, but the different schools of Christian theology take their points of departure here, as, on the one hand, they press the essential dependence of the creature upon the Creator in substance, properties, and actions, or as, on the other hand, they press the self-active power of second causes, and by consequence their self-sufficiency and independence. Here we have the ultimate antithetical grounds of Pelagianism and Augustinianism. Pelagius, who was characterized by a rationalistic habit of thought and a superficial religious experience, believing that power to the contrary is an inalienable attribute of every act of free-will, necessary to render it responsible and therefore moral, maintained, in the supposed interests of morals, that every free agent is so adequately endowed by God as to be self-sufficient for action, each in a manner appropriate to his kind. Augustine, on the contrary, held that every creature exists and acts only as its substance is momentarily sustained, and its action conditioned, by the omnipresent and omnipotent energy of God. While admitting the free self-determining power of the human soul, he referred the moral character of the volition to the disposition which prompted it, and the moral nature of man to the influences of the Spirit of God. Anterior to apostasy, therefore, the spirit of man depended for spiritual life and moral integrity upon the *concursus* of the Spirit of God, the withdrawal of which is the immediate cause of spiritual death and moral impotence. This Divine influence, in one degree and in one mode or another, is common to all creatures and all their actions, and it is called "grace" when, as an undeserved favor, it is in a supernatural manner restored to the souls of sinful men with the design of affecting their moral character and action. This view of Augustine was subsequently elaborated by his disciples into the theory of the "previous," "simultaneous," and "determining" *concursus* of the Thomists and Reformed theologians. (*Summa of Tho. Aquinas*, 2. 1. 10: and *Turretin*, 6. 6. 6 and 7.)

II. *The End or Design of God in Creation.*—Every intelligent Theist must regard the universe as one system, and must therefore believe that the Creator had from the beginning one general end, for the accomplishment of which the whole and all its parts were intended. This general end must have determined the Creator in every step He has taken in the evolution of the universe, and hence our conception of it will give shape to any speculations we may form with respect to the relations of God and His works. It is evident that no solution of this transcendent question can be reached by reasoning from *a priori* principles, or by generalizations drawn from the comparatively few facts at present accessible to our observation, and that it can be rationally sought for only in a direct revelation. For the most part, this general end has been referred to the essential benevolence of God, prompting Him to confer the greatest possible amount of blessedness, in the highest forms of excellence, upon innumerable objects of His love. Leibnitz, in his "Théodicée" (1710), which has exerted a wide influence on all modern speculation, lowered this view by emphasizing the "happiness" of the creatures as the great end of the creative goodness.

The Scriptures, on the contrary, emphatically declare that the manifestation of His own glorious perfections is the actual and most worthy possible end of the great Designer in all His works of creation, providence, and redemption, and hence likewise the final end of all His intelligent creatures in all moral action. The recognition of this great principle, and its application to the interpretation of all God's dealings with man, and of all man's duties to God, has always been an essential characteristic of Calvinism. Pelagians and Semi-pelagians, with more or less decision, place the general end of the system of things in the well-being of the creature: Calvinists place it absolutely in the glory of the Creator, which carries with it, not as a *co-ordinate* design, but as a *subordinate* yet certain effect, the blessedness of all loyal creatures.

III. *The Relation which the Eternal Plan of God sustains to the Actual Evolution of Events in Time.*—Every Theist believes that the eternal and absolutely perfect intelligence of the Creator must have formed from the beginning a plan comprehending the entire system of creation and providence in reference to the great end for which they were designed. Pelagius himself admitted that the absolute foreknowledge of God embraced the future volitions of free agents, as well as all other classes of events, while he denied their foreordination. The Socinians, who have developed Pelagianism into a complete system, more consistently deny foreknowledge, as well as foreordination, since, if it is essential that a volition should be purely contingent in order that it should be responsible, it must be indeterminate before the event, and while indeterminate it cannot be certainly foreknown. The Arminians admit foreknowledge, but deny foreordination. The Calvinists maintain the following positions: 1. This eternal and immutable plan of God has constituted man a free agent, and consequently can never interfere with the exercise of that freedom of which it is itself the foundation. 2. However, according to the principles above stated, this created free-will is not independent, but ever continues to have its ground in the conserving energies of the omnipresent Creator. 3. In the case of an infinitely wise, powerful, and free Creator of all things *ex nihilo*, it is obvious that the certain foreknowledge of all events from the absolute beginning virtually involves the predetermination of each event, without exception; for all the causes and consequences, direct and contingent, which are foreseen in creation, are, of course, determined by creation. As Sir William Hamilton asserts (*Discussions*, Appendix I, A.), "the two great articles of foreknowledge and predestination are both embarrassed by the selfsame difficulties." 4. Since all events constitute a single system, the Creator must embrace the system as a whole, and every infinitesimal element of it, in one all-comprehensive intention. Ends more or less general must be determined as ends, and means and conditions in all their several relations to the ends which are made dependent upon them. Hence, while every event remains dependent upon its causes and contingent upon its conditions, none of God's purposes can possibly be contingent, because in turn every cause and condition is determined in that purpose, as well as the ends which are suspended upon them. All the decrees of God are hence called absolute, because they are ultimately determined always by "the counsel of His own will," and never by anything exterior to Him which has not in turn been previously determined by Him. 5. This determination, however, instead of interfering with, maintains the true causality of the creature, and the free self-determination of men and angels. Since the holiness of the created moral agent is conditioned upon the indwelling of Divine

grace, and its turning from grace is the cause of sin, it follows that all the good in the volitions of free agents is to be referred to God as its positive source, but all the evil (which *originates* in defect, privation) is to be referred simply to His permission. In this view, all events, without exception, are embraced in God's eternal purpose; even the primal apostasies of Satan and of Adam, as well as all those consequences which have flowed from them.

It is in view of these principles that Calvinism has been so often confounded with fatalism, and held up as distinguished from the majority of human opinions by its pre-eminent offensiveness. It should be remembered, however, that the philosophy which has underlain the religions and the speculations of the immeasurable preponderance of the most intelligent nations in the past (Augustinian Christianity excepted), as well as of the advanced thinkers of the present, has been fatalistic. Witness the fatalism of the ancient Stoics and the modern Mohammedans and Deists—the eternal and necessary conflicts of the dualism of Zoroaster, perpetuated among the Gnostics and Manichæans—the ceaseless modifications of the one eternal essence in the pantheism of the Booddhists, the Brahmanists, the ancient Greeks, and the modern disciples of Spinoza—the eternal interplay of unconscious and immutable natural laws as held by Positivists, Humists, and all modern scientific materialists, after the manner of the ancient Epicureans. How infinitely superior to all this is the Calvinistic conception of the all-penetrating and all-energizing will of the personal Jehovah, who, being at once perfect Love and perfect Light, constitutes and conserves our free agency, and through its free spontaneity works continually the ever-blessed counsel of His own will, weaving even rebellious volitions into the instrumentalities of His purpose, and making every consenting soul a conscious co-worker with Himself.

As to the bearing of this principle upon the question of the design of God in the application of redemption (predestination), see below.

IV. *The Manner in which the Divine Attributes of Benevolence, Justice, and Grace are illustrated in the Scheme of Redemption.*—Arminians have generally held, with Leibnitz, that "justice is benevolence acting according to wisdom"—*i. e.*, inflicting a lesser pain in order to effect a greater or more general happiness. The necessity for punishment therefore lies not in the essential and inexorable demands of righteousness, but in its being the best means to secure the moral reformation of the sinner, and the best motive to restrain the community from disobedience. Grotius maintained that the moral law is a product of the Divine will, and therefore capable of being relaxed by that will. In the gospel scheme, therefore, God, in the exercise of His sovereign prerogative, relaxes His law by forgiving sinners upon repentance and reformation, while as an administrative precaution He makes an exhibition of severe suffering in the person of His Son, in order that all other subjects of His moral government may be deterred from making the impunity of repentant men an encouragement to disobedience. The atonement, therefore, was an exhibition solely of the Divine benevolence, but not of justice in the ordinary sense of that word.

Calvinists, on the contrary, hold that justice as well as benevolence is an essential and ultimate property of the Divine nature, and hence lies back of, and determines the character of, the Divine volitions. By the perfection of God's nature He is always benevolent to the innocent, and just as certainly is He determined to punish the guilty. In the gospel, God has sovereignly separated the sin from the sinner in certain cases; in the vicarious penal sufferings of His Son punishing sin in strict rigor of justice, and then treating the believing sinner as a righteous person—that is, as a person with regard to whom all the demands of justice are fully satisfied. Hence He has exercised both justice and benevolence—justice to the sin and to the law, benevolence to the sinner; which benevolence to the undeserving is sovereign grace. While Arminians in their view of the gospel emphasize benevolence, Calvinists in their view emphasize justice and grace.

V. *The Degree of Guilt and Moral Damage entailed through the Apostasy of Adam upon his Posterity.*—The answers respectively given to this question impose form and character upon all the various systems of theology.

1. Pelagius held that free-will (*liberum arbitrium*), in the sense of an absolutely unconditioned power of choice between good and evil, is essential to responsible moral agency, and hence inalienable from human nature. Since, then, all men continue after the apostasy to be responsible moral agents, their nature in this essential respect must remain in the same condition in which it was created. The moral agency of a man at any one moment cannot determine the character of his moral agency at any other moment, and he possesses throughout his entire existence ability to will and to do all that God has any right to require of him. Hence Pelagians deny—(1.) All original sin or corruption of nature, because sinfulness can be predicated only of free acts, and man in order to be responsible must always possess plenary ability to will aright. (2.) All original *guilt* or desert of punishment common to the race, and prior to actual transgression, since it would be a violation of justice to hold one moral agent responsible for the wrong volitions of another. (3.) Hence men need redemption through Christ only to deliver them from the guilt of actual and personal transgression, and only those need it who have thus sinned. Those dying in infancy can be benefited by Christ only by being raised to a higher plane of blessedness—the *regnum cœlorum* as distinguished from the *vita æterna*.

2. Augustinians and Calvinists, on the contrary, maintain—(1.) That the entire soul, with all its constitutional faculties and acquired habits, is the organ of volition, the agent willing. (2.) That this soul possesses the inalienable property of self-determination, the moral character of which determination always depends upon the moral condition of the soul acting. (3.) That the holy moral condition of the soul, and hence its spontaneous disposition to will that which is right, depends upon the indwelling of the Divine Spirit. The free agency of God is an absolute self-existent and self-sufficient perfection, self-determined to good and incapable of evil. The freedom of saints and angels is dependent upon Divine assistance, but, like that of God himself, it is the very opposite to the "liberty of indifference" or "power to the contrary," being a *non posse peccare*, a *felix necessitas boni*. Adam was created in fellowship with God, and hence with a holy tendency of heart, with full power not to sin (*posse non peccare*), but also, during a limited period of probation, with power to sin (*posse peccare*). He did sin. As a punishment, the Holy Spirit is withdrawn from the race, and he and his descendants lost the *posse non peccare*, and retained only the *posse peccare*, which thus became the fatal *non posse non peccare*.

This *theological* doctrine of total moral inability has nothing whatever to do with the *psychological* theory of "philosophical necessity" as an attribute of voluntary action, which, since the time of President Edwards, has been too frequently regarded essential to the defence of Calvinism. It has been conclusively shown by Principal Cunningham (*Theology of the Reformers*, Essay IX.) that this metaphysical doctrine is not essential to Calvinism; while Sir William Hamilton (*Discussions*, Appendix, I, A.) and Sir James Mackintosh (*Dissertations on the Progress of Ethical Philosophy*, Note O) propose to prove that it is absolutely inconsistent with Calvinism as historically taught. The phrases "bondage of the will," etc., so frequently used by all classes of Augustinian theologians, and above all by Luther in his treatise "De Servo Arbitrio," are intended to apply only to the corrupt spontaneous tendency of fallen man to evil, which can be reversed only by a new creating energy from above. At the same time, every Calvinist holds devoutly to the free self-determination of the soul in every moral action, and is at liberty to give whatever psychological explanation of that fact may seem to him most reasonable. (See *Confession of Faith*, ch. 9, and *Calvin's De Servitute et Liberatione Humani Arbitrii*.)

Hence Calvinists hold—First. As to original guilt. (1.) Human sin, having originated in the free apostatizing act of Adam, deserves God's wrath and curse, and immutable justice demands their infliction. (2.) Such, moreover, was the relation subsisting between Adam and his descendants that God righteously regards and treats each one as he comes into being as worthy of the punishment of that sin, and consequently withdraws his life-giving fellowship from him. Some refer this responsibility of Adam's descendants for his apostatizing act to a purely sovereign "divine constitution" (New England view); others hold that we all were in our generic essence guilty coagents with him in that act (Realistic view); while the common opinion is that God, as the guardian of our interests, gave to us all the most favorable probation possible for beings so constituted in Adam as our covenant representative (Federal view). The whole race, therefore, and each individual it embraces, is under the just condemnation of God, and hence the gift of Christ, and the entire scheme of redemption, in its conception, execution, and application, are throughout and in every sense a product of sovereign grace. God was free to provide it for few or many, for all or none, just as he pleased. And in every case of its application the motives determining God cannot be found in the object, but only in the good pleasure of the will of the Divine Agent.

Calvinists also hold—Secondly. As to original sin. (1.) Since every man thus comes into the world in a condition of antenatal forfeiture because of Adam's apostasy, he is judicially excluded from the morally quickening energy of the Holy Ghost, and hence begins to think, feel, and act

without a spontaneous bias to moral good. (2.) But since moral obligation is positive, and the soul is essentially active, it instantly develops in action a spiritual blindness and deadness to divine things, and a positive inclination to evil. This involves the corruption of the whole nature, and absolute impotency of the will to good, is, humanly speaking, without remedy, and necessarily tends to the indefinite increase both of depravity and of guilt. It is therefore said to be total. Some Calvinists hold original guilt to be conditioned upon original depravity (*e. g.*, the advocates of mediate imputation and the *ex traduce* origin of souls). Others, as the writer of this article, hold original depravity to be the penal consequence of Adam's apostatizing act, and therefore to be conditioned upon original guilt (hence immediate imputation and creationism).

3. The advocates of the middle scheme have, of course, varied very much from the almost Pelagian extreme occupied by many of the Jesuits and the later Remonstrants, to the almost Augustinian position of the Lutherans and of the great Wesleyan Richard Watson. The Semi-pelagians admitted that the nature of man was so far injured by the fall that he could do nothing in his own strength morally good in God's sight. But they held that man is able to incline himself unto good, though he is not able to effect it; so that in every case of spiritual reformation the *first* movement towards good is from the soul itself, while the performance of it is the result of the co-operation of Divine grace with the human will. They consequently denied the *gratia præveniens*, but admitted the *gratia co-operans*.

The modern Protestant Arminians (Limborch, Episcopius, etc.) admit original *sin*, while they deny original *guilt*, and regard innate corruption rather as a vice or fault of nature than as a sin in the full sense of that term. Dr. D. D. Whedon ("Bibliotheca Sacra," April, 1862) admits—1. That Adam and Eve by their apostasy morally corrupted their own nature and that of all their descendants; 2. That every child of Adam is born with an inherent tendency to sin which he cannot remove by his own power; 3. That Adam and Eve were fully responsible for their apostasy, because they sinned in spite of possessing power to the contrary, and therefore might justly have been damned; 4. Nevertheless, their descendants, although corrupt and prone to sin from birth, are neither responsible nor punishable until there has first been bestowed upon them redemptively a gracious ability to the right; 5. After Adam sinned, therefore, only one alternative was open to Divine justice—either that Adam should be punished at once without issue, or that he should be allowed to generate seed in his own moral likeness, when equity required that an adequate redemption should be provided for all; 6. Hence Christ died for all men, and sufficient grace (including *gratia præveniens* and *gratia co-operans*) is given to all men, which is essential to render them responsible, and they become guilty only when they abuse (by failing to co-operate with) that gracious power to the contrary (*posse non pecare*) which has been conferred on them in the gospel.

Quoting the dictum of Pres. Edwards (*Will*, pt. 4, § 1), "The essence of the virtue or vice of dispositions of the heart and actions of the will lies not in their cause, but in their nature," Whedon says: "To this we oppose the counter-maxim, that in order to responsibility for a given act or state, power in the agent for a contrary act or state is requisite. In other words, power underlies responsibility." The only limit he allows to this principle is in the case of that moral inability which results from the previous abuse of freedom by the agent himself. This he declares is the fundamental ground upon which all the issues between Arminianism and Calvinism depend. Thus, while Calvinism exalts the redemption of Christ in its execution and in each moment of its application as an adorable act of transcendent grace to the ill-deserving, Arminianism, in its last analysis, makes it a compensation brought in by the equitable Governor of the world to balance the disabilities brought upon them without their fault by the apostasy of Adam. This difference is the practical reason that Calvinism has such a strong hold upon the religious experience of Christians, and that it finds such frequent irrepressible expression in the hymns and prayers of evangelical Arminians.

VI. *The Nature and Necessity of that Divine Grace which is exercised in the Moral Recovery of Human Nature.*—Grace is free sovereign favor to the ill-deserving. It is the motive to redemption in the mind of God. It is exercised in the sacrifice of His Son, in the free justification of the believing sinner on the ground of His vicarious obedience and sufferings, and in the total change wrought in that sinner's moral character and actions by the energy of the Holy Ghost. While the word *grace* applies equally to the objective change of relations and the subjective change of character, it is used in this connection to designate that energy of the Holy Ghost whereby the moral nature of the human soul is renewed, and the soul, thus renewed, is enabled to act in compliance with the will of God.

Pelagius found in his system neither need nor room for this Divine energy, except in the way of objective revelations and educational and providential influences.

Semi-pelagians admitted its necessity to help man to complete that which he had himself commenced, and that it is actually given to all those who had thus prepared themselves for it and made themselves worthy of it.

Arminians admit that it is necessary in order that the corrupt will shall be even predisposed to good, but they regard it as a compensation for the irresponsible defects of an inherited nature, which restores the native power for either good or evil, and which depends for its effects wholly upon the use made of it by the soul in which it acts. This is styled the theory of co-operation as held by the Arminians, and of "synergism" as held by the followers of Melanchthon in Germany. Regeneration is the result of the co-working of two energies, but the determining factor is the human will. Hence grace is *sufficiens* in every case, and *efficax ab eventu vel congruitate*.

Augustinians and Calvinists, on the other hand, hold—1. That, for Christ's sake, and in spite of all human demerit, a gracious influence is excited on the minds of all men of various intensities. This is "common grace," and is a moral and suasory influence on the soul, tending to good, restraining evil passions, and adorning the soul with the natural virtues; which may be resisted, and is always prevailingly resisted, by the unregenerate. 2. But at His pleasure, in certain cases, God exerts a new creative energy, which in a single act changes the moral character of the will of the subject, and implants a prevailing tendency to co-operate with future grace in all forms of holy obedience. This is *gratia efficax*, "effectual calling," which is always effectual because it consists in effecting a regenerative change in the moral nature of the will itself. The change which this grace effects is the "new heart" of Scripture, the *conversio habitualis seu passiva*, of which God is the agent and man the subject, which as a new habit of soul lays the foundation for all holy activities. Augustine has been followed by many in styling this grace "irresistible," because it cannot be resisted. But this is as incongruous as it would be to call the creation of the world or the generation of a child irresistible. Effectual calling consists in a new creative energy within the soul, making it willing, upon which it spontaneously embraces Christ and turns to God (the *conversio actualis seu activa*). It merges itself into the very spontaneity of the will, and enfranchises it from the corruption which had hitherto held it in bondage, and restores it to its normal equilibrium, in harmony with reason and conscience and the indwelling Spirit of God. 3. Afterwards this same Divine energy continues to support the soul, and prepare it for, and to concur with it in, every good work. This grace is now prevailingly co-operated with by the regenerated soul, and at times resisted, until the status of grace is succeeded by the status of glory.

Calvinists hold that this "grace" in all its stages is purely undeserved favor, and therefore sovereignly exercised by God upon whom and at what times He pleases; hence it is called *gratia gratuita et gratis data*, otherwise grace would be no more grace. It also works in its various stages progressively, except in the single regenerative act. It is at first the *gratia præveniens*, then the *gratia operans*, then the *gratia co-operans*, and finally the *gratia perficiens*, including the *donum perseverantiæ*, infallibly securing perseverance in faith, and obedience unto the complete redemption of soul and body in glory.

VII. *The Relation which the Eternal Plan of God bears to the Application of Redemption to Individuals.*—Predestination, or the purpose of God to secure the salvation of some men and not of all, has been popularly regarded as the distinguishing feature of Calvinism, and one most revolting to the moral sense. Some Calvinists, reasoning downward from the nature of God as absolute, and developing this doctrine in a strictly speculative manner, have made it the foundation of their whole system. These have necessarily conceived of it in the high and logically coherent Supralapsarian sense, which, in a speculative point of view, is impregnable. The vast majority of Calvinists, however, are brought to this point by practical rather than speculative considerations, such as the explicit authority of Scripture and the personal sense of absolute unworthiness and moral impotency, and therefore of absolute dependence upon grace. These are all willing to stop in the Infralapsarian view of the decree of redemption, which, if less logically complete, is nevertheless exactly conformed to all the facts open to our inspection or embraced in our experience, and to all the representations of Scripture. The Scriptures never speak of God as creating men in order either to save or damn them, nor of electing certain individuals considered merely as creatable, and then allowing them to fall in

order that they might be redeemed; but they uniformly represent God as electing His people out of the mass of guilty sinners, and then as providing redemption for them in order to carry out the purpose of election. Arminians maintain that this decree of election is conditioned on God's foresight of faith and repentance; but Calvinists insist that if faith and repentance are the gifts of God and the fruits of His Spirit, they cannot be the conditions upon which election is suspended, but rather its predetermined and graciously effected results. Augustine held the Infralapsarian scheme. The position of Calvin has been disputed. Beza, his successor in Geneva; Gomarus and Voetius, the great opponents of the Remonstrants of Holland; Twiss, the prolocutor of the Westminster Assembly, have been the most conspicuous advocates of Supralapsarianism. On the other hand, the canons of the Synod of Dort (1619), the Confession and Catechisms of the Westminster Assembly (1648), the Formula Consensus Helvetica (1675), and the vast majority of Calvinists, ancient and modern, are decided Infralapsarians.

Gottschalk (848–868) insisted much upon a *predestinatio duplex* of the elect to salvation and of the reprobate to damnation, and this view has often been offensively insisted upon as essential to Calvinism by its enemies. It is, however, a gratuitous assumption and without scriptural warrant, and not taught in the recognized standards of Calvinism. God positively decrees grace, and thus produces all that is good. He only determines the permission of sin, and punishes it because he forbids and in every way morally discountenances it. He elects of free grace all those he purposes to save, and actually saves them, while those whom he does not elect are simply left under the operation of the law of exact justice, whatever that may be. Archbishop Whately, himself an Arminian, in his "Essays on Some of the Difficulties in the Writings of the Apostle Paul," honorably admits that the apparent harshness of Calvinism lies in the *facts* of the case as admitted by all Christians. All infants, idiots, and all believers in Christ are saved by grace—all others are left to the operation of pure justice. It is obvious that all who are born sin and die, that all do not believe, and that all are not saved. Calvinistic "particularism" admits the actual results of salvation in their widest scope, and refers all to the gracious purpose and power of God, but does not restrict it one iota within the limits determined by the facts themselves.

B. *The History of Calvinism.*—Pantheism, which is the only philosophical basis of polytheism (in the forms of Booddhism, Brahmanism, and underlying all forms of Greek philosophy), and the Dualism of Zoroaster (which was revived in the second and third centuries in a Christianized form in the various systems of the Gnostics and Manichæans), together constituted the substratum of all ancient philosophies and religions. All such systems were consequently essentially fatalistic, and made sin either an essential attribute of an eternal self-existent Principle, or a necessary condition of the eternal evolution of the infinite and absolute into the finite and contingent. In necessary antagonism to these fundamental heresies, the early Fathers, especially Origen and all his colleagues and followers of the Alexandrian school from the reaction of Neo-Platonism (200–350 A. D.), were led in a very unqualified manner to insist upon the independent, self-determining power of the human will, and to maintain that sin is the product of that freedom abused. They universally held that human nature was morally ruined by Adam's sin, and that it was redeemed by the blood and restored by the Spirit of Christ; but they conceived of these great principles in a crude and indefinite manner, without determining their relations to each other. All the ancient Fathers were induced to render special attention to the defence of human self-determining power as the basis of responsibility. As a general fact, the Greeks were specially distinguished for emphasizing the autocracy of the will, without denying the need of grace, while the Latins especially emphasized inherited depravity, without denying the freedom of the will. And the anthropology of the Greek Church has continued to preserve the same characteristics to the present day (*Athanasius, Expos. in Psalmos*, Ps. l. 7; *Orthodox Confession of Peter Mogilas*, 1642). On the other hand, there was during the third century a marked tendency in the Latin Church to more profound views as to the moral and spiritual nature and relations of man. This characteristic was developed most obviously in Tertullian of Carthage (220 A. D.), who taught the propagation (*ex traduce*) of a corrupt nature from Adam to each of his descendants; in Hilary of Poitiers (368); and in Ambrose of Milan (397), the most explicit defender in that age of the sovereignty of God and the moral impotence of man, and the immediate teacher of Augustine. But the "history" of all systematic theology properly commences with the great controversy of Augustine and Pelagius in the first quarter of the fifth century. On the one hand we have Augustine (354–430), a native of Tagaste, in Numidia, the son of a heathen father and of the sainted Monica, in turn a prodigal, unbeliever, Manichæan, Platonist, disciple of Ambrose, Christian of profound experience, preacher and teacher of transcendent genius, bishop of Hippo Regius from 395 to 430, and the greatest theologian of all time. On the other hand we have Pelagius (Morgan), a British monk, student of the Greek Fathers, a man of pure life, clear, practical intellect, and earnest zeal for the moral interests of human life. He was the moral author of the system which bears his name, while its intellectual constructor was Cœlestius, a youthful Roman advocate; and its most effective advocate was Julian, the deposed bishop of Eclanum, in Campania. The opinions of Pelagius were universally condemned by the whole Church, Eastern and Western, at the councils held at Carthage, 407 and 416 A. D., at the council at Mileve, 416 A. D., by the popes Innocent and Zosimus, and by the œcumenical council held at Ephesus, 431 A. D. This rapid and universal condemnation of Pelagianism, after making all due allowance for extraneous influences, proves that, however indefinite the views of the ancient Greek Fathers may have been, nevertheless the system taught by Augustine was in all essentials the common and original faith of the Church. In the history of the entire Church to the present moment, Pelagianism has been never adopted into the public creed of any ecclesiastical body except that of the Socinians (*Racovian Catechism*, 1605), and it has prevailed practically only among Rationalists, whose Christianity was disentegrating into Deism.

In the mean time, John Cassian, a disciple of Chrysostom, abbot of the monastery at Marseilles, brought into prominence the middle system of compromise, whose advocates were at first styled Massilians; during the Middle Ages and at present in the Romish Church, Semi-pelagians; among Lutherans, Synergists; and among the Reformed, Arminians. His most influential supporters and followers were Vincentius of Lerinum (434), Faustus, bishop of Rhegium (475), Gennadius, and Arnobius; and his opinions prevailed in France for a long time, and were confirmed by the provincial synods of Arles (472) and of Lyons (475). Against this party Augustine wrote his great works "De Prædestinatione Sanctorum," and "De Dono Perseverantiæ," and he was ably represented by Prosper and Hilarius, and the unknown author of the great work "De Vocatione Omnium Gentium," ascribed to Pope Leo I. (461); by Avitus, archbishop of Vienne (490–523), Cæsarius, archbishop of Arles (502–542), and by Fulgentius of Ruspe (1533). Semi-pelagianism was condemned by the decree of Pope Gelasius (496), and finally in the synods of Orange and Valence (529), which were confirmed by the edict of Pope Boniface (530); from which time a moderate form of Augustinianism became the recognized orthodoxy of the entire Western Church. It was taught by Gregory the Great, and held by the emperor Charlemagne, the two persons who exerted the greatest influence in the reconstruction of Europe at the commencement of the Middle Ages. It was held throughout those ages by all the greatest Church teachers and ornaments, as the Venerable Bede (673–735), Alcuin (804), and Claudius of Turin (839). The history of the persecution and condemnation of Gottschalk, under the influence of Rabanus Maurus and Hincknar, with which Scotus Erigena was involved (about 850), prove beyond question that the entire Church of that age, and even the part most opposed to Gottschalk, was agreed in adopting the Augustinian system (as they understood it), and all the consequences that flowed from it. (*Neander.*) All the most illustrious teachers of the scholastic age, making allowance for the extravagance of many of their speculations, were disciples of Augustine; as, for example, Anselm, archbishop of Canterbury (910); St. Bernard, bishop of Clairvaux (1140); Peter Lombard, "Magister Sententiarum;" Hugo de St. Victor; and, above all, Thomas Aquinas, "Doctor Angelicus" (1247), and Thomas Bradwardine, archbishop of Canterbury (1348). The Dominicans as a class followed Aquinas, while the Franciscans followed their champion, Duns Scotus (1265), "Doctor Subtilis," and in that age the ablest advocate of Semi-pelagianism. The controversies then revived have continued to agitate the Romish Church up to the present time, when they have been annihilated by the capitulation of the whole body to the Jesuits in the Council of the Vatican (1870). The Council of Trent (1546) attempted to satisfy both parties by indefinite decrees, and accordingly both Augustinians and Semi-pelagians, Thomists and Scotists, have claimed that their respective views were sanctioned. The truth is, that while the general statements of doctrines which are to be found among the canons are Augustinian in form, the more detailed explanations which follow are uniformly Semi-pelagian in sense. The Jesuit society, whose doctrines and casuistry have been signally ventilated in the "Provincial Letters" of the immortal Pascal, has

always advocated Semi-pelagianism. The illustrious gentlemen of Port Royal, Paris, called Jansenists from Jansenius, bishop of Ypres (Tillemont, Arnauld, Nicole, Pascal, Quesnel, etc.), were at the same time devout Catholics, and in the matters of grace and predestination earnest Calvinists. They were persecuted by the Jesuits, and finally outlawed by the bulls of Popes Innocent X. and Alexander VII. (1653 and 1656 A. D.), and of Clement XI. (1713). By the suicidal action of the Œcumenical Council of the Vatican (1870) all Scripture, traditions, canons of councils, and classical theology have been superseded by the plenary inspiration of a pope who in turn is a creature of the Society of Jesus. Thus at last Popery has become definitely Semi-pelagian.

All the great evangelical teachers and forerunners of the Reformers in the century immediately preceding the Reformation were decided Augustinians (*Neander's Hist. Doc.*, vol. ii., p. 609). This is most conspicuously true of Wickliffe (1384), Jerome of Prague, John Huss (1415), John of Goch (1475), John of Wesalia, Jerome Savonarola, a Dominican (1498), John Wessel (1499), "the Light of the World," and his disciple, the great Grecian, John Reuchlin, in his turn the teacher of Melanchthon, and Staupitz, vicar-general of the Augustines and the spiritual teacher of Luther.

All of the great national Reformers, Zwingle of Switzerland, Luther of Germany, Calvin of France, Cranmer of England, and Knox of Scotland, although each movement was self-originated and different from the others in many permanent characteristics, were alike strictly Calvinistic. The complete agreement of Zwingle with what was afterwards called Calvinism on the point of absolute predestination, although denied by Mosheim and Milner, is beyond question. (See his work "De Providentia Dei," written when Calvin was twenty years old; also Scott's "Continuation of Milner," vol. iii., p. 142–231; Neander's "Christ. Doc.," vol ii., p. 668; and Cunningham's "Theology of the Reformers," Essay V.) That Luther agreed with Calvin on all points considered characteristic of his system, with the exception of the sacraments, is demonstrated by his great work, "De Servo Arbitrio" (1525), written against the "De Libero Arbitrio" of Erasmus, the sentiments of which were never retracted, and are obviously in harmony with all his religious opinions in their entirety. Melanchthon, in the earliest editions of his "Loci Communes" (1521), took extreme ground as to the moral impotence of the human will and absolute predestination, which, however, he gradually and radically modified in subsequent editions, until he finally assumed Synergistic or Arminian ground. The personal followers of Melanchthon excited the strong opposition of the stricter Lutherans, and the struggle came to an explosion in the Weimar Confutation (1558). The result was the triumph of the stricter party, who left to posterity that grandest monument of Lutheran symbolism, the "Formula Concordiæ" (1580). The system here presented agrees in all its deepest positions with Calvinism as presented in this paper. It differs from it (*a*) by making the sacrament of baptism the efficient means by which ordinarily regeneration is effected; (*b*) by making the difference between the saved and the lost to be ultimately determined by the "non-resistance" to grace of the former in contrast with the resistance of the latter. In all other respects, as to the guilt, pollution, and helplessness of the condition into which all children are born, as to justification, and the necessity and the efficacy of regenerating and sanctifying grace, it is one with Calvinism.

By far the greatest of the Reformers, viewed either as a theologian, an interpreter of Scripture, as a social organizer, and founder of churches and republics, was John Calvin. His "Institutes" (1530), written when he was twenty-seven years old, the first and grandest work of systematic divinity the world has seen, has recast Augustinianism in its final Protestant form, and handed it over to the modern world stamped with its great author's name. His "Commentaries" are acknowledged by the most advanced modern scholars of every school to be upon the whole the ablest and most complete work of the kind ever achieved by a single hand. His "Tractatus" consists of various controversial treatises in defence of the truth, and his "Epistolæ" consist of his voluminous correspondence with princes, nobles and commoners, statesmen and churchmen in every part of the Protestant world, concerning the important movements then revolutionizing Europe, both in Church and State. By him Calvinism and its correlates, Presbyterianism in the Church and republicanism in the State, were not invented, but advocated and disseminated with transcendent ability and success. His doctrines have been most consistently developed and illustrated in the writings of such men as Bullinger, Martin Bucer, Theodore Beza, Diodati, Heidegger, Turretin, Cocceius, Witsius, Vitringa, Markius, De Moor, Pictet, John Owen, and Jonathan Edwards; in the deliverance of the international Synod of Dort (1618–19), of the national Assembly of Westminster (1648), of the French synods of Charenton and Alez, and in the following creeds and confessions of the Church: The Creed of the Waldensian pastors at Angrogne (1532), the two Helvetic, the Gallic, Belgic, and Scotch Confessions, the Thirty-nine Articles of the Church of England, the Lambeth Articles (1595), the Articles of Religion of the Dublin Convocation (1615), the Heidelberg Catechism, the Savoy Confession of the English (1658), and the Boston Confession (1680) of the American Independents. Calvinism is professed by all those Protestants of Germany who embrace the Heidelberg Catechism, the national (Protestant) churches of France, Switzerland, Holland, England, and Scotland, the Independents and Baptists of England and America, and the various branches of the the Presbyterian Church in England, Ireland, and America,—in all about thirty-six millions of adherents, if the Episcopal churches are included. From the time of Archbishop Laud (1644) a large proportion of the clergy and influential writers of the Episcopal churches have been Arminian, and it has even been disputed whether the Church of England was originally Calvinistic or not. The fact that the founders and leading ministers of that Church were thorough Calvinists during the first hundred years of its history, and that its creed remains such to this day, is as certain and as conspicuous as any other fact in the history of mankind. The seventeenth article, "On Predestination," corresponds in spirit, design, and expression with all the other Calvinistic creeds in the world. Tyndal, Frith, Barnes, who suffered under Henry VIII.; Hooper, Latimer, Ridley, who suffered under Bloody Mary; Cranmer, the real author, and Jewel, who gave the finishing touch to the Thirty-nine Articles, were all Calvinists. Jewel wrote to Peter Martyr of Zurich, "We do not differ from your doctrine by a hair's breadth." Cranmer put Martin Bucer and Peter Martyr into the divinity chairs of Oxford and Cambridge. "The same is proved by the whole history of the proceedings connected with the Lambeth Articles, the cases of Baro and Barret (1595), the Irish Articles (1615), and the Synod of Dort (1619)." (*Cunningham.*) The sources of information, and the arguments on both sides of this controversy, may be found in the "Works of the Parker Society," Richmond's "Fathers of the English Church," the "Zurich Letters," the works of Heylin, Winchester, Daubeny, Tomline, and Lawrence on the Arminian side, and the works of Prynne, Hickman, Toplady, Overton, Goode, and Principal Cunningham on the Calvinistic side.

Over this vast area of time, and under all these various conditions of national and ecclesiastical life, Calvinism preserves its essential identity as a system of theological principles. It has, of course, undergone within these limits very various modifications as to details of structure and modes of statement. In Germany it has been rendered less thorough and definite through the influence of the compromising school of Melanchthon. In Holland, England, and Scotland it has been modified in form by the "Federal Scheme" introduced by Cocceius and the Westminster divines (1650). In France it was temporarily modified by the "Universalismus Hypotheticus," or the universal impetration and limited application of redemption (1642), as held by Amyraldus, Daillé, and Placeus on the Continent, and by Baxter, Davenant, and in modern times by Wardlaw and others, in England. In America it has been coerced through more radical and more transient transformations in the speculations of Hopkins, the younger Edwards, Emmons, N. W. Taylor, and others of the New England school.

C. *The Practical Effects of Calvinism on Personal Moral Character, and upon the Social and Political Interests of Men.*—From the time of Cœlestius and Julian, in the fifth century, to that of Heylin (1659) and Tomline (1811), the *a priori* objection has always been brought against Calvinism that its principles are necessarily immoral, and must lead either to licentious liberty or to abject subserviency, to discouragement in the use of means, and to undue disparagement and neglect of human reason. It is argued that the doctrine of the absolute moral impotence of man's will must destroy all sense of accountability, and that the doctrine of absolute decrees must cause the use of means to appear either unnecessary or ineffectual, and to lead to despair upon the one hand, or to licentiousness upon the other.

The advocates of Calvinism have triumphantly vindicated the moral character of their system in two ways: 1st, on the ground of reason. The recognition of the true (*i. e.*, actual) condition of man's nature and relations to God, as this is revealed in Scripture and experience, must be more moral in its effect than the most skillful misrepresentation possible of that actual condition can be. The historian Froude, himself held by no trammels of sect or party, says in his late address at St. Andrew's (1871): "If Arminianism most commends itself to our feelings, Calvinism is nearer to the facts, however harsh or forbidding those facts may

seem." Archbishop Whately, himself an Arminian (in his essay on "Some of the Difficulties in the Writings of St. Paul"), acknowledges that the ordinary objections against the moral attributes of Calvinism are in effect objections to the open *facts* of the case. That standard of morals which places the ground of obligation in the supreme will of the All perfect, instead of a tendency to promote happiness, and which utterly condemns fallen man, is obviously higher, and therefore more moral, than a more self-pleasing one which either justifies or excuses him. The system which teaches the total depravity and guiltiness of human nature from birth, its absolute dependence upon Divine grace, together with the universal sweep of God's absolute decrees, at once maintaining the free agency of man and the infallibility of the Divine purpose, must of course empty man of self, make all men equal before the law, and exalt the all-wise and all-powerful Father to the control of all events; such a system must make the highest attainments the condition and the fruit of God's favor, and must raise even the weakest believer to the position of an invincible champion for God and the right, "a co-worker together with God." 2d. In the second place, Calvinists claim that on the ground of an illustrious and unparalleled historical record they can show that their system has been eminently distinguished by the effects produced by it upon all the communities which have embraced it in its purer forms, as to the following particulars: (*a*) the general standard of moral character practically realized in personal and social life; (*b*) the amount of rationally regulated liberty realized both in Church and State; (*c*) the standard of popular intelligence and education actually attained; (*d*) the testimony yielded to the power of the truth by the number and illustrious character of its martyrs; and (*e*) the zeal and devotion expressed in sustained missionary efforts for the extension of the kingdom of Christ.

1st. As to the influence of Calvinism on the moral character of individuals, it is only necessary here to quote the ex-rector Froude's citation of the names of "William the Silent, Luther, Calvin, Knox, Andrew Melville, the regent Murray, Coligny, Cromwell, Milton, John Bunyan—men possessed of all the qualities which give nobility and grandeur to human nature." As to its effect upon the general moral character of communities, it will be sufficient to cite the Waldensians; the little radiant state of Geneva, whose Protestant reconstruction began with the establishment of a Court of Morals; the Huguenots, as compared with their Catholic fellow-citizens; the Jansenists, as compared with the Jesuits; the Dutch Protestants prior to the latter half of the seventeenth century; the Scotch Covenanters; the English Puritans, whose very name signalizes their eminent moral character, in contrast with the unparalleled corruption brought in at the Restoration in association with the ecclesiastical revolution effected by the despot Laud (see Macaulay's "Essays on Milton" and Hallam's "Constitutional History"); and finally, all those sections of America settled by English Puritan New Englanders, by the Scotch and Scotch-Irish, and by Presbyterians from France and Holland.

Mr. Froude (*Address*, p. 7) says: "The first symptom of its operation, wherever it established itself, was to obliterate the distinction between sins and crimes, and to make the moral law the rule for states as well as persons." Pascal, the sublime avenger of the persecuted religionists of Port Royal, shows in the first nine of his "Provincial Letters" the connection between the infamous morality of the Jesuits and their Semi-pelagian views as to sin and grace. Sir James Mackintosh, in vol. xxxvi. of the "Edinburgh Review," vindicates at length the morality of the theological doctrine of predestination by a general review of the history of its most conspicuous professors.

2d. It appears superfluous to prove the tendency of Calvinism to promote freedom and popular government, both in Church and State. Its principles strip the ministry of all sacerdotal powers: they make all men and all Christians equal before God: they make God absolute and supreme over all, and the immediate controller and disposer of human affairs. Hence all churches accepting Calvinism, unless prevented by external conditions, have immediately adopted popular constitutions, either Presbyterian or Independent. This is true of all the churches of Switzerland, France, Holland, the Palatinate, Scotland, America, and the free churches of England and Ireland. The apparent exception is the English Establishment. The history of its political relations explains its prelatical character. Cranmer and the other Calvinistic founders of that Church held, as did Archbishop Usher, a very moderate theory of the episcopate, and submitted to the constitution actually established only for state reasons. Afterwards, as Calvinism became more thoroughly incorporated in the public faith, Presbyterianism was established by the Long Parliament, and Independency by the Puritan army and Protector. It is a conspicuous fact of English history that high views as to the prerogatives of the ministry have always antagonized Calvinistic doctrine.

The political influence of Calvinism was at an early period discerned by kings as well as by the people. The Waldenses were the freemen of the ante-Reformation period. The republic was established at the same time with Presbytery at Geneva. The Hollanders, grouped around the sublime figure of William the Silent (*Calvus et Calvinista*), performed deeds of heroism against odds of tyranny unparalleled utterly in all foregoing and subsequent history. This battle was fought by Calvinistic Holland, and the victory won (1590) completely before the Arminian controversies had commenced. Add to these the French Huguenots, the Scotch Covenanters, the English Puritans in the Old and in the New World, and we make good our claim that Calvinists have been successful champions of regulated freedom among men.

Bancroft, the historian of our republic, attributes over and over again the modern impulse to republican liberty to the little republic of Geneva and to its Calvinistic theology (vol. i., 266; ii., 461–464). He credits the moulding of American institutions chiefly to New England Independents, and to Dutch, French, and Scotch-Irish Presbyterians. "The Mecklenburg Declaration, signed on the 20th of May, 1775, more than a year before that of July 4, 1776, signed in Philadelphia, was the first voice publicly raised for American independence. And the convention by which it was adopted and signed consisted of twenty-seven delegates, nine of whom, including the president and secretary, were ruling elders, and one, Rev. H. J. Balch, was a Presbyterian minister." Tucker, in his life of Jefferson, says: "Every one must be persuaded that one of these papers must have been borrowed from the other;" and Bancroft has made it certain that the Declaration of Jefferson was written a year after that of Mecklenburg. The correspondence between the representative system and the gradations of sessions, presbyteries, provincial synods, and national general assemblies, developed in the Westminster Confession, to the federal system of State and national governments in the Constitution of the United States, is too remarkable to have been accidental.

3d. The relation of Calvinism to education is no less conspicuous and illustrious. The little republic of Geneva became the sun of the European world. The Calvinists of France, in spite of all their embarrassments, immediately founded and sustained three illustrious theological schools at Montauban, Saumur, and Sedan. The Huguenots so far surpassed their fellow-countrymen in intelligence and skill that their banishment on the occasion of the Revocation of the Edict of Nantes (1685) quickened the manufactures and trades of Germany, England, and America, and for a time almost paralyzed the skilled industries of France. (See Weiss's "History French Protestant Refugees.") The fragment of marshy sea-coast constituting Holland became the commercial focus of the world, one of the most powerful communities in the society of nations, and the mother of flourishing colonies in both hemispheres. The peasantry of Scotland has been raised far above that of any other European nation by the universal education afforded by her parish schools. The common-school system of Puritan New England is opening up a new era of human history. In this country, for the first two hundred years of its history, "almost every college and seminary of learning, and almost every academy and common school even, which existed, had been built up and sustained by Calvinists." (See "New Englander," October, 1845.)

4th. The martyrology of Calvinism is pre-eminent in the history even of the entire Church. We call to witness John Huss and Jerome of Prague, who perished for their adherence to this faith one hundred years before Luther. The Waldenses, of whom were the "slaughtered saints whose bones lie scattered on the Alpine mountains cold," the victims of the reign of "Bloody Mary," John Rogers and Bishops Hooper, Ferrar, Ridley, Latimer, and Cranmer, and their fellow-martyrs, were all Calvinists, as well as Hamilton and Wishart, the victims of Claverhouse and the "Killing Time" of 1684 in Scotland, and the victims of the High Commission and of the "Bloody Assizes" of England (1685). Under Charles V. and Philip of Spain, Holland had been made a spectacle to all nations by her sufferings, and had surpassed all other Christian communities with the number and steadfastness of her martyrs. When the duke of Alva left the Netherlands, December, 1573, he boasted that within five years he had delivered eighteen thousand six hundred heretics to the executioner. (Motley's "Rise of the Dutch Republic," vol. ii., p. 497.) Moreover, Calvinists claim the victims of the Inquisition in Spain and Italy; the history of the Huguenots of France, from the martyr-doom of Leclerc (1523) to the promulgation of the Edict of Nantes, 1598; the victims of the unparalleled atrocity of the mas-

sacre of St. Bartholomew, August 22, 1572, when some fifty thousand princes, noblemen, and commoners perished at one time by the hand of assassins; and all the hundreds of thousands of the very flower of France who fell victims either to the wars which raged with comparatively short exceptions from the Reformation to 1685, or to the dragoonings, the galleys, and the expatriation which preceded and followed that dreadful time.

5th. Calvinism has been proved an eminent incentive to all missionary enterprises, domestic and foreign. It is, of course, acknowledged that several Christian bodies not characterized by what are generally regarded as the peculiarities of Calvinism have been in the highest degree distinguished by missionary zeal and efficiency. The most remarkable instances of this kind have been the Nestorians in Western and Central Asia from the fifth to the ninth century, the Moravians from 1732, and the Wesleyan Methodists from about 1769 to the present time. These bodies (except the Nestorian) may be said to be eminently evangelical and Augustinian in the general usage of that term, nearly agreeing with the Calvinism set forth in this article in its most essential principles of total depravity, moral inability, and dependence upon divine grace. And it is obvious that these evangelical principles, common to these great missionary churches, with others whose Augustinianism is more pronounced, must supply the strongest incentives and encouragements possible to urge all Christians to the rescue of their perishing fellow-men.

In the early Church, St. Patrick, the missionary of Ireland, fifth century; Augustine, the missionary of Gregory the Great to England; and Columba and his missionary college at Iona in the Hebrides, and his disciples the Culdees, in the sixth century, as well as the Lollards, the followers of Wickliffe, in the fourteenth century, were all of the general school of St. Augustine. In 1555, through Admiral Coligny, Calvin sent two ministers to the heathen in Brazil. Cromwell in the next century proposed to appoint a council to promote the Protestant religion in opposition to the congregation *De Propaganda Fide* in Rome. One of the principal objects of the promoters of the Plymouth and Massachusetts colonies was the conversion of savages and the extension of the Church. The charter of the "Society for the Propagation of the Gospel in Foreign Parts" was granted by the Calvinistic prince William III. As to the number of missionaries to the heathen employed by the different branches of the Protestant Church at present, the following may be regarded as a fair statement as to the proportion of the several confessions in England and America and on the Continent: Congregational, including the Baptists (all Calvinists), about 400; Episcopal, a majority of those supporting missions being of the Evangelical school, and many of these being Calvinists, about 310; Presbyterians, about 430; Moravians, about 160; Methodists, about 300.

D. *Literature.*—This is so immeasurable that only a few books of the greatest interest from the stand-point of this article will be mentioned: "S. Aurelii Augustini Hipponensis Episcopi Opera," of different editions, especially his Anti-pelagian writings collected in the tenth tome of Ed. Bened., Par. 1690; "The Works of John Calvin," especially his "Institutes," his "Consensus Genevensis," and his "Letters," by Bonnet; "The Treatise on Predestination," by Moses Amyraldus, Saumur, 1634, and his "Answer" to Hoard's "Doctrinæ J. Calvin Defensio;" "The Works of John Owen," Edinburgh, 1850; "The Institutes of Theology" of Francis Turretin, Geneva, 1682; "Collectio Confessionum in Ecclesiis Reformatis Publicatarum," Niemeyer, and "Libri Symbolici Ecclesiæ Evangelicæ sive Concordia," Hase; Wiggers's "Historical Presentations of Augustinianism and Pelagianism," translated by Ralph Emerson; "The Works of the Parker Society," 1841–55; Mozley's "Treatise on the Augustinian Doctrine of Predestination;" Goode's "Vindication of the Defence of the Thirty-nine Articles," and his "Effects of Infant Baptism;" "The Works of Jonathan Edwards;" "The Reformers and the Theology of the Reformation," and "Historical Theology," by William Cunningham, D. D.; "Calvinism," an address by James Anthony Froude, M. A., delivered at St. Andrew's, March 17, 1871; "History of the Christian Religion and Church," by Augustus Neander, translated by Torrey; Neander's "History of Christian Dogmas," translated by Ryland; "History of the Christian Church," by Philip Schaff, D. D.; Pascal's "Provincial Letters," translated by Thomas McCrie, D. D.; Motley's "History of the Rise of the Dutch Republic;" Neal's "History of the Puritans;" Macaulay's "History of England" and "Miscellanies;" "Dissertation on the Progress of Ethical Philosophy," note O, included in the miscellaneous works of Sir James Mackintosh; "Our Theology and its Developments," by Dr. E. P. Humphrey, Presbyterian Board of Publication; "Comparative Influence of Calvinism and Arminianism on Civil Liberty;" "The New Englander," Oct., 1845; Bancroft's "History of the U. S." (See also the article ARMINIUS, ARMINIANISM, by D. D. WHEDON, D. D., LL.D.)

A. A. HODGE.

Calvinistic Methodists, in Great Britain, are in three divisions: (1) "Whitefield's Connection," dating from 1741; (2) "Lady Huntingdon's Connection," dating from 1748; (3) "Welsh Methodists," from about 1750.

Cal'vy, a post-village and township of Franklin co., Mo., about 55 miles E. S. E. of Jefferson City. Pop. 2100.

Calx (gen. *calcis*), the Latin name of quicklime, was applied by the alchemists to many products of combustion or oxidation, especially to those obtained from metals and other minerals, which were supposed to be converted into earths.

Calycan'thus [from the Gr. κάλυξ, a "cup," and ἄνθος, a "flower;" the bottom of the flower being cup-shaped], a genus of plants of the order Calycanthaceæ, allied to Rosaceæ. It comprises only a few known species, which are natives of the U. S. and Japan, and are shrubs with square stems. The flowers, bark, and leaves are fragrant and aromatic. The *Calycanthus floridus*, a native of Carolina, called Carolina allspice and sweet-scented shrub, is cultivated in many gardens of the U. S. Its flowers are of a lurid purple or rich-brown color.

Cal'ydon [Gr. Καλυδών], an ancient and celebrated city of Ætolia, on the river Evenus, a few miles from its entrance into the sea. It is often mentioned by Homer, and continued to be an important city in the historical period.

Calydo'nian Hunt, The, in classic mythology, was a celebrated enterprise against a wild boar which ravaged the dominions of Œneus, king of Calydon. Among the heroes who took part in this hunt were Meleager, Theseus, Jason, and Nestor.

Calym'ene, a genus of fossil trilobites, which is distinguished from the other genera of that order by the faculty which the animal had of rolling itself up into a ball, in which form they are often found. This genus is characteristic of the Silurian formation. The *Calymene Blumenbachii*, sometimes called "Dudley locust," is remarkable as a long-surviving species which is found in beds of several successive periods in England and the U. S.

Calymene Blumenbachii.

Calyp'so [Gr. Καλυψώ], a beautiful nymph and demi-goddess of classic mythology, who was, according to Homer, a daughter of Atlas. She reigned over the island of Ogygia, on which Ulysses landed after he had been shipwrecked. She treated him kindly, and tempted him to marry her with the promise of immortality, which he declined for the sake of Penelope.

Calyp'so Borea'lis, a rare and beautiful plant of the natural order Orchidaceæ, growing in cold bogs and wet woods of the Northern U. S. and Canada. The flower is variegated with purple, pink, and yellow. It has a single, nearly heart-shaped leaf.

Calyp'tra, the hood which covers the urnlike sporecase of certain mosses.

Calyptræ'a [Gr. καλύπτρα, a "head-dress or veil"], a genus of gasteropod mollusks, the type of a family, Calyptræidæ, formerly included in the genus *Patella*, or limpet, and still known as chambered limpets, bonnet limpets, and slipper limpets. The shell is limpet-shaped, but the apex is spiral, and has a calcareous process from its inner surface for the attachment of a muscle. The Calyptræidæ differ in shape, some being very flat, and others very conical; some are elongated and slipper-like. The species are generally natives of the shores of warm climates. Calyptræidæ are common in the older fossiliferous rocks. Fifty living species are known.

Ca'lyx, plu. **Cal'yces** [Gr. κάλυξ, a "cup;" Fr. *calice*], a botanical term applied to the flower-cup, which is the outermost of the proper floral envelopes, or of the circles of modified leaves which surround the organs of reproduction, and along with them constitute the flower. The leaves or separate parts of the calyx are called *sepals*. They are generally green, but in some cases are richly colored and *petaloid*, as in the *Mirabilis*, *Salvia splendens*, and *Fuchsia*. The calyx serves to protect the interior organs of the flower. If it falls off before the corolla, it is called *caducous*, and if it remains until the fruit is ripe it is called *persistent*. When the calyx is adherent to the sides of the ovary, it is *superior*, and when quite free from the sides of the ovary, it is *inferior*.

Cam, or **Granta,** a river of England, rises in Essex, flows north-eastward through Cambridgeshire, and enters the Ouse 3½ miles above Ely. Length, about 10 miles. It is navigable from its mouth to Cambridge, which derives its name from it. The Cam is considered as a classic stream, on account of its associations with Cambridge University.

Cam, or **Camb,** in machinery, is a contrivance for converting a uniform rotatory motion into a varied rectilinear motion. The end of a rod which is free to move only in the direction of its length is held in contact, by the action of a spring or weight, with the edge of an irregularly-shaped mass which revolves uniformly upon an axis. A varied motion is thus communicated to the rod, which carries with it the machinery by which the motion is to be applied.

Cam (Diogo), a Portuguese navigator who in 1484 explored the W. coast of Africa S. of the equator.

Camaieu. See Camayeu.

Camaldulen'sians, or **Camal'dolites,** an order of monks founded about 1018 by Saint Romuald at Camaldoli, in the Apennines, about 30 miles from Florence. They are divided into two classes—Cœnobites and Eremites—and follow the rule of Saint Benedict. There are also a few houses of Camaldolite nuns.

Caman'che, a post-village of Clinton co., Ia., on the Mississippi River, about 35 miles above Davenport. It is on a railroad which extends from Clinton to the Missouri River, and is 5 miles S. W. of Clinton. Pop. 840; of Camanche township, 1453.

Camanche Indians. See Comanche Indians.

Camar'go, a post-township of Douglas co., Ill. P. 1808.

Camargue, La, a populous island of France, department of Bouches-du-Rhône, is at the mouth of the Rhone, and enclosed on two sides by the arms of that river. It is an alluvial fertile delta, partly occupied by marshes. Area, about 240 square miles. Large quantities of salt are obtained here.

Camari'lla, a Spanish word, the diminutive of *camara,* a "chamber," signifies, literally, a "little chamber." It is applied to the private chamber or cabinet of the king of Spain, or to his courtiers and confidential advisers, who usually had great power in the government and exerted a pernicious influence. The term is also used in other European countries and languages to denote the influence of courtiers and secret counsellors, counteracting the opinions and policy of the legitimate ministers.

Camari'na, a celebrated Greek city of Sicily, on the southern coast, about 20 miles E. of Gela. It was founded by a colony of Syracusans in 599 B. C. It is said that no trace of it now exists.

Camas'sia [from its Nootka Indian name, *camass* or *quamash*], a genus of plants of the natural order Liliaceæ, consists of a single species, the *Camassia esculenta,* the quamash of the Nootka Indians. It grows in swampy places in the U. S. west of the Rocky Mountains, and resembles the *Scilla,* having bulbs which the savages use as food.

Camayeu (or **Camaieu**) and **Mon'ochrome** are French terms used to denote a painting in a single color. Pictures of several tints, which do not represent the natural colors of objects, are said to be *en camayeu.* The same term may be properly applied to drawings in India ink and red chalk, as well as engravings.

Camb. See Cam.

Cambacérès (Jean Jacques Régis), duke of Parma, an able French statesman and lawyer, born at Montpellier Oct. 18, 1753. He was elected in 1792 a member of the National Convention, in which he acted a cautious and moderate part. After the death of Robespierre (9th Thermidor, 1794) he was president of the Committee of Public Safety, and opposed the continuance of the Reign of Terror. He became a member of the Institute about 1796. About the end of 1799 he was appointed second consul by Bonaparte, of whom he became a faithful adherent. He took a prominent part in the rédaction of the civil code. Under the empire he was arch-chancellor and president of the council of state. During the Hundred Days he was Napoleon's minister of justice. He held no office after the Restoration of 1816. Died Mar. 5, 1824.

Cambay', a seaport-town of Hindostan, is at the head of the Gulf of Cambay, and on the right bank of the Myhee, 82 miles N. N. W. of Surat. It has a fine mosque, several Hindoo temples, and a curious subterranean Booddhist temple. Ruined palaces and mosques attest the former magnificence and extent of this town, which was once much more populous than it is now. One cause of its decline was the increasing shallowness of the gulf. It still exports cotton, grain, ivory, etc. Pop. about 10,000.

Cambay, Gulf of, is an inlet of the Arabian Sea, in the W. part of Hindostan. It is about 75 miles long, and extends in a nearly N. and S. direction. The width of the entrance, which is the widest part, is 32 miles or more. It receives the rivers Nerbudda, Taptee, Myhee, and Subbermuttee. The tide here is very rapid, and rises about thirty feet.

Cam'ber [Fr. *cambre*], a term applied by builders to the slight degree of arching which is usually given to beams or other parts of a frame in order to compensate the settlement of the various parts or the subsidence of the joints. Camber in shipbuilding signifies a curvature upward, or a convexity. A deck is said to be "cambered" when it is higher amidships than at the bow or stern.

Cambis'ta, an Italian word signifying "a banker," "a money-changer." It is also used as the title of a book in which the moneys, weights, and measures of various nations are given in the equivalents of some particular nation.

Cam'bium, in botany, a mucilaginous, viscid substance which is secreted between the liber and alburnum of exogenous trees and other plants in early spring. It is supposed by some physiologists to be the matter out of which new wood and bark are formed; by others, to be a preparation of organizable matter out of which the horizontal growth of the cellular system and the vertical growth of the woody system may be nourished during their respective developments. These are the old views. Cambium is now known to consist of forming cells of wood and bark gorged with rich sap.

Cambo'dia is known under three different names: first, *Kampootcha,* which is given to it in the sacred books; *Youdra Skan,* the appellation by which it is best known to foreigners; and *Khamain,* the common name used among the natives themselves. This vast kingdom lies between Laos on the N. and Cochin China on the E., the China Sea and the Gulf of Siam on the S., and the kingdom of Siam proper on the W. The country between Cambodia and Siam is an inclined plane falling off to the sea, beginning from the Khoa Dong Rèke, or the highlands of Korat, which constitutes the first platform of the terraces that gradually ascend to the mountain-chain of Laos. Khoa Dong Rèke, the Cambodian Atlas, includes in its domain a magnificent and extensive forest, Dong P'hya Fai, or "the forest of the Lord of Fire," whence issue many beautiful streams to flow into the Pachim River. Its area is about 250,900 square kilomètres. Its population is estimated at a little over 1,000,000. The religion is Booddhism, with a small but rapidly growing proportion of converts to Roman Catholicism. It is subdivided into Northern and Southern Cambodia, and the great province of Cancao on the S. E., and it teems with every species of mineral and vegetable wealth. Near the coast the country is covered with woods; a little farther inland, especially along the banks of the rivers and lakes, the land is well cultivated. But in the interior it abounds with impenetrable jungles, where elephants, lions, tigers, and wild buffaloes find shelter and afford excellent sport to the natives, who hunt them in large parties for their ivory and skins. Deer, hogs, goats, and a great many species of wild fowl abound in the forests, as well as in the more cultivated districts. The country abounds in iron, tin, precious stones, teak, sandal, and other wood, gamboge and numerous other dyestuffs. The finest gamboge is produced by the tree *Garcinia gambogoides;* and Bantabang is noted for its gold-mines. Saigon annually exports quantities of pepper, rice, cardamoms, cotton, hides, horns, and cocoanut oil.

The climate is warm but wholesome, the scenery varied and beautiful; the navigation of the Gulf of Siam and the China Sea, along with such splendid rivers as the Meikong and the Saikong, magnificent forests of fine woods, endless crops of rice, Indian corn, sugar-cane, and tea, and vast plantations of mulberry trees for the rearing of silkworms, producing the finest article of silk, are some of the prospective advantages of the superb region to which Saigon is the key. The export of rice alone for the month of Aug., 1870, amounted to 130,000 piculs, sent to Europe, Mauritius, Singapore, Malacca, China, and Japan. The arrivals for that month at the port of Saigon alone were thirty-two vessels, of from 200 to 2000 tons, and there were twenty vessels loading under the British, French, and German flags, aggregating 9000 tons; and indigo and silk are now cultivated with splendid prospects of success.

The kingdom of Cambodia was in its day not only independent, but powerful. As to its antiquity, two opinions prevail; one ascribing to it a duration of 1300 years, the other 2400. The native historians reckon 2400 years from the building of the wonderful temples found in the neighborhood of Angkor, near the great lake Talasap. Angkor has even at this day sufficient proof, in its memorable ruins,

that it was at some remote period the centre of a wealthy, powerful, and highly civilized state. Its decline probably dates from the dispersion of the Indian Booddhists, which took place from seven to five centuries before Christ. The ruins of Angkor Tom or watt are still in a tolerable state of preservation, and are composed of a central tower surrounded by four turrets and flanked by two other towers, all connected together by extensive galleries. At the top of the central tower are four immense heads in the Egyptian style, and every available space on these buildings is filled with exquisite sculptures in bas-relief. The scenes are drawn from the ancient mythological books of the Cambodians. There are here, also, several gigantic stone bridges of almost superhuman magnitude and solidity.

During the reign of His Siamese Majesty Phra-Chow-Maha-Chakraphat, who reigned in Ayodhia, the ancient capital of Siam, in the Siamese civil era 900 (corresponding to 1540 of our Christian era), the Cambodians fitted out an immense army and attacked Siam, marched their forces as far as Bangnah and Phrakanong, ancient seaport-towns of Siam, which they pillaged and destroyed. The Siamese thereupon set out with a powerful army and took possession of Inthapataburee, the ancient capital of Cambodia, and remained masters of the citadel until the emperor of Cambodia acknowledged himself penitent and willing to become tributary to Siam. About a hundred years ago dissensions among the reigning family led to weakness, and Cambodia fell under the control of the Annamites, who exacted heavy tribute, and at last, in 1809, unblushingly divided its provinces between themselves and the Siamese.

The name Cochin China was applied to it by the Portuguese, who thought they saw a likeness in it to Cochin on the coast of Malabar. In 1471 it was reunited to the great province of Tonkin. In the sixteenth century it broke away, and in 1774, after a long and terrific war, Tonkin was reduced to submission and incorporated that fine country with the kingdom of Annam. It was about this time that European influence first began to be felt in this region. The emperor of Cambodia, Chow Ngayen, felt the need of some support, and offered, through a Christian missionary who was a bishop in the country, to place himself under the protection of France. On this many French officers went to the new kingdom in the East, disciplined its armies, and took a share in the government. In 1820 the old-school Booddhists, in order to revenge the indiscriminate pillage of the French officers on the property of the simple inhabitants, instituted a ferocious persecution of the Christians. Since then, French fleets have been sent out to demand indemnities and protect the Catholic missionaries. Thus, France and other European nations have made their way into Annam, until now France holds the best part of Southern Cochin China and the whole of the fine province of Cambodia.

MRS. ANNA H. LEONOWENS.

Cambon (JOSEPH), a French statesman and financier, born at Montpellier June 17, 1756. He was elected to the National Convention in 1792, voted for the death of the king, and became a member of the Committee of Public Safety in 1793. He promoted the fall of Robespierre in 1794. As a member of the committee on finance he made several able reports, and is said to have laid the foundation of the modern financial system of France. He procured the adoption of the great book or register of the public debt. He held no office under the empire, was exiled in 1816, and died Feb. 15, 1820.

Cam'borne, a town of England, in Cornwall, 11 miles N. W. of Falmouth. Here is a church which has a stone inscription of the tenth century. Productive mines of copper, tin, and lead are worked in this vicinity. Pop. 7500.

Cambray [Lat. *Camaracum*], a fortified city of France, in the department of Nord, on the Schelde, 45 miles by rail N. N. E. of St.-Quentin, the seat of an archbishop, celebrated for its fine linens, called *cambrics*. Cambray is an ancient city, with gabled houses, handsome streets, and is surrounded by a wall with ancient towers and gates. It has manufactures of laces, tulles, leather, soap, etc. Pop. 22,207.

Cam'bria, the ancient and Latin name of Wales, which the Romans called Britannia Secunda. Cambria is derived from *Cymry*, by which name the Welsh people have always called themselves.

Cambria, a county in S. W. Central Pennsylvania. Area, 670 square miles. It is drained by the West Branch of the Susquehanna and Conemaugh Creek, both of which rise within its limits. The surface is elevated and uneven, and traversed by precipitous ravines. Grain, wool, potatoes, and dairy products are extensively raised. Bituminous coal and iron are abundant here, and lumber is the chief article of export. It is intersected by the Central R. R. Capital, Ebensburg. Pop. 36,569.

Cambria, a township of Hillsdale co., Mich. P. 1683.

Cambria, a township of Blue Earth co., Minn. P. 339.

Cambria, a post-township of Niagara co., N. Y. Within its limits there are pre-historic remains of a fortification, etc. covering six acres. Pop. 2145.

Cambria, a post-borough of Cambria co., Pa. P. 1744.

Cambria, a township of Cambria co., Pa. Pop. 1086.

Cambria, a post-village of Courtland and Randolph townships, Columbia co., Wis. Pop. 502.

Cam'brian Rocks (or **System**), a name given by Prof. Sedgwick to the oldest known fossiliferous rocks, on account of their extensive development in North Wales (*Cambria*). They are in part the equivalents of rocks described by Murchison as lower Silurian. The Cambrian is therefore regarded by some geologists as a subordinate member of the Silurian group. The government geological surveyors confined the term to a series of sandstones, slates, and gritstones which underlie the Silurian lingula beds.

Cām'bric, the name generally given to the lightest and finest of linen and cotton fabrics, originally made at Cambrai, in France, whence the name is derived. In 1563 Dutch emigrants introduced the manufacture into England.

Cam'bridge [anc. *Granta;* Lat. *Cantabrigia*], a town of England, capital of Cambridgeshire, is situated on both sides of the river Cam, and on the Eastern Counties Railway, 48 miles N. N. E. of London. The site is level, and the town is embosomed among lofty trees. It is the seat of one of the great universities of England, and contains many noble edifices belonging to that institution. Among the remarkable buildings of the town are Trinity church and the church of the Holy Sepulchre, which was built in the reign of Henry I., and has a round tower. It is said that Cambridge was destroyed by the Danes in 871 A. D. The Doomsday Book mentions it as an important place under the name of *Grentebrige*. It obtained a charter from King John in 1200. Jeremy Taylor was born here. Cambridge returns two members to Parliament, besides those who represent the university. Pop. in 1871, 30,074.

Cambridge, a post-village of Union township, Storey co., Ia. Pop. 200.

Cambridge, a post-village, capital of Henry co., Ill., 140 miles N. by W. from Springfield, is the chief intermediate station and grain-market on the Peoria and Rock Island Railway. It has two weekly papers. Pop. of tp. 1682.

GEO. C. SMITH, ED. "HENRY COUNTY CHRONICLE."

Cambridge, a post-township of Somerset co., Me. Pop. 472.

Cambridge, a post-village, capital of Dorchester co., Md., is on the S. side of the Choptank River, 50 miles S. E. of Annapolis. The river is here about 2 miles wide. Cambridge is the western terminus of the Dorchester and Delaware R. R., which extends 33 miles to Seaford. It has academies for both sexes, four hotels, five churches—four M. E. and one Episcopal—a flouring mill, a tobacco and a stave factory, and four canning establishments. It has three weekly papers. Pop. 1692.

JOSEPH P. JOHNSON, ED. "NEWS."

Cambridge, a city of Massachusetts, and one of the shire-towns of Middlesex co., is on the N. W. bank of the Charles River, which is here about 1 mile wide, and separates Cambridge from Boston. Cambridge, though incorporated as one city, was formerly divided into several villages, the local names of which still survive; these are Old Cambridge, Cambridgeport, East Cambridge, and North Cambridge. Harvard University is in Old Cambridge. Cambridgeport and East Cambridge contain many mercantile houses and manufactories, mostly of glass, furniture, organs, steam-engines, and boilers. East Cambridge is connected with Boston and Charlestown by bridges. West Boston Bridge connects Cambridgeport with Boston. In the whole city there are thirty churches, six national banks, and four savings banks. Extensive printing establishments exist here, and the first printing-office in America was located in Cambridge. There are two weekly newspapers. Near Harvard University is a fine soldiers' monument, erected in 1869–70 at a cost of $35,000. The city hall is in Cambridgeport. Cambridge is beautifully situated on a plain, contains some handsome public buildings, and a great number of elegant private residences, with spacious grounds ornamented with shrubbery and flowering plants. The city is furnished with water from Fresh Pond, the consumption being about 2,000,000 gallons daily. Pop. in 1850, 15,215; in 1870, 39,634; in 1873 (estimated), 50,000. Valuation of real and personal property in 1873, $62,421,215. The town is one of the oldest in New England, having been settled in 1630. (See HARVARD UNIVERSITY.)

H. R. HARDING, ED. "CAMBRIDGE PRESS."

Cambridge, a post-township of Lenawee co., Mich. Pop. 1110.

Cambridge, a post-village, capital of Isanti co., Minn., on Rum River, about 44 miles N. of Minneapolis. Pop. of Cambridge township, 374.

Cambridge, a post-village of Blackwater township, Saline co., Mo. Pop. 375.

Cambridge, a township of Coos co., N. H. Pop. 28.

Cambridge, a post-village of Washington co., N. Y., on the Rensselaer and Saratoga R. R., 35 miles N. E. of Albany. It has a national bank, a fine academy, a foundry and machine-shop, two tanneries, a cigar-factory, seven churches, four hotels, and one weekly newspaper. It has also a fine driving park. Pop. 1530, of which 967 are in White Creek township; pop. of Cambridge township, 2589.
Ed. "Washington County Post."

Cambridge, a post-village, capital of Guernsey co., O., situated on Will's Creek and the Baltimore and Ohio (Central Ohio division) and Marietta and Pittsburg R. Rs., in a good agricultural and mineral region, 85 miles E. of Columbus and 65 miles N. of Marietta. It has five churches, two monthly and three weekly newspapers, a national bank, and several mills. P. 2193; of Cambridge township, 3624.
Lenfesty & Goodrel, Pubs. "Guernsey Times."

Cambridge, a post-borough and township of Crawford co., Pa., on French Creek and on the Atlantic and Great Western R. R., 14 miles N. N. E. of Meadville. It has one weekly paper. Total pop. 1199.

Cambridge, a post-township of Lamoille co., Vt., situated at the foot of Mount Mansfield on the Lamoille River and the Lamoille Valley R. R. It contains two villages, Cambridge Borough and Jeffersonville. Surrounded by fine scenery, it is extensively visited by pleasure-seekers in summer. It has one newspaper. Pop. 1651.
A. N. Merchant, Pub. "Valley Sentinel."

Cambridge (Adolphus Frederick), Duke of, the seventh son of George III. of England, was born Feb. 25, 1774. He entered the army about 1790, was appointed governor of Hanover in 1816, and viceroy of that kingdom in 1831. Died July 8, 1850.

Cambridge (George William Frederick Charles), Duke of, a British general, a son of the preceding, was born Mar. 26, 1819. He became a major-general in 1845, served in the Crimean war in 1854, and was appointed acting commander-in-chief of the British army in 1856, and field-marshal in 1862.

Cambridge City, a post-village of Wayne co., Ind., on the Whitewater River, 15 miles W. of Richmond, and at the junction of the Pan-Handle R. R. with the White Water Valley, the Fort Wayne Muncie and Cincinnati and the Jeffersonville branch roads. It has a national bank with a capital stock of $350,000, the car-shops of the Indiana Car Company, employing 300 hands and manufacturing six cars a day, and other manufactures. There is one newspaper. P. 2162. Ed. "Cambridge City Tribune."

Cambridge Platform, a system of church government drawn up by a synod at Cambridge, in the colony of Massachusetts Bay, in 1648. The Congregational churches of New England at that time differed somewhat in regard to discipline, some being inclined to Presbyterianism and others to Independency, while the majority avoided both extremes. The synod reaffirmed the doctrines taught in the Westminster Confession, but recommended a form of church discipline substantially the same as that which now prevails in the Congregational churches.

Cam'bridgeshire, a county of England, is bounded on the N. by the river Nen, on the E. by Norfolk and Suffolk, on the S. by Essex and Hertford, and on the W. by Bedford and Huntingdon. Area, 820 square miles. Pop. in 1871, 186,363. The surface is mostly flat, and about one-fourth of the county is occupied by fens or marshes. The northern portion is part of the Bedford Level (which see). The soil is fertile, and the inhabitants are mostly engaged in agriculture. Among the staple products are wheat, beans, hay, oats, butter, and cheese. It is intersected by the river Ouse, and also drained by the Cam. In the N. part is a tract called the Isle of Ely. The chief towns are Cambridge, Ely, and Newmarket.

Cambridge, University of, one of the two ancient universities of England. In 1110, Joffrid, abbot of Croyland, sent to his manor of Cottenham, near Cambridge, Gislebert, a professor in divinity, with three other learned monks. They in a short time drew together so great a number of scholars that in the second year no single building was able to contain them. When Alfred of Beverly was there, in 1129 A. D., there were no public halls, but each one lived in his own lodgings. About the year 1257 students began to live together in hostels, under a principal, at their own charges. The hostels were named after saints or the churches which they adjoined, or the persons who built them. Trinity hostel survived to 1540. The hostels were the beginning of the college system, which distinguishes the universities of Oxford and Cambridge. A hostel for medical students was opened in 1859, and another has been opened in connection with Trinity College.

Before the close of the sixteenth century nearly all the foundations were endowed which now constitute the university. The predominance of the religious element in the discipline is to be attributed to the usage of the times in which the colleges were founded. There had been, from very early times, "religious houses," which were in many cases united with collegiate foundations, as, for example, the Dominicans, whose house is now Emmanuel College. The friars who lived in these convents kept their "acts" or exercises for degrees like other university-men. To the same cause is traced the condition of celibacy, upon which, with scarcely an exception, the fellowships are tenable. With some exceptions, the fellows are obliged to take holy orders within a limited period or to vacate their fellowships.

The present statutes were confirmed July 31, 1858. The governing body is a senate of eight members. All university laws are approved by the council, consisting of a chancellor and vice-chancellor, before they are submitted to the senate. The executive powers are a chancellor, high steward, vice-chancellor, commissary, and assessor. There are three terms—Michaelmas, Lent, and Easter. Dissenters are not excluded from taking degrees, except in divinity.

There are four classes, or orders, of students—viz. fellow-commoners and noblemen, pensioners, sizars, and scholars on the foundation of their college. The first are so called from their dining at the fellows' table; they wear silk or embroidered gowns and pay heavier fees. The pensioners are the students not on the foundation, who pay for their own commons and for their chambers. The sizars are the poorer students, who are admitted at lower charges than the pensioners, but wear the same dress, and no longer perform menial offices, as they once did. St. John's and Trinity have very liberal endowments for sizars, and pecuniary assistance is given. All students coming to the university are entered in one of the above classes. The scholars are elected, by examination, from the pensioners and sizars; they have rooms and commons free, and other emoluments. The fellows are generally elected from the scholars. The fellowships are given to members of the college, and are not, as at Oxford, open to the whole university. Before a student can be admitted he must be sufficiently instructed in Latin, Greek, and mathematics.

When the undergraduate comes in he is called a "freshman;" in his second year, a "junior soph;" in his third year, a "senior soph." The degree of bachelor of arts requires usually nine terms, or three years, of residence. The master's degree is conferred three years later. The candidates for degrees are called questionists.

The mathematical examination embraces the whole range of mathematics. The successful candidates are arranged in a tripos—*i. e.* in three classes, called respectively wranglers, senior optimes, and junior optimes; the first mathematician is called the senior wrangler. In the examination for classical honors the candidates are arranged in a tripos, and distinguished as first, second, and third class. The examinations for degrees are called the "great go." The previous examination, which comes in the second year of residence, is called the "little go." There is also a tripos for the natural sciences. The pecuniary value of the first place in either the classical or the mathematical tripos has been estimated at £10,000, for it secures to its possessor high social position, as well as lucrative employment. The next prizes are the fellowships, of which there are 430 tenable for life. The office of tutor is one of great honor and emolument. In 1870 the members of the university amounted to 9241. The undergraduates for the same year numbered 2019.

The following is a list of the colleges and halls:

Name.	Founded
St. Peter's College	1257
Clare College	1326
Pembroke College	1347
Gonville Hall and Caius College	1348
Trinity Hall	1350
Corpus Christi College	1351
King's College	1441
Queen's College	1448
St. Catherine's College	1473
Jesus College	1496
Christ's College	1505
St. John's College	1511
Magdalene College	1519
Trinity College	1546
Emmanuel College	1584
Sidney Sussex College	1598
Downing College	1800

The Fitzwilliam Museum is the finest modern addition to the university. Viscount Fitzwilliam bequeathed, in 1816, £100,000, the interest of which was to build and support a museum. He bequeathed also a valuable collection of books, paintings, etc. The University Library is a fine mass of buildings of different periods, and contains at present more than 230,000 volumes, without reckoning those in the college libraries, some of which are very important. The Geological Museum contains the collection of Dr. Woodward, with recent numerous and interesting acquisitions. Besides this, there are other valuable scientific museums. (For full information about the university see the "Cambridge Calendar.") REVISED BY T. D. WOOLSEY.

Camby'ses [Gr. Καμβύσης; Old Persian cuneiform inscriptions, *Kabujiya*], king of the Medes and Persians, and a son of Cyrus the Great, whom he succeeded about 530 B. C. He invaded Egypt in 525, defeated Psammenitus, its king, in battle, and captured Memphis, the capital of Egypt. Having completed the conquest of that country, he led an army to Ethiopia, but was compelled by famine to retire before he had conquered it. He afterwards indulged in violent and capricious acts of tyranny and cruelty in Egypt, so that many believed him to be insane. Cambyses was an epileptic, but a man of strong though very cruel character. By his Egyptian subjects he was utterly detested. Died in 522 B. C.

Cam'den, a county which forms the S. E. extremity of Georgia. Area, 600 square miles. It is bounded on the E. by the Atlantic Ocean, and on the S. by the St. Mary's River, and is intersected by the Santilla (or Satilla) River. The surface is level; the soil is sandy. Rice and corn are the chief crops. It embraces some of the Sea Islands. Capital, St. Mary's. Pop. 4615.

Camden, a county in S. Central Missouri. Area, 600 square miles. It is intersected by the Osage River, and also drained by the Niangua. The surface is diversified by hills and valleys; the soil is moderately fertile. Lead is found in this county. Grain, tobacco, and wool are the chief products. Capital, Linn Creek. Pop. 6108.

Camden, a county in the S. W. of New Jersey. Area, 235 square miles. It is bounded on the N. W. by the Delaware River, which separates it from Philadelphia, and is drained by Big Timber and Cooper's creeks, and other streams. The surface is nearly level; the soil is mostly sandy, and in the W. part is a fertile loam. Marl is abundant in this county, which is intersected by the Camden and Atlantic R. R. Corn, wheat, fruit, and garden and dairy products are extensively raised. It has manufactures of flour, machinery, and a great variety of goods. Capital, Camden. Pop. 46,193.

Camden, a county of North Carolina, bordering on Virginia and Albemarle Sound. Area, 280 square miles. It is bounded on the S. W. by the Pasquotank River. The surface is level, and partly covered with forests of cedar and cypress. Indian corn is the chief crop. The northern portion of the county is part of the Dismal Swamp. Capital, Camden Court-house. Pop. 5361.

Camden, a post-village, capital of Wilcox co., Ala., is about 4 miles S. of the Alabama River and 80 miles S. W. of Montgomery. It has a weekly paper. Pop. of Camden township, 3060.

Camden, a post-village, capital of Ouachita co., Ark., is on the right bank of the Washita River, 110 miles S. by W. from Little Rock. Steamboats ascend the river to this point, which is connected by navigable water with New Orleans, and for two-thirds of the year steamers ascend the river to Arkadelphia. There are two weekly papers. Camden is an important commercial centre. It was once called *Écore à Fabre*, and was a great hunting rendezvous. Pop. 1612.

Camden, a post-village of North Murderkill hundred, Kent co., Del., near Wyoming Station, on the Delaware R. R., 3 miles S. of Dover. Pop. 657.

Camden, a post-township of Schuyler co., Ill. P. 1173.

Camden, a post-village of Jackson township, Carroll co., Ind., on the Logansport Crawfordsville and Southwestern R. R., 14 miles S. W. of Logansport. Pop. 476.

Camden, a post-village of Knox co., Me., on the W. side of Penobscot Bay, about 8 miles N. N. E. of Rockland. It derives its support from the burning of lime, shipbuilding, commerce, and manufacture of cars, car-wheels, railroad spikes, and ship's furniture of various kinds. It has a weekly paper. Pop. including Camden township, 4512.
DUNTON BROS., PUBS. CAMDEN "HERALD."

Camden, a post-township of Hillsdale co., Mich. The township is on the Ohio and Indiana State line, and on the Fort Wayne Jackson and Saginaw R. R. Pop. 1883.

Camden, a township of Carver co., Minn. Pop. 414.

Camden, a township of De Kalb co., Mo. Pop. 1359.

Camden, a post-village and township of Ray co., Mo., on the St. Louis Kansas City and Northern R. R., 5 miles S. W. of Richmond, and on the N. bank of the Missouri River. Pop. of village, 357; of township, 3347.

Camden, a post-township of Seward co., Neb. P. 309.

Camden, a city and river-port of New Jersey, and the capital of Camden co., is situated in a plain on the Delaware River opposite Philadelphia, and 32 miles by railroad S. W. of Trenton. It is the terminus of the Camden and Amboy R. R. and the Camden and Atlantic R. R., and of the West Jersey R. R., which extends to Cape May, Millville, etc. The plan of the city is regular. It contains a court-house, near thirty churches, and two national banks; also several iron-foundries and manufactures of machinery, chemicals, and other goods. There is a large manufactory of steel pens. Numerous steam ferry-boats cross the river at various points, and connect Camden with Philadelphia. It has three weekly papers. Pop. 20,045.

Camden, a post-village of Oneida co., N. Y., on the Rome Watertown and Ogdensburg R. R., 18 miles N. W. of Rome. It has three churches, one weekly paper, and manufactures of lumber, leather, pumps, and sash and blinds, etc. Pop. 1703; of township, 3687.

Camden, a township of Lorain co., O. Pop. 858.

Camden, a post-village of Somers township, Preble co., O., on the Cincinnati Richmond and Chicago R. R., 44 miles N. of Cincinnati. Pop. 648.

Camden, a post-village, capital of Kershaw co., S. C., is on the E. bank of the navigable Wateree River, 33 miles N. E. of Columbia. Camden is the terminus of a railroad which extends southward and connects it with Charleston. It contains seven churches and four academies, and has good water-power. Gen. Gates was defeated here Aug. 16, 1780, by Lord Cornwallis, and April 25, 1781, Gen. Greene was defeated by Lord Rawdon at Hobkirk's Hill, near Camden. During the recent civil war this place was captured, Feb. 24, 1865, by the Federal forces under Gen. Sherman after a lively skirmish; 2000 bales of cotton and a large quantity of tobacco were destroyed by burning. Camden has two weekly papers. There are ancient mounds near this town. Pop. 1007.
J. B. KERSHAW, ED. OF CAMDEN "JOURNAL."

Camden, a post-village, capital of Benton co., Tenn., on the Nashville and North-western R. R., 82 miles W. of Nashville. Pop. 148.

Camden, MARQUESSES OF, earls of Brecknock (United Kingdom, 1812), Earls Camden (1786), Viscounts Bayham (1836), Barons Camden (1765, Great Britain).—JOHN CHARLES PRATT, born June 30, 1840, was member of Parliament for Brecon in 1866, and succeeded to the marquisate in the same year.

Camden (CHARLES **Pratt**), FIRST EARL OF, an eminent English statesman and lawyer, born in 1713, was a son of Chief-Justice Sir John Pratt. He was called to the bar in 1738, became attorney-general about 1758, and chief-justice of the court of common pleas in 1762. His decision against the legality of general warrants, which he gave in the trial of John Wilkes, rendered him very popular. He received the title of Baron Camden in 1765, and was appointed lord chancellor, but he resigned that office in Jan., 1770. He afterwards distinguished himself as a champion of constitutional liberty, and acted with Lord Chatham in opposition to the American policy of Lord North. In 1783 he became president of the council. He was created Earl Camden in 1786. Died April 18, 1794. "Among the names that adorn the legal profession," says Lord Brougham, "there are few which stand so high as that of Camden." On account of his liberal policy during the Revolutionary war his name became very popular in the U. S., and was given to several counties and many towns and villages.

Camden (WILLIAM), an eminent English antiquary, born in London May 2, 1551, graduated at Oxford. He was appointed second master of Westminster School in 1575. His most important work is a description of Great Britain in Latin, entitled "Britannia sive Regnorum Angliæ, Scotiæ, et Hiberniæ, ex intima Antiquitate Chorographica Descriptio" (1586). He published several new editions of it, enlarged and improved. Among his works is "Annals of the Reign of Elizabeth" (in Latin), highly commended by Hume. He became head-master of Westminster School in 1593, and Clarenceux king of arms in 1597. His promotion to this position over the heads of all the College of Heralds led to many heart-burnings and recriminations, and embittered many years of the life of this worthy man, who has been called "the judicious Camden" and "the British Pausanias." He was buried in Westminster Abbey. Died Nov. 9, 1623.

Camden Court-house, a post-village, capital of

Camden co., N. C. It is a port of entry, and is on the navigable Pasquotank River.

Camden Mills, Ill. See MILAN.

Camden Society, an association organized in 1838 in London for the purpose of publishing the MSS. of old British authors, historical documents of importance, old records, visitations, both heraldic and ecclesiastical, and other matter of antiquarian, literary, or historical interest relating to England. Some of their materials are not very ancient, but are published for their general interest. The results of their work are contained in a large number of volumes, which are, as a whole, of very great value. The name was given in honor of William Camden, the historian.

Cam'el [Lat. *camelus;* Ger. *Kamel;* Gr. κάμηλος; Arabic, *gammel*], a genus of ruminant quadrupeds of which

Dromedary, or Arabian Camel.

only two species now exist. This genus is the type of the family Camelidæ, which includes the genus *Auchenia*, the llama, alpaca, etc. The Camelidæ exhibit a wonderful adaptation to their native regions both in the Old World and the New. The dentition differs from that of all other ruminating animals in the presence of incisor teeth in the upper jaws, camels having canine teeth in both jaws, and the Auchenia in the lower jaw; the feet have not the cloven hoof of the rest of the order, but two elongated toes, each tipped with a nail-like hoof, the feet resting not upon the hoofs, but upon elastic cushions. In the camels the toes are united by a common sole, instead of having each a separate one, as in the genus *Auchenia;* the broad foot enabling the animals of the one genus easily to traverse the sand of the desert, while the separation of the toes in the other is suited to rocky heights. Camels have a hump or humps upon the back, of which the others exhibit no trace. With similarity of form the Camelidæ of the Andes exhibit a gracefulness which strongly contrasts with the gaunt angularity of those of the East. The Arabian camel (*Camelus dromedarius*) has only one hump on the back, while the Bactrian camel (*Camelus Bactrianus*) has two. The first-named species is found chiefly in Arabia, Syria, and Northern Africa. The other is a native of Central Asia, where it is still found wild. The Arabian camel is bred to some extent in Italy; the Bactrian in the Crimea. The two are sometimes crossed. The Bactrian is the larger, being often ten feet high. It is much hardier than the other. Confusion has arisen from the employment of the name dromedary as a designation of the former species, it being properly limited to a slender, graceful, and fleet variety of that species. The hump on the camel's back is chiefly a store of fat, from which the animal draws as the wants of its system require; and the Arab is careful to see that the hump is in good condition before a long journey. Another interesting adaptation is the thick sole which protects the foot of the camel from the burning sand. The nostrils may be closed by valves against blasts of sand. Most interesting is the provision for drought made by providing the second stomach and a portion of the first with great cells, in which water is long retained. This store of water is known to the Arabs, who sometimes avail themselves of it by killing some of the camels of the caravan. Sight and smell are extremely acute in the camel.

The Arabian camel carries about 500 pounds. The Bactrian camel is sometimes loaded with 1000 or even 1600 pounds weight, but can carry the latter weight but a short distance. The East India Company had at one time a corps of camels, each mounted by two armed men. The Persians mount light swivel guns upon the saddle of the camel. The pace of the loaded camel is steady and uniform: it proceeds from day to day at a rate of about two and a half miles per hour. Some of the dromedaries, however, can carry a rider more than 100 miles in a day. The motion of the camel is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it. The camel produces a single young one at a time, or rarely two. It lives thirty or forty years. The patience of the camel has been celebrated by authors. But with all its general submissiveness, it is resentful of injury, and, according to some observers, is always ill-humored and morose, and during the rutting season is particularly vicious. The flesh and milk of the camel are valued by the Arabs as food. Its dung is a very useful fuel in the desert. The hair is used for the manufacture of cloth, some kinds of which are coarse, and others soft and fine. Camel's hair is also imported for the manufacture of pencils or small brushes used by painters. A fossil camel (*Camelus Sivalensis*), larger than either existing species, has been discovered in miocene deposits in Hindostan. Numerous remains of fossil Camelidæ occur in the tertiary of Dakota and Nebraska. These are of many species and several genera. The U. S. government in 1857 introduced a number of camels for service in the arid regions along the South-western frontier. These were owned and employed by the government, and performed good service; but, owing to the civil war and the unsettled condition of that region, the attempt to naturalize them for general use has not been successful. But their descendants still exist in Nevada, where they have proved very useful.

REVISED BY J. S. NEWBERRY.

Camel, a contrivance by which ships are floated over sandbars and shoals. A long caisson, or "camel," nearly filled with water, is fastened to each side of the ship: when the water is pumped out the caissons rise and lift the ship with them. The principle is more fully explained in the article DOCK (which see, by SAMUEL H. SHREVE, C. E.), for it is essentially the principle of all floating docks. Camels were formerly used at Nantucket and New Bedford, Mass. A similar machine is employed in raising sunken ships.

Camel'lia [in honor of G. J. Kamel, D. D., a German Jesuit missionary to Luzon in the last century], a genus of evergreen plants of the order Camelliaceæ, natives of China, India, and Japan, and extensively cultivated in greenhouses in Europe and the U. S. for the beauty of their flowers. The most admired species is the *Camellia Japonica*, a shrub which has ovate-elliptical, serrate, and shining leaves, and large, polypetalous flowers, which resemble a rose. Many others belong to *Camellia reticulata* and to hybrid varieties. In the wild state it bears red and single flowers, but the flowers of the cultivated varieties are generally double. Among their various colors are red, white, and yellow. Many of the varieties originated in China or Japan, and others have been raised by European and American florists. New varieties of them are annually produced. The value of the camellia is increased by the fact that it flowers in autumn and winter. The single camellia is propagated by seed, and the cultivated or double varieties by grafting, cuttings, or layers. The proper soil for these is a loose, black mould. They should be protected from frost, and liberally supplied with water, but are liable to be injured with an excess of moisture. It is important that they should receive a free access of fresh air and light. *C. Oleifera* and *C. Sasanqua* are cultivated in China for their seeds, which yield an oil similar to olive oil. Some writers refer the tea-plant to this genus.

Camellia'ceæ, a natural order of exogenous trees and shrubs, mostly natives of Southern and Eastern Asia and South America. North America has four species (loblolly bays and Stuartias), while Africa has also a few. They generally have beautiful flowers. The *Camellia* and the tea-plant are the most important.

Camelopard. See GIRAFFE.

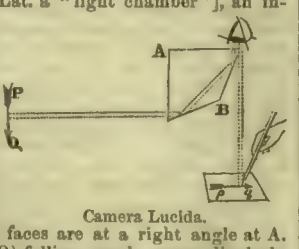
Camelopardalis, a constellation of the northern hemisphere of the celestial globe called the GIRAFFE. It contains only sparsely scattered stars. It is situated between Cassiopeia, Perseus, Ursa Major, etc. It was added by Hevelius to the list of constellations.

Camel's Hair is used by the Arabs and Persians, who weave it into stuff for tents and clothing. A fine quality of camel's hair is imported from Persia, and is used to make pencils for artists. Camel's hair was extensively worn by monastics in the Middle Ages for the mortification of the body. It was harsh and rough. Camel's hair is woven to some extent in Europe, but most of the goods now so called are of wool.

Camel's Rump, or **Camel's Back Mountain,** in Vermont, is one of the highest peaks of the Green Mountains, and is 17 miles W. of Montpelier. Its height is 4188 feet.

Camel's Thorn [Dutch, *kameel-doorn*], (*Alhagi*), a genus of plants of the order Leguminosæ, comprises nu-

merous herbaceous and shrubby species, mostly natives of the deserts of Asia and Africa. They have simple leaves and jointed pods, with one seed in each joint. These plants grow where other vegetation is scarce, and afford valuable food for camels, which are fond of them. The *Alhagi camelorum* yields a kind of manna, which appears in the form of drops on the leaves. In South Africa fences of the camel's thorn are used to protect camps by night from wild beasts.



Came'næ, the general name of four prophetic nymphs of Roman mythology—viz. Antevorta, Postvorta, Carmenta, and Egeria. The Nine Muses were also called Camenæ by the Latin poets.

Ca'menz, or **Kamenz,** a town of the kingdom of Saxony, on the Black Elster, 20 miles N. E. of Dresden. It has manufactures of earthenware, tobacco, starch, etc. Lessing was born here in 1729. Pop. in 1871, 6406.

Cam'eo [Fr. *camaïeu*], a term applied to gems of various colors carved in relief, especially to diminutive pieces of sculpture, which are formed of precious stones having two strata or layers of different colors, the uppermost of which is partly removed so as to expose the lower stratum, which forms the background of the figure. The art of cutting cameos is of great antiquity, having been practised by the ancient Egyptians and Babylonians. It was brought to great perfection by the Greeks, and practised with success in ancient Rome. The cameos of the ancients were formed mostly of the onyx, agate, and sard, and were sometimes executed on a factitious stone called *vitrum obsidianum*. The famous Barberini or Portland Vase is a beautiful specimen of cameo in glass. The ancients used cameos as personal ornaments, and as cups, vases, and other articles. Many of the antique cameos now extant are marvellously beautiful in design and perfect in execution. Among the finest antique specimens are the Gonzaga cameo, which represents the head of a king and his queen, and is now at St. Petersburg; "The Judgment of Paris," in the cabinet of Prince Piombino at Rome; and the onyx called the "Apotheosis of Augustus," which is now in Paris. The last is twelve inches high and ten inches wide. The art revived in Italy in the fifteenth century, and was patronized by the Medici. Some specimens of this period are perhaps as perfect as the antique. The fabrication of cameos, both in *pietra dura* and in shell, has become in Italy an important branch of art.

Shell Cameos are made from such shells as have layers of differently-colored material, such as the conch-shells of the Bahamas. The art—a modern one—of cutting these shells has been carried to a high degree of perfection. These cameos began to be cut at Rome about 1805, and the best work is done there now; but many shells are cut at Paris, especially for exportation to England and America.

Cam'era Lu'cida [Lat. a "light chamber"], an instrument invented by Wollaston, and intended to facilitate the delineation of objects, consists of a quadrilateral prism of glass (A B) in a frame attached to an upright rod, having at its lower end a clamp to fix it to the edge of a table. The prism has its upper face horizontal, and two of its faces are at a right angle at A. Rays from an object (P Q) falling nearly perpendicularly on the first surface enter the prism and undergo reflection at the contiguous surface; they then fall at the same angle on the next surface, and are reflected again; finally they emerge nearly perpendicularly to the remaining surface. The eye receives the emergent light in such a way that an image of the object is seen projected upon a sheet of paper upon the table. The pencil and image being seen together upon the paper, a sketch of the latter can be taken. But the image and the pencil are at different distances from the eye, and cannot be seen together distinctly at the same time. To obviate this, a plate of metal with a small eyehole is placed under the eye, so that the rays through the prism and those from the drawing-pencil, which both pass through the eyehole, form only very small beams of light. By this the difficulty is diminished. It is, however, difficult to use the instrument satisfactorily, though many acquire readiness in its use. Besides this form of the camera lucida, which is the most common, there are others. Its simplest form is a piece of smooth glass fixed at an angle of 45° to the horizon. An image from a horizontal object falling on this glass will be perfectly reflected, so that the eye looking vertically down will see the image, and the artist will be able to trace it upon paper. The name has been applied to other optical instruments.

Camera Lucida.

Cam'era Obscu'ra [Lat. a "dark chamber"], an instrument whose invention is ascribed to Baptista Porta in the sixteenth century, but Roger Bacon described it 300 years before. It is known in a simple form as a box furnished at one end with a lens whose focal length is equal to the length and depth of the box, at the opposite end of which a plane reflector is placed at an angle of 45°, which throws the image of any objects to which the lens may be directed upon an opaque surface which is viewed through a slit in the box.

The camera obscura, being indispensable in photography, has received improvements which make it rank as a scientific instrument. The principle involved in all forms may be made intelligible by the following experiment: Let a hole be bored in a window-shutter and the room darkened. If the light entering the room by this hole be intercepted by a sheet of white paper at a small distance from the hole, an inverted image of objects without will be seen upon the paper. By placing a convex lens in the hole this image is rendered much more distinct. At a certain distance from the hole the image attains a maximum degree of sharpness, and if the paper be removed to a position either nearer to the hole or farther from it, the image becomes indistinct.

Camera'rius (Joachim), an eminent German scholar, born at Bamberg April 12, 1500. His proper name was Liebhard. His ancestors were chamberlains to the bishops of Bamberg; hence he took the Latin name Camerarius, which signifies a "chamberlain." He was a friend of Melanchthon, and became president or principal of the University of Tübingen in 1535. He was rector of the University of Leipsic for many years after 1541. Among his works are numerous translations of Greek authors, a "Life of Melanchthon" (1566), "Elements of Rhetoric," and Latin "Commentaries on the Greek and Latin Languages" (1551). Died April 17, 1574.

Cam'eron, a new parish in the S. W. part of Louisiana, made from parts of Calcasieu and Vermilion parishes. Cotton, corn, and stock are raised. Capital, Grand Chenière. Pop. 1591.

Cameron, a county in N. W. Central Pennsylvania. Area, 400 square miles. It is drained by Sinnemahoning Creek. The surface is hilly, and mostly covered by forests. Grain, timber, potatoes, and butter are the chief products. Coal, iron, and salt are found. It is intersected by the Philadelphia and Erie R. R. Capital, Emporium. Pop. 4273.

Cameron, a county which forms the S. extremity of Texas, bordering on Mexico. Area, 3000 square miles. It is bounded on the E. by the Gulf of Mexico, and on the S. by the Rio Grande. The surface is nearly level; the soil is partly productive. Cattle, corn, and wool are raised. Several saline lakes occur in this county. Capital, Brownsville. Pop. 10,999.

Cameron, a post-village of Clinton co., Mo., on the Hannibal and St. Joseph R. R., where it is crossed by the Chicago and South-western R. R., 35 miles E. of St. Joseph. It has a weekly paper. Pop. 1428.

Cameron, a post-village and township of Steuben co., N. Y., on the Erie R. R., 22 miles N. W. by W. of Corning. Pop. 161; of township, 1334.

Cameron, a thriving post-village of Lumber township, Cameron co., Pa., on the Philadelphia and Erie R. R., 6 miles S. E. by S. of Emporium. Here are valuable mines of gas-coal and beds of iron ore. Lumber is manufactured.

Cameron, a township of Northumberland co., Pa. Pop. 603.

Cameron, a post-village, capital of Milam co., Tex., on Leon River, 63 miles N. E. of Austin, has a weekly paper.

Cameron, a post-township of Marshall co., West Va. Pop. 1627.

Cameron (Angus). See Appendix.

Cameron (Donald) **of Lochiel,** a Highland Scottish chief who fought for the Pretender in 1745. He was wounded at the battle of Culloden, and escaped to France in 1746. Died in 1748. He was the subject of Campbell's poem entitled "Lochiel's Warning."

Cameron (James), brother of Simon Cameron, born at Maytown, Pa., Mar. 1, 1801, learned the trade of a printer, subsequently became an editor, and studied law. He entered the army at the beginning of the civil war as colonel of the Seventy-ninth New York Highlanders. In the battle of Bull Run, July, 1861, he was killed while gallantly leading his men in a charge.

G. C. Simmons, *Clerk Board of Engineers.*

Cameron (Richard), a Scottish minister, born at Falkland, was the founder of the sect of Cameronians or "Cov-

enanters." He strenuously opposed the measures by which the government endeavored to establish the Episcopal Church in Scotland. He persisted in preaching in fields, which was prohibited by law. In June, 1680, he, with about twenty armed adherents, entered the town of Sanquhar and formally renounced their allegiance to Charles II. He was killed in a fight with the royal troops July 20, 1680. (See CAMERONIANS.)

Cameron (SIMON), an American Senator, born in Lancaster co., Pa., in 1799. He was elected Senator of the U. S. by the Democrats in 1845, and having joined the Republican party, he was re-elected a Senator in 1856. He was secretary of war from Mar., 1861, to Jan., 1862, and was then sent as minister to Russia, from which he returned in 1863. In 1866 he was again elected to the Senate of the U. S. He was elected to the national Senate for another term (1873–79).

Camero'nians, the followers of Richard Cameron, who in 1680 made a public declaration that Charles II., by his suppression of civil and religious liberty, had forfeited all right to the crown. They were also called Covenanters, from their having demanded the strict observance of the Solemn League and Covenant received by the Parliament in 1643. The Cameronians still exist as a sect, both in Great Britain and America, under the name of REFORMED PRESBYTERIANS (which see).

Cam'eronites were the adherents of John Cameron, a native of Scotland, who went to France in 1600, and became professor of theology at Saumur. "He devised a method," says Mosheim, "of uniting the doctrines of the Genevans, as expounded at Dort, with the views of those who hold that the love of God embraces the whole human race." They have sometimes been called Hypothetical Universalists.

Cameroons', or **Camerones,** a river of Africa, in Upper Guinea, enters the Bight of Biafra about lat. 4° N. and lon. 9° 40′ E. by an estuary 20 miles wide. Its length is not known. It has a cataract 90 miles from its mouth.

Cameroons Mountains, of Western Africa, culminate in a peak which is near 13,000 feet high, and about lat. 4° 13′ N. and lon. 9° 10′ E.

Camil'la, a fabulous Italian virgin, celebrated for swiftness of foot, was said to be a daughter of the Volscian king Metabus, and aided Turnus against Æneas.

Camilla, the capital of Mitchel co., Ga., is on the Atlantic and Gulf R. R., 28 miles S. of Albany. It has two churches, an academy, and a newspaper. From 6000 to 8000 bales of cotton are shipped from here annually. Pop. 289. T. M. MASON, ED. CAMILLA "ENTERPRISE."

Camil'lus, a post-village of Onondaga co., N. Y., on the New York Central R. R., 8 miles W. of Syracuse, has three churches. Camillus township contains valuable limestone and gypsum, and several sulphur springs. Pop. of village, 598; of township, 2423.

Camillus (MARCUS FURIUS), a celebrated Roman dictator and patrician, who became a tribune in 403 B. C. He was chosen dictator in 396, and soon captured Veii. About 390 he was exiled, and retired to Ardea. After Brennus and the Gauls had captured Rome in 390 B. C., Camillus was recalled and appointed dictator. According to the popular tradition, which is perhaps mixed with fable, he defeated the Gauls, and afterwards gained victories over the Volsci and other enemies. In 367 he was chosen dictator for the fifth time. Died in 364 B. C. (See PLUTARCH'S "Life of Camillus;" ARNOLD'S "History of Rome.")

Camisards, French Protestants who lived in the Cevennes early in the eighteenth century, so named from the *camise* or loose outer garment which they wore. They strove to obtain the religious liberty which had been sacrificed by the Revocation of the Edict of Nantes, but although they gained several victories over the royal troops, they were subdued by the duke of Berwick in 1705. (See SCHULTZ, "Geschichte der Camisarden," Weimar, 1790.)

Cam'let, a fabric originally made of camel's hair, but in more recent times of the hair of the Angora goat. It is also made of wool, or a mixture of wool with other materials. Camlets are mentioned in Marco Polo's narrative as among the articles manufactured in Thibet.

Camo'ëns (LUIS or LUIZ), a celebrated Portuguese epic poet, was born of a noble family, probably at Lisbon, in 1524. He was educated at Coimbra, and soon after he left college fell in love with a lady of honor at court. He was consequently banished to Santarem. Having joined the army, he served with valor in several battles against the Moors. Before this time he had written some verses, which, like his military services, had been treated with neglect. He therefore resolved to emigrate, and embarked for India in 1553, exclaiming with Scipio, "Ingrata patria, non possidebis ossa mea." He wrote a political satire called "Follies in India," for which he was banished in 1556 from Goa to Macao, where he composed his great epic poem "The Lusiad" ("Os Lusiadas"), which celebrates the martial exploits of the Portuguese warriors and heroes, and is pervaded by patriotic sentiments. It was first printed in 1572. He was recalled from exile in 1561, and returned in 1569 to Lisbon, where he passed his later years in great poverty, and died June 10, 1580. Among his works are elegies, sonnets, odes, satires, and epigrams. The versification of "The Lusiad" is remarkably stately. (See JOHN ADAMSON, "Memoirs of the Life and Writings of Luis de Camoens," 1820; SOUZA BOTELHO, "Vida de L. Camoens," 1817.)

Camor'ra, the name of a secret society of outlaws and robbers called *Camorristi* who infested the former kingdom of Naples. This society had a rendezvous in every large town. Under the Bourbon dynasty its members openly presented themselves at markets and public spectacles, where they extorted a portion of the money that passed from hand to hand. They were also addicted to violent crimes, and could be hired to commit murder. The society was thoroughly organized and subject to a strict discipline. Candidates for membership were not admitted until they had passed through a probation for a year, and given proofs of courage and obedience. They are said to have been tolerated by King Ferdinand II.

Camp [from the Latin *campus,* a "plain;" Fr. *camp;* Ger. *Lager*], in a general sense the ground (constructions included) upon which tents, huts, etc. are erected for the shelter of any collection of human beings; in a military sense, that occupied by an army under tents or temporary shelter in the field. It is usually distinguished from *bivouac* by the use of shelter (such as tents), as distinguished from passing the night in the open air (*à la belle étoile*). More exclusively yet, the ground and shelter of an army in *tents;* but in our "Army Regulations" a camp is the place where troops are established in tents, in huts, or in bivouac. The Roman camp (Lat. *castra,* a word which in the form of the termination *cester* or *chester* indicates the origin of numerous English towns, as arising from a Roman camp, and to which also are due the words *château* and *castle*), described with great detail in most cyclopædias, was in reality an *intrenched camp* (see BARDIN, "Dictionnaire de l'Armée de Terre"). Such were constructed in the heart of invaded countries to secure for the troops a place of retreat, to control the district, to provide secure dépôts for provisions of all kinds, and to protect the communications with the frontier. A Roman army might occupy its camp several winters. In the mean time it sallied forth to resume its operations. Most commonly, when the legions had thus vacated them to undertake long marches, *veterans* remained behind to guard the ramparts, and thus became a kind of permanent garrison, which, by intermarriage, became the origin of a town or colony; *e.g.* the English "Chesters" and the German Cologne or Köln (*Colonia*).

The Romans necessarily had, besides these, temporary camps, sometimes of huts, but more generally tents of skins of animals. The details of these Roman camps are of little interest (unless to antiquarians); neither indeed, except to soldiers, those of the modern military camp. Its arrangements (as practised with us) are set forth in our "Army Regulations." Strictly speaking, the arrangements of a camp for a regiment of infantry or cavalry are governed purely by considerations of discipline and administration. The encampment of an army must indeed be sedulously governed by tactical considerations, such as the defence of the position and the formation of line of battle, the character of the issues, the approaches, etc. But these arrangements belong to "Tactics." An INTRENCHED CAMP is a fortified position of greater or less extent, usually of field-works to be occupied during a campaign or the duration of a war. (See INTRENCHED CAMPS, by GEN. A. BRIALMONT, Belgian Army.) J. G. BARNARD, *U. S. Army.*

Camp, a township of Polk co., Ia. Pop. 1558.

Camp, a township of Renville co., Minn. Pop. 418.

Camp-and-Garrison Equipage is a general name for the tents, furniture, utensils, etc. used in an army which serve to supply the wants of the soldiers, rather than to aid their military operations.

Camp-Followers, the sutlers and dealers who follow an army, and carry a variety of articles which they sell to the soldiers. In India the camp-followers of British armies are very numerous, comprising sutlers, servants, hostlers, water-carriers, snake-charmers, conjurers, and women. An army of 15,000 men which invaded Afghanistan in 1839 is said to have been accompanied with 85,000 camp-followers.

Campa'gna, a town of Italy, in Principato Citra, is

situated amidst high mountains, 18 miles E. of Salerno. It is a bishop's see, has a fine cathedral, a college, and several convents. Pop. 8776.

Campa'gna di Ro'ma, an extensive undulating, desolate plain of Central Italy, nearly coinciding in limits with the ancient *Latium*, was formerly a province of the Pontifical States. It is bounded on the S. W. by the Mediterranean, extends along the coast from Cività Vecchia to Astura and the Pontine Marshes, and surrounds the city of Rome, which is near its centre. Its length is estimated at 75 miles, and its width varies from 27 to 40 miles. The highest parts of it rise about 200 feet above the level of the sea. The soil is of volcanic formation, and the climate is rendered unhealthy by pestilential malaria or miasmatic effluvia. This region, once rich and populous, is now almost deserted and uncultivated. In autumn the inhabitants of the Apennines descend into the Campagna with their flocks and herds, for which some parts of it afford good pasture. Numerous ancient monuments, aqueducts, and other ruins are scattered over this plain. It contains several lakes, which occupy craters of extinct volcanoes.

Campaign' [Fr. *campagne*], a connected series of military operations forming a distinct stage in a war; the time that an army keeps the field, either in fighting or marching, without entering into winter quarters. The term had a more definite meaning formerly, when armies kept the field only in the summer and autumn, than it has now, when the operations of armies are not interrupted by winter or any ordinary degree of cold.

Campan (Jeanne Louis Genest), born Oct. 6, 1752, was reader to the daughters of Louis XV. and a companion and friend of Marie Antoinette. After the Revolution she was an instructress of high reputation. Died May 16, 1822. She wrote, among other works, "Memoirs of the Private Life of Marie Antoinette."

Campa'na, La, a town of Spain, in the province of Sevilla, on the river Madre Viega, 30 miles E. N. E. of Seville. It has a trade in grain, wine, and fruit. Pop. about 5500.

Campana'rio, a town of Spain, in Estremadura, 72 miles E. of Badajos. It has manufactures of linen fabrics, wine, oil, and ropes. Pop. 6145.

Campanel'la (Tommaso), an eminent Italian philosopher and Dominican monk, born in Calabria Sept. 5, 1568. He published in 1591 "Philosophy Demonstrated by the Senses," which opposed the scholastic philosophy and gave offence to the partisans of Aristotle. On a charge of heresy and conspiracy against the Spanish government, he was in 1599 committed to prison in Naples, where he was confined about twenty-seven years, during which he wrote several works. Pope Urban VIII. procured his release in 1626. Campanella, after passing several years in Rome, retired to France in 1634, in order to avoid the renewed persecution of the Spaniards. He was kindly treated by Cardinal Richelieu. Among his important works are "Civitas Solis," etc. ("The City of the Sun, or the Idea of a Philosophic Republic," 1623), "The Five Parts of Rational Philosophy" (1638), and a "Discourse on the Spanish Monarchy" (in Latin, 1640). Died in Paris Mar. 21, 1639. (See Baldacchini, "Vita e Filosofia di T. Campanella," 1840; Dareste, "Thomas Morus et Campanella," 1843.)

Campa'nha, a town of Brazil, in the province of Minas Geraes, about 156 miles N. W. of Rio de Janeiro. It has several churches, a hospital, and a theatre. Gold is found in the vicinity. Pop. about 6000.

Campa'nia, a province of ancient Italy, was bounded on the N. E. by Samnium, on the E. and S. by Lucania, on the S. W. by the Mediterranean, and on the N. W. by Latium. The Apennines extended along the N. E. border. Between these mountains and the sea was an extensive and very fertile plain, which produced abundance of corn, wine, and oil. Ancient writers concur in extolling the fertile soil, the genial climate, and the beautiful landscapes of Campania, which was the *Regio felix* of the Romans. It was traversed by the Appian Way (*Via Appia*), the greatest thoroughfare of ancient Italy. Its principal cities were Capua, Pompeii, Neapolis (Naples), Cumæ, Salernum, and Herculaneum. Among its physical features was Mount Vesuvius. During the Roman empire, Campania was the favorite resort of wealthy Romans, who adorned its shores with villas and palaces. It is supposed that the original population of this region was an Oscan or Ausonian race. The earliest fact which can be affirmed as historical in relation to Campania is the foundation of the Greek colony of Cumæ, which is said to have been the most ancient of the Greek colonies in Italy. The Campanians were conquered by the Samnites about 430 B. C., but they continued to speak the Oscan language after that event. The Romans gained a decisive victory over the allied Latins and Campanians in 340 B. C., when Campania became subject to Rome. It embraces the modern provinces of Benevento, Naples, Principato Citeriore, Principato Ulteriore, and Terra di Lavoro, with an area of 6937 square miles and 2,625,830 inhabitants.

Campani'le, a structure standing by the side of the main church in many Italian cities, is a lofty belfry tower, often of elaborate, but of a lighter, profaner architecture than the sacred edifice. The finest of the campaniles are—that at Florence, designed by Giotto, the Leaning Tower of Pisa, and in Spain the beautiful Giralda of Seville, built by Guever the Moor.

Campan'ula, a Latin word signifying a "little bell," from *campana*, a "bell," is the name of a genus of hardy herbaceous plants, the type of the natural order Campanulaceæ (which see). The genus is characterized by a bell-shaped, 5-lobed corolla, five stamens, the filaments of which are dilated at the base, and a top-shaped capsule, with two to five cells opening by lateral clefts. It comprises numerous species, with beautiful blue or white flowers, to many of which the common name of bell-flower is given. Among the remarkable species are the *Campanula medium* or Canterbury bell, a native of Europe, and the *Campanula rotundifolia*, or harebell, which is indigenous both in England and the U. S.

Campanula'ceæ [from *Campanula*, one of the genera], a natural order of exogenous plants, herbaceous or suffruticose, with a milky juice, alternate leaves, and a calyx adherent to the ovary. The corolla is regular, monopetalous, bell-shaped, and valvate in the bud. The stamens, five in number, are free from the corolla, which is generally blue and showy. This order comprises nearly 500 known species, mostly natives of the temperate and cool climates of the northern hemisphere. Two genera are indigenous in the U. S.—viz. *Campanula* and *Specularia*.

Campbell, kam'el, a county in N. W. Central Georgia. Area, 360 square miles. It is intersected by the Chattahoochee River. The surface is hilly or undulating; the soil is fertile. Corn, cotton, and wool are staple products. Gold has been found in the county. Capital, Campbellton. Pop. 9176.

Campbell, a county in Northern Kentucky, borders on the Ohio, and is bounded on the W. by the Licking River. Area, 120 square miles. Grain, wool, and tobacco are the chief products. The soil is based on Trenton limestone, and is fertile. Capital, Newport. Pop. 27,406.

Campbell, a county in N. N. E. Tennessee, bordering on Kentucky. Area, 450 square miles. It is drained by New River and other streams. Coal is found. Wool, grain, and tobacco are the chief products. The surface is hilly or mountainous. Capital, Jacksboro'. Pop. 7445.

Campbell, a county in the S. of Virginia. Area, 576 square miles. It is bounded on the N. by James River, and on the S. by Staunton River. The surface is hilly; the soil is mostly productive. Grain, wool, and tobacco are the chief products. Granite is found here. The Atlantic Mississippi and Ohio R. R. passes through the N. part of the county. Capital, Campbell Court-house. Pop. 28,384.

Campbell, a township of Lawrence co., Ark. P. 576.

Campbell, a post-township of Pulaski co., Ark. Pop. 1304.

Campbell, a township of Searcy co., Ark. Pop. 359.

Campbell, a township of Jennings co., Ind. P. 1563.

Campbell, a township of Warrick co., Ind. P. 1437.

Campbell, a post-township of Ionia co., Mich. P. 1120.

Campbell, a township of Douglas co., Mo. Pop. 413.

Campbell, a township of Greene co., Mo., contains the town of Springfield. Pop. 8694.

Campbell, a post-village and township of Steuben co., N. Y., on the Rochester division of the Erie R. R., 9 miles N. W. of Corning. Pop. of the township, 1989.

Campbell, a township of La Crosse co., Wis., 5 miles N. of La Crosse. Pop. 2084.

Campbell (Alexander), D. D., a theologian, born in the county of Antrim, Ireland, in June, 1788, emigrated to the U. S. in 1809, after studying at the University of Glasgow. He founded a sect called Disciples of Christ, who accept the Bible as their only creed. In 1841 he founded Bethany College, West Va., of which he was long president. Died Mar. 4, 1866. (See Disciples of Christ.)

Campbell (Archibald), an American officer and engineer, born 1813 in New York, graduated at West Point 1835, serving while in infantry at frontier posts till he resigned, Sept. 30, 1836. Civil engineer 1837–44, chief clerk U. S. war department 1846–49 and 1853–57, and commissioner to establish the North-western boundary of the U. S. between Washington Territory and British America 1857–

69, and to run the 49th parallel from the Lake of the Woods to the Rocky Mountains, since 1872.

GEORGE W. CULLUM, *U. S. Army.*

Campbell (Sir COLIN), LORD CLYDE, a British general, born in Glasgow Oct. 20, 1792. He entered the army in 1808, and served in the Peninsular war (1809-14). In 1812 he obtained the rank of colonel. Having served with distinction in India, he was appointed in 1854 to the command of the Highland brigade, which he led at the battles of Alma and Balaklava in the Crimea. In 1855 he was raised to the rank of major-general, and created a knight grand cross of the Bath. He was appointed in July, 1857, commander of the army in India, then fighting against the mutinous Sepoys. He relieved Lucknow in Nov., 1857, defeated the Sepoys at Cawnpore, and quelled the mutiny in 1858. He was raised to the peerage as Baron Clyde in the same year. Died Aug. 14, 1863.

Campbell (DUNCAN R.), D. D., born in Scotland about 1797, received a university education, came while young to the U. S., was ordained to the Baptist ministry, and was president of Georgetown College, Ky. (1849-65). Died Aug. 11, 1865.

Campbell (GEORGE WASHINGTON), born in Tennessee in 1768, graduated at Princeton in 1794, was a member of Congress 1803-09, U. S. Senator (1811-14 and 1815-18), became secretary of the treasury in 1815, and minister to Russia in 1818. Died Feb. 17, 1848.

Campbell (JAMES), an American jurist and statesman, born in Philadelphia in 1813, was a judge of the court of common pleas (1841-50), and became attorney-general of the State in 1852, and postmaster-general under President Pierce in 1853.

Campbell (JOHN), LORD, an eminent British lawyer, was born in Fifeshire, Scotland, Sept. 15, 1779. He was called to the English bar in 1806, and soon obtained an extensive practice. In 1830 he became a Whig member of Parliament, and in 1834 attorney-general. He was made chancellor of Ireland and a peer of the United Kingdom in 1841. He was appointed chief-justice of the court of queen's bench in 1850, and lord chancellor of England in 1859. He published "Lives of the Lord Chancellors and Keepers of the Great Seal of England" (7 vols., 1846), which obtained much popularity, and "Lives of the Chief-Justices of England" (3 vols., 1849-57). Died June 23, 1861.

Campbell (JOHN A.), an eminent jurist, born in Washington, Ga., June 24, 1811, was the son of Duncan G. Campbell, a distinguished lawyer of that State. He was educated in the Georgia University, where he graduated with distinction in 1826, and was admitted to the bar by special act of the legislature in 1829, some time before his majority. He moved to Alabama, where he soon took high rank in his profession, and was appointed associate justice of the U. S. Supreme Court by President Pierce in 1853. This position he resigned in 1861, after the outbreak of the conflict between the two sections. While he had opposed the policy of secession, he yet believed in its rightfulness. He was afterwards appointed assistant secretary of war of the Confederate States. He was one of the commissioners appointed by Mr. Davis to meet Mr. Lincoln and Mr. Seward at the Fortress Monroe conference in Feb., 1865. After the fall of Richmond and the surrender of the Southern arms, he was arrested and imprisoned for some time at Fort Pulaski, but was finally discharged on parol. Since then he has been engaged in the practice of the law in New Orleans.

Campbell (THOMAS), a popular British poet, born in Glasgow July 27, 1777. He was educated at the university of his native city, and became a good classical scholar. He produced in 1799 his admirable poem, "The Pleasures of Hope," which was considered by Lord Bryon as "one of the most beautiful didactic poems in the English language." During a visit to the Continent he witnessed the battle of Hohenlinden, Dec., 1800, on which he composed a lyrical poem of great beauty and celebrity. He soon afterwards published short poems entitled "The Exile of Erin" and "Ye Mariners of England." Having married his cousin, Miss Sinclair, he removed to London in 1803, and adopted literature as a profession. In 1809 he produced "Gertrude of Wyoming," which is generally and greatly admired. He became editor of the "New Monthly Magazine" in 1820, and was elected lord rector of the University of Glasgow in 1827. He published, besides other works in prose, "The Life and Times of Petrarch" and a "Life of Frederick the Great." Among his finest poems is a spirited ode called "The Battle of the Baltic." He died June 15, 1844, and was buried in Westminster Abbey. "No poet at such an age," says Moir, referring to the "Pleasures of Hope," "ever produced such an exquisite specimen of poetic mastery—that is, of fine conception and high art combined." (See "The Life and Letters of Thomas Campbell," by WILLIAM BEATTIE, 3 vols., 1850.)

Campbell Court-house, a post-village, capital of Campbell co., Va.

Camp'bellford, a post-village of Seymour township, Northumberland co., Ontario (Canada), on the river Trent, has great water-power and considerable manufactures. Pop. about 1000.

Campbellites. See DISCIPLES OF CHRIST.

Camp'bell's, a township of Clarke co., Ala. Pop. 401.

Campbell's Station, a post-village of Knox co., Tenn. Here Gen. Burnside's army was attacked Nov. 16, 1863, by the Confederates under command of Gen. Longstreet. The engagement lasted from noon till dark, the Confederates being repulsed. Pop. in 1870, 1807.

Camp'bellsville, a post-village, capital of Taylor co., Ky., 75 miles S. S. W. of Frankfort. Pop. 512.

Camp'bellton, a post-village, capital of Campbell co., Ga., on the Chattahoochee River, about 20 miles S. W. of Atlanta. Pop. 119.

Campbelton, a royal borough and seaport of Scotland, in the county of Argyle, and near the S. end of the peninsula of Cantire, 65 miles W. S. W. of Glasgow. It has a good harbor on the E. coast of Cantire, is the chief town in Argyleshire, and is a favorite resort in summer. Here are more than twenty distilleries of whisky. Pop. in 1871, 6628.

Camp Branch, a township of Shelby co., Ala. P. 637.

Camp Branch, a township of Cass co., Mo. P. 1258.

Camp Branch, a township of Warren co., Mo. P. 901.

Camp Colora'do, a post-village, capital of Coleman co., Tex.

Camp Creek, a township of Rutherford co., N. C. Pop. 1007.

Camp Creek, a township of Pike co., O. Pop. 743.

Cam'pe (JOACHIM HEINRICH), a German philanthropist and writer on education, was born in Brunswick in 1746. He was appointed superintendent of schools in the duchy of Brunswick in 1787, after which he was the proprietor of a publishing-house. He wrote several popular books for the instruction of youth, among which is "Robinson the Younger." Died Oct. 22, 1818.

Campeach'y, a state of Mexico, is bounded on the N. by Yucatan, on the E. by the Caribbean Sea, on the S. by Belize and Guatemala, and on the W. by the Gulf of Campeachy. Area, 23,958 square miles. Many ruins of ancient cities have been found in this province, the most extensive of which are the ruins of Tekel. Chief town, Campeachy. Pop. in 1868, 80,366.

Campeachy, a city of Central America and the principal seaport of Yucatan, is situated on the Gulf of Mexico and the W. coast of that peninsula, 90 miles S. S. W. of Mérida; lat. 19° 50′ N., lon. 90° 33′ W. It contains many good stone houses, a college, about six churches, several convents, and a theatre. The harbor is capacious, but shallow. Logwood, wax, and cotton are exported from this port. Pop. about 18,000.

Campeachy Wood, a name of LOGWOOD (which see).

Cam'per (PIETER), M. D., PH. D., born at Leyden May 11, 1722. He became professor of medicine at Amsterdam in 1755, and at Groningen in 1765. He wrote a number of works on anatomy and physiology, and gained distinction as a lecturer as well as a writer. Among his works is "Anatomico-Pathological Demonstrations" (1760-61). He discovered the presence of air in the bones of birds. In 1785 he was chosen a foreign associate of the Academy of Sciences in Paris. Died April 7, 1789.

Cam'perdown, a village of Holland, 27 miles N. W. of Amsterdam, famous for the victory gained off its coast by the English, under Admiral Duncan, over the Dutch, commanded by Admiral de Winter, Oct. 11, 1797.

Camp Halleck, a post-township of Elko co., Nev. Pop. 160.

Camp'hausen (LUDOLF), a Prussian statesman, born at Hünshoven in 1803. He became president of the council of ministers in Berlin in Mar., 1848, resigned in June of that year, and was soon appointed ambassador to the Diet at Frankfort. In 1851 he retired from political life.

Camphausen (OTTO), a Prussian statesman, born Oct. 12, 1812, was appointed minister of finance in 1869. Through him the corn-tax and other burdensome taxes have been removed and replaced.

Camphene, or **Camphine,** a term applied to purified oil of turpentine, obtained by rectifying it over dry

chloride of lime. It consists of 10 atoms of carbon combined with 8 of hydrogen, and is represented by the equivalent number 68. Camphene has been burned in lamps for the purpose of illumination, but many fatal accidents having resulted from its use, it has been superseded by coal oil or rectified petroleum. Ordinary camphor is a protoxide of camphene, which is sometimes called camphogen. Borneo camphor is by some chemists considered to be a binoxide of camphene.

Cam'philene, or **Artificial Camphor,** is obtained from the oil of turpentine, by acting on it with dry vapor of hydrochloric acid, and keeping the whole at a low temperature by immersing the vessel in a freezing mixture. A solid substance is produced in the form of white crystals, with the taste and aromatic smell of natural camphor. It is regarded as a hydrochlorate of camphene.

Camp Hill, a post-township of Tallapoosa co., Ala. Pop. 373.

Camphine. See CAMPHENE.

Cam'phogen [from *camphor*, and the Gr. γεννάω, to "produce," because from it is obtained artificial camphor], a synonym of CAMPHENE (which see).

Cam'phor [Lat. *camphora;* Sp. *alcanfor* or *canfor;* Arabic *al kâfoor*, not improbably derived from the Sanscrit *khapur*, a name applied to several fragrant plants] is a concrete substance found in many plants, particularly those of the order Lauraceæ. The greater part of the camphor of commerce is the produce of the camphor laurel or camphor tree (*Camphora officinarum*, formerly known as *Laurus camphora*), a native of China, Japan, Formosa, and Cochin-China, and which has been introduced into Java and the West Indies. The camphor laurel is a tree of considerable height, with evergreen leaves and yellowish-white flowers in panicles. The fruit is not unlike a black currant. Every part of the tree smells strongly of camphor. The wood is much valued for carpenter's work. In the extraction of camphor the wood is chopped up and then steeped and boiled in water, when the steam carries off the camphor in vapor. The camphor is deposited around the straw (with which the head of the still is filled) in minute grains. The crude camphor is heated in a vessel, from which the steam is allowed to escape at a small aperture. The camphor sublimes as a semi-transparent cake. Camphor was unknown to the Greeks and Romans, and was first brought to Europe by the Arabs. It is a white, tough solid, slightly lighter than water. It is sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid and the essential oils. It fuses at 347°, and boils at 399°, is very inflammable, and burns with a white smoky flame. When set fire to upon water it floats with a curious rotary motion. It has a peculiar aromatic taste and a characteristic odor.

Camphor is used in medicine, internally and externally, as a stimulant. In small doses it is an anodyne and antispasmodic; in very large doses a narcotic poison. Its alcoholic solution (spirits of camphor) and liniments in which it is an ingredient are much used in sprains and bruises, chilblains, and chronic rheumatism. Paregoric is a camphorated tincture of opium. The effluvium of camphor is very noxious to insects, and it is therefore much used for preserving specimens in natural history, as well as clothing.

The Borneo camphor, sometimes called hard camphor, is the produce of *Dryobalanops aromatica*, a large tree of the order Dipteraceæ. The camphor is obtained by cutting down the tree and splitting it into small pieces, being found in crystalline masses in natural cavities of the wood. To this substance the Chinese ascribe extraordinary medicinal virtues, so that it is taken in exchange by them for more than fifty times its weight of common camphor. It is seldom brought to Europe as an article of commerce. The tree yields also a pale-yellowish limpid fluid, which gushes out when deep incisions are made in the tree with an axe, and which is called liquid camphor, camphor oil, or borneole. When this oil is distilled it yields a light fragrant liquid called borneene, which is used in perfumery. It is sometimes imported into Europe. It has a smell somewhat resembling that of camphor, but more like oil of cajuput. It is supposed that from this fluid the hard camphor is deposited. REVISED BY C. W. GREENE.

Campido'glio, Pala'zzo del, the name of a palace or pile of buildings erected by Michael Angelo on the Capitoline Hill in Rome, on the site of the ancient Capitol. Campidoglio appears to be a corruption of *Capitolium*.

Campi'nas, or **São Carlos,** a city of Brazil, about 65 miles N. of São Paulo. Much sugar is produced here. Pop. about 6000.

Cam'pion, or **Campian** (EDMUND), a learned Catholic priest, born in London in 1540. He visited Rome in 1573, and having joined the Jesuits returned to England on a mission. He challenged the clergy of the Anglican Church to dispute with him. In 1581 he was convicted on a charge of treason, and put to death Dec. 1. He was author of a "History of Ireland" and other works.

Cam'po Bas'so (formerly called **Molise**), a province of Central Italy, is bounded on the N. by Chieti, on the N. E. by the Adriatic Sea, on the S. E. by Foggia, on the S. by Benevento, and on the W. by Caserta. Area, 1778 square miles. The country is mountainous and sterile, and there is very little industry. Chief town, Campo Basso. Pop. in 1871, 363,943.

Campo Basso, a fortified city of Italy, capital of the province of Campo Basso (formerly Molise), is on the declivity of a mountain, about 55 miles N. N. E. of Naples. It has a fine cathedral, a ruined castle, a college, several convents and palaces of the nobility; also celebrated manufactures of cutlery and arms. Pop. 13,354.

Campobel'lo, a town of Sicily, in the province of Trapani, 50 miles S. W. of Palermo. Pop. 5141.

Campobello, an island in Passamaquoddy Bay, 2 miles E. of Eastport, Me. It is a part of Charlotte co., New Brunswick. It is 8 miles long, its N. point being in lat. 44° 57′ N., lon. 66° 55′ W. Copper and lead ores exist in the island. The inhabitants are chiefly engaged in the herring, cod, and mackerel fisheries. Pop. in 1871, 1073.

Campo Bello, a post-township of Spartanburg co., S. C. Pop. 2951.

Campobel'lo di Lica'ta, a town of Sicily, in the province of Girgenti, 15 miles N. W. of Licata. Here are mines of sulphur. Pop. 5764.

Cam'po de Cripta'na, a town of Spain, in the province of Ciudad Real, about 50 miles N. E. of Ciudad Real. It has manufactures of coarse cloths, and a trade in grain and fruit. Pop. about 5500.

Cam'po For'mio, Campio Formio, or **Campo Formido,** a village of Northern Italy, in Friuli, about 66 miles N. E. of Venice and 7 miles S. W. of Udine. An important treaty of peace was concluded here between Austria and the French republic, Oct. 17, 1797. Alarmed by the recent victories gained by Bonaparte in Italy, Austria was inclined to peace, and negotiated with the French general this treaty, by which she ceded the Netherlands and recognized the independence of the Cisalpine republic, including Milan, Mantua, and other parts of Austrian Italy. In return for these concessions the French gave up Venice, Istria, and Dalmatia to Austria.

Camp of Seventh Cavalry on Saline, a township of Ellis co., Kan. Pop. 80.

Campoma'nes (PEDRO RODRIGUEZ), COUNT, an eminent Spanish author and minister of state, was born in the Asturias July 1, 1723. He gained a high reputation by his writings on political economy, and was distinguished for his probity and enlightened policy. He became president of the royal council of Castile in 1788, and afterwards a minister of state. Among his works are a "Discourse on the Promotion of Popular Industry" (1774) and a "Discourse on the Popular Education of Mechanics" (1775). Died Feb. 3, 1802.

Cam'po Mayor', a fortified town of Portugal, in Alemtejo, about 16 miles N. W. of Badajos. Pop. 5277.

Camp Point, a village and township of Adams co., Ill. It has two mills, a manufactory of agricultural implements, and one weekly newspaper. There is a fine public-school building. Pop. 2130.

GEO. W. CYRUS, ED. CAMP POINT "JOURNAL."

Camp Stur'gis, a township of Ellis co., Kan. P. 320.

Camp'ton, a township of Kane co., Ill. Pop. 957.

Campton, a post-village, capital of Wolfe co., Ky., about 65 miles E. S. E. of Lexington. Pop. 67.

Campton, a post-township of Grafton co., N. H. It has four churches and manufactures of woollens, lumber, etc. Pop. 1226.

Camp'tonville, a post-village of Yuba co., Cal.

Cam'pus, a Latin word signifying a "plain," "an open field," any level surface, as of the sea. It was sometimes used to denote a field of battle, and was applied figuratively to a subject of discourse, a field of debate or speculation. The grounds about college buildings in some places are called the campus.

Cam'pus Mar'tius (*i. e.* the "field of Mars"), a celebrated plain and open field of ancient Rome, was on the left bank of the Tiber, outside of the walls of the city. It was the place in which the Roman youth performed military exercises and evolutions, and in which the *comitia* assembled for the purpose of enacting laws and electing magistrates. It was subsequently used as a public park or pleasure-ground.

Campveer', Kampveer, or **Veer,** a decayed maritime town of the Netherlands, province of Zeeland, on the N. E. coast of the island of Walcheren, 4 miles N. N. E. of Middelburg. It has a beautiful cathedral, and a town-house with an elegant tower. The Scotch Staple was transferred from Bruges to Campveer in 1444, after which this town had peculiar trading relations with Scotland for several centuries.

Camus (CHARLES ÉTIENNE LOUIS), a French mathematician, born at Crécy-en-Brie Aug. 25, 1699. He was a member of the Academy of Sciences, which in 1727 sent him, with Maupertuis, to Lapland, to determine the figure of the earth. He wrote scientific works. Died Feb. 2, 1768.

Cam'wood, or **Bar'wood,** a dyewood which yields a brilliant but not permanent red color, and is used along with sulphate of iron as a dyestuff. It is the wood of the *Baphia nitida*, a tree of the order Leguminosæ, a native of Angola.

Ca'na, a village of Galilee, was the scene of Christ's first miracle. (John ii.) Its site is supposed to be indicated by some ruins 6 miles N. of Nazareth. The natives call this place *Cana-el-Jelil*.

Ca'naan, an ancient patriarch, was a son of Ham and the ancestor of the Canaanites, who lived in Palestine before the Israelites conquered it. Palestine was called the land of Canaan by the Hebrew writers. It was bounded on the E. by the Jordan and on the W. by the Mediterranean Sea. (See PALESTINE.)

Canaan, a post-township of Litchfield co., Conn., at the crossing of the Connecticut Western and Housatonic R. Rs. The scenery here is very fine. It has a national bank at Falls Village. Pop. 1257.

Canaan, a township of Henry co., Ia. Pop. 784.

Canaan, a post-village of Somerset co., Me., about 35 miles N. by E. from Augusta. It has manufactures of lumber and cloth. Pop. of Canaan township, 1472.

Canaan, a post-township of Gasconade co., Mo. Pop. 1107.

Canaan, a post-township of Grafton co., N. H. It has manufactures of straw-board and boots and shoes, and has one newspaper. Pop. 1877.

Canaan, a post-township of Columbia co., N. Y., on the Boston and Albany R. R., 34 miles S. E. of Albany, contains several villages, has valuable water-power, several paper-mills and other manufactories, four churches, and a slate quarry. The township has two communities of Shakers, who have a farm of 1400 acres, where they raise garden-seeds and manufacture brooms, etc. Pop. 1877.

Canaan, a township of Athens co., O. Pop. 1543.

Canaan, a township of Madison co., O. Pop. 729.

Canaan, a township of Morrow co., O. Pop. 1109.

Canaan, a post-township of Wayne co., O. Pop. 1997.

Canaan, a post-township of Wayne co., Pa. Pop. 680.

Canaan, a post-township of Essex co., Vt. It has manufactures of starch and lumber. Pop. 419.

Can'ada, Dominion of, a country of North America which is to embrace all of the American possessions of Great Britain lying N. of the U. S. Founded in 1867 by the union of the provinces of Canada West, Canada East, New Brunswick, and Nova Scotia, it embraced in 1872, besides these four provinces named, also the provinces of Manitoba and British Columbia and the North-west Territory. The only portion of British North America which in 1873 had not yet joined the Dominion of Canada was the province of Newfoundland, Prince Edward Island having joined the Dominion in June of that year. It is bounded on the S. by the U. S., on the E. by the Atlantic, on the N. by the Arctic Ocean, and on the W. by the Pacific. It comprises the whole country N. of the U. S., with the only exception of the Territory of Alaska and of Greenland. A part of the southern frontier is formed by the lakes Superior, Huron, Erie, and Ontario. The frontier-line which separates it from the State of Maine was fixed in 1843 by the Ashburton Treaty. The long-pending dispute between Great Britain and the U. S. as to the island of San Juan in the Pacific was in 1872 decided by the arbitration of the emperor of Germany. The principal rivers on the Atlantic side are the St. Lawrence, the Ottawa, the St. Maurice, and the Saguenay, which enter the St. Lawrence from the left. On the Pacific side the most important rivers are the Columbia and the Fraser. The Saskatchewan, rising in the Rocky Mountains, traverses fifteen degrees of longitude, or a distance of at least 900 miles, and falls into the great Lake Winnipeg in 53° N. lat. This lake is connected with Hudson's Bay, the most remarkable indentation of the American coast, by the Nelson or Port Nelson, about 500 miles in length. Lake Athabasca, situated about lat. 58° N. and lon. 110° W., receives, among others, the Peace River and the Athabasca, a large stream rising in the Rocky Mountains near the source of the Columbia. The Mackenzie, entering the Arctic Ocean, is one of the largest rivers on the globe.

Climate and Soil.—The climate of the Atlantic provinces is similar to that of Sweden and Norway. The heat of summer and the cold of winter are greater here than in the corresponding latitudes in Europe. At Montreal the mercury in winter often sinks to 24° or 30° below zero, and rises in summer to 96° or 100°. The climate of Ontario (Canada West) is milder than that of Quebec (Canada East), because it is farther S., and is modified by the vicinity of the great lakes. Peaches flourish and ripen on the N. shore of Lake Erie, and near Toronto on Lake Ontario. The transition from winter to summer is sudden, especially in the north-eastern parts of Canada. The most fertile portion of this part of the Dominion is Ontario, especially the peninsula formed by Lakes Huron, Erie, and Ontario. The climate of British Columbia, like that of the Pacific coast in general, is more uniform and moderate than that of the Atlantic provinces. The soil of the peninsula formed by Lakes Huron, Erie, and Ontario produces good crops of wheat and other grains. The greater part of Canada is covered with forests of good timber, from which large quantities of pine lumber are exported. The province of Quebec abounds in romantic and picturesque scenery. Seven miles below Quebec is the cataract of the Montmorenci, with a perpendicular descent of 240 feet. Among other remarkable objects is the sublime scenery of the Saguenay, which flows between high and precipitous rocks. The northern portion of the Dominion will undoubtedly be doomed to everlasting sterility on account of the severity of the climate. The country on the lower Saskatchewan and on the Red River, it is believed, will be long among the most fertile regions of the Dominion.

Area and Population.—The area of the Dominion in 1872 was estimated at 3,389,442 square miles, being almost equal to the extent of the U. S. The population of the four old provinces of the Dominion (Ontario, Quebec, New Brunswick, and Nova Scotia), according to the census of 1871, was 3,484,924, against 3,089,659 in 1861—an increase in ten years of 12.79 per cent. The population of Manitoba, according to the census of 1870, was 11,953. The population of British Columbia was in 1871 estimated at 50,000, and that of the North-west Territory at 28,700; total for the whole Dominion in 1871, 3,575,577. The number of immigrants entering the St. Lawrence in 1870 was 44,475; the number who entered from the U. S. was estimated at 24,544; making a total immigration during the year of 69,019—a figure considerably exceeding the immigration of any previous year. During the period from 1851 to 1870 the aggregate number of arrivals by the St. Lawrence was 560,996, and of arrivals from the U. S. 399,461. The number of those who settled in Canada was calculated to be 418,910, while the remainder went on to the U. S. The large majority of the population of Quebec (847,615 out of 1,111,566) are of French origin; in all the other provinces the descendants of the British largely predominate. The city of Ottawa has been made the capital and seat of legislation. The largest cities are Montreal, Quebec, Toronto, St. John, Halifax, and Hamilton. The Indian population in Canada proper is estimated at 25,673; of the former Hudson's Bay Territory, 42,870; of British Columbia, 18,000; total, 86,543.

Church and Education.—There is no state Church in the Dominion and in the whole of British North America. According to the census returns of 1861, there were in the four original provinces of the Dominion, 1,372,913 Roman Catholics, 471,946 Presbyterians, 465,572 Anglicans, 431,927 Wesleyans and Methodists, 189,080 Baptists, 29,651 Lutherans, 17,757 Congregationalists, 76,176 of miscellaneous creeds, 18,860 of "no religion," and 16,682 "no creed stated." Roman Catholics were most numerous in the province of Quebec, and they also constituted a plurality in New Brunswick; the leading religious denomination of Ontario is the Wesleyans, and the leading denomination of Nova Scotia the Presbyterians. The provinces of Quebec and Ontario have separate school laws adapted to the religious elements prevailing in either. The common schools are supported partly by government and partly by local self-imposed taxation, and occasionally by the payment of a small fee for each scholar. All common-school teachers must pass an examination before a county board of education or receive a license from the provincial normal school. Similar arrangements exist in the other provinces, nearly all the public schools of which possess endowments of land and personal property.

Commerce, etc.—Canada enjoys great advantages for commerce by the navigation of the great lakes and the river St. Lawrence, which give the Canadians ready access to the

markets of the U. S. The greater portion of the Canadian exports go to the U. S., while the greater part of the imports are from Great Britain. The trade is also facilitated by several canals and railways. The Rideau Canal, 135 miles long, extends from Kingston, on Lake Ontario, to the Ottawa River, and the Welland Canal connects Lake Erie with Lake Ontario. The principal railways of Canada are the Grand Trunk Railway (1377 miles), which connects Montreal with Detroit (Mich.) on one hand, and with Portland (Me.) on the other; the Great Western (351 miles), which with several branches traverses the south-western part of Ontario; the European and North American Railway (108 miles), which extends from Bangor (Me.), *viâ* St. John, to Point du Chêne, in New Brunswick; the Nova Scotia Railway (145 miles), which extends from Halifax to Pictou, on the Gulf of St. Lawrence, with a branch line (32 miles) from Halifax to Windsor, on the Bay of Minas; the New Brunswick and Canada Railway (116 miles), which extends from St. Andrew's on the sea-coast to Richmond, with branch lines to St. Stephen, Woodstock, and Houlton. At the beginning of the year 1872 over 3000 miles were in operation, besides which 1100 more were in the process of construction, and charters had been obtained for more than 800 miles in addition, apart from the Canadian Pacific Railway, which is to be 2500 miles long, will connect Lake Nipissing with some port in British Columbia, and is to be completed in ten years. The longest among the railways in the course of construction is the Intercolonial Railway, which will extend from the Grand Trunk at Rivière du Loup to Truro, Nova Scotia, a distance of 499 miles. The receipts and expenditures for the financial year ending June 20, 1870, amounted to $22,895,077.87, each. The monthly publications of the revenue and expenditure for the fiscal year ending June 30, 1871, showed a very large surplus of revenue over expenditure. The debt of the Dominion on July 1, 1870, amounted to $115,993,706; total assets, $37,783,964; net debt, $78,209,742. The fisheries of British North America are the finest in the world, and inexhaustible. The value of fish exported in 1871 exceeded $7,000,000, and the minister of marine and fisheries states the aggregate annual value of the fish-product of the provincial fisheries at nearly $17,000,000. The total exports of Canada in 1870 were valued at $73,573,540, of which $28,772,312 were exported to the U. S. The imports for that year amounted to $71,239,187, of which $24,724,071 were imported from the U. S. The merchant-navy of the Dominion consisted in 1868 of 5822 vessels, of a total burden of 776,343 tons.

Government.—The constitution of the Dominion, which was adopted in 1867, is formed after the model of the mother-country. The Parliament consists of the queen of Great Britain, an upper house, styled the senate, and a house of commons. The queen is represented by a governor-general, who is appointed by the Crown, and exercises his authority with the aid and advice of a council appointed by himself. The senate consists of not more than seventy-two members, who are chosen by the governor-general, and hold the appointment for life. The house of commons consists of about 180 members, elected by the people. Each of the provinces has also its local or provincial legislature and administration, with a lieutenant-governor at the head of the executive. The troops maintained by the imperial government have been reduced to 5000 men. The militia, which was organized in 1868 by a statute of the first federal Parliament, consists of all male British subjects between eighteen and sixty, divided into an active and a reserve force. In 1870 the number of men on the rolls was 675,000. The naval forces of Canada in 1871 consisted of eight armed screw steamers, maintained on the great lakes and the river St. Lawrence, and two coast-steamers, which are available as gunboats.

History.—The first settlement made by Europeans in Canada was made in 1541 at St. Croix's Harbor by Jacques Cartier, a French navigator, who sailed up the St. Lawrence. The French founded Quebec in 1608, after which numerous French colonists settled in Lower Canada, near the St. Lawrence River. The English general Wolfe captured Quebec in 1759, and the conquest of Canada was completed in 1760. Upper Canada was settled mostly by English emigrants. In 1791 Canada was divided into two provinces, called Upper and Lower Canada (afterwards called Canada West and Canada East). Both of these provinces were disturbed by an insurrection in 1837, and were reunited in 1840. By an act of the British Parliament, which was passed Mar. 29, 1867, and came into force June 1 of that year, the Canadian provinces, Ontario and Quebec, and New Brunswick and Nova Scotia, were federally united into one Dominion of Canada. The legislature of Newfoundland declared in favor of joining the Dominion, but the people, in Nov., 1869, by a large majority, declared against it. From the Hudson's Bay Company the government of the Dominion purchased in the same year its vast territory. An insurrection of colonists and natives, who protested against having their land treated as a dependent territory, induced the government to organize in 1870 that part of the newly-purchased territory which is situated between lon. 96° and 99° W., and the U. S. boundary-line and lat. 50° 38′ N., as an independent province of the Dominion, under the name of Manitoba. The immense unorganized territory beyond the limits of Manitoba is called the North-western Territory. On Mar. 31, 1871, British Columbia was received into the Dominion. Invasions of Canada by armed Fenians from the U. S. were attempted in 1866 and 1870, but were repelled without difficulty. The long-pending controversies with the U. S. were mostly settled by the Washington treaty of 1871. In 1873 Prince Edward Island joined the Dominion.

A. J. Schem.

Canada, a township of Labette co., Kan. Pop. 480.

Canada Balsam [Lat. *Balsamum Canadense*] is a turpentine or oleoresin obtained from the *Abies balsamea*, a species of fir which grows in Canada and the U. S., and is sometimes called balsam fir. It is a pale yellow, transparent liquid, having a peculiar and agreeable odor. When it exudes from the bark it has the consistence of honey, but by age and exposure to air it becomes solid. It is used in medicine, in photography, in mounting objects for the microscope, and is an ingredient in varnishes. It is also valuable to opticians, who use it as a cement.

Canada Goose, or **Wild Goose** (*Anser Canadensis*), an inhabitant of the entire continent of North America, belonging to the order Natatores, family Anatidæ, is thirty-five inches long, brownish above, lighter beneath, with the head, neck, bill, and feet black. "It spends the winter in the warmer regions, chiefly in the South-western States and in the everglades of Florida, but in spring moves northward in large flocks." While on the wing the birds generally arrange themselves in a <-shaped figure (though sometimes they fly in a straight line), led by an experienced gander, who frequently gives utterance to his familiar *honk*. "Their spring migrations usually take place from the 20th of March to the last of April, but are wholly dependent upon the state of the season. They breed at the north, and linger there till the hard frosts warn them that the lakes and streams will soon be frozen over." While performing their long journeys they usually fly at a great height, probably a quarter of a mile or more.

Canada Goose, or Wild Goose.

Canadian, a township of Mississippi co., Ark. Pop. 330.

Canadian River rises in the N. E. part of New Mexico, and flows through the N. part of Texas into the Indian Territory. Its general direction is nearly eastward. After a course of about 900 miles it enters the Arkansas River about 50 miles W. of Fort Smith. The North Fork of the Canadian is sometimes called Rio Nutria. It rises in the N. E. part of New Mexico, flows in an E. S. E. direction, and enters the Canadian about 50 miles from its mouth. Length, estimated at 600 miles.

Can'adice, a post-township of Ontario co., N. Y. Pop. 905.

Canajohar'ie, a post-village and township of Montgomery co., N. Y., on the S. bank of the Mohawk River and on the Erie Canal, and opposite Palatine Bridge on the New York Central R. R., 55 miles W. N. W. of Albany. The village has five churches, an academy, a school district library of 800 volumes, a weekly paper, two national banks, a planing mill, two malt-houses and an extensive paper-bag factory. The township has another academy, six other churches, six cheese-factories, and a woollen mill. Pop. of village, 1822; of township, 4256.

Ed. "Radii and Tax-Payers' Journal."

Canal', a post-township of Venango co., Pa. P. 1205.

Canal. See Navigation, Inland, by J. J. R. Croes.

Canal', or **Canalet'to** (Antonio), an Italian painter, was born at Venice Oct. 18, 1697. He worked in his native city, and acquired a high reputation. He painted many views of Venetian palaces, canals, etc., which are highly commended by some critics, but others charge him with mannerism. He is said to have been the first who used the camera obscura for artistic purposes. Died Aug. 20, 1768.

Canalet'to, a surname of Bernardo Belotto, a Venetian painter, born in 1724. He was a nephew and pupil of the preceding. He worked in Rome, London, Dresden, and other places, and excelled in perspective. He painted many buildings and the environs of cities. Died at Warsaw in 1780.

Canal' Do'ver, a post-village of Dover township, Tuscarawas co., O., on the Tuscarawas River, the Ohio Canal, the Lake Shore and Tuscarawas Valley R. R., and the Tuscarawas branch of the Cleveland and Pittsburg R. R. It has several mills and iron-furnaces, and one weekly paper. Pop. 1593.

Canal' Ful'ton, a post-village of Stark co., O., on the Ohio Canal and on the Lake Shore and Tuscarawas Valley R. R., and on the Tuscarawas branch of the Cleveland and Pittsburg R. R., 56 miles S. of Cleveland. Pop. 1048.

Canals' of Can'ada, The, may be classed under the following heads:

1st, The St. Lawrence and lake navigation, including the Lachine Canal, the Beauharnois, Cornwall, Farran's Point, Rapide Plat, and Galops canals, commonly designated the St. Lawrence canals, in the river St. Lawrence, surmounting its rapids between Montreal and Kingston; and the Welland Canal, between Lake Ontario and Lake Erie, surmounting the falls and rapids of Niagara; to which may be added the Burlington Bay Canal, through a sandbar at the mouth of that bay, at the head of Lake Ontario.

2d, The Ottawa and Rideau navigation, including St. Anne's Lock, the Carillon, Chute à Blondeau, and Grenville canals, surmounting the rapids of the Ottawa between Montreal and the city of Ottawa; and the Rideau Canal, connecting the river Ottawa with the St. Lawrence at Kingston, through the rivers Rideau and Cataraqui.

3d, The Richelieu and Champlain navigation, being the St. Ours Lock and Chambly Canal, surmounting obstacles on the river Richelieu from the St. Lawrence to Lake Champlain.

4th, The river Trent navigation, consisting of locks and dams on the river Trent, a large tributary of Lake Ontario, extending into the interior of the Newcastle district, originally proposed as a line of communication with Lake Huron.

5th, The St. Peter's Canal, connecting the Bras d'Or, a bay of the sea in the interior of the island of Cape Breton, with St. Peter's Bay, on the S. coast of the island.

Along with the foregoing may be noticed the following projected canals: the Caughnawaga Canal, to connect Lake Champlain with the river St. Lawrence above the Lachine Rapids; the Ottawa and Huron Canal, to form a direct and short route between Montreal and Lake Huron by the Ottawa and French River; a canal at Sault Ste. Marie; the Huron and Ontario, or Georgian Bay Canal; the Bay Vert Canal, from the Gulf of St. Lawrence to the Bay of Fundy; and the Shebandowan and Lake of the Woods navigation, forming 311 miles of the route from Lake Superior to Red River.

The canals of Canada derive an extraordinary importance from the vast extent and importance of that great system of inland navigation, the river St. Lawrence and its lakes, the obstructions in which they are almost exclusively designed to overcome.

When we consider the great extent of fertile lands of the States and provinces adjoining it, and the still vaster territories behind them of fertile prairies and wooded lands in the U. S. and Canada, for the traffic of which this great water-system must be the highway; and also that as the western extremity of Lake Superior reaches the middle of the continent, a considerable trade with the Pacific will naturally be directed to it to gain the advantage of cheaper transport by water,—it will be seen how enormous must be the amount of future traffic passing through the canals constructed to avoid or surmount the obstacles in its course.

With the extent and character of the great North-western States and Territories of the Union the public are already familiar. The States of Wisconsin, Iowa, Minnesota, Michigan, Illinois, Indiana, and Ohio, for whose surplus produce the St. Lawrence and its great lakes are more or less the natural highway to the ocean and European markets, embrace a grain-growing region unequalled on this continent, or perhaps in the world. It may be sufficient to remind the reader that it is but little more than thirty years since settlement and cultivation had advanced sufficiently in the territories on the Western lakes to have any considerable amount of surplus produce to export, but that their progress since has been so great that in 1871 the grain or its equivalent in flour brought to the five principal ports on these lakes for shipment amounted to upwards of 140,000,000 bushels, though the productive capacity of the region that yielded it is still far from being fully developed, and the territories in rear of it as yet comparatively unoccupied.

The country on the Canadian side of the boundary, being hitherto much less known, may require a little more notice. The valley of the Saskatchewan or Nelson River and its tributaries resembles very much in formation, soil, and climate, as well as extent, that of the Volga of Russia, the greatest river in Europe. The region N. W. of it, drained by the Athabasca and the Peace River, the main arms of the river Mackenzie, each about a thousand miles in length, is fully as suitable for settlement; the Peace River country especially being superior in soil, both richly wooded and interspersed with rich, well-watered prairies, with a climate better than that of Red River Settlement or Northern Minnesota.

The extent of country within the valleys of these three rivers, and within the limits of successful cultivation of wheat, estimated on carefully selected evidence confirmed by recent explorations, is equal to ten times the area of the State of New York. It is remarkable for the great extent of very fertile and arable prairie and wooded land it contains, its vast coal-fields, and its abundance of petroleum. Iron ore is found in it, and gold that promises to afford profitable diggings has recently been definitely ascertained to exist on Peace River, besides what was already found on the Saskatchewan.

The cost of transport will no doubt check the exportation of heavy produce from the remote parts of these territories especially; but there are farm products, such as flax, wool, cured meats, etc., that can be carried with profit much farther than grain, which has hitherto been the chief export of the West; and every improvement in our means of transport, by canals or otherwise, that reduces the cost of it, will extend the distance from which grain can be exported. The gold of the mountain countries westward, alike in the U. S. and Canada, will encourage settlement and stimulate commerce, compensating as a remittance, in payment for imports, for the reduced value, as such, of heavier products. The outward and inward traffic, from all sources, by the Northern Pacific and Canadian Pacific R. Rs. will, from the greater economy of transport by water, to the utmost possible extent, consistent with the destination of the freight, use the route by the great lakes, the St. Lawrence, and its canals.

Reverting to the North-west territories of Canada, it may be worth noticing here, as connected though remotely with the route by the great lakes and the St. Lawrence as a commercial highway, that it has been ascertained, by a recent exploration for the Canadian government by Mr. Horetzki, C. E., of Ottawa, that the valley of the Peace River offers a site for the Canadian Pacific Railway presenting several important advantages over any other route known or surveyed. Its summit-level in passing through the Rocky Mountains is less than 1700 feet in elevation over the sea (the Peace River being there large and navigable); that is, less than half the summit-elevation of the Yellow Head Pass, which previously was justly considered the most favorable known. The Peace River route, by passing farther N., avoids the exceedingly rugged, almost insurmountable, region between the Yellow Head Pass and the Frazer River, the *caput mortuum* on that route, and which would entail great crookedness and extraordinary cost. It also avoids the necessity for bridging that river and the chasm in which it flows. It has the advantage also of being free from the heavy falls of snow which the other passes at higher levels are subject to; and, as was

previously known as to the general character of the country, traverses to a greater extent the best lands for settlement.

From Fort Simpson, on the Mackenzie, about 400 miles N. of this route, that great river is navigable uninterruptedly downward for about 800 miles,* with a depth sufficient for the largest sea-going ships, to the Arctic Sea at its mouth, where there are whales in great abundance. The country between the Peace River and Fort Simpson is generally very fertile, arable land, and two-thirds of it is within the limits of successful wheat cultivation. Whale-fishing, as now carried on, has ceased to be profitable, owing to the competition of mineral and other oils, the increasing scarcity of whales, and their having to be sought farther into the Arctic, the dangers of the voyage, and the great distance the oil has to be carried—from the Arctic within Behring Strait to the Sandwich Islands, and thence home, in all about 24,000 miles. Were the Mackenzie connected by rail with the Canada Pacific Railway, the richest whale-fishing in the world could be rendered available, and 800 miles of transport on the Mackenzie, where coal and wood abound for steamers that might be used with great advantage in the fishing, and 1800 miles by rail, would bring the products of the fishing to Duluth on Lake Superior. Though the prospect of such communication be remote, it may be noticed in considering the area for which the St. Lawrence may be the commercial outlet.

The acquisition by Canada of the great territories formerly held by the Hudson's Bay Co., including so much valuable country, has greatly changed the position of Canada in relation to the improvement of the navigation of the St. Lawrence. Previously, it might be argued that it was absurd for the Canadian people to task their resources for the construction of a gigantic system of canals on the St. Lawrence to render it the great highway of the West, as the benefit of it would chiefly be to reduce the cost of transport and increase the value of the produce of the great Western grain-growing regions of the U. S.; but now that Canada has acquired an equal share of the vast fertile regions of the West, she has a common interest with the U. S. in the improvement of that great inland route of navigation, which must more or less be their common outlet. Though there may be antagonism between rival shipping-ports and routes of transport on the one side of the international boundary and the other, and large though such interests may be, they cannot be considered otherwise than secondary to that of the millions of producers, present and future, having a common interest in every work of improvement that tends to reduce the cost of transport, and thereby enhance the value of the products of the great regions of the West. With this view, the canals of Canada may be considered of important interest to the American people, especially now, since the right of using them for commercial purposes has been secured by the treaty of Washington.

Before describing the canals of Canada it may be suitable to take a brief view of the general character of the river St. Lawrence, and of the obstructions in its course which they are chiefly intended to overcome.

Notwithstanding these obstructions, it has certain specialities as a water-system which otherwise render it peculiarly suitable as a commercial highway for trade of the greatest magnitude. Its course is so free from minor sinuosities that though scarcely 2000 miles in length from its mouth at Anticosti to the W. end of Lake Superior, it extends as far into the continent as the Mississippi does with its course of 3160 miles; the upper part of which, even where navigable, is of insignificant capacity for transport compared with the great lakes of the St. Lawrence. Directness (which means shortness of route) and great capacity are most important advantages. The great proportion of it that consists of lakes and wide water—that is, three-quarters of its whole length—affording sea-room admitting of free navigation by sailing-vessels, is another important advantage. So also is the uniform height of its waters; from their being held in reserve in the great lakes, it never falls one-twentieth below its mean volume; and its navigation is free from all the disadvantages arising from low water that other rivers are liable to.

Its enormous volume also is attended with an important commercial advantage in the depth of water it affords on its rapids, which is such as to admit of large passenger steamers and lake vessels of 500 or 600 tons, if lightly loaded, passing as freely down through its vast swaying surges as the lightest bark canoe of the Indian descends the rapids of an ordinary river, and with an increased speed, instead of the delay necessarily attending the passage through the canals and locks which are so essential for vessels going upward.

The St. Lawrence drains an area of 565,000 superficial statute miles. The mean volume passing Niagara is given in the New York State reports as 389,000 cubic feet per second. But this is the drainage of only 237,300 square miles of the basin of the St. Lawrence. Before reaching the Galops Rapid it is augmented by that of the basin of Lake Ontario and all its tributaries, and has an average width of about a mile. Before reaching the Lachine Rapids it receives nearly half of the waters of the Ottawa; the remainder passes N. of the island of Montreal. The Ottawa, according to the careful measurements taken in the canal survey of it, has a mean discharge of 83,000 cubic feet per second.†

Between the seaports of Montreal and Quebec the St. Lawrence has an average width of a mile and three-quarters. Midway it receives the St. Maurice (which discharges as much water as the Ottawa) and other large tributaries. From Quebec it increases rapidly in width; below the island of Orleans, where still fresh water, it is eleven miles wide. At 100 miles lower it receives the Saguenay, nearly equal to the Ottawa in volume of discharge, besides other large rivers below it. Taking the 327,700 square miles of the basin of the St. Lawrence as yielding as much water in proportion to its area as the 273,000 above it, the total discharge of the St. Lawrence past Anticosti must at least be 926,035 cubic feet per second. But it is known by all observers that the tributaries of the lower St. Lawrence, coming from mountainous wooded regions, where the snow falls from four to eight feet in depth, deliver more water comparatively than its upper tributaries. With the smallest addition admissible for that difference, the total discharge of the St. Lawrence must be upwards of 1,000,000 cubic feet per second. Darby, the great American hydrographer, who surveyed the Mississippi, computed the mean discharge of the St. Lawrence as fully one-half greater than the Mississippi, but afterwards thought he had under-estimated the former.

Other rivers after their floods shrink to comparative littleness, but the St. Lawrence flows on at all seasons with unabated grandeur; and it remains to be determined by scientific observation how far any other river in the world exceeds the mass it pours to the Gulf, where the stern Laurentides and the lofty mountains of Notre Dame faintly skirt its remote horizon on the one side and the other.

As the treaty of Washington, besides securing the right of using the canals of Canada, provides that the river St. Lawrence, to and from the sea, "shall for ever remain free and open for the purposes of commerce to the citizens of the U. S.," the lower course of that river, with which the treaty secures unbroken communication, may now be considered as a subject of greater interest to Americans than heretofore. The right of in-shore fishing in the St. Lawrence and the Gulf, and of having fishing establishments along their coasts, will doubtless lead to great extension of the fisheries there and business connected with them. As the provisions necessary for their use can be supplied with much greater advantage from lake ports by the way of the St. Lawrence than otherwise, a considerable trade in that way will no doubt arise. This new interest in the lower St. Lawrence may justify its being noticed here in connection with its canals.

To ascend the St. Lawrence from the Atlantic we traverse the Gulf for 426 miles from the entrance of the Straits of Belle-Isle to the mouth of the river St. Lawrence, which is at an imaginary line from Cape Gaspe to the head of the island of Anticosti, and thence to the N. shore.

To Quebec, 400 miles, the river is navigable for the largest ships that float, including the Great Eastern. Thence to Montreal the distance is 160 miles; midway is Lake St. Peter. Extensive shoals in the upper part of it had originally a depth of only 11½ feet at low water. A channel has been dredged through them to the depth of nearly if not quite 20 feet at low water. It is 11½ miles in length and 300 feet wide at bottom. It was begun in 1844, and completed in 1865, and cost $1,347,018. Many large vessels, drawing from 18 to 23 feet laden, now ascend to Montreal harbor. The parliamentary commission recommend deepening this channel to 22, and ultimately to 24 feet.

The seaport of Montreal, 586 miles from the mouth of the St. Lawrence, is situated at the foot of the Lachine Rapids, which are surmounted by the Lachine Canal, 8½ miles in length, the first of the series of St. Lawrence canals. From the head of it, at Lachine, it is 15½ miles through Lake St. Louis to the "Cascades," which, together

* With the exception of the Stony Rapid above Fort Simpson, the Mackenzie is navigable throughout its course of 1000 miles into Slave Lake.

† This seems an under-calculation, being only two-thirds of the rate of discharge to its area in proportion to the St. Lawrence, which, being exposed to much evaporation, should be less for its area than the Ottawa.

with the "Cedars" and "Coteau" Rapids, are overcome by the Beauharnois Canal, 11¼ miles in length. Thence through Lake St. Francis it is 32¾ miles to the foot of the "Longue Sault" Rapids, which are surmounted by the Cornwall Canal, 11½ miles in length. At 5 miles farther, ascending the river, is "Farran's Point Rapid" and canal, ¾ of a mile in length. At 10½ miles farther by the river is the "Rapide Plat" and its canal, 4 miles in length. At 4½ miles is Galops Canal, 7⅝ miles in length, surmounting the "Pointe aux Iroquois," "Pointe Cardinal," and "Galops" Rapids. These, from Farran's to the "Galops" inclusively, are called the Williamsburg canals, terminating 7⅝ miles below Prescott. The descent from the head of the "Galops" to Montreal harbor, 111¼ miles, is 234 feet; Kingston, 178 miles from Montreal, is 59 miles above Prescott. From Kingston, where we enter Lake Ontario, to Port Dalhousie, at the foot of the Welland Canal, 27 miles from the head of that lake, the distance is 170 miles.

By the Welland Canal it is 27 miles to Lake Erie at Port Colborne, from which to the head of the lake, at the mouth of the Detroit River, as the entrance of the St. Lawrence is there called, is 232 miles. The Detroit River, 18 miles, Lake St. Claire, 25, and St. Claire River, 33 miles, reach to Lake Huron.

Lake Huron to its head at river St. Mary is 270 miles in length, river St. Mary up to the Sault, 47 miles; in all 625 miles of unbroken navigation from the head of the Welland Canal to the Sault Ste. Marie Canal, which is 1 mile in length; thence it is 7 miles to Lake Superior, which is 390 miles long to Fond du Lac, at the head of it; making in all the total distance of 2384 miles from the Atlantic at the entrance of the Straits of Belle-Isle, of which 71¾ miles are artificial navigation, and 2312¼ open navigation.

Reverting to the rapids between Montreal and Kingston, the navigation of them by steamboats was not attempted till 1842. Daily passenger steamers have run these rapids from Kingston to Montreal during open navigation for many years past. These steamers in returning ascend the Lachine, Beauharnois, and Cornwall canals, but ascend the Iroquois Rapid, Rapide Plat, and the Galops without entering the canals. It is not usual for freight vessels to run the lower rapids; but as the saving of time is very great in descending the rapids, compared with passing through the canals at much lower speed, besides detention in lockage, the improvement of the channel there necessary, so as to admit of the largest freight vessels fully laden descending the rapids at lowest water with perfect safety, has long been advocated, and is one of the works recommended to be prosecuted by the canal commission of the Canadian Parliament in 1871. In the "Galops Rapid" there is a short shoal, having not more than 9 or 10 feet water over it when lowest. In the "Longue Sault" the water is often over 50 feet in depth, but there is one shoal in it with only 12 feet of water over it. On the "Coteau Rapid" the depth is often over 20 feet, but there are two shoals with only from 7½ to 10 feet depth at lowest water. The "Cedars" are generally 12 to 25 feet in depth, but one or two shoals have been found with only 9½ to 10 feet depth at lowest water. In the "Cascades" there is a shoal having 6 or 7 feet in depth in dry weather; this is the shallowest spot in all the rapids of the St. Lawrence. In the lower part of the Lachine Rapids there are two shoals having not more than 8 feet over them at lowest water. The cost of completing a 12 to 13 feet channel from Lake Ontario level to Lachine by blasting has been estimated at $720,000, which probably might be much reduced by adopting a system of side-dams to gorge the channel as far as practicable.

Taking the works constructed to surmount the obstacles in the navigation of the St. Lawrence in the order in which they have been mentioned, the first is the Lachine Canal.

The Lachine Canal is 8½ miles in length, extending from the harbor of Montreal to the village of Lachine on Lake St. Louis. It surmounts the St. Louis or Lachine Rapids. Its construction was urged as a necessity as early as 1791; a grant by the legislature of £25,000 was obtained in aid of the project in 1815, on the recommendation of the governor-general, Sir George Prevost, who considered it important in a military point of view. In 1819 the grant of 1815 was repealed, and an act passed incorporating a joint-stock company for carrying out the design; but it proved abortive. In May, 1821, a bill was passed repealing its incorporation, and authorizing the construction of it by government in the month of July following. In 1825 the canal was opened for the passage of vessels. Its dimensions as then constructed were 28 feet in width at bottom and 48 feet at the water-line, with 4½ feet depth of water. It had seven locks, 100 feet long and 20 wide, built substantially of stone. The cost of that canal up to Mar., 1826, was $438,404.15, of which the British government contributed $50,000 and the province the remainder. This canal being found insufficient, a little before the union of the provinces of Lower and Upper Canada, Lieut.-Col. Phillpotts, R. E., at the instance of Earl Durham, made a report and estimate for the construction of a new line of canal, with locks 200 feet by 45, and 9 feet depth of water. After careful consideration of what were then considered to be the requirements of the trade of the great lakes, and with a view of satisfying the wants of Upper Canada, it was decided that the canal should be continued in the same site, and that it should be enlarged to its present dimensions (with the exception of the lowest two locks), which are as follows:

Breadth of the canal at bottom	80 feet.
" " " at water-surface	120 "
Dimensions of locks	200 by 45 "
Depth of water on sills, 2 locks	16 "
" " " 3 "	9 "
No. of locks 5	
Total rise of lockage	44½ feet.
Length of canal	8½ miles.

The two locks of 16 feet depth of water on sills were so made to allow the largest vessels then trading to Montreal to enter the first basin of the canal. During the enlargement navigation was not discontinued, the new locks being built by the side of the old ones. The total cost of this work, up to 1st July, 1867, is given, in the report of the department of works of Canada, for that year, as being $2.587,532.85; cost since for works and repairs to 1st July, 1870, $42,640.30. It was not till early in 1862 that the excavation of the enlargement was completed to its full width.

But, though this enlargement has been but so recently completed, the increase of trade by the St. Lawrence in the products of the West has been such as again to call for further enlargement and increased accommodation. It having been shown in evidence before the Canadian canal commission of 1871 that the Montreal entrance to this canal was quite insufficient, especially in view of the enlargement of the Welland Canal, and even now causing much delay, and that an additional entrance was necessary, so as to admit of one being used for vessels ascending and the other for those descending the canal, contracts have been entered into for the construction of a new entrance to the canal, with two locks, and of two new basins, and for the enlargement of present basin No. 2. One of the new basins is to be 1250 feet in length and 225 feet in breadth; the other is to be 540 feet in length by 260 in breadth. Both are to be 19 feet in depth. The locks are to be 270 feet long and 45 feet wide, with a depth of 18 feet of water on the mitre sills; the locks, and also the walls of the basins, to be of the most substantial structure and best quality of masonry, laid in hydraulic cement mortar, as usual. This is mentioned as indicating the common character of work of the Canadian canals. But though the length of 270 and breadth of 45 feet has been adopted for these locks, in accordance with the scale recommended by the Canadian canal commission for the St. Lawrence canals throughout, as well as the Welland Canal, the depth of 18 feet is exceptional, 12 feet being the standard depth recommended by the commissioners, together with the improvement of the channel of the St. Lawrence above Montreal, so as to give 14 feet of water throughout. The Canadian government will no doubt be governed by the practicability of obtaining that depth throughout without unreasonable outlay. But the depth of water in the locks should not be limited to the capacity of lowest water, but be made to correspond with the greater depth of channel that may be obtained in future.

It is to be observed that the scale of 200 feet by 45, with 12 feet of water on the sills, recommended by the commissioners, will admit vessels of about 1300 tons, instead of 700, which is the limit of the capacity of the lesser locks on this canal and others on the St. Lawrence, excepting the Cornwall Canal.

The navigation of the Lachine Canal is open in general for 210 to 220 days during the year, and may be safely counted upon from the last week in April to the last week in November. In some years its period of navigation is considerably longer. In 1839 it opened on the 11th of April; in 1852 it was open till December 16th; in 1849 it was open 234 days. The freight that passes through the Lachine Canal is much greater than that passing by the canals between Lake St. Louis and Lake Ontario, as the trade of the Ottawa and the Rideau Canal joins that of the St. Lawrence in Lake St. Louis, and the export of sawn lumber from the Ottawa is very great.

The next in succession of the St. Lawrence canals is the Beauharnois Canal, 11¼ miles in length, connecting Lake St. Louis with Lake St. Francis, and surmounting the "Cascades," "Cedars," and "Cotean" rapids. Previous to the construction of the Beauharnois Canal four short canals had been made which admitted of boats carrying thirty

barrels of flour, descending from Lake St. Francis to Lake St. Louis. Several small improvements were subsequently made on this part of the navigation of the St. Lawrence. In 1833 the increasing importance of the subject led the government of Lower Canada to appoint commissioners for the improvement of the navigation from Lake St. Louis to Lake St. Francis. Their engineer, Mr. Mills, made a survey with that view, and his reports and plans, which were for the construction of three short canals at the rapids, were approved of by a committee of the house of assembly, who recommended a grant of $960,000 for that purpose. The report, however, fell to the ground, and in 1839 Col. Phillpotts, before mentioned, recommended a canal on the N. side of the river for military reasons. After other projects had been entertained and abandoned, the present site, on the S. side, after much discussion, was adopted as the most favorable, on the recommendation of the chief engineer of the department of public works of Canada, and in 1842 contracts were entered into for the construction of it. The canal was opened at the close of the season of 1845, but it was found that its upper entrance was imperfect, its channel crooked, too shallow in dry seasons, and impeded by cross currents. On account of these and other difficulties, in the course of years up to a recent date considerable sums have been expended in constructing dams, regulating weirs, and dykes to give the required facilities for the trade passing through it, and the original difference of opinion as to which side is the best canal route exists up to this day. The work, however, was constructed in the same substantial manner and superior quality of masonry and workmanship as the Lachine Canal.

The present dimensions of the Beauharnois Canal are as follows:

Breadth at bottom	80 feet.
" " surface	120 "
Length of canal	11½ miles.
Total rise of lockage	82½ feet.
Dimensions of locks	200 by 45 "
No. of locks 9; depth of water on sills 9 feet.	

Total cost to 1st July, 1867, $1,611,424.11; works and repairs since to 1st July, 1870, $26,120.03.

The navigation of this canal is open on an average for 221 days of the year, opening about the 20th of April and closing about the 28th of November. Earliest opening on record, 12th of April; latest, 5th of May. Earliest closing, 24th of November; latest, 13th of December.

The Cornwall Canal is the next in ascending the St. Lawrence. It is on the N. side of the river, and extends from the town of Cornwall. It is 11½ miles in length, and surmounts the Longue Sault Rapids. This is the first of the St. Lawrence canals that was constructed on the present scale. In 1817 the governor of Upper Canada called the attention of the legislature of that province to the importance of improving the navigation of the river below Prescott, which is situated a few miles above the head of the rapids of the St. Lawrence. In 1818 a joint commission was appointed by the governments of Upper and Lower Canada, and reported favorably on the subject, recommending the construction of small canals of 4 feet depth of water. In this report the cost of transport from Montreal to Prescott, a distance of 119 miles, is stated as being then $16 a ton, and thence to Niagara $8. Nothing further was done till 1826, when, at the instance of the legislature of Upper Canada, a report was laid before it with estimates for such canals, and also others of larger dimensions, 8 feet in depth. In 1832 an appropriation was made for a scale of canals 9 feet in depth. In 1834 the work was put under contract, but its progress was retarded by the insurrection and financial difficulties, and it was not completed till 1843. This canal is similar in construction to the others already described, excepting that instead of striking back for a direct route, it winds along the shore of the river, having necessarily heavy embankments towards it, in which breaks have taken place that have been repaired at considerable cost.

Its present dimensions are:

Breadth at bottom	100 feet.
" at water-surface	150 "
Length	11½ miles.
Locks, 7 in number	200 by 55 feet.
Depth of water on sills	9 "
Total lockage	48 "

Cost to 1st July, 1867, $1,933,152.69; cost since for works and repairs to 1st July, 1870, $46,962.79.

On an average this canal is open for 230 days of the year, opening about four days sooner and closing as much later than the Cornwall Canal. It has been known to open as early as the 7th of April, and the latest closing was on the 18th of December.

The next in the order of succession are the Farran's Point, "Rapide Plat," and "Galops" canals, known collectively as the Williamsburg canals.

Farran's Point Canal commences 5 miles above the head of the Cornwall Canal. It surmounts the Farran's Point Rapid, and is only three-quarters of a mile in length. Its dimensions are:

Breadth at bottom	50 feet.
" at water-surface	90 "
1 lock	200 by 45 "
Total rise of lockage	4 "
Depth of water on sills	9 "

Less breadth was considered necessary for this canal than the others below it, as it is used principally by vessels ascending. Descending vessels run down the rapids with ease and safety. Though proposed and surveys made of a site for it, this canal was not commenced till four years after the union of Upper and Lower Canada. It was completed for traffic in Oct., 1847.

The "Rapide Plat" Canal commences 10½ miles above the head of Farran's Point Canal. It surmounts the rapids after which it is named. Its other dimensions are the same as the preceding; it is narrow in width for the same reason. It has two locks, and a total lockage of 11½ feet.

The "Galops" Canal commences 4½ miles above the "Rapide Plat" Canal. It surmounts the rapids at "Pointe aux Iroquois" and the "Galops." It originally was in two parts that were opened in Sept., 1847. The connecting portion was completed in 1856. It is 7⅝ miles in length. Its other dimensions are the same as the two preceding, for the same reason. It has three locks, and a total lockage of 15½ feet.

These three canals are on an average open for navigation 233 days in the year; the dates of opening and closing closely resemble those given for the Cornwall Canal. The total cost of these three canals to 1st July, 1867, was $1,320,655.54; cost since for repairs to 1st July, 1870, $20,975.60.

For the year to 30th June, 1872, on the St. Lawrence canals, including the Lachine Canal:

The total of tolls accrued was	$84,675.09
Of tonnage of vessels passed	1,134,446 in Canadian vessels 52,320 in U. S. "
Of goods transported, tons	940,645

The Welland Canal is the next that occurs in ascending the St. Lawrence navigation. The distance to it from the last is 226 miles. It is the most important of Canadian canals. It leaves Lake Ontario at Port Dalhousie, 12 miles westward of the mouth of the Niagara River, and at Port Colborne, 17 miles westward of the head of that river, it enters Lake Erie, surmounting the falls and rapids of Niagara. Its length, apart from that of its branches, is 27 miles.

In 1816 the project of connecting these lakes by a canal was first taken into consideration, and reported upon by a committee of both houses of the Upper Canada Parliament. In 1821 a commission appointed to consider the subject of inland navigation reported favorably upon it, and suggested the formation of a commission to carry out the work. This led to the incorporation of a company, on the petition of W. H. Merritt and others, in 1824, who proposed constructing a combined canal and railway, the canal to admit of passing boats of 40 tons. In 1825 this scheme was abandoned, and another adopted of connecting the Welland River with Lake Ontario by a canal, with wooden locks 110 feet by 22, and 8 feet of water on the sills, to admit of the passage of sloops and schooners. The company went into operation in 1825 with limited capital and partial assistance from the imperial and provincial governments, encountering many difficulties, financial and physical; among others, a land-slide caused them to abandon the river Welland as a feeder and adopt the Grand River instead of it. In 1829 water was let into the canal, and two schooners ascended by it to the river Welland. Subsequently, the company obtained an extension of capital, and adopted the design of carrying the canal over the Welland River to Port Colborne, nearly on its present site, which was completed accordingly in 1833, but with small wooden locks. In 1839 an act was passed authorizing government to purchase all the private stock, which was not done till 1841, when the canal was placed under the board of works of Canada, and the enlargement of it decided upon. It was determined to rebuild all the locks in stone, 120 feet by 24, with 8½ feet water; the aqueduct to be rebuilt in stone; the Grand River feeder to be converted into a navigable canal; the harbors of Port Colborne and Port Dalhousie, one lock at the former and two at the latter, to be 200 feet by 45, with 9 feet of water; the Port Maitland branch to be constructed with a similar lock at its Lake Erie entrance. This led to the works being carried out in their present dimensions, which are as follows, the main line from Lake Ontario to Lake Erie:

Length of canal	27 miles 1099 feet.
3 pairs of guard gates.	
2 lift-locks	200 by 45 feet.
24 "	150 by 26½ "
1 "	230 by 45 "

Total rise of lockage to Lake Erie	330 feet.
8 feet by 2 feet Grand River level	16 "
Total lockage up and down	346 feet.
Depth of water on sills	10½ "

For 14 miles the summit-level is 8 feet above Lake Erie, making 16 feet of lockage up and down, in addition to the difference in level of 330 feet between the lakes. The summit-level receives the branch from Grand River, which is the feeder of the main canal, besides being a navigable arm of it. But as the supply from it is found inadequate to meet the requirements of the steadily increasing traffic, the lowering of this summit-reach to the level of Lake Erie, which is to be the feeder of the canal, has been for some years in progress.

The breadth of the main canal varies in different parts of it from 26 feet at bottom and 66 at surface to 70 feet at bottom and 110 at surface. The enlargement of this canal to a uniform scale of dimension of 100 feet breadth at bottom and 12 to 13 feet depth of water, with locks of 270 feet in length between the gate-quoins, and 45 feet in breadth, with 12 feet depth of water on the sills, has been decided upon in accordance with the recommendation of such dimensions by the Canada canal commission of 1871, as a general scale to be adopted throughout all the Canadian canals on the St. Lawrence navigation. In pursuance of this decision, the Canadian government has advertised for tenders to be received on Oct. 18, 1873, for the enlargement and deepening to the above dimensions of a great part of this canal (including the Deep Cut, which is 1¾ miles in length and 60 feet deep in parts), together with the construction of new portions of canal between Thorold and Port Dalhousie, and of fourteen new locks of the above size and depth, and their weirs; and also for the deepening and enlargement of Port Colborne. When enlarged to this the Welland Canal will admit of vessels of 1300 tons burden passing through it.

The existing twenty-seven lift-locks and their weirs, and three guard-locks, are all substantially constructed of durable stone masonry, excepting a guard-lock at Port Robinson, which is of wood and masonry. There is on it a substantial stone aqueduct, which carries this canal over the river Welland. A lock into the Welland above the aqueduct, and the connection by another below Port Robinson, enable vessels to pass down that river without serious obstruction from the aqueduct.

The Welland Canal has two branches—the Welland River or Chippewa branch, and the Grand River feeder; the latter has a short branch connecting it near its termination with Port Maitland on Lake Erie. The Welland River or Chippewa branch descends from the main line into the Welland River by means of a lock at Port Robinson. The river Welland is then descended 8¾ miles, with a short cut to the Niagara River at Chippewa. The canalling on this branch consists of—

The cut from Port Robinson to Welland River	2622 feet.
Length of lock above aqueduct	340 "
" " Chippewa Cut to Niagara River	1020 "
2 locks, each	150 by 26½ "
Depth of water on sills	9 feet 10 inches.

The Grand River feeder is 26 feet wide at bottom and 60 to 70 at the surface, and 8 feet deep. It taps the Grand River at Dunnville, where a dam 564 feet long raises the water of the river, making it navigable for 16 miles up to Cayuga.

Length of Grand River feeder	21 miles.
Locks { 1 of	150 by 26½ feet.
Locks { 1 of	200 by 45 "
Depth of water on sills	10½ "
Total rise of lockage	7 to 8 "

Its branch to Port Maitland is 1½ miles long, with one lock of 185 by 45 feet, and 11 feet depth of water on sills, with a total lift of 8½ feet.

For the year ending June 30, 1872, on the Welland Canal—

The total of tolls accrued was	$254,781.92
Of tonnage of vessels passed	505,207 in Canadian vessels.
	812,508 in U. S. vessels.
Of goods transported, tons	1,319,996

The total cost of the Welland Canal and its branches to July 1, 1867, was $7,638,239.83; cost since to July 1, 1870, for works and repairs, $224,375.07.

It is on an average open for 241 days in the year. Its earliest opening on record was 25th of March; the latest, 5th of May. Its earliest closing, 15th of November; its latest, 19th of December.

The Burlington Bay Canal is generally classed in the St. Lawrence navigation. It is merely a cutting of half a mile in length through a piece of low land which separates Lake Ontario from a large sheet of deep water, called Burlington Bay, at the W. end of it. It enables vessels to reach the city of Hamilton and the Desjardin Canal (a deepened channel), the property of a private company, leading up 5 miles to the town of Dundas. The canal is navigable for vessels drawing 12 feet of water; its width is from 108 to 138 feet between the piers on each side of it, that are of cribwork filled with stone. The outer end of the S. pier extends 300 feet into Lake Ontario. This work was begun in 1843; the upper part of the piers has been rebuilt since 1855. The total cost of this canal to July 1, 1867, was $432,684.40; cost since to July 1, 1870, for repairs, $682.53.

This completes the list of existing Canadian canals on the St. Lawrence and its lakes.

The second part of the canals of Canada that presents itself for consideration is the Ottawa and Rideau navigation, which includes the St. Anne's, Carillon, Chute à Blondeau, and Grenville canals on the Ottawa, surmounting the rapids on that river between Montreal and the city of Ottawa, and the Rideau Canal, connecting the Ottawa with the St. Lawrence, at Kingston, by the rivers Rideau and Cataraqui.

The Lachine Canal already described forms the first link in this line of navigation, as it serves alike the traffic of the Ottawa and the St. Lawrence between Lake St. Louis, where these rivers meet, and the harbor of Montreal. From the head of the Lachine Canal, 8½ miles from Montreal, there is a channel of fifteen feet and upwards in depth, but crooked in parts, through Lake St. Louis for fifteen miles, nearly to the St. Anne's lock. The formation of a new and direct channel of 120 feet in width and of ample depth, flanked with a guide-pier of cribwork, through the shoal below the entrance, has been contracted for and is in progress.

St. Anne's Canal is situated on the N. side of a channel of the Ottawa between Ile Perrot and the head of the island of Montreal. It overcomes a short rapid with a fall of 3 feet, the difference of level between Lake St. Louis and the Lake of the Two Mountains above it. The canal is half a mile in length, and the lock is 190 feet by 45, and has a depth of from 6 to 7 feet of water on the sill. It is built of substantial masonry. The lock was contracted for in 1840, and opened for use in 1843. The total cost of these works to July 1, 1867, was $134,456.51; cost since to July 1, 1870, for repairs, $3528.44.

For the year to June 30, 1872, on St. Anne's lock—

The total of tolls accrued was	$2,991.98
Of tonnage of vessels passed	3,460 in U. S. vessels.
	91,425 in Canadian vessels.
Tons of goods transported	100,865

It is generally open from the last week in April to the last week in November.

From St. Anne's lock, with the exception of the imperfect upper entrance to it, and a shoal with 13 feet of water a little above it, the Lake of the Two Mountains is 20 to 30 feet deep; the distance through it and a short part of the Ottawa above it to the foot of the Carillon Canal is 27 miles.

The "Carillon," "Chute à Blondeau," and "Grenville" canals were constructed by the imperial government of Great Britain. They were projected in 1819, but it was not till April, 1834, that the Grenville Canal, the latest of them in being completed, was opened for navigation. In 1856 they were transferred to the province of Canada. It would be difficult to ascertain the cost of the original construction of these works under the direction of the royal staff corps. The expenditure upon them by the provincial government up to 30th June, 1867, was $63,053.64.

The Carillon Canal, as it at present exists, is of the following dimensions:

Breadth at bottom	30 feet.
" " surface	50 "
Length of canal	2¼ miles.
3 locks, two rising; in all	21⅔ feet.
one falling	13 "
Total rise	8¾ "
Dimensions of locks from 126½ to 128 by	32½ "
Depth of water on sills	6 "

All built of substantial masonry.

The inadequacy of this canal for the requirements of the increasing trade of the Ottawa, the lockage up and down of 34½ feet to overcome a rise of 8¾ feet, and the insufficiency of the supply by the summit-feeder were reasons for abandoning the present canal; especially as, in accordance with the recommendation of the canal commission of 1871, the Canadian government decided on adopting an increased scale of dimensions for the Ottawa canals, with locks of 200 feet by 45, and 9 feet depth of water on the sills, and as the designed improvement could be better effected by damming the rivers.

Acting accordingly, the Canadian government has (in 1873) contracted for the construction of a wooden dam across the Ottawa on the Carillon Rapids of sufficient height to flood them out, and also the Chute à Blondeau Rapids, with three-quarters of a mile of canal, with two

locks descending from it, on the N. side, and a raft-slide 220 feet in width and 550 long on the S. side. The locks are to be built of the above dimensions and of the most substantial masonry. The canal is to be made by embankment in the river-bed, faced with substantial masonry, and all to be completed by the 1st of Nov., 1875. This dam will afford an enormously great and very available water-power in a commanding position on a great line of navigation. But the chief advantage of it is that by flooding out both of these rapids it will supersede the "Carillon" and "Chute à Blondeau" canals, and the necessity of enlarging them; and by substituting its lockage of 12½ feet and the broad river for the narrow canals and their 38½ feet of lockage, it will much reduce the time of vessels passing.

The "Chute à Blondeau" Canal commences 4 miles above the head of the present Carillon Canal. It surmounts the rapid of that name, and is half a mile long, cut through solid rock, on the N. side of the river. It is 30 feet in breadth at top and bottom, has one lock, 130⅝ feet by 32⅝ at the upper and 36½ at the lower end, and 6 feet depth of water on the sills. The total rise of lockage is 3⅝ feet.

The Grenville Canal commences 1⅜ miles above the preceding. It is 5¾ miles long, and surmounts the "Longue Sault" Rapid. As originally constructed, its breadth at bottom was from 20 to 30 feet and at surface 30 to 60 feet, but much of it has been very recently enlarged. It has seven locks. The first and second are combined, and also the third and fourth. They vary from 128 to 130 feet by 31⅝ to 32½, with 6½ feet of water on sills. The remaining three locks originally were about 107 feet by 19, with 6 feet of water on sills, but two of them have been already rebuilt on the enlarged scale of 200 feet by 45, with 9 feet of water on sills, recommended for the Ottawa, and the third is now being so enlarged. The total rise of lockage is 45¾ feet.

The cost of these three canals since their transfer to Canada, to 1st July, 1867, was $63,053.64; for repairs and work to 1st July, 1870, $47,034.56.

The navigation of the Ottawa and the works upon it are noticed so fully here because they form part of the proposed Ottawa and Huron navigation, which, when the Caughnawaga Canal is constructed between Lake Champlain and Lake St. Louis, will offer by far the shortest and apparently the most advantageous line of navigation between New York and Chicago. These Ottawa canals are generally open from the 25th of April to the 30th of November.

From the head of the Grenville Canal to the entrance of the Rideau Canal, at the city of Ottawa, is, by the course of the river, 56 miles, making a total distance of 120 miles from the city of Montreal. The ordinary breadth of the river between Grenville and Ottawa is about half a mile, and its depth of channel 30 feet, excepting one short shoal of 8 feet at low water.

The Rideau Canal is 126¾ miles in length. From Ottawa to Kingston it is a system of continuous slack-water navigation, obtained by damming the rivers Rideau and Cataraqui between the river Ottawa and Lake Ontario. It was constructed by the British government, chiefly with a view to the defence of the province, by securing, in connection with the Ottawa, an interior route of water-communication between Montreal and Lake Ontario, avoiding alike the rapids of the St. Lawrence and the danger in time of war of transporting stores along that river where it formed the international boundary. Though fortunately never required for use under such circumstances, it was of great use commercially to the provinces from 1834, when the Ottawa canals were first opened to the public, till the opening of the St. Lawrence canals. Steamers with long lines of barges with up-freights ascended to Kingston by the Ottawa and Rideau, and the barges returned down through the St. Lawrence laden to Montreal. Since the opening of the St. Lawrence canals that traffic has been altogether discontinued, and the Rideau Canal has become of comparatively little importance. With respect to the Ottawa canals the case is otherwise in a very great degree, owing to the growth of the city of Ottawa, the progress of settlement, and the great development of the lumber-trade of the Ottawa, especially the manufacture of sawn lumber. During the year ending on 30th June, 1872, the traffic through the Ottawa and Rideau canals amounted to upwards of 500,000 tons, three-fourths of which was sawn lumber.

For the year to 30th June, 1872, on the Ottawa and Rideau Canals—

The total of tolls accrued was....	$38,017.14
Of tonnage of vessels passed.....	25,245 in U. S. vessels.
	360,909 in Canadian vessels.
Of goods transported, tons.....	519,040

The construction of the Rideau Canal was first taken into consideration in 1814, after various reports and projects respecting it had been submitted. The construction of it was decided on by the British government in 1825. In Sept., 1826, Colonel By was sent out to superintend the work, and on the 21st of the same month the excavation for ten locks was begun. It was completed and opened to the public in the spring of 1832. The works are all of the most substantial description, no expense being spared in their construction.

The length of the Rideau Canal from Ottawa to Kingston is 126¼ miles, but the total length of actual canals connecting the slack-water reaches is only 8½ miles. It has forty-seven locks, of which thirty-three ascend 282¼ feet from the Ottawa level to Rideau Lake, the summit, from which fourteen locks descend 164 feet to the Lake Ontario level at Kingston. The locks are all of the most substantial masonry, 134 feet by 33, with 5 feet of water on the sills. The breadth of the canal cuttings is at bottom 60 feet in earth and 54 in rock; at surface of water it is 80 feet in earth and 54 in rock. The line throughout admits of vessels passing of 4½ feet draft. Between Ottawa and the summit there are seven stone dams, from 200 to 548 feet in length and from 5 to 29 feet in height, and 11 of wood or earth, from 108 to 1616 feet long and 6 to 45 in height. Between the summit and Kingston there are four stone dams, 130 to 300 feet long and from 16 to 60 feet high. The extent of flooded lands caused by the dams and the broad lakes upon the line of the Rideau Canal made it impracticable to have a towpath along it.

The total cost of it to 1st July, 1867, was $4,064,764.47, of which the original outlay by the imperial government was £758,966 12*s.* 11¾*d.* sterling, apart from land damages. This canal was transferred to the Canadian government in 1856, and the cost for works and repairs from 1st July, 1867, to 1st July, 1870, was $58,666.51.

The distance from Montreal to Kingston is 68½ miles longer by the Ottawa and the Rideau Canal than by the St. Lawrence. The Rideau Canal is generally opened in the last week of April, and closed at the end of November.

3. The Richelieu and Champlain navigation is the next to be considered.

The river Richelieu enters the St. Lawrence 46 miles below Montreal. It is rendered navigable from the St. Lawrence to Lake Champlain by a dam and lock at St. Ours, 14 miles above its mouth, and a canal of 12 miles in length 32 miles farther up the river, known as the Chambly Canal.

The St. Ours Locks and Dams.—At St. Ours the river divides into two deep channels. In the eastern channel a lock in cut stone, with a dam 300 feet long of earthwork, has been constructed, and in the western channel a dam 600 feet long, of cribwork filled with stone, has been made. The length of canal is one-eighth of a mile. The lock is 200 feet by 45, with 7 feet water on the sills at lowest; its total lift is 5 feet. These works raise the river from 4 to 7 feet above its natural level, and give a depth of not less than 7 feet up to the entrance of the Chambly Canal. They were commenced in 1844, and finally completed in 1851.

The Chambly Canal is 12 miles in length. It has nine locks of cut stone, varying from 118 to 125 feet in length and about 23½ feet in width, with 7 feet of water on their sills. The total rise is 74 feet. The canal is 36 feet wide at bottom and 60 at the surface of the water.

The construction of this canal commenced in Oct., 1831. After much delay in the progress of the work the charge of it was assumed by the department of public works of the united provinces, and in 1843 it was opened for use. The lock walls having proved weak, and the excavation of the canal being imperfect, an expenditure of $69,758 was found necessary for completing and repairing the work.

The account of cost of the St. Ours and Chambly canals is undivided in the public accounts. The total expenditure before and since the union of the provinces, up to 1st July, 1867, is given by the department of public works report as $756,249.41, of which $634,711.76 is stated to be for the Chambly Canal and $121,537.65 for the St. Ours works. The further cost for repairs to 1st July, 1870, for the St. Ours locks is $3159.24, and for the Chambly Canal, $43,179.38.

For the year to 30th June, 1872, on these works—

The total of tolls accrued was....	$30,610.38
Of tonnage of vessels passed.....	327,911 in Canadian vessels.
	81,998 in U. S. "
Of tons of goods transported.....	246,148

The St. Ours lock generally opens about the middle of April and closes in the beginning of December. The Chambly Canal closes about the same time, but opens a little later.

The trade of the Richelieu Canal is steadily increasing, being swollen by sawn lumber from the Ottawa passing through to Lake Champlain for markets in the U. S. It is now taxed to nearly its utmost capacity of transport; during the year to 30th June, 1872, the freight that passed

through it amounted to 346,128 tons. This large trade will continue till the Caughnawaga Canal from the St. Lawrence to Lake Champlain is constructed. Then the Ottawa lumber will go by it instead of the Richelieu: the latter, however, will still have the transport of lumber from the St. Maurice and other tributaries of the St. Lawrence below Montreal, which will steadily increase, as the exhaustion of the pine forests will bring the spruce lumber of Lower Canada more into demand.

The Canadian canal commission have recommended the enlargement of the Chambly Canal locks to the Ottawa standard of 200 feet by 45, which doubtless will be done before long in the required rebuilding of them.

4. The river Trent navigation is the next subject in succession. It has to be noticed separately, not from its importance, but because it does not properly come under any other head.

The river Trent discharges into the Bay Quinté, Lake Ontario, about 67 miles above Kingston. It was originally proposed to form a line of slack-water navigation by it and the lakes of the New Castle district of Upper Canada through to Lake Huron, as a means of shortening the distance by water from Kingston to the far West. But that idea had to be abandoned, as the summit-level was found to have an elevation at Balsam Lake of 589¼ feet, and the route is so crooked as to be more than double the direct one of 112 miles from Kingston to Lake Huron. In Feb., 1833, however, the legislature of Upper Canada appointed commissioners and authorized the raising of a loan for the improvement of this route, as a line of inland communication and for the descent of timber, as far as Lake Scugog, a distance of 190 miles, including the length of that lake. Work was commenced in 1833, and a short piece of canal and a wooden lock (since rebuilt in stone) were completed in 1855 at the rapid below Sturgeon Lake, 140 miles up the route, which permitted vessels navigating Chemong, Buckhorn, and Pigeon lakes to pass through Sturgeon Lake up to the town of Lindsay.

Afterwards several grants of money were obtained, and dams and other works constructed. After the union of the provinces various unfinished works were completed and others made, including four stone locks, 133 feet by 33, with 6 feet of water on the sills, and one of wood; also nine dams, one of which is of stone, and some short pieces of canal.

The total expenditure on these works, apart from timber-slides, roads, and bridges, up to 1st July, 1867, amounts to $319,371.31. There is no account of tolls and tonnage in the public accounts for the Trent navigation.

Steamers navigate the upper lakes above mentioned, chiefly for the towing of rafts and other purposes of the lumber-trade. Of the whole distance of 190 miles to the head of Scugog Lake, 152¼ miles are navigable, and 37¼ not practicable, even for boats. The Peterboro' and Port Hope Railway has diverted traffic from part of this route, and for some years the works were neglected. The opening and closing of this navigation may be taken to be nearly the same as of the Rideau Canal.

5th. The St. Peter's Canal is the only existing Canadian canal remaining to be noticed. It is the only canal in actual operation in the maritime provinces of Canada. It connects the Bras d'Or Lake of Cape Breton with the Atlantic at St. Peter's Bay on the S. coast of that island. The Bras d'Or is a large landlocked arm of the sea in the interior of the island. It is 60 miles long from its entrance on the N. E. coast to its southern extremity, and 15 miles in greatest breadth. It has several bays or arms that reach far inland in different directions. Its southern extremity reaches within half a mile of St. Peter's Bay, and it is across this narrow isthmus that the St. Peter's Canal is cut.

The project of constructing this canal was adopted by the legislature as designed by Captain Barry, and the work commenced in Sept., 1854. It was suspended for a time, and resumed at the instance of the Cape Breton representatives in 1864. It was handed over to the Dominion in 1867. It is 2400 feet in length and 26 feet wide at bottom. It has one tidal lock 122 feet by 26, with 13 feet depth of water on the sills at lowest tide. The lock has four pairs of gates. The extreme rise and fall of the tide in St. Peter's Bay is 9 feet. The total cost of it up to 30th June, 1870, was $302,037.53, including $138,433.09 since confederation for further work.

The Bras d'Or and its arms abound in fish, and the surrounding country is rich in mineral and agricultural resources. The traffic on this canal during the year ending 30th June, 1871, consisted of 656 vessels, freighted with coal, limestone, marble, fish, and flour, making an aggregate of 26,757 tons; besides 262 open boats. The canal opens about the 20th of April, and closes about the last of December.

The projected canals of Canada claim consideration, not only for the unusual magnitude of most of them as engineering works, and the importance of the objects to be attained by them, but especially because they are all calculated more or less to benefit the people of the U. S. by giving them improved outlets for the products of the great West, and otherwise facilitating their commerce and fisheries—some of them, indeed, to a greater degree than they can benefit the Canadian people. This is decidedly the case as to the Caughnawaga Canal. It was first brought prominently before the public by Messrs. John Young, L. H. Holton, and other merchants of Montreal in 1848. Mr. J. B. Mills, by direction of the governor-general, made a survey and reported in favor of a line from the Indian village of Caughnawaga, on the St. Lawrence opposite the head of the Lachine Canal, to St. John on the Richelieu, at the head of the Lake Champlain navigation. It was recommended by the commissioner of the public works in 1852, but no action was taken about it by government, excepting the obtaining of further surveys and reports by Mr. Jarvis and others of various routes. In 1870, at the instance of Mr. Young and others, a bill was passed incorporating a company to build the Caughnawaga Ship Canal from Lake St. Louis on the St. Lawrence to Lake Champlain, the locks not to be less than those of the Beauharnois Canal—that is, 200 feet by 45—and 9 feet of water on the sills; the canal to be completed in five years, otherwise the charter to expire.

Lake Champlain is only 29 feet above the St. Lawrence at Caughnawaga in Lake St. Louis. One of the proposed routes would be about 34½ miles long, with Lake Champlain as its summit-level and feeder; another of 25½ miles in length would have its summit 37½ feet above Lake Champlain, with a feeder from the St. Lawrence; and a third route, 37½ miles long, would connect Lake Champlain with the lower part of the Beauharnois Canal, of which it would, in a manner, form a branch. The opening of this canal would have very important results. It would very greatly benefit and expand the lumber-trade of the Ottawa. Its sawn lumber in barges, on reaching the mouth of the Ottawa in Lake St. Louis, instead of descending the Lachine Canal and St. Lawrence, 55 miles, and ascending the Richelieu and its canals, 58 miles, to St. John's, would pass from Lake St. Louis to St. John's, 28 miles, or thereby, by this canal, saving about 85 miles in distance and 86 feet of lockage. During the year ending June 30, 1869, 220,000,000 feet of sawn lumber passed down through the Ottawa canals, besides what descended through the rapids; 150,000,000 of this probably passed by the Richelieu to Lake Champlain. Had the Caughnawaga Canal been in operation, the saving by it on the freight on that quantity would have been, at reasonable rates, $100,000, besides a corresponding reduction in the cost of transport of return cargoes of coal and other merchandise. When it is made and in operation, much inferior timber, and of various kinds, that would not now pay its freight, will be manufactured and taken to market with profit.

When the New York Champlain Canal is enlarged and this canal opened, they, with the enlarged Welland Canal, will no doubt form a more eligible route for the transport of the grain of the West to New York than the Erie Canal ever can, even if it were enlarged to the utmost capacity its summit-supply of water will permit. It is true that the distance from Lake Erie to New York will be about 217 miles longer by this route than by the Erie Canal, but as the Welland and the St. Lawrence canals, when enlarged on the scale begun, will pass vessels of 1300 tons (the latter already can pass vessels of 700 tons, and one passed in 1872 of 760), the much quicker trips, far less lockage, and the great economy of the very much larger cargoes, either by propellers or barges going through to New York without transshipment at Albany, must obviously give the route by the Caughnawaga Canal a most decided advantage. In short, the opening of such a route would render every improvement on the St. Lawrence by the people of Canada for the purpose of drawing the trade of the West to Montreal necessarily equally effective in favor of New York, and draw to it much trade which Montreal, in virtue of the advantages of the St. Lawrence route, is now rapidly appropriating. That would be so far advantageous to Montreal: but it is alike the interest of the U. S. and Canada that the producers of both countries on the great lakes and in the Western territories should have the cheapest transport of their produce to market, irrespective of the interest of either city; and that the rivalry on equal terms would certainly ensure.

A glance at a map will show that the entrance of this Caughnawaga route is directly opposite the mouth of the river Ottawa, the entrance to the proposed line of the Ottawa and Huron navigation, the next projected work to be noticed.

The projected Ottawa and Huron Canal, as it is called,

offers, according to the report of that eminent engineer, Mr. Walter Shanly, a route to Chicago 368 miles shorter than that by the St. Lawrence. It is true that the recent correction of the reputed distance by the lakes to Chicago by U. S. engineers will reduce this difference, but will no doubt more or less affect the lake portion of both routes; and the difference to Lake Superior and Duluth will in any case be 40 miles more in favor of the Ottawa and Huron route. The lockage by this route would be 157 miles more than by the St. Lawrence; nevertheless, by Mr. Shanly's calculations, based upon McAlpine's well-known rates for comparison, the movement of freight would cost fully one-ninth part less from Montreal to Chicago than by the St. Lawrence and Welland canals, or by the St. Lawrence and the Georgian Bay canals. The saving of time he estimates at 44 hours as compared with the St. Lawrence and Welland route, and 22 hours as compared with the route by the Georgian Bay Canal.

The Ottawa and the French River, which the route follows to Lake Huron, offer great facilities for canalization in the lakes and long trench-like reaches of deep navigable water which characterize their courses, and both are remarkable for their great volume of water, well sustained in dry weather. Lake Nippiseongue, the proposed summit-feeder of this route, presents an enormously redundant supply. The navigable reaches of the Ottawa vary from 10 or 15 to 50 or 60 miles in length. They are navigable now by steamers for upwards of 300 miles above its mouth. One of the upper boats draws 9½ feet, plying on a reach of 40 miles.

Mr. Clarke, who completed the canal survey of the Ottawa for government, estimated that canalling, where required, the whole route through to Lake Huron, 431 miles, with locks 250 feet by 45, with 12 feet of water on the sills, would cost $12,057,680, to be effected chiefly by damming; 21 miles of actual canalling only being required. Locks of 200 feet by 45, with 9 feet of water on the sills, is the scale adopted on the recommendation of the Canada canal commission for the progressive improvement of the Ottawa.

No doubt this route would be very advantageous, especially as a barge route, as the dangers of the lakes would be avoided between St. Joseph Island and Montreal, while the great size of the river navigation would give room for the utmost speed. But as the Canadians have constructed great works for the perfecting of the St. Lawrence route, and are enlarging and completing them, it would seem unwise for them to undertake the task of opening another rival route before the trade of the country needed it. The requirement of the lumber-trade, and the increasing settlement and prosperity of the Ottawa country, will lead gradually to the construction, successively, of the requisite works for surmounting the obstacles on this route, till little be needed to complete it as a highway to the West. It will then afford, in conjunction with the Caughnawaga Canal, a most direct and favorable route from Duluth and Chicago to New York. Two locks are being built by government now, 200 feet by 45, at L'Islet's Rapids, 213 miles up the Ottawa, that by connecting two reaches will give 70 miles of uninterrupted navigation.

It is argued that as the dams to be built to flood out the rapids, together with the falls on the Ottawa and French rivers, will, from the great volume of the rivers, afford unlimited water-power at numerous points on the route, they will become the sites of important manufactories, as on the Erie Canal, but with incomparably greater available water-power; and that the grain of the West may, with great advantage, be manufactured there into flour while on its way to market.

This route is deservedly advocated by the inhabitants of the Ottawa valley; but they are a minority, and it was not to be expected that the inhabitants of the far more populous districts of Canada upon the St. Lawrence, and their parliamentary representatives, who would chiefly have to bear the burden of the cost, should readily consent to the Ottawa, far from them, which they cannot use, being, at great outlay, made the commercial highway of the West, instead of their own route, the St. Lawrence, in the improvement of which they are so deeply interested.

Apart from its claims as a highway to the West, the improvement of the Ottawa route is of great importance to the provinces of Ontario and Quebec in opening up their interior country, as the Ottawa is the boundary between them for 400 miles of its course. In that respect the Georgian Bay Canal, the next projected work to be noticed, is very different. Connecting Lake Ontario at Toronto with the S. extremity of the Georgian Bay of Lake Huron, it would be almost, perhaps quite, equal to the Ottawa and Huron route in shortening the distance for the trade of the West. It would feed the Erie Canal eastward of Oswego, but it would be of no use to the country around Lake Erie, and passing through an already occupied country, that has a railway connecting the same points as the canal, would, in its 100 miles of course, develop nothing new of importance. The chief objection to it is its impracticability except at enormous cost.

The canal commission of Canada in 1871 state in their report "that the public should be reminded of the facts that the proposed canal is of equal length with the Suez Canal, that has cost $80,000,000 and occupied fifteen years in construction. But it is encompassed with difficulties infinitely greater. While the Suez, being on a dead level from sea to sea, is unencumbered by a single lock, the Huron and Ontario has an intermediate summit of 470 feet above Ontario to surmount, which requires forty-two locks and 600 feet of lockage. It has also no less than three deep cuts, the least of which is larger than the celebrated deep cut on the Welland, and the largest of which exceeds it in volume of material eighty-fold."

The commission concludes with the opinion that, "admitting it to be physically possible, the cost of carrying out such a project would render it commercially worthless."

A canal at Sault Ste. Marie is the next Canadian project to be noticed. It is stated that a canal on the Canadian side of the river St. Mary would be much more commodious and secure, especially at the upper entrance, than the existing canal on the U. S. side of the river; that it would have deeper approaches and be one-third shorter; in short, that it would have every advantage over the latter. There was strong testimony in favor of it given before the Canadian canal commission, already mentioned, and the commission recommended it as a work of the first class in importance. This arose, no doubt, chiefly from the passage of vessels with troops for Red River Settlement through the Sault Ste. Marie Canal having been refused at the time of the disturbances there. Possibly, the better understanding and agreement as to the use of canals in common through the treaty of Washington may abate the urgency for this work. But it is not unlikely that the necessity of having a passage through Canadian ground for the transmission of troops in case of disturbances between Indians and settlers, or other necessity, will ultimately lead to the construction of the proposed canal.

The next project proposed to be noticed is the Bay Verte Canal, which also has been included as of first-class importance by the canal commission. The object of this canal is to connect the waters of the Gulf of St. Lawrence at Bay Verte with those of the Bay of Fundy at Cumberland Basin, by cutting across the isthmus of Chignecto, which unites Nova Scotia with New Brunswick, so as to admit of vessels engaged in the coal-trade of Pictou and the fisheries of the Gulf, and the coasting-trade of the St. Lawrence, the Gulf, and the Bay of Fundy, passing directly between these waters, which are only 15¼ miles apart, instead of having to make a circuit of 600 miles out through the Gut of Canso to the Atlantic, and round the peninsula of Nova Scotia. In addition to former surveys, one has just been made by order of the government of the Dominion of Canada for a site for this canal. It will present serious and unusual difficulties in its construction, owing to the great difference in the height to which the tide rises on each side of the isthmus. Spring tides rise 45¼ feet in the Bay of Fundy, and but 10½ in Bay Verte. The canal commission recommended a canal with locks of 270 feet length of chamber, by 40 feet in width, having 15 feet in depth of water on the sills. The estimated cost is $3,250,000.

The last route of communication proposed to be noticed in this article is the Shebandowan and Lake of the Woods navigation, which forms about 311¼ miles of the line of communication established by the Canadian government between Thunder Bay of Lake Superior and Fort Garry in Manitoba, known as the Dawson route, which is 451¼ miles in length. This is the route by which the military expedition under Col. Wolsey passed through to Red River Settlement in 1870. Since then the route has been much improved by the Canadian government, and emigrants and their luggage are conveyed over it at moderate rates. The 311¼ miles of water-conveyance on this route, though not, strictly speaking, a canal, are admirably adapted for canalization. The connection of its principal reaches has been proposed, and will no doubt before long be carried into effect to a considerable extent. It consists of ten navigable reaches, varying from 8 to 120 miles in length. The last and greatest is formed by Rainy River and the Lake of the Woods, separated only by the falls at Fort Francis from Rainy Lake, which is navigated for 44 miles. On the Lake of the Woods and Rainy River a steamer of 120 feet keel and 20 feet beam plies from the falls to the N. W. angle of the Lake of the Woods; on Rainy Lake one of 100 feet keel and 19 feet beam. On the eight other reaches the transport is effected by barges towed by small steam-launches. The smallness of the crafts is not caused by want of depth of water. On the contrary, the slack

water consists of deep trench-like lakes generally, with the exception of Rainy River, which is large and deep. The ten portages amount together to nearly 7¾ miles.

The total fall to be overcome by lockage in the distance of 314¼ miles from the summit-level at the commencement, to be obtained by damming, to the N. W. angle of the Lake of the Woods, is 425 feet, or an average of $1\frac{35}{100}$ feet per mile. This is more favorable than the Erie Canal, which has an average of $1\frac{91}{100}$; the Rideau Canal has $3\frac{11}{100}$. There is much valuable pine and other timber on the tributaries of Rainy Lake. As the supply of water is abundant and permanent, with prevailing deepness, it could be made a line of water-communication of great capacity. For the W. half of its extent it is the boundary of the U. S. Its eastern extremity reaches within 45 miles of Lake Superior. An important lumber-trade for the supply of the prairie country beyond will necessarily arise in this wooded region. From the Lake of the Woods westward the Canadian Pacific Railway and its connections will give the means of distributing the manufactured lumber.

The following table of tonnage and tolls levied on freight and passengers on all Canadian canals from 1850 to 1870, shows the progress of traffic upon them during that period; it also shows the extent to which they were used by American commerce:

Tonnage and Tolls levied on Freight and Passengers passed through all the Canadian Canals from 1850 to 1870, inclusive, distinguishing whether from or to Canadian or U. S. Ports. (Abridged from the "Report of the Canada Canal Commission" of 1871.)

Remarks.	Year.	From Canadian to Canadian ports.	From Canadian to American ports.	From American to Canadian ports.	From American to American ports.	Total Freight.	Tolls Collected on Freight and Vessels.		Net Revenue on Freight and Vessels after deductions and refunds.

A. J. Russell.

Canal' Win'chester, or **Winchester,** a post-village of Madison township, Franklin co., O. It has one weekly paper. Pop. 633.

Canandai'gua, capital of Ontario co., N. Y., on the Auburn branch of the New York Central R. R., the E. terminus of the Niagara Falls Branch R. R., and the N. terminus of the Northern Central R. R. It is 28 miles S. E. of Rochester, at the N. extremity of Canandaigua Lake, which is navigated by daily lines of steamers. It is picturesquely situated on high ground which commands an extensive view of the lake. The beautiful scenery of the lake and the fishing and boating accommodations make Canandaigua a popular pleasure resort. Canandaigua (or, as originally, *Canandarqua*, signifying in the Indian tongue the "chosen spot") is a beautiful village with wide shaded streets, fine public buildings, and handsome residences. There are two weekly newspapers, seven churches, an academy, a female seminary, a library association and museum, four banks, various manufactures, two orphan asylums (one public and one private), a private lunatic asylum, a jail, and a fine court-house built jointly by the county and the U. S. government. Pop. 4862; of township, 7274.

N. J. Milliken, Ed. "Times."

Canandaigua Lake of Western New York is mostly included within Ontario co. It is 15 miles long, and varies in width from three-fourths of a mile to 1½ miles. It is surrounded by high banks which present beautiful and diversified scenery. The water is discharged at the northern extremity of the lake by an outlet which communicates with Clyde River, an affluent of the Seneca River. The surface of this lake is 437 feet higher than that of Lake Ontario, and 668 above the sea. The lake is navigable by steamers.

Cana'ries, or **Cana'ry Islands** (anc. *Fortunatæ Insulæ*), a group of islands in the Atlantic Ocean, belonging to Spain, are about 60 miles W. from the coast of Africa. They are between lat. 27° 49′ and 29° 26′ 30″ N., and between lon. 13° 25′ and 18° 16′ W. The names of the seven largest islands are Lanzarote, Fuerteventura, Gran Canaria, Teneriffe, Gomera, Palma, and Ferro (or Hierro); besides which there are several small islets. Their total area is 2806 square miles. The Canaries are of volcanic formation, and have high rocky coasts. The surface is mountainous, and the highest point, the Pico de Teyde, in Teneriffe, rises 12,182 feet above the level of the sea. The climate is mild and equable, the heat being moderated by the sea-breezes. The vegetation is arranged in zones, according to the height above the sea. The first or lowest zone produces the date-palm, sugar-cane, etc.; in the second flourish the grapevine, olive, and maize. The highest summits are barren and naked rocks. The largest island of the group is Teneriffe, which is nearly 60 miles long, and has an area of about 900 square miles. The Canaries have belonged to Spain since 1493, and the population is Spanish. The aboriginal race, called Guanches, was conquered in the latter year. The meridian of the island of Ferro (17° 39′ 51″ W. of Greenwich) is usually taken as the dividing-line between the eastern and western hemispheres. Pop. 267,036.

Cana'rium, a genus of trees of the order Amyridaceæ, natives of the East Indies, having compound leaves and diœcious flowers. The fruit is a drupe. The *Canarium commune* is cultivated in Java and the Moluccas for the sake of its fruit, which is edible and yields a lamp oil. This tree grows about fifty feet high, and is supposed to be one of the trees which produce elemi.

Cana'ry Bird, a small singing-bird of the family Fringillidæ, is nearly related to the finches, and is a native of the Canary Islands. The species of canary bird which is commonly kept in cages is called *Carduelis Canaria* by some naturalists, but others place it in the genus *Linota* or *Fringilla*. In its wild state it builds on shrubs or trees, and produces five broods in a year. In confinement it seems to be contented, and breeds readily several times in a year. The color of its plumage is mostly a rich and delicate yellow. Its favorite articles of food are canary seed, hempseed, sugar, and bland green leaves, such as those of chickweed or lettuce. It has great imitative powers, and can be trained to sing various notes. Some of the wild canary birds are said to surpass the best trained singers in loudness and clearness of note.

Canary Grass (*Phalaris Canariensis*), a grass the seed of which is used as food for cage-birds. It is a native of the Canary Islands, and is cultivated for its seed in England and continental Europe. This plant is sparingly naturalized in the U. S., and is also somewhat cultivated for its seed. A fine flour is prepared from canary seed, which is employed as dressing in fine cotton-weaving and for the finishing of silks. The groats and flour of this seed are also used in the Canary Islands, in Barbary, and in Italy as food, the flour being made into bread which is very nutritious and palatable. The reed canary grass (*Phalaris arundinacea*) is very common on the banks of lakes and rivers and in other places in Europe and America. It yields a great bulk of coarse grass, very nutritious when cut early, but it is stated that its seeds are so infested

* Half year.

with ergot as to render it sometimes poisonous to cattle. A variety with curiously striped leaves is well known in gardens as *ribbon grass*.

Canary Seed, the product of CANARY GRASS (which see).

Canary Wine, or **Teneriffe Wine,** is produced in the Canaries, and so much resembles Madeira wine that it is often sold for that article. It is improved by a long voyage. The term Canary is properly applied to the Bidogue wine, which is the juice of grapes gathered before they are ripe, and is not good until it is rendered mellow by age.

Canasera'ga, a post-village of Burns township, Allegany co., N. Y., on the Buffalo division of the Erie R. R., has an academy and several manufactories.

Canasto'ta, an incorporated village of Madison co., N. Y., on the Erie Canal and the Central R. R., 20 miles E. of Syracuse. It has one national bank, four churches, a high school, and an academy. Salt brine in paying quantities has been found by boring. There are sulphur and sulphur-and-iron springs within the village. It has a weekly paper. Pop. 1402.

A. R. BARLOW, PUB. "HERALD."

Can'by (EDWARD RICHARD SPRIGG), LL.D., born in 1817 in Kentucky, graduated at West Point 1839, major-general U. S. volunteers May 7, 1864, and July 28, 1866, brigadier-general U. S. A.; being in infantry till June 18, 1846, assistant adjutant-general to Mar. 3, 1855, and in infantry till July 28, 1866. He served in Florida 1839–42 on quartermaster duty; in emigrating Indians, garrison duty, etc., 1842–46; as adjutant Second Infantry 1846–47; in war with Mexico 1846–48, engaged at Vera Cruz, Cerro Gordo, Contreras, Churubusco (brevet major), and city of Mexico (brevet lieutenant-colonel); as assistant adjutant-general of Pacific division 1849–51; in adjutant-general's office, Washington, D. C., 1851–55; on Utah expedition 1857–60; and in command of Navajo expedition 1860–61. In the civil war he served in command of the department of New Mexico 1861–62, where, after the defection of his seniors, he displayed great energy and skill in defending the country at Fort Craig, Valverde (brevet brigadier-general), and Peralta against a formidable inroad from the South; on special duty in war department at Washington and suppressing New York draft riots 1863–64; in command of division of West Mississippi 1864–65 (wounded on White River); in command of the expedition which captured Mobile and its defences (brevet major-general), Montgomery, Ala., and received the surrender of the armies of Gen. R. Taylor and E. K. Smith; in command of various Gulf departments 1865–66, and of department of Washington 1866–67. After the war he was placed on various important special duties, and when fatigued by a long and laborious career in 1869 he voluntarily consented to take command of the department of the Columbia, which he held till treacherously shot dead April 11, 1873, by the chief "Jack" while he was endeavoring to mediate for the removal of the Modocs from their rocky fastness on the northern border of California.

GEORGE W. CULLUM, *U. S. Army.*

Cancale, a seaport-town of France, in the department of Ile-et-Vilaine, is situated on the English Channel, 9 miles E. N. E. of St. Malo. It has good anchorage. Large quantities of good oysters are procured from a chain of rocks, called Rochers de Cancale, which partly enclose the port. Pop. 6400.

Cancan, a French word, the primary signification of which is noise, pother. It is also the name of an irregular French dance which is not restrained by conventional proprieties.

Cancella'ria, a genus of univalve mollusks of the class Gasteropoda and order Prosobranchiata. The shell is oval or turreted, the spire is prominent, the last whorl is ventricose, the surface reticulated, and the columella plicated. All the recent species are natives of tropical or sub-tropical seas. Numerous fossil species are found in the strata above the chalk.

Can'cer [from the Lat. *cancer*, a "crab," the swollen veins around it being likened to crabs' claws], the popular name for carcinoma, a disease characterized by tumors or slow ulcerations in various parts, occurring either simultaneously or in succession, and having a malignant character; that is, a tendency to spread to other parts, and to grow worse, resisting medication, and usually ending in the death of the patient.

Among the tumors admitted by general consent into the order of cancers there are widely different degrees of malignancy; some having the tendency to spread rapidly and infect the system at an early period, while others remain local for a considerable time, and may be removed with good hope of a permanent recovery.

The practical distinction or *diagnosis* of these tumors is founded upon a careful comparison of the characters of malignant and non-malignant tumors, and also upon a thorough knowledge of the anatomy and relations of the textures in which they arise. The attempts to distinguish these from other growths call for the highest qualities of the surgeon, including a knowledge of minute structure as obtained by the use of the microscope. What the characteristic microscopical element of cancer is it is, however, not easy to define. But Billroth confidently asserts that it always springs from true epithelium, and that the modified epithelial cell is the constant characteristic element of cancer.

The most common seats of cancer are, among external parts, the female breast, the eye, the tongue, the lip, the male genital organs; among internal organs, the liver, stomach, uterus, rectum, gullet, peritoneum, and lymphatic glands. Scirrhus or hard cancer, observed most frequently in the breast, uterus, and stomach, is more frequently solitary than encephaloid (brain-like), otherwise called medullary or soft cancer; the rare colloid cancer is of a glue-like consistency; melanosis, or melanic cancer, a variety charged with brown or black pigment, is almost always multiple in its occurrence; while epithelial cancer, or epithelioma, of which examples are frequently found in the lip, scrotum, or tongue, is so generally solitary as to have led some pathologists to place it in a class altogether apart from the truly cancerous growths. Again, there are varieties of fibrous and of cartilaginous tumor, as well as certain tumors of bone and bone-like tumors in soft parts (osteoid), which occupy a doubtful position between the malignant and non-malignant growths, the so-called "cauliflower excrescence" being one of the number.

A tumor falls under the suspicion of being cancer when it infiltrates the texture in which it arises and passes into the surrounding textures; when it invades the lymphatic glands; when it is attended by stinging or darting pains, or by obstinate and slowly extending ulceration; when it occurs in a person having impaired health or past middle life, and is not traceable to any known cause of inflammatory disease or local irritation, nor to any other known constitutional disease, such as syphilis or scrofula. But the elements of diagnosis here referred to ought to be early submitted to the scrutiny and judgment of a well-educated medical adviser.

The removal of cancerous tumors is resorted to by surgeons, and when performed early in well-selected cases it has been followed by long-continued exemption. Operations are rarely performed after the lymphatic glands are involved, or when there is evidence of a deteriorated constitution or of internal disease; but sometimes great pain or profuse and exhausting discharge from an external tumor may justify its removal, as a palliative measure, even under these unfavorable circumstances.

REVISED BY WILLARD PARKER.

Cancer, the Latin name of a crab. In astronomy, it is the fourth sign of the Zodiac, and is denoted by the figure ♋. The sun enters this sign about the 21st of June. The first point of Cancer is 90° distant from the first point of Aries, and is called the summer solstice. Cancer is also the name of a constellation of the Zodiac, which does not coincide with the sign just described. (See PRECESSION OF THE EQUINOXES, by GEN. J. G. BARNARD, U. S. Army.)

Cancer Root, or **Beech Drops,** a name given to the *Epiphegus Virginiana*, a parasitic plant of the natural order Orobanchaceæ. It is a native of the U. S., and grows on the roots of beech. The plant is astringent, and the root has been reputed a remedy for cancer, but it has no favorable effect upon that disease.

Cancer, Tropic of, in geography, one of the lesser circles of the earth, a parallel about 23° 27′ N. of the equator. At the summer solstice (June 21st) the sun is vertical over this line. There is a corresponding circle on the astronomical globe. This circle touches the ecliptic in the first point of the sign Cancer. Hence the name.

Cancrin' (GEORG), COUNT, a German financier, born at Hanau Dec. 8, 1774. He entered the service of Russia in 1796, became a councillor of state in 1811, and lieutenant-general in 1815. He was Russian minister of finance for twenty-one years (1823–44), and performed the duties of that office with ability and success. Died Sept. 22, 1845.

Can'crinite, a silicate of alumina and soda with carbonate of lime, is found in Norway and at Litchfield, Me. It is remarkable as an instance of a silicate containing carbonic acid.

Can'crum O'ris (synonyms, *noma*, *aqueous cancer*), a mortification of the cheek, mostly in children who have

long suffered from poverty, moist or close air, or fever. The proximate cause is generally found in an imprudent administration of mercury, or in the inanition and dissolution of the blood from measles, typhoid fever, hooping-cough, or dysentery. It is almost always fatal. Usually but one cheek is affected. A small vesicle shows itself half an inch or an inch from the angle (mostly the left) of the mouth; it soon bursts and gives way to a yellow hardening surface. The surrounding parts swell and exhibit a waxy color. A day or two after a hard spot is felt in the cheek which extends rapidly. The skin become black and fetid, and the whole cheek is perforated. The destruction spreads rapidly over the cheek, nose, upper lip to the median line, eyelids, neck, and jaw-bones. The teeth fall out, the stench is intolerable. Hæmorrhages are rare. While in this manner half of the face is being destroyed, the patient may be without fever, inclined to play and to eat. After about a week has elapsed fever will set in, depression will take the place of indifference; pneumonia or diarrhœa, with swelling of the feet, will make its appearance and accelerate the fatal termination. Recoveries have been observed, but are rare. Amongst the best preventives early attendance in cases of the common forms of ulcerous inflammations of the mouth, restriction in the use of mercurial medicines, and the improvement in the condition of the poor, take prominent places. When the malady is developed the diseased portion must be disinfected by hypermanganate of potassa or carbolic acid, or destroyed by concentrated mineral acids, chloride of zinc, arsenic paste, or the red-hot iron. The general condition of the patient requires a generous diet, and the administration of stimulants and iron, or quinia, or both combined. ABRAHAM JACOBI.

Candahar′, or **Kandahar,** called by the Afghans **Ahmed Shahee,** the capital of Central Afghanistan, is situated in a fertile plain, 220 miles S. W. of Cabool. It is well supplied with water by two canals. The houses are mostly mean and built of wood. Candahar has an extensive trade and some manufactures. About 2 miles N. of this town is a precipitous rock which is crowned by a strong fortress or citadel. Candahar is supposed to have been founded by Alexander the Great. It was captured by Tamerlane in 1384, and by Shah Abbâs of Persia in 1620. The British army occupied it in 1839–42. Pop. estimated at from 50,000 to 80,000.

Candela′brum [Lat., plu. *candelabra*], a "candlestick," a support for lamps. There were perhaps few articles in which the ancients so combined the beautiful with the useful as in their candlesticks and lamps. Candelabra usually were of wood, but marble and metals were used for their construction, and sometimes they were adorned with gems. The candelabra found at Herculaneum and Pompeii are mostly of bronze; they were also frequently of marble. The base in many instances consists of three feet of a lion, goat, or other animal, real or imaginary. In addition to the various kinds of candelabra which seem to have stood on the floor, the ancients had others intended to be placed on a table. These consisted either of a pillar or of a tree, and from the capital in the former case, or from the branches in the latter, lamps were suspended.

Can′dia, or **Meg′alo-Cas′tro,** a fortified seaport and capital of the island of Crete, is on the N. coast; lat. 35° 21′ N., lon. 25° 8′ E. It contains several mosques, a cathedral, a pasha's palace, and an arsenal. Its massive fortifications and its cathedral were erected by the Venetians, who owned the island until it was captured by the Turks in 1669. Pop. 15,000.

Candia, a post-township of Rockingham co., N. H. Pop. 1456.

Candia. See CRETE.

Can′didate [Lat. *candidatus*], the name given by the Romans to a person soliciting the office of quæstor, consul, etc., from his appearing in public dressed in a white (*candida*) toga. Among the early Christians converts newly baptized were called candidates, on account of the white robes worn by them eight days after baptism. In Germany, at the present time, a theological student who has been approved before the highest authorities in the Church is called a candidate, and the term is generally given to any applicant for office, religious or secular.

Can′dle [Lat. *candela* (from *candeo*, to "shine"); Fr. *chandelle*], a cylinder of wax or fat with a central wick, intended for giving light, and used in various religious ceremonies. Candles are made of tallow, of stearine, bleached wax, spermaceti, and paraffine. They are either dipped, moulded, or rolled. "Dips" are made by hanging wicks upon a frame, at a distance from each other equal to about double the intended thickness of the candle: these are then dipped in melted tallow, and hung upon a rack until cooled, then dipped again and again, until the required thickness is obtained. Mould candles are cast by pouring the tallow down a tube, along the axis of which the wick has been previously adjusted. These tubes are smooth inside, and several are fitted in a frame, the upper part of which forms a trough into which the moulds all open; and by pouring into the trough all the moulds are filled at once. Wax candles are not moulded, on account of the contraction which wax undergoes in cooling, and the difficulty of drawing it from the moulds. The wicks are warmed, and melted wax is poured over them until they acquire the proper thickness; they are then rolled between flat pieces of wet hard wood.

Certain fatty acids are also used in making the best candles. Lime is used to separate the glycerine from the fatty acid of tallow, palm oil, etc. The lime forms an insoluble soap by combining with the fatty acid, and the glycerine remains in solution with the water. This lime-soap is then reduced to powder, and the fatty acid separated by means of sulphuric acid, which combines with the lime. The whole being heated, the fatty acid is skimmed off, and the candles moulded from it. These are called star or composite candles; they give a purer light than ordinary tallow. Stearic acid, the principal fatty acid of tallow, is a hard crystalline substance, perfectly dry and free from any greasiness, with a somewhat pearly lustre. Its crystalline structure presents a difficulty in the manufacture of candles, for when cast in moulds it contracts on cooling and leaves small spaces between the crystals. This is obviated by mixing the "stearine" with a little wax.

Various ingenious arrangements have been introduced to obviate the necessity of snuffing candles; in nearly all of them the object is effected by causing the wick to bend over and its end to fall outside of the flame, and thus, by coming in contact with the oxygen of the air, to be completely burned, for such combustion cannot take place within the flame. This bending over is variously brought about. One method is by braiding the wick with one strand shorter than the rest. Another process loads the wick with metallic bismuth, which fuses to a bead in the flame, and the weight of the bead bends the wick.

REVISED BY C. W. GREENE.

Can′dlemas, a festival to commemorate the purification of the Virgin Mary, is observed by the Roman Catholics on the 2d of February, when they form a procession with many lighted candles. On this day all the church candles for the year are blessed.

Candle-Nut (*Aleurites triloba*), a tree of the order Euphorbiaceæ, a native of Java, the Moluccas, and the Pacific islands. It bears a nut as large as a walnut, having a hard shell and a kernel which is edible when roasted. It yields an excellent bland oil, which is used for food and is burned in lamps. The natives of the Society Islands arrange the perforated kernels on a string or rush and use them as torches.

Cand′lish (ROBERT SMITH), D. D., a Scottish preacher, born in Glasgow Mar. 23, 1807. He was licensed as a minister in 1831, and began to preach in Edinburgh in 1834. He was one of the prominent leaders of the popular party, and co-operated with Dr. Chalmers in organizing the Free Church after the disruption which occurred in 1843. He acquired much distinction as a pulpit-orator and a debater in religious assemblies. He published several religious works. Died Oct. 19, 1873.

Can′dor, a post-village of Tioga co., N. Y., on the Cayuga and Susquehanna R. R., has four churches, a weekly paper, a bank, and some manufactures. Pop. of Candor township, 4250.

Candy, a town of Ceylon. See KANDY.

Can′dytuft (*Iberis*), a genus of plants of the natural order Cruciferæ, are indigenous in the countries bordering on the Mediterranean. The flowers have unequal petals and grow in dense corymbs. Some of the species are cultivated in gardens for the beauty of their flowers.

Cane [Lat. *canna*], a name given to several species of plants, and to the stems of the smaller palms and the larger grasses. The canes or rattans of commerce, which are used in making cane-seats of chairs, etc., are the product of the palmaceous plants *Calamus Rotang* and *Calamus viminalis*. The term cane is also applied to the *Arundinaria macrosperma*, an arborescent grass which grows in the Southern U. S. on the alluvial banks of rivers, and forms thickets called canebrakes which are almost impenetrable. This plant often grows to the height of fifteen or twenty feet. (See RATTAN and SUGAR-CANE.)

Cane′a, or **Can′na,** called **Khani′a** by the modern Greeks, a seaport-town of Candia or Crete, is on the N. coast, about 70 miles W. of Candia. It occupies the site of the ancient *Cydonia*. It is the most commercial town

in the island, and has a safe but shallow harbor, which will admit vessels of 300 tons. It has a lighthouse, an arsenal, and a fort. Oil, soap, wax, etc. are the chief articles of export. Pop. about 7000.

Canea'dea, a post-village and township of Allegany co., N. Y., contains valuable stone-quarries. Pop. of village, 236; of township, 1869.

Cane Creek, a township of Clarke co., Ala. Pop. 480.

Cane Creek, a post-township of Butler co., Mo. P. 323.

Cane Creek, a township of Lancaster co., S. C. Pop. 1759.

Cane Hill, a township of Washington co., Ark. Pop. 1611. It is the seat of Cane Hill College.

Canel'la Al'ba, a large tree which grows in Florida and the West Indies, and is called wild cinnamon. It has fragrant flowers and an aromatic bark, which is exported in quilled pieces of a pale buff color and a pungent taste. This is sometimes used in medicine as a stimulant tonic. The genus *Canella* belongs to the order Clusiaceæ.

Ca'nes Venat'ici (*i. e.* the "Hunting Dogs"), the Latin name of a constellation of the northern hemisphere. It is represented on the celestial globe by the figures of two dogs named Asterion and Chara, which are held in leash by Boötes, and appear as if pursuing Ursa Major.

Ca'ney, a township of Independence co., Ark. Pop. 177.

Caney, a post-township of Ouachita co., Ark. Pop. 845.

Caney Fork, a township of Pike co., Ark. Pop. 199.

Caney Fork, a township of Jackson co., N. C. Pop. 951.

Caney River, a township of Yancy co., N. C. Pop. 1202.

Can'field, a post-village, capital of Mahoning co., O., on the Niles and New Lisbon R. R., 69 miles S. E. of Cleveland. It has one large leather-belt factory, a good machine-shop, and one weekly paper. The exhibition grounds of the Mahoning Agricultural Society are located here. Pop. 640; of Canfield township, 1513.

WM. R. BROWNLEE, ED. "MAHONING COUNTY NEWS."

Can'gas de Tine'o, a town of Spain, in the province of Oviedo, 37 miles S. W. of Oviedo, on the Narcea. Pop. 21,337.

Canicat'ti, a town of Sicily, in the province of Girgenti, on the river Naro, 15 miles E. N. E. of Girgenti. It is well built, and has sulphur-mines in the vicinity. Pop. in 1871, 20,908.

Canic'ula, a name formerly given to Sirius, the dog-star, a star in the constellation Canis Major. This name signifies in Latin "little dog."

Canic'ular Year, the ancient year of the Egyptians, so called because its commencement was determined by the heliacal rising of Sirius (or Canicula). Their reason for computing time from the rising of that star was perhaps because it occurred about the same date as the annual inundation of the Nile. The common year of the Egyptians consisted of 365 days, and every fourth year of 366.

Can'idæ [from the Lat. *canis*, a "dog"], a family of the digitigrade carnivorous Mammalia, to which belong the dog, fox, wolf, etc. The hyænas are sometimes referred to this family, and sometimes to the Viverridæ (civets, ichneumons, etc.). These families are closely connected, and hyænas may be said to form a connecting link between them. The Canidæ have two flat tuberculous molar teeth on each side behind the great cheek tooth of the upper jaw, a dentition resembling that of the bear family, or Ursidæ, to which they exhibit a further resemblance in their power of adapting themselves to the use of vegetable food. They have generally three incisors or cutting teeth, with one large canine tooth, and four præmolars on each side in each jaw, two true molars on each side in the upper jaw, and three in the lower.

Cani'na (LUIGI), CAVALIERE, an Italian architect and antiquary, born at Casal Oct. 23, 1795. He was professor of architecture at Turin, and published, besides other works, "Ancient Architecture Described and Illustrated by Monuments" (9 vols., 1844). Died Oct. 17, 1856.

Ca'nines, or **Canine Teeth** [Lat. *dentes canini*, from *canis*, a "dog"], a name given to four teeth which are pointed and are placed between the incisors and bicuspidate teeth. Each jaw has two of these, which are sometimes called eye-teeth or stomach-teeth. In the Carnivora they are very large and adapted to tearing flesh.

Canis'ius (PETRUS), SAINT, a Dutch Jesuit, born at Nimeguen May 8, 1521. His proper name was PIETER DE HONDT. He became in 1549 professor and rector of the University of Ingolstadt, and was also a prominent member of the Council of Trent in 1545. He wrote, besides other works, "Summa Doctrinæ Christianæ." Died Dec. 21, 1597. He was canonized by Pope Pius IX. in 1864.

Ca'nis Ma'jor (*i. e.* the "Greater Dog"), a constellation which appears in the celestial globe under the feet of Orion. It comprises Sirius, the dog-star, which surpasses all the stars of the firmament in splendor and apparent magnitude.

Ca'nis Mi'nor (the "Lesser Dog"), a constellation adjacent to Canis Major and to Gemini. It comprises Procyon, a star of the first magnitude, which is nearly in a direct line between Sirius and Pollux.

Caniste'o, a post-village of Steuben co., N. Y., on the Canisteo River and the Erie R. R., 55 miles W. N. W. of Elmira. It has some manufactures and a weekly paper. Pop. of Canisteo township, 2435.

ED. CANISTEO "REPORTER."

Canister, a township of Dodge co., Minn. Pop. 880.

Canister Shot. See CASE SHOT.

Cank'er [from the same root as *cancer*]. Canker in plants is especially injurious to fruit trees. It is a kind of gangrene, usually beginning in the young branches and gradually descending to the trunk. Wet subsoils appear to cause canker in some cases. Varieties of fruit trees which have been long propagated by grafting and budding are most liable to this disease. (For the diseases of the human mouth known as canker, see STOMATITIS and APHTHÆ.)

Canker-Worm (*Anisopteryx*), a genus of destructive insects, of the order Lepidoptera and family Phalænidæ or Geometridæ. The common American species (*Anisopteryx vernata*) is rather smaller than the European, and with darker wings. The female is wingless. The male has four thin, silky wings, which have an extent of about an inch and a quarter when expanded. The moths come out of the ground principally in the spring, sometimes also in the autumn. The female lays from sixty to one hundred eggs, glued in clusters to branches of trees; they hatch in the early part of May. The larvæ then feed upon the leaves, especially of apple and elm trees, which they pierce with multitudes of holes. When fully grown the larva is nearly or quite an inch in length. After about four weeks of feeding, the larvæ descend, by crawling or hanging down by their threads, to the ground, burrowing generally to the depth of a few inches. Within twenty-four hours afterwards they are changed to light-brown chrysalids. From these the moths emerge after a variable time. As the female canker-worms are wingless, trees may be protected from them by leaden troughs containing tar or fish oil being placed around their trunks. It is also desirable, however, to destroy as many of the caterpillars as possible. Shaking the trees will often dislodge them. (See HARRIS, "On Insects Destructive to Vegetation," Boston, 1862.)

Can'na [a Latin word signifying a "cane" or "reed"], the name of a genus of plants of the order Marantaceæ. The fruit is a capsule containing hard black seeds, which are called Indian shot. The flower has one fertile petal-like stamen, and a petaloid style. One or more species are extensively cultivated as ornamental plants. The starch of *Canna coccinea* is used sometimes instead of arrow-root, under the name *tous-les-mois*. The *Canna flaccida* is a native of the Southern U. S., near the coast.

Cannabina'ceæ [from *Cannabis*, "hemp"], a small natural order of exogenous plants which most botanists include in the order Urticaceæ. They are distinguished by solitary suspended ovules and a hooked or spiral embryo. This order comprises only two genera of plants, the hemp (*Cannabis*) and the hop (*Humulus*).

Can'nabis [Gr. κάνναβις], the typical genus of plants of the order Cannabinaceæ. The only known species of it is *Cannabis sativa*, or hemp, a tall diœcious annual with elegant palmate leaves, which grows wild in India, and is cultivated for its fibre, etc. (See HEMP, by M. C. WELD, PH. B.)

The intoxicating drug called *hasheesh* by the Arabs and *bhang* by the Hindoos is procured from a variety called *Cannabis Indica*. Under the name of *gunjah* the dried female flowering hemp-plants are sold in bundles for smoking. The resinous extract called *churrus* is swallowed for intoxicating effect. Several native African tribes use it. There appears to be more of the active resinoid (*cannabin*) in the Indian than in the European variety, owing probably to the difference of climate. It has been proved by the experiments of Dr. H. C. Wood, Jr., of Philadelphia, that the extract of American hemp has the same kind of influence on the brain and nervous system as that from India. Transportation must induce some change in the latter, as the medicinal dose found to be safe by physicians in England

is about ten times as large as that used by Dr. O'Shaughnessy and others in Bengal. The effects of Indian hemp vary considerably with different persons. Mostly, they are agreeably exciting, the plant being known in India as the "increaser of pleasure," the "cementer of friendship," and the "laughter-mover." Some persons become violent under its use. The word *assassin* is said to be derived from the Arabic *hashishin*, one who drinks or smokes hasheesh. With many there is an exaggeration of ordinary impressions, so that slight sounds are taken for thunder, one's head seems as large as a house, etc. Others have their sensibility diminished or suspended by it. The pupil of the eye is dilated under its internal use. It does not, like opium, affect the secretions, and seldom produces nausea. As with other stimulants, the habit of taking it becomes a pernicious slavery.

The ancients possessed some knowledge of the narcotic powers of hemp. Dioscorides and Galen mention its juice as a remedy for earache. The Scythians made a vapor-bath of its fumes by throwing the seeds on red-hot stones. Dr. Royle suggests that it may have been the nepenthes (*φάρμακον νηπενθές*) which, according to Homer, Helen received from an Egyptian woman and gave to Telemachus in the house of Menelaus.

Extract of hemp (*Extractum cannabis Indicæ*) is now used as a medicine for neuralgia and some other nervous affections. The variability of its effects, however, has hitherto interfered with its extensive employment. (See PEREIRA, "Materia Medica and Therapeutics," Philada. ed., 1866.) REVISED BY WILLARD PARKER.

Can'næ, an ancient Roman town in Apulia, on the river Aufidus (Ofanto), near its entrance into the Adriatic Sea. Here, on Aug. 2, 216 B. C., Hannibal gained a decisive victory over the Roman army commanded by C. Terentius Varro. According to Livy, the Romans on this day lost about 45,000 infantry and 3000 cavalry. The site of Cannæ is occupied by a village called *Canne*, about 10 miles W. S. W. of Barletta.

Can'nel Coal [originally *candle* coal, because its bright flame was a substitute for candle-light], a variety of bituminous coal which is very dense and compact, and breaks with an uneven or largely conchoidal fracture. It sometimes exhibits a brilliant waxy lustre, and is generally of a brown or black color. It burns with a bright flame, and during the process of combustion splits and crackles without melting. This coal, which is found in England and the U. S., is used for fuel and is valuable for making gas. (See COAL, by PROF. J. S. NEWBERRY, M. D., LL.D.)

Can'nelton, a post-village, capital and principal town of Perry co., Ind., is on the Ohio River, about 68 miles above Evansville. It has a large cotton factory, built of sandstone, about 300 feet long and five stories high, which employs over 100 operatives; also manufactories of draining-tiles, pottery, chairs, flour, etc. Bituminous coal abounds in the adjacent hills, and is supplied in large quantities to steamboats. It has two weekly newspapers. Pop. 2481.
C. H. MASON, ED. "REPORTER."

Cannes, a seaport-town of France, in the department of Alpes-Maritimes, on the Mediterranean Sea, 25 miles S. E. of Draguignan. It has an old Gothic castle and a good quay. The mildness and salubrity of the climate render this a favorite winter resort for English families. Napoleon landed at Fréjus, near Cannes, after his escape from Elba on Mar. 1, 1815, and Lord Brougham died here in 1868. Pop. 9618.

Can'nibal [etymology doubtful], a person who feeds on human flesh. The practice appears to have prevailed in ancient as well as in modern times. Facts show that the people addicted to the eating of human flesh are not always the most degraded of the human race. For instance, in Australia, where the large animals are scarce, there are tribes of an extremely degraded type, who have only been known in exceptional conditions to feed on human flesh. The New Zealanders, on the other hand, who are one of the most highly developed aboriginal races with which civilization has had to compete, were, down to a late period, habitual cannibals. Cannibalism is chiefly found in the islands of the Pacific and in Africa. Among certain tribes of aborigines of America cannibalism is said to have formerly prevailed. It is also believed by some archæologists that the inhabitants of Europe in the prehistoric stone-period were to some extent cannibals.

Can'ning (CHARLES JOHN), EARL, an English statesman, a son of George Canning, noticed below, was born Dec. 14, 1812. He succeeded to the peerage on the death of his mother in 1837, and began his public life as a conservative. In 1852 he became postmaster-general in the ministry of Lord Aberdeen. He was appointed governor-general of India in 1855. During his administration occurred the great Sepoy mutiny (1857–58). Died in England June 17, 1862.

Canning (GEORGE), an eminent English statesman and orator, born in London April 11, 1770. He was educated at Christ's Church College, Oxford, where he distinguished himself as a classical scholar. In 1793 he entered Parliament as a supporter of Pitt, who was then prime minister, and he became an under secretary of state in 1796. About 1797, Canning, Ellis, and others began to publish the witty and famous political satires called "The Anti-Jacobin." He married a daughter of General John Scott. After the resignation of Mr. Pitt, in 1801, Canning joined the opposition against the ministry of Addington. In April, 1807, he became minister of foreign affairs in the Tory cabinet formed by the duke of Portland. He fought a duel in 1809 with Lord Castlereagh, who was the favorite leader of the Tories. Soon after this duel he ceased to be a cabinet minister. He advocated Catholic emancipation in 1812, was returned to Parliament for Liverpool in that year, and was appointed president of the board of control in 1816. In the latter part of his life Canning and Lord Brougham were considered the most eloquent and powerful orators in the House of Commons. On the death of Lord Castlereagh, in 1822, Canning succeeded him as secretary of foreign affairs in the cabinet of Lord Liverpool. He infused a more liberal spirit into the cabinet, and rendered an important service to his country by pursuing a foreign policy that was not subservient to the interests and designs of the Holy Alliance. In April, 1827, he became first lord of the treasury as the successor of Lord Liverpool, who was disabled by paralysis. He formed a cabinet partly of Tories and partly of Whigs. Died Aug. 8, 1827. (See ROBERT BELL, "Life of George Canning," 1846; A. G. STAPLETON, "The Political Life of G. Canning," 1859; RUEDER, "G. Canning, seine Lebon, etc.," 1827.)

Canning (STRATFORD). See STRATFORD DE REDCLIFFE.

Can'nington, a post-village of Brock township, Ontario co. and province (Canada), on the Toronto and Nipissing Railway, 59 miles N. of Toronto. It has a weekly paper and some manufactures. Pop. about 800.

Cannon. See ARTILLERY, by GEN. WILLIAM F. BARRY, U. S. Army.

Can'non, a county of Middle Tennessee. Area, 220 square miles. It is drained by Stone River and other small streams. The surface is undulating or hilly; the soil is mostly fertile. Grain, wool, and tobacco are the chief products. Capital, Woodbury. Pop. 10,502.

Cannon, a township of Kent co., Mich. Pop. 1206.

Cannon (NEWTON), born in Guilford co., N. C., about 1781, served in the Tennessee mounted riflemen as colonel at Tallahatchie (Nov. 3, 1813), was a member of Congress from Tennessee (1814–17 and 1819–23), and was governor (1835–39). Died Sept. 29, 1841.

Cannon (WILLIAM), born at Bridgeville, Del., in 1809, was governor of Delaware in 1864–65. Died Mar. 1, 1865.

Cannonade, in general, is the discharge of balls or shells from cannon or great guns; the act of firing artillery in a battle or a siege. As a technical term it is sometimes used to denote an action between two armies in which the artillery is employed almost exclusively.

Cannon-ball Tree (*Couroupita Guianensis*), a large tree of the order Lecythidaceæ, a native of Guiana. It bears racemes of white and rose-colored flowers, and a fruit which has a hard woody shell and is nearly round. This fruit is about the size of a thirty-six pound cannon-ball.

Cannon City, a post-township of Rice co., Minn. Pop. 510.

Cannon Falls, a township of Goodhue co., Minn. Pop. 957.

Can'non's, a township of Newberry co., S. C. P. 1224.

Cannonsburg, Pa. See CANONSBURG.

Can'nonsville, a post-village of Tompkins township, Delaware co., N. Y., on the Delaware River, 8 miles above Deposit, has three churches, and manufactures of leather, flour, etc. Pop. 319.

Cann'stadt, a town of Würtemberg, is situated in a beautiful and fertile valley, on the river Neckar, 2¼ miles by rail N. E. of Stuttgart. It is connected by railways with Carlsruhe, Heilbronn, and other cities. It has manufactures of cotton and woollen fabrics and an active trade, for which the navigable Neckar affords facilities. Here are many mineral springs, which are much frequented in the summer. Pop. in 1871, 11,904.

Ca'no, a township of Iowa co., Ia. Pop. 235.

Cano (ALONZO), a celebrated Spanish painter, sculptor, and architect, was born at Granada Mar. 19, 1601. He

studied painting under Pacheco and Juan de Castillo, and became the founder of the school of Granada. In 1638 he was appointed court-painter by Philip IV. Among his chief works is a "Conception of the Virgin." Died Oct. 5, 1665.

Canoe [etymology uncertain], a rude boat made of the trunk of a single tree hollowed out. Canoes are generally open boats, propelled by paddles and steered by oars. The length and other dimensions vary greatly. On sea-coasts canoes are sometimes made of light wooden frames covered with seal skins, which are drawn across as a deck, with only a hole large enough for one man to sit in. The name is also applied to boats made of birch bark, and to other rude craft, and of late to a pleasure-boat designed for long excursions by a single person.

Canoe, a township of Escambia co., Ala. Pop. 479.

Canoe, a post-township of Winneshiek co., Ia. P. 864.

Canoe, a township of Indiana co., Pa. Pop. 998.

Canoe Creek, a township of Rock Island co., Ill. P. 413.

Cano'ga, a post-village of Fayette township, Seneca co., N. Y., has an extensive water-power furnished by an immense spring, which discharges also nitrogen gas. The village is on the W. shore of Cayuga Lake. Pop. 197.

Can'on [Gr. *κανών*, a "rule"], a term of various significations in theology, science, and art, means, in general, a law, rule, or standard. In ecclesiastical language it is applied to a law or rule of doctrine or discipline, or the decree of a general council; also to the genuine books of the Holy Scripture, called the *Sacred Canon*. The Roman Catholic Church recognizes as parts of the canon of Scripture the apocryphal books, which Protestants reject. In the canon of the New Testament the agreement of the Christian churches may be said to be unanimous. (See Bible, The, by Prof. W. G. Sumner.)

Can'on [Lat. *canonicus*], the name of a dignitary of the Roman Catholic and Anglican churches. In each cathedral and collegiate church there are canons, who perform some parts of the services and receive a portion of the revenue of the church. In a collective capacity the canons are called a chapter, and form the council of the bishop. Canons (in England) must reside at the cathedral for three months in each year. Canons were originally monks or priests who lived in a community or monastery. They are historically known as Canons Regular, and followed the rule of Saint Augustine, Saint Benedict, Saint Anthony, etc. They were once the most numerous of the religious orders. They are still found in some parts of Europe.

Can'on, in music, a perpetual fugue; a kind of fugue in which not merely a certain period or phrase is to be imitated or answered, but the whole of the first part with which the canon begins is imitated throughout by all the other parts. The canon is composed for two, three, four, or more voices.

Canon (Sacred). See Bible, The, by Prof. W. G. Sumner.

Cañon, a Spanish word, pronounced cányon, meaning a tube, and applied by the American Spaniards to long and narrow mountain-gorges, or deep ravines with precipitous slopes assuming almost a tubular form. The Rocky Mountains, the Sierra Nevada, and the great Western plateaus of North America furnish numerous and striking examples. The Great Cañon of the Colorado, in the middle course of the river, above its last great bend, between 111° and 115° W. lon., is the most remarkable of its kind, and may serve as a type. It is hollowed out below the general surface of a vast plateau to the depth of 3000 to 5000 feet, opening to view, in its perpendicular walls, all the series of geological strata down to their granite foundation. At the bottom of this vertiginous chasm, occupying its whole width, roll the waters of the stream, now foaming through wild rapids, now flowing peacefully in its deep and narrow channel. Its tributaries, Grand River, the Little Colorado, and others, are hardly less remarkable.

The Snake River, or Lewis branch of the Columbia, runs through a deep valley full a thousand feet below the surface of the surrounding country. The nature of these chasms, their winding course, the disposition of their affluents, seem to force us to ascribe their origin to the erosive action of the flowing waters, and these wonderful structures prove the enormous power of the agent which was capable of scooping out such channels. In the far West the name of cañon has been extended to almost every narrow mountain-gorge, whatever be its origin and character.

Arnold Guyot.

Cañon City, capital of Fremont co., Col., situated on the Arkansas River where it emerges from the Rocky Mountains, on a branch of the Denver and Rio Grande R. It is a resort for invalids, having both cold and warm mineral springs and a healthful climate. In this vicinity is fine scenery. It has unlimited water-power, and in the neighborhood are coal, iron, oil-wells, marble and limestone quarries, and rich copper and silver mines. It contains a planing mill, a grist-mill, three churches, a public school and seminary, and contains the Colorado penitentiary. It has one weekly newspaper. The city is 5280 feet above the sea-level. Pop. 229.

Henry Ripley, Ed. Cañon City "Times."

Cañon City, a post-village, capital of Grant co., Or., about 150 miles S. E. of Dalles City. It contains several fine fireproof buildings. Gold-mines have been opened in the adjacent hills.

Cañon Creek, a post-township of Lewis and Clark co., Mon. Pop. 39.

Can'oness [Lat. *canonissa*]. The canonesses were members of certain religious orders of the Roman Catholic Church, who often took no monastic vows, though they lived in common and usually observed the rule of Saint Augustine. Many noblemen sought well-endowed canonical livings for their daughters, who were at liberty to marry when they chose. The custom prevailed in Germany even after the Reformation, and there were many houses (*Stifter*) of Protestant canonesses, especially in Westphalia and Mecklenburg.

Canon'ical, according to the canon or rule. The canonical books of Scripture are those which are admitted to be genuine and of divine origin. (See Bible, The.)

Canonical Hours, in the Roman Catholic Church, are certain fixed times in the day for devotions. These hours are called nocturnes, matins, lauds, tierce, nones, vespers, and complines. The breviary has seven canonical hours, because the Psalter says "Seven times in the day will I praise Thee." In England the hours between 8 A. M. and 12 M. are canonical, and no marriage can take place in any church except in canonical time.

Canonical Virgins, in the early ages of the Church, were young women who, remaining in their homes, took upon themselves vows of perpetual virginity. They were enrolled in a list or canon, whence their name.

Canon'icus, an American Indian, chief of the Narragansetts, who, though at first hostile to the Pilgrims who landed at Plymouth in 1620, subsequently became friendly to the whites, and especially to the inhabitants of the colony of Roger Williams. Died June 4, 1647.

Canon'icut, or **Conanicut,** a beautiful island in Narragansett Bay, nearly 8 miles long and 1 mile wide. The island constitutes the township of Jamestown, in Newport co., R. I. Pop. 378.

Canoniza'tion, the act of declaring a person a saint; a ceremony in the Roman Catholic and Greek churches by which deceased beatified persons are enrolled in the catalogue or canon of saints. In the Roman Catholic Church the pope has exclusive authority to canonize since the year 1170, but before that date other bishops had the same right or power. When it is proposed to canonize a person, a formal process is instituted by which his merits and character are investigated. After it has been proved that he died in the odor of sanctity, the ceremony is performed in St. Peter's church, Rome. The day of his death is annually celebrated by the Church.

Canon Law, a system of rules for the discipline of the Church. The name is especially applied to the rules of the Roman Catholic Church, which are also in force to some extent in the churches of England, Scotland, and Germany. This system of laws is based largely upon decisions of ancient councils, and also shows marks of the influence of the Bible and of the Roman jurisprudence. It received frequent additions and other modifications from the decretals, bulls, and extravagants of the popes. In England, the kings and parliaments were always jealous of the introduction of foreign canons, but permitted to some extent their introduction in cases where they did not interfere with the statutes of the land. In this way the common law came to receive the influence of the papal decretals; which are sometimes cited as of authority in matters of marriage, divorce, inheritance, etc., since these affairs were under the control of the ecclesiastical courts. In Scottish jurisprudence the influence of canon law is very great, it having been originally received as of equal force with the statutes of the realm. (See Law, by Prof. T. W. Dwight, LL.D.)

Can'onsburg, a post-borough of Washington co., Pa., on the Chartiers Valley R. W., 22 miles S. W. of Pittsburg. It is the seat of Jefferson College. It has one newspaper, a planing mill, and a woollen factory. The Pennsylvania Reform School is near by. Pop. 641.

T. M. Potts & Co., Pubs. Canonsburg "Herald."

Cano'pus, or **Cano'bus** [Gr. Κάνωπος], a very bril-

liant star of the first magnitude in Argo, a constellation of the southern hemisphere. It is never visible in the Northern or Middle U. S., being only 37½° from the South Pole.

Canopus, or **Canobus,** an ancient city of Lower Egypt, was situated on the Mediterranean, near the western mouth of the Nile, 15 miles E. of Alexandria. Before the foundation of Alexandria it was the principal seaport of the Delta. Here was a famous shrine and oracle of Serapis. Canopus was notorious for the dissolute morals of its people and the number of its religious festivals. Its ruins are still visible about three miles from Aboukir.

Can opy [Gr. *κωνωπεῖον*, from *κωνωψ*, a "gnat," because canopies were used to keep off gnats, like our mosquito-curtains; Lat. *canopeum*], an ornamental covering over a throne or bed; also a covering which is carried over the heads of kings on journeys, and over the holy sacrament in Roman Catholic processions. The latter is called BALDACHIN (which see). In architecture and sculpture, canopy is a magnificent decoration which covers an altar, throne, pulpit, or tribunal. In Gothic architecture, the term is applied to the rich coverings which are often seen over niches and tombs.

Cano'sa (anc. *Canusium*), a town of Italy, in the province of Bari, is situated on the declivity of a steep hill 14 miles S. W. of Barletta. It has an ancient cathedral. Here are interesting ruins of the ancient *Canusium*, an important city of Apulia. In the subterranean tombs of this place were found painted vases and magnificent funereal furniture, with precious stones and jewels. Pop. 12,769.

Cano'va (ANTONIO), a celebrated Italian sculptor, born at Possagno, in Venetia, Nov. 1, 1757. He studied art in Venice and Rome, and aspired to restore the pure and classic style of the antique. Among his early works were a statue of Apollo and a group of "Daedalus and Icarus." He settled in Rome in 1782, and acquired celebrity by his "Theseus and the Minotaur." He did not adhere strictly to the severe simplicity of the antique, but modified it by a peculiar grace, which is apparent in his "Cupid and Psyche" and his "Venus and Adonis." Having been invited by Napoleon, he went to Paris in 1802, and executed an admirable statue of that emperor. Among his other works are a "Venus Victorious," a monument to Clement XIII., erected in St. Peter's church, a statue of Washington, and a "Perseus with the Head of Medusa." In 1816 he received the title of marquis of Ischia. He was the founder of a new school of sculpture, and was reputed the greatest sculptor of his age. Died at Venice Oct. 13, 1822.

Canrobert (FRANÇOIS CERTAIN), a French general, born at St. Ceré, Lot, June 27, 1809. Having served many campaigns in Algeria, he became a general of brigade in 1850, and a general of division in 1853. He commanded a division in the Crimea in 1854, and was wounded at Alma. In Sept., 1854, he succeeded Marshal St.-Arnaud as commander-in-chief of the French army, and he began the siege of Sebastopol. He resigned the command to General Pelissier in May, 1855, and was made a marshal of France in 1856. In June, 1859, he commanded a corps at Solferino. On the outbreak of hostilities in 1870, the Sixth corps, under Canrobert at Châlons, was, immediately after the disaster of Forbach and Reichshofen, summoned to Metz to reinforce Bazaine. As its commander, Canrobert took a prominent part in all the battles and events preceding and attending the investiture and capitulation of Metz (see BAZAINE); and at the trial of Bazaine the bearing and evidence of this veteran soldier excited popular admiration.

Can'so, Gut of, a strait which separates Nova Scotia from the island of Cape Breton, and connects the Atlantic with the Gulf of St. Lawrence. It is 17 miles long, and has an average width of 2½ miles.

Cant, a term used in architecture to express the sides of a polygon turned from the spectator, or an angular deflection of a straight line which is neither in the same direction to the horizontal nor to the perpendicular line of the base.

CANT, on shipboard, is a term applied to timbers which lie obliquely to the line of the keel, and are near the bow or stern. It is also applied to anything sloping or inclined.

CANT also signifies an impulse with a sudden jerk; obliquity of position; a whining or affected tone; a whining pretension to goodness; the peculiar words and phrases of professional men; any barbarous jargon in speech.

Canta'bri, a rude race of ancient mountaineers who lived in Cantabria, the northern part of Spain, near the Bay of Biscay. Their chief towns were Juliobrigas, Concana, and Vellica. They made a brave resistance to the Romans in the Cantabrian war (25–19 B. C.). They are said to have been of Iberian origin.

Canta'brian Moun'tains, a general name of several ranges in the N. part of Spain. They are connected with the Pyrenees, from which they extend westward to Cape Finisterre. The highest summits are estimated at 10,000 feet high. Several portions of these mountains receive the local names of Salvada, Ordunte, Peña, Anaña, Mellara, etc.

Cantacuze'nus, Anglicised as **Cantacuzene** [Gr. *Καντακουζηνος*], (JOHN), a Byzantine emperor and historian. He was prime minister under Andronicus III. (who died in 1341), and he became emperor in 1342. He was involved in a civil war with Anna, the wife of Andronicus III., and abdicated in 1355. He wrote a work on Byzantine history from 1320 to 1357. Died Nov. 20, 1411.

Cantal, a central department of France, formed of the S. part of the old province of Auvergne. It is bounded on the N. by Puy de Dôme, on the E. by Haute Loire, on the S. E. by Lozère, on the S. by Aveyron, and on the W. by Lot and Corrèze. Area, 2217 square miles. It is drained by the sources of the Dordogne. The surface is mountainous, and mostly occupied by the *débris* of extinct volcanoes. The soil is mostly sterile. Among the staple products are cattle, butter, cheese, and chestnuts. Capital, Aurillac. It is divided into 4 arrondissements, 23 cantons, and 200 communes. Pop. in 1872, 231,867.

Can'taloupe (commonly pronounced kan'ta-lōp) **Melon,** or **Musk-melon,** named from Cantalupo, in Italy, the *Cucumis melo* of botanists, is of the same genus with the cucumber, family Cucurbitaceæ. It has round, heart-shaped leaves, a creeping stem, yellowish flowers, and fleshy fruit, which is much esteemed. It is largely cultivated in New Jersey.

Canta'ta [Fr. *cantate*], an Italian musical term, derived from *cantare*, "to sing." It is the name of a local composition, not easily defined, which consists of choruses, arias, and recitatives with instrumental accompaniment. Later forms of it are much simpler.

Canteen' [Fr. *cantine*], a military term used in several senses: 1, a small tin or wooden vessel, which each soldier carries and uses for holding water; 2, a small wooden or leathern chest or coffer containing the table equipage and utensils of an officer when he is in active service; 3, a public-house licensed in British garrisons and barracks for the sale of malt liquor, ardent spirits, and groceries, in order that the soldiers may obtain such articles without going beyond the precincts of the barracks.

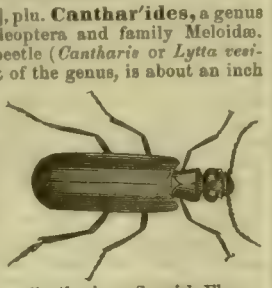
Cantemir' (DEMETRIUS), an historian, was born in 1673. He was appointed vaivode of Moldavia by the sultan of Turkey in 1710. Having become an ally of Peter the Great, he was expelled from Moldavia by the Turks in 1711. He wrote in Latin a "History of the Origin and Decay of the Ottoman Empire." Died in 1723.

Can'terbury, a city and county of England, in Kent, on the river Stour, 56 miles E. S. E. of London, with which it is connected by railway. It is the metropolitan see of England, being the seat of the archbishop of Canterbury, who is primate of all England and the first peer of the realm. It stands in a vale or level space between hills of moderate height. It contains fourteen old churches, mostly built of flint; also remains of St. Augustine's Benedictine abbey, and the ruins of a Norman castle. Among its institutions are several hospitals, a museum, and a theatre. Canterbury returns two members to Parliament. It has manufactures of linen damask, and is noted for its brawn. St. Augustine became the first archbishop of Canterbury in 597 A. D. About this time the town was the capital of the kingdom of Kent, and was called *Caer Cant* (*i. e.* "city of Kent"). Archbishop Cuthbert built here, about 740 A. D., a church which received numerous additions in succeeding ages. The choir having been destroyed by fire in 1174, it was soon rebuilt by William of Sens. This restored choir is probably one of the oldest parts of the cathedral, which presents a magnificent union of almost every style of Christian architecture. The central tower is 234 feet high, and the total exterior length of the cathedral is 545 feet. Immense numbers of pilgrims came here to worship at the shrine of Thomas à Becket, who was killed here in 1170. Pop. in 1871, 20,961.

Canterbury, a post-village of Windham co., Conn., on the Quinebaug River and on the Hartford Providence and Fishkill R. R., 40 miles W. S. W. of Providence. Pop. of Canterbury township, 1543.

Canterbury, a post-township of Merrimack co., N. H., on the Boston Concord and Montreal R. R., 8 miles N. of Concord. It has a community of Shakers and some manufactures. Pop. 1169.

Canterbury, a village of Cornwall township, Orange co., N. Y., has six churches, and manufactures of cord, fish-lines, and woollen yarn.



Canterbury, a settlement of about 2400 square miles on the E. coast of the N. island of the New Zealand group.

Capital, Christchurch; Lyttleton is its chief port. The products are potatoes, oil, whalebone, gold-dust, and hides.

Canterbury, Viscounts (United Kingdom, 1835).—John Henry Thomas Manners-Sutton, third viscount, K. C. B., governor of Victoria colony, born May 27, 1814, was member of Parliament for Cambridge borough 1841–47, under-secretary for the home department 1841–46, has been lieutenant-governor of New Brunswick and governor of Trinidad, and succeeded his brother Nov. 13, 1869.

Canterbury Bell. See Campanula.

Can'tharis [Gr. *καν θαρίς*], plu. **Canthar'ides,** a genus of insects of the order Coleoptera and family Meloidæ. The Spanish fly, or blister beetle (*Cantharis* or *Lytta vesicatoria*), the most important of the genus, is about an inch long; has a large head and long antennæ, and soft wing-covers concealing the abdomen. It is of a bright green. Its brilliancy is of use in detecting cases of poisoning by cantharides, golden-green particles being always seen in powders made of these insects, and these particles remaining long unchanged. The common blister fly is found in the south of Europe and in Asia. It is rare in England. They are imported from Spain, France, Italy, Russia, and the Levant. The perfect insect is taken by beating the branches of trees in the morning or evening, when it is comparatively lethargic, a cloth being spread below to receive the insects as they fall. Those who collect them wear gloves and veils. Unpleasant effects have been experienced from even sitting under trees on the leaves of which cantharides were numerous. They are killed with the vapor of vinegar, sulphurous acid, or oil of turpentine. Unless kept with great care, they lose their active properties. They are liable to be injured by mites. Some of the species of the genera *Meloe* and *Mylabris* are occasionally used as vesicants. The American *Lytta vittata* (potato-fly) and other native species have very similar properties.

Cantharis, or Spanish Fly.

The active principle of the flies is cantharidin, of which $\frac{1}{100}$ of a grain placed on the lip rapidly causes the rise of blisters. Internally, the flies cause heat in the throat, stomach, kidneys, etc., and in large doses they give rise to inflammation of a serious nature. There are various preparations of blistering flies, such as tincture of cantharides, cantharidal collodion, etc., but that most commonly employed is blistering plaster, made by mixing powdered flies, yellow wax, resin, and lard.

Can'ticle [in the Vulgate, *Canticum Canticorum*, the "Song of Songs"], called in the common English version of the Bible **Solomon's Song,** the Hebrew שיר השירים (*i. e.* "Song of the Songs"), is a collection of poems, perhaps with a dramatic arrangement, whose subject is chaste love. The rabbis first began to interpret it allegorically of God and His people, and this interpretation was so established before the time of the Massoretes that they did not hesitate to recognize the book as canonical. The same method of interpretation passed into the Christian Church, only that the allegory was there accepted as referring to Christ and the Church. The more crass forms of this method of interpretation have been abandoned, but the effort is still made by types or symbols or other devices to give to the book another significance than that which it bears on its face. Not a syllable appears in the book to suggest any such hidden significance, and this interpretation rests on the assumption that, since the book is in the canon, it *must* be something more than it appears to be. Niebuhr is said to have replied to a young man, who regretted its place in the canon, that he would not consider the Bible complete as "the book of humanity," if it contained no representation of pure and faithful love. The book probably belongs to the time of Solomon, though there are no satisfactory data for deciding as to its date and author.

Cantire, kan-tīr', or **Kintyre,** a long narrow peninsula of Scotland, forms the S. end of the county of Argyle. It is bounded on the E. by the Frith of Clyde or Kilbrannan Sound, and on the W. by the Atlantic Ocean. Its length is 40 miles, and its average width 6½ miles. It contains a large portion of arable land. A lighthouse stands at the S. W. extremity, which is called the Mull of Cantire.

Can'to Fer'mo, in music, the subject-song or theme. Every part that is the subject of counterpoint, whether plain or figured, is called canto fermo by the Italians. In church music this term means plain song or choral song in unison, and in notes all of equal length.

Can'ton [from the It. *canto*, a "corner"], a small piece of territory; the name of each of the states or independent provinces which united form the federal republic of Switzerland, each retaining its autonomy in matters of internal administration.

Canton, in heraldry, occupies a corner of the shield, either dexter or sinister, and in size is the third of the chief. It is one of the nine honorable ordinaries.

Canton' [a corruption of *Quang-Tong*, the name of the province; Chinese *Sang-Ching*], a populous city, the greatest commercial emporium of China, and the capital of the province of Quang-Tong, is on the left (N.) bank of the Canton or Pearl River, about 70 miles from its entrance into the China Sea; lat. 23° 7′ N., lon. 113° 14′ E. The mean annual temperature is 69° F. The city is enclosed by a brick wall about seven miles in extent, and is entered by twelve gates. It is also defended by four strong forts, erected on the hills which rise on its northern side. Several islands in the river below Canton are also fortified. The city is divided into the old and new town, the former of which is occupied by Tartars, and the latter by the Chinese. The European merchants occupy one of the suburbs called *hongs*, which face the river and are separated from it by a quay 100 feet wide. The streets of Canton are crooked and narrow, having an average width of about eight feet. The houses are built of brick, stone, or wood, and are seldom more than two stories high. Many thousands of people called Tankia, having no homes on the land, live on boats and rafts, and gain a subsistence by fishing and rearing poultry. Canton contains several many-storied pagodas, a Mohammedan mosque, and about 120 joss-houses or Booddhist temples. The most remarkable of these is on the island of Honam, which is opposite the city. This temple covers about seven acres. Canton has extensive manufactures of silk, cotton, brass, iron, and wood.

The city has an advantageous position for foreign and internal trade, and has access to the rich provinces of Quang-See and Quang-Tong by its large navigable river. The chief articles of export are tea and silk goods, of the former of which 24,477,411 pounds were exported in 1863. Sugar, porcelain, and precious metals are also exported. All the legitimate foreign trade of China was confined to Canton before 1843, when the more northern ports of Amoy, Foochoo, Ningpo, and Shanghai were opened to foreigners, since when the importance of Canton has declined. The exports from this city to Europe and America in 1844 were valued at $26,755,626, and in 1871 they were valued at about $13,840,000. The quantity of tea exported in 1847 is said to have been more than 72,000,000 pounds. Large quantities of opium, produced in Hindostan, are imported into Canton contrary to law.

Canton is supposed to be the oldest city of China. Its population is notorious for profligacy, turbulence, dishonesty, and other vices. The European factories have been more than once attacked by mobs of Cantonese, actuated by a violent hostility to foreigners. The police is rendered inefficient or worse by the venality and rapacity of its officers, who share in the profits of robberies, and are often bribed to liberate offenders. In May, 1841, the British forces captured the defences of Canton, but before they entered the city they were induced to retire by the payment of £6,000,000. The city was occupied by the British and French armies in Dec., 1857. Pop. about 800,000.

A. J. Schem.

Canton, a township of Wilcox co., Ala. Pop. 1528.

Canton, a post-village and township of Hartford co., Conn., 15 miles N. W. of Hartford. Pop. 2639.

Canton, a post-village, capital of Lincoln co., Dak., on the Sioux River, in a good farming region. It has good water-power, and one weekly newspaper.

R. H. Miller, Ed. Sioux Valley "News."

Canton, a small post-village, capital of Cherokee co., Ga., on the Etowah River, about 37 miles N. of Atlanta. Gold is found in this county. Pop. 214.

Canton, an incorporated city in Fulton co., Ill., 28 miles W. S. W. of Peoria, 12 miles W. of Illinois River, at the crossing of the Toledo Peoria and Warsaw R. R., and the Rushville and Buda branch of the Chicago Burlington and Quincy R. R., is situated in a coal-region with mines within the city. It has 7 churches, 1 national and 2 private banks, 3 iron-foundries, large agricultural implement and wagon manufactories, 4 cigar manufactories, and a large packing-house, putting up meat for the English market. There is a good library, four ward and one high school, erected at a cost of $10,500 each, a good fire department, etc. It has two weekly newspapers. Pop. 3308; of township, 4472.

W. P. Tanquary, Ed. "Register."

Canton, a township of Benton co., Ia. Pop. 1509.

Canton, a post-township of Oxford co., Me., on the Androscoggin River, at the N. terminus of the Portland

and Oxford Central R. R., 50 miles from Portland. It has manufactures of furniture and carriages. Pop. 984.

Canton, a post-village of Norfolk co., Mass., on the Boston and Providence R. R., 14 miles S. of Boston. Canton township has one national bank, and manufactures of cotton and woollen goods, sewing silk, machinery, etc. Pop. 3879.

Canton, a post-twp. of Wayne co., Mich. Pop. 1392.

Canton, a township of Fillmore co., Minn. Pop. 1012.

Canton, a post-village, capital of Madison co., Miss., is the southern terminus of the Mississippi Central R. R., which here connects with the New Orleans Jackson and Great Northern R. R. It is 23 miles N. N. E. of Jackson. It has two weekly newspapers. Pop. 1963.

Canton, a post-village of Lewis co., Mo., on the Mississippi River, about 185 miles above St. Louis. The Mississippi Valley and Western R. R. connects it with Quincy, Ill., 17 miles distant, Keokuk, and St. Louis. It is one of the chief shipping-points of the county, and contains Canton University, an institution of the "Christian" connection. There are two public schools, two banks, two wagon and plough factories, and various other manufactures. It has one weekly and one monthly newspaper. Pop. 2363; of Canton township, 3434. Ed. "Press."

Canton, a village of Van Buren township, Onondaga co., N. Y. Pop. 223.

Canton, a post-village, and capital of St. Lawrence co., N. Y., on the Rome Watertown and Ogdensburg R. R., 60 miles N. E. of Watertown, and on Grass River, which affords valuable water-power, used in manufacturing lumber, flour, machinery, leather, castings, etc. Canton contains a court-house, jail, almshouse, good graded schools, and nine churches, and is the seat of St. Lawrence University (Universalist), having law and theological schools connected with it. The university buildings are very elegant. It has one weekly newspaper. P. 1681; of Canton township, 6014.

Canton, the capital of Stark co., O., is a handsome city at the confluence of the East and West branches of Nimishillen Creek, and on the Pittsburg Fort Wayne and Chicago R. R., 102 miles W. N. W. of Pittsburg and 54 miles S. S. E. of Cleveland. It is on the line of the Valley R. R., now in course of construction, from Cleveland, O., to Wheeling, W. Va. It contains 14 churches, 6 banks, 1 academy, St. Vincent's College (Roman Catholic), 4 weekly newspapers (1 German), 3 manufactories of mowers and reapers, 1 printing-press works, 1 manufactory of safes, 1 saw and spring manufactory, 2 woollen and 5 flouring mills, 2 plough manufactories, and a variety of smaller manufactures. The city is supplied with water from a lake three miles N. W. of the town by means of a Holly engine. Coal is abundant in the vicinity, and the city derives its prosperity chiefly from its manufactures, though the surrounding country is a very rich agricultural one. Canton is rapidly increasing in population and business. Pop. 8660; including Canton township, 10,612. Ed. "Repository and Republican."

Canton, a township and post-borough of Bradford co., Pa. It has one weekly newspaper. Pop. of township, 1840; of borough, 710.

Canton, a township of Washington co., Pa. Pop. 592.

Canton, a post-village, capital of Van Zandt co., Tex., about 200 miles N. N. E. of Austin City. It has two weekly newspapers. Pop. 183.

Canton, a township of Buffalo co., Wis. Pop. 648.

Canton (John), F. R. S., an English natural philosopher, born at Stroud in 1718. He made some discoveries in electricity, and received from the Royal Society a gold medal in 1765 for his demonstration that water is compressible. Died in 1772.

Can'tonment* [Fr. *cantonnement*], a military term applied to temporary resting-places of European armies. When troops are detached and quartered in several adjacent towns or villages they are said to be in cantonments. In India the term is applied to permanent military stations of the British army, or to regular military towns at a considerable distance from any city. A cantonment on a large scale comprises, besides barracks for European soldiers and huts for native troops, magazines, public offices, and bungalows for the officers.

Cantù (Cesare), a popular Italian historian and poet, born near Milan Sept. 5, 1805. He wrote "Storia Universale" (20 vols., 1837–42), which has been translated into English and French, and "Della Indipendenza Italiana" (1872). He supported the liberal cause in 1848.

Canu'sium [Gr. Κανύσιον], an important and very ancient city of Apulia, in Italy, on the river Aufidus (Ofanto), about 15 miles from its mouth. It was probably founded by the Greeks. The inhabitants were called *bilingues* by Horace, because they spoke Greek and Latin. It was captured by the Romans in 318 B. C. Its site is occupied by the modern Canosa (which see). Here were found, about 1803, remarkable remains of ancient art, among which were painted vases, marble statues, and jewels of exquisite workmanship.

Canute, Knut, or **Knud,** king of Denmark and the conqueror of England, was the son and successor of Sweyn, king of Denmark, who died in 1014. After the death of Edmund Ironsides, in 1016, Canute reigned as sole monarch of all England, having completed by arms the subjugation of the Anglo-Saxons. He confirmed his power by mildness and prudent policy, and became the most powerful European monarch of his time. He founded monasteries, patronized minstrels, and wrote verses or ballads himself. He died in 1036, leaving three sons, Sweyn, Harold, and Hardicanute.

Can'vas [from the Lat. *cannabis*, "hemp"], a coarse hempen or linen cloth which is extensively used in the form of tents and the sails of ships. It is also the principal material on which artists paint oil-pictures. The word is sometimes employed as synonymous with sail. In Old English it meant also a straining-cloth or sieve.

Can'vas-back (*Fuligula valisneria*), a species of North American duck, the flesh of which is highly prized. It is considered by some persons as the most delicious of all waterfowl. It is not found in Europe. It frequents the bays of the sea and the estuaries of rivers. The plumage is diversified with black, white, chestnut-brown, and slate-color. The length is about twenty inches. These birds, after breeding in the northern parts of the continent, migrate southward about November. During the winter many of them are shot on Chesapeake and Delaware bays. Those found on the Chesapeake are considered better than any others.

Canzo'ne, a form of Italian lyrical poem adopted, with some alteration, from the poetry of the Troubadours. The canzone is divided, like the Greek strophic ode, into stanzas, in which the number and place of rhymes and metre of verses respectively correspond. The last stanza, commonly shorter than the others, is called *congedo* or *ripresa*. This form of poetry was adapted by Petrarch to the expression of different veins of thought—elevated and heroic.

Caoutchouc, Gum Elastic, or **India-Rubber,** a valuable substance used in the arts for a great variety of purposes, is the inspissated juice or sap of several species of plants of the natural orders Euphorbiaceæ, Moraceæ, Artocarpaceæ, and Apocynaceæ. It is produced chiefly in tropical and sub-tropical countries, especially in the East Indies and South America. The milky juice of the tree is obtained by incisions in the bark, and is dried on clay moulds over smoky fires, which gives it its usual black color. Pure caoutchouc is a hydrocarbon, C_8H_{14}. It is extremely valuable in the arts on account of its elastic and waterproof properties. By combining it with less than 25 per cent. of sulphur, and exposing it to a temperature of about 270° F., it is converted into soft vulcanized rubber, a substance much more valuable than the original caoutchouc. By adding 50 per cent. or more of sulphur, and heating to 300° F., it forms hard vulcanized rubber or ebonite. (See elaborate article on the manufacture of caoutchouc products by Prof. C. F. Chandler, under India-Rubber.)

Cap, in shipbuilding, is a strong, thick block of wood fixed near the top of each mast. It has a hole to receive the upper end of the lower mast, and another to receive the lower end of the topmast, with eyebolts to aid in hoisting the topmast. When made of iron the cap is called a *crance*.

Ca'pac, a post-village of St. Clair co., Mich.

Capac'ity [from the Lat. *capax*, "capable"], in law, ability or power to do a particular thing, such as to take or to hold land, to sue and to be sued, and the like. Capacity may sometimes exist to do one of these acts, and not to do another. Thus, one may be able to take and hold land, and not have capacity to dispose of it, as in the case of an infant; or one may be able to take, and not have the power to hold against another, as in the case of an alien, who may at common law take land as between himself and his grantor, but cannot hold it as against the state. Capacity may be conveniently considered under two general heads—capacity to have rights, and capacity to act. Some rules as to incapacity depend upon natural disabilities; others rest upon arbitrary grounds. This subject is closely connected with the doctrine of *status*, as treated by writers on public law. This has been shown by Mr. Maine in his work on "Ancient Law" to have had its principal origin in the early idea of the family. The arbitrary rules of archaic law have been, to a considerable extent, gradually

* Frequently pronounced kan-too'ment in the British army.

supplanted by the modern idea of fixing one's relations to another by contract, so that the movement of modern progressive society has been from *status* to contract. This doctrine is well illustrated in the case of master and servant. In ancient law the position of the servant was fixed by an arbitrary rule, so that he was a slave. In modern times the relation depends on contract. Still, there always will be a class of cases where legal capacity is denied, as where persons have not the mental power to enter into a contract, including infants, insane persons, and habitual drunkards, or where a supposed rule of public policy may intervene, as in the case of aliens. These are still in some of the American States denied the power to hold land by purchase, or even to take it at all by descent. In fact, capacity to have rights largely depends on the general convictions of the people of a state, while the capacity to act is commonly determined by a desire to protect one who has rights from an improvident surrender of them. (See as to the relations of this subject to private international law, WESTLAKE'S or SAVIGNY'S treatises on that topic, and PHILLIMORE or WHEATON on international law.) T. W. DWIGHT.

Capanno'ri, a city of Italy, in the province of Lucca, and 5 miles E. of Lucca. It is situated in a fertile plain on the railway from Florence to Pisa, and has considerable trade. Pop. in 1871, 48,313.

Cape Ann, the eastern point of Essex co., Mass., is 31 miles N. E. of Boston. Here is a rocky headland, in which, at Rockport, valuable quarries of syenite are worked. Lat. 42° 38′ 3″ N., lon. 70° 34′ 2″ W. Two stone lighthouses stand on Thatcher's Island, ⅔ of a mile distant, each 112½ feet high, showing fixed white dioptric lights of the first class, 165½ feet above the sea.

Cape Ar'ago, or **Greg'ory,** is a point at the S. side of the entrance to Coos Bay, in Coos co., Or. Its lighthouse stands on a small island, lat. 43° 20′ 38″ N., lon. 124° 22′ 11″ W., and shows a flashing light 75 feet above the sea.

Cape Bab-el-Man'deb, on the Arabian side of the strait of that name, lat. 12° 40′ N., lon. 43° 31′ E., is a rock of basalt 865 feet high.

Cape Béarn, a promontory of France, in the Mediterranean; lat. 42° 31′ N., lon. 3° 7′ 30″ E. Here is a lighthouse of the first class, 751 feet above the sea.

Cape Bianco, lat. 37° 20′ N., lon. 9° 48′ E. This is the most northern point of Africa.

Cape Blan'co (*i. e.* "White Cape"), on the Atlantic, is, next to Cape Verde, the westernmost point of Africa; lat. 20° 47′ N., lon. 17° 4′ W.

Cape Blanco, or **Orford,** on the Pacific, is the most western point of Oregon; lat. 42° 50′ N., lon. 124° 32′ 29″ W. Its lighthouse shows a fixed white dioptric light of the first order, 256 feet above the sea.

Cape Boe'o (anc. *Lilybæum Promontorium*) is the most western point of Sicily. It was in ancient times an important naval station, near which the Romans gained a great naval victory in the First Punic war. Lat. 37° 48′ N., lon. 12° 25′ E.

Cape Boj'ador', a bold headland of Western Africa, is the termination of a range of Mount Atlas, in lat. 26° 7′ N., lon. 14° 29′ W.

Cape Bon, or **Ras Adder,** on the N. coast of Africa, 58 miles N. E. of Tunis; lat. 37° 6′ N., lon. 11° 3′ E.

Cape Breton (brit'tn), an island of North America, belonging to Great Britain, and forming a part of the province of Nova Scotia, is in the Atlantic Ocean, and is separated from the north-eastern extremity of Nova Scotia by a narrow strait called the Gut of Canso. It is a rocky island of very irregular shape, and has an area of 3120 square miles. The chief articles of export are fish, coal, and lumber. It is noted for its fisheries of cod and mackerel. It is divided into four counties, Cape Breton, Inverness, Richmond, and Victoria. The climate is severe. Pop. in 1871, 75,483.

Cape Breton, a county of Nova Scotia, Dominion of Canada, is a part of the island of Cape Breton, and borders on the Atlantic Ocean. Bituminous coal is the chief product. Capital, Sidney. Pop. in 1871, 26,454.

Cape Canav'eral, on the E. coast of Florida, in Volusia co., lat. 28° 27′ N., lon. 80° 33′ W., is nearly surrounded by dangerous shoals, and has on its N. E. pitch a revolving light of the first order, 139 feet above the sea.

Cape Canso, the most easterly point of Nova Scotia, has a lighthouse on Cranberry Island; lat. 45° 19.5′ N., lon. 60° 55′ 3″ W. It is also a port of entry in Wilmot township, Guysborough co., having active trade and fishing interests. It has a U. S. consul. Gold has been found here. Pop. about 1000.

Cape Cato'che, the north-eastern extremity of Yucatan, is on the Gulf of Mexico. This was the part of the American continent on which the Spaniards first landed; lat. 21° 34′ N., lon. 86° 57′ 51″ W.

Cape Charles, Va., is the southern point of the "Eastern Shore," a peninsula which separates Chesapeake Bay from the Atlantic Ocean. A lighthouse stands on Smith's Island near this cape with a flashing light of the first order; lat. 37° 07′ 08″ N., lon. 75° 53′ 12″ W.

Cape Clear, the most southern point of Ireland, is in the county of Cork. Here is a lighthouse on a cliff 455 feet above the sea; lat. 51° 26′ N., lon. 9° 29′ W.

Cape Coast Castle, a British settlement and town on the W. coast of Africa, in Upper Guinea; lat. 5° 6′ N., lon. 1° 15′ W. This is the capital of the British colonies on the coast of Guinea. It is defended by several forts. The climate is unhealthy. The chief articles of export are palm oil, gold-dust, and tortoise-shell. Pop. about 10,000.

Cape Cod, Mass., is a long and narrow sandy peninsula, which nearly coincides with Barnstable county. It is about 65 miles long, and from 1 to 20 miles wide. The form of it is similar to a man's arm bent at the elbow. On the northern extremity, which is called Race Point, is a revolving light 47 feet above the sea; lat. 42° 03.7′ N., lon. 70° 14.3′ W.

Cape Colon'na (anc. *Sunium Promontorium*), the most southern point of Attica, on the Mediterranean; lat. 37° 39′ N., lon. 24° 2′ E. Its summit is crowned by the ruins of a marble temple 269 feet above the sea.

Cape Col'ony, or **Cape of Good Hope,** a British territory which forms the southern extremity of Africa, is bounded on the N. by the Orange River, on the E. and S. by the Indian Ocean, and on the W. by the Atlantic. Area, 221,311 square miles. The interior of this region is described as a succession of platcaus and mountain-ranges, which increase in elevation as they recede from the coast. The highest mountains are estimated at nearly 10,000 feet above the level of the sea. The sea-coast presents several comparatively safe and commodious harbors, among which the most frequented are Table Bay and Algoa Bay. Cape Colony has no rivers that are of much value for navigation. The climate is healthy, but the extremes of temperature have a wide range. But little rain falls in the interior. The vegetation of this region is peculiar, and rich in beautiful flowers, among which are the ixia, gladiolus, tritonia, strelitzia, pelargonium or Cape geranium, and xeranthemum. The characteristic vegetation of the vicinity of Cape Town consists of Ericaceæ (heaths), Stapeliæ or carrion flowers, and Proteaceæ. Here are about 400 species of Ericaceæ. Among the indigenous animals of Cape Colony are the elephant, giraffe, rhinoceros, lion, buffalo, panther, wild-boar, hyæna, antelope, quagga, springbok, and ostrich. Many cattle and sheep are raised here. The soil in some parts is fertile, but a large portion of it is arid and barren without irrigation. Wheat and other cereals are cultivated extensively. The chief articles of export are wool, wine, copper, hides, horses, flour, aloes, fish, fruits, and maize. The value of the exports in 1870 amounted to £2,603,000, and that of the imports to £2,502,000. In 1870, 28,813,583 pounds of wool were exported, valued at £1,835,390.

The colony is divided into two provinces—the eastern and western, the respective capitals of which are Graham's Town and Cape Town. The pop. in 1865 was 496,381, of which 81,598 were Hottentots, 100,536 were Kaffers, and 181,592 were Europeans.

History.—The Dutch were the first Europeans who colonized this region. They founded Cape Town in 1652. The colony was captured in 1806 by the British, to whom it was formally ceded in 1814. The European colonists have been often disturbed by the hostility of the Kaffers, a warlike race of negroes. In 1836 the BOERS (which see) left the country in great numbers, and founded the independent Transvaal Republic and Orange Free State. In 1866, British Kaffraria, and in 1868 a part of the Basuto country, were annexed to the colony. A. J. SCHEM.

Cape Com'orin, in the Indian Ocean, is the southern extremity of Hindostan; lat. 8° 5′ N., lon. 77° 30′ E.

Cape Di'amond, in Canada, is at the confluence of the St. Charles River with the St. Lawrence. It is 333 feet above the river, to which it presents a precipitous bluff. On this point stands the citadel of Quebec.

Cape Disappointment, or **Cape Hancock,** the S. W. point of Washington Territory and of Pacific co., at the mouth of the Columbia; lat. 46° 16′ 33″ N., lon. 124° 02′ 13″ W., has a lighthouse 40 feet high, showing a fixed white light of the first order 232 feet above the sea.

Cape Duca'to, or the **Leuca'dian Prom'ontory,** sometimes called **The Lover's Leap,** is the S. point of the Greek island of Leucadia or Santa Maura; lat. 38° 34′ N., lon. 20° 32′ 45″ E. It is a perpendicular white cliff over

2000 feet high, whence Sappho is said to have cast herself for love of Phaon. From this precipice the ancients once a year cast a criminal, first tying a great number of birds to him. If the flight of the birds was strong enough, so that the man was alive when he reached the sea, he was taken up in a boat and set at liberty. Mariners have always regarded this cape with dread.

Cape Eliz'abeth, a township of Cumberland co., Me., 1 mile from Portland, contains seven churches, and has a rolling-mill, oil-refinery, a dry-dock, and manufactures. Cape Elizabeth is a summer resort and the seat of a State reform school. The township takes its name from the cape, in lat. 43° 33′ 56″ N., lon. 70° 11′ 41″ W. It has two stone lighthouses, one with a fixed and one with a flashing light. Pop. 5106.

Cape Farewell', the southern extremity of Greenland, is in lat. 59° 49′ N., lon. 43° 54′ W.

Cape Fear, on the Atlantic, is the southern extremity of Smith's Island, N. C., and is the most southern point of the State; lat. 33° 52.3′ N., lon. 77° 59.8′ W.

Cape Fear, a township of Chatham co., N. C. Pop. 2285.

Cape Fear, a township of New Hanover co., N. C. Pop. 996.

Cape Fear River is formed by the Haw and Deep rivers, which unite at Haywood in Chatham co., N. C. It flows south-eastward, passes Fayetteville and Wilmington, and enters the Atlantic near Cape Fear. The length, excluding the branches above named, is estimated at 200 miles. Steamboats can ascend it to Fayetteville, 120 miles.

Capefigue (Baptiste Honoré Raymond), a French historian, born at Marseilles in 1802. He became a royalist and editor of several journals of Paris. Among his numerous works on French history are "Europe during the Consulate and the Empire" (1839–41), a "History of the Restoration" (1842), and (his best work) a "History of Philippe Auguste" (1831–34, 4 vols.).

Cape Flat'tery, the N. W. point of Washington Territory and of Clallam co. On Tatoosh Island, half a mile distant, is a small lighthouse, in lat. 48° 23′ 20″ N., lon. 124° 43′ 48″ W. This is the most western point of the U. S., exclusive of Alaska.

Cape Flor'ida, the S. point of Key Biscayne, off the S. E. point of Florida, has a lighthouse standing in a grove of cocoanut trees; lat. 25° 39′ 56″ N., lon. 80° 09′ 24″ W., with a fixed white light.

Cape Foulweath'er, or **Yaqui'na Head,** the westernmost point of Tillamook co., Or., has a brick lighthouse 81 feet high, showing a fixed white light of the first order 150 feet above the sea; lat. 44° 16′ 33″ N., lon. 124° 05′ W.

Cape Gas'pe, the point of land at the N. side of the entrance to Gaspe Bay, Quebec (Canada). It is in lat. 48° 45′ N., lon. 64° 12′ W.

Cape Girardeau, a county in E. S. E. Missouri. Area, 875 square miles. It is bounded on the E. by the Mississippi River, and drained by the Whitewater. The surface is nearly level; the soil is fertile. Grain, wool, tobacco, cattle, and timber are among the chief products. Capital, Jackson. Pop. 17,558.

Cape Girardeau, a city in Cape Girardeau co., Mo., on the W. bank of the Mississippi, 150 miles S. of St. Louis, is the seat of St. Vincent's College, and contains also a normal school, a female academy, and a public school. There are 4 newspapers, one of them German. Its exports are cotton, ploughs, and mineral paints. There are 7 churches, 2 of them Catholic. Pop. 3585; outside township, 1651.

A. M. Casebolt, Pub. "Marble City News."

Cape Guar'dafui, or **Gardafui,** the easternmost point of Africa, is in lat. 11° 50′ N., lon. 51° 21′ E.

Cape Hancock. See Cape Disappointment.

Cape Hat'teras, the eastern extremity of North Carolina, is a point of a low sandy island, separated from the mainland by Pamlico Sound. The navigation is dangerous in this vicinity, on account of shoals which extend far out into the sea; lat. 35° 15.2′ N., lon. 75° 30.9′ W. Two miles N. of the extremity stands the lighthouse, 190 feet in height, showing a flashing dioptric light of the first order.

Cape Hay'tien, formerly **Cape Français,** a seaport of Hayti, 90 miles N. of Port-au-Prince. It has a safe harbor and some handsome squares. It has some trade with the U. S. and England. Lat. 19° 46.4′ N., lon. 72° 11′ W. Pop. estimated at 10,000.

Cape Henlo'pen, Del., is at the entrance of Delaware Bay, 13 miles S. S. W. of Cape May; lat. 38° 46.6′ N., lon. 75° 04.7′ W. It has a stone lighthouse, showing a fixed white dioptric light of the first order, 128 feet above the sea.

Cape Henry, Va., is at the entrance of Chesapeake Bay, 12 miles S. of Cape Charles. Here is a fixed light 129 feet above the level of the sea; lat. 36° 55.5′ N., lon. 76° 0.2′ W.

Cape Horn, the southernmost point of America, is an island of the archipelago of Terra del Fuego; lat. 55° 59′ S., lon. 67° 16′ W. Vessels which pass from the Atlantic to the Pacific, or the reverse, usually double this cape, rather than pass through the Strait of Magellan.

Cape la Hague, a headland of France, in Normandy, on the English Channel, is the N. W. extremity of the peninsula of Cotentin, and about 16 miles N. N. W. of Cherbourg. On the E. side of Cotentin is Cape la Hogue, near which the English and Dutch fleets defeated the French in 1692. Lat. 49° 44′ N., lon. 1° 56′ W.

Ca'pelin, or **Caplin,** a little marine fish of the salmon family (the *Mallotus Grænlandicus*), which visits the coasts of Labrador and Newfoundland in vast shoals, furnishing bait for the cod-fishermen. Capelins are also taken and dried for the European market, and are very good eating. They are about the size of the smelt.

Cap'ell (Edward), an English Shakspearian critic, born at Troston in 1713. He published the works of Shakspeare in 10 vols. 8vo, 1767, "Notes and Various Readings of Shakspeare" (1775), and the "School of Shakspeare," 3 vols. 4to (1783). Died Feb. 24, 1781.

Capel'la (*i. e.* the "Kid"), a bright star of the first magnitude in the constellation of Auriga, is also called *a Aurigæ*. It is a double star.

Cape Lookout', the S. E. extremity of the islands off Carteret co., N. C., has a lighthouse 150 feet high near its extremity, in lat. 34° 37′ 16″ N., lon. 76° 31′ 07″ W., with a fixed white light of the first order.

Cape May, the southernmost county of New Jersey. Area, 250 square miles. It is bounded on the E. by the Atlantic Ocean and on the W. by Delaware Bay. The surface is level; the soil is alluvial, and partly sandy. The chief crops are grain, potatoes, and dairy products. The county is intersected by the West Jersey R. R. It contains a deposit of cedar-wood which is still sound, although it has probably been buried many centuries. Capital, Cape May Court-house. Pop. 8349.

Cape May, or **Cape Island,** a celebrated watering-place of Cape May co., N. J., is on a small island in the Atlantic Ocean, 81 miles by railroad S. of Philadelphia. The distance from that city by water is nearly 100 miles. This place is the southern terminus of the West Jersey R. R., and has daily communication with Philadelphia by steamboats in summer. It has two weekly newspapers. It is one of the most fashionable summer-resorts in the U. S., and contains numerous hotels.

Cape May, the southern extremity of New Jersey, is at the entrance of Delaware Bay. Here is a revolving light elevated 152 feet above the sea, in lat. 38° 55.8′ N., lon. 74° 57.3′ W.

Cape May Court-house, capital of the above county, is on the West Jersey R. R., 68 miles S. of Camden. Pop. 1248.

Cape Mendoci'no, a lofty headland of Humboldt co., Cal., is the westernmost point of that State. It has a wrought-iron lighthouse, with a flashing white light of the first order, 428 feet above the sea; lat. 40° 26′ 24″ N., lon. 124° 23′ 27″ W.

Capen (Elmer Hewitt). See Appendix.

Cape North, a promontory in the Arctic Ocean, is the northernmost point of Europe. It is the N. extremity of the island of Magerö, separated by a narrow channel from the mainland of Norway; lat. 71° 10′ 12″ N., lon. 25° 46′ E.

Cape of Good Hope, a promontory near the southern extremity of Africa, is the termination of Table Mountain, rising about 1000 feet above the level of the sea; lat. 34° 22′ S., lon. 18° 30′ E. It is about 30 miles S. of Cape Town. This cape was discovered by Bartholomew Diaz in 1486, and was first doubled by Vasco da Gama in 1497.

Cape Pal'mas, the S. extremity of Liberia, lat. 4° 22′ N., lon. 7° 44′ W., is a high point with a lighthouse. It is also the popular name of that part of the country. It is included in the Liberian state of Maryland. Cape Palmas is the diocese of a bishop of the Protestant Episcopal Church.

Cape Pine, Newfoundland, lat. 46° 37′ 4″ N., lon. 53° 31′ 45″ W., has an iron lighthouse with a fixed catoptric white light of the first order, 314 feet above the sea.

Cape Poge, the N. E. point of Chappequiddick Island, in Edgartown, Dukes co., Mass., lat. 41° 25′ 14″ N., lon. 70° 26′ 44″ W., has a wooden lighthouse 36 feet high, with a fixed white light of the fourth order.

Cape Prince of Wales, the westernmost point of the

American continent, on the E. side of Behring Strait; lat. 65° 45′ N., lon. 168° 17′ W. It is a lofty headland, with dangerous shoals in the vicinity.

Ca′per, the common name of the pickled flower-buds of the *Capparis spinosa*, of Southern Europe and Barbary. Several other species yield buds which are similarly used. It is a trailing shrub of the order Capparidaceæ, growing on rocks and walls, and extensively cultivated in Sicily and the south of France. The flowers are large and beautiful. Capers have an agreeable pungency of taste, and are used as a condiment and ingredient of sauces. They have medicinal properties, being anti-scorbutic, stimulant, and laxative. The buds are gathered every morning, and immediately put into vinegar. They are sorted, and the best are sent to market in jars. Florida has two native species of the caper tree, which are erect and not trailing. The plant called "caper" in England is the caper spurge, a *Euphorbia*.

Cape Race, near the S. E. extremity of Newfoundland, lat. 46° 39′ 30″ N., lon. 53° 4′ 30″ W., is a point very dangerous to ships sailing in foggy weather between the U. S. and Europe. It has a revolving light 180 feet above the sea. It was established by the British government, and (with Cape Pine light) is sustained by a tax upon all ships sailing from or to Great Britain to or from Canada and the North-eastern U. S.

Capercail′zie, Capercail′lie, Wood Grouse, or **Cock of the Woods** (*Tetrao urogallus*), a large gallinaceous bird, a native of Europe, is a species of grouse. The male sometimes weighs fifteen pounds or more. The plumage of the male is variegated with black, brown, and white, and the chest is dark green. Above the eye is a scarlet patch of naked skin. The legs and feet are feathered to the toes. This bird is found in the pine-covered mountains of several countries of Europe and Northern Asia, and feeds on berries, seeds, insects, and young shoots of the fir and pine. It builds on the ground. The flesh is highly esteemed for food.

The Capercailzie.

Caper′naum, an ancient city of Palestine, situated on the N. W. coast of the Sea of Galilee. Some authorities identify it with the modern Tel-Hûm.

Cape Romain′, on Raccoon Key, Charleston co., S. C., has a brick lighthouse 150 feet high, with a flashing light of the first order; lat. 33° 01′ 08″ N., lon. 79° 22′ 12″ W.

Ca′pers (Samuel Wragg). See Appendix.

Capers (William), D. D., an eloquent preacher and bishop of the Methodist Episcopal Church South, born in St. Thomas parish, S. C., Jan. 26, 1790, educated at South Carolina College, studied law, entered the Methodist ministry in 1809, was sent as delegate from his denomination to the Wesleyan Conference, in England, in 1828, professor of evidences of Christianity in Columbia College 1835, editor of the "Southern Christian Advocate" 1836–40, missionary secretary of the M. E. Church 1840–44, and superintendent of colored missions in the Southern States 1844. He took an active part in the proceedings of the Methodist General Conference of 1844, which resulted in the division of the Church, and was elected bishop by the Southern division in 1844. Died in Anderson, S. C., Jan. 29, 1855. He was author of an "Autobiography" (in Wightman's "Life of Capers"), "Catechisms for the Negro Missions," and "Short Sermons and True Tales for Children." He was an able and highly venerated man.

Cape Sa′ble, the S. E. point of Nova Scotia, is in lat. 43° 26′ N., lon. 65° 38′ W. It has a lighthouse, and is on Cape Sable Island, in Barrington township, Shelburne co. The island has some 600 inhabitants, mostly fishermen, descended from loyalists who left the U. S. during the Revolution. A ferry connects it with the mainland. The name Cape Sable Island is also given to Sable Island.

Cape Sable is the most southern point of the peninsula of Florida; lat. 25° 06′ N., lon. 81° 09′ W. It is sandy and low, and is the site of Fort Poinsett.

Cape San Blas, the S. extremity of Calhoun co., Fla., has a brick lighthouse 96 feet high, with a flashing white light of the third order 102 feet above the sea, in lat. 29° 39′ 46″ N., lon. 85° 21′ 38″ W.

Cape San Lucas, the southernmost point of the peninsula of Old California; lat. 22° 44′ N., lon. 109° 54′ W.

Cape Spear, Newfoundland, lat. 47° 31′ 11″ N., lon. 52° 36′ 59″ W., has a colonial lighthouse, showing a revolving catoptric light of the first order, 264 feet above the sea.

Cape St. George, the S. point of St. George's Island, Franklin co., Fla.; lat 29° 35′ 15″ N., lon. 85° 02′ 40″ W., has a brick lighthouse 68 feet high, with a fixed white light of the third order 73 feet above the sea.

Cape St. Mary's, Newfoundland, lat. 46° 49′ 30″ N., lon. 54° 11′ 34″ W., has a brick (colonial) lighthouse, with a flashing red and white catodioptric light of the first order, 300 feet above the sea.

Cape St. Roque, a promontory on the coast of Brazil; lat. 5° 28′ S., lon. 35° 16′ W.

Cape St. Vin′cent (anc. *Promontorium Sacrum*), the S. W. extremity of Portugal: lat. 37° 3′ N., lon. 9° W. Near this cape the British admiral Jervis defeated the Spanish fleet on Feb. 14, 1797.

Capet (Hugh), king of France, was the founder of the Capetian dynasty. He was a son of Hugh the Great, count of Paris, and was born about 940 A. D. The throne having become vacant by the death of Louis V., the last Carlovingian king, in 987, Hugh assumed the royal power with the consent of many of the barons. He ruled with moderation, and selected Paris as the capital of France. He died in 996, and was succeeded by his son Robert.

Cape′tian Dy′nasty, the third dynasty of French kings, was founded by Hugh Capet, who ascended the throne in 987 A. D. (see Capet), and is said to have been the ancestor of thirty-two kings of France. According to some authorities, the last of the direct line of Capetian kings was Charles IV., who died in 1328, without male issue. He was succeeded by his cousin Philippe, who founded the house of Valois. The Bourbon line, from Henry IV. onward, were descendants of the youngest son of Saint Louis, or Louis IX., and so of Capet.

Cape Tit′mouse (*Parus Capensis*), a small bird belonging to the order Insessores, family Paridæ, found at the Cape of Good Hope. It is remarkable for the ingenuity it displays in constructing its nest, which is made chiefly of cotton, and is shaped like a bottle, as shown in the accompanying illustration. Whilst the female is hatching inside, the male, a most watchful sentinel, remains outside, resting in a pouch made for the purpose fixed to one side of the

neck of the nest. But when his mate moves off, and he wishes to follow her, he beats the opening of the nest vio-

Cape Titmouse.

lently with his wing, and succeeds in closing it, in order to protect his young from enemies.

Cape Town, a seaport of South Africa, the capital of Cape Colony, is on the S. W. shore of Table Bay, and between that bay and Table Mountain; lat. of observatory 33° 56′ 3.2″ S., lon. 18° 28′ 45″ E. It is intersected by several canals, is built on a regular plan, and lighted with gas. Close behind rise the perpendicular rocks of Table Mountain. The town contains an exchange, a college, an observatory, a public library, and a botanic garden. It is the see of a bishop of the Church of England. This port is visited by a large number of vessels, and is a convenient place for mariners to stop for rest and provisions in the voyage between Europe and India. The Constantia wine is produced in this vicinity. Cape Town was founded by the Dutch in 1652, and ceded to Great Britain in 1815. Pop. 28,457.

Cape Trafalgar', a headland of Spain, on the Atlantic Ocean, between Cadiz and Gibraltar; lat. 36° 10′ N., lon. 6° E. Near this cape, on Oct. 21, 1805, the English fleet gained a great victory over the French, and Lord Nelson, who commanded the former, was killed.

Cape Verd, or **Verde** ("Green Cape"), the most western point of Africa, projects into the Atlantic Ocean between the rivers Senegal and Gambia; lat. 14° 44′ N., lon. 17° 33′ W.

Cape Verd, or **Verde** (called also **Cape de Verd**) **Islands** [Port. *Ilhas Verdes*], a group belonging to Portugal, in the Atlantic, 320 miles W. of Cape Verd. They are between lat. 14° 47′ and 17° 12′ N., and between lon. 22° 45′ and 25° 25′ W. Area, 1650 square miles. The group consists of fourteen islands, nine of which are inhabited—namely, Sal, Boavista, Mayo, Fogo, Brava, São Nicolão, São Thiago, São Antão, and São Vicente. They are all mountainous and of volcanic formation, and the highest point is the peak of Fogo, which rises 9157 feet, and is an active volcano. The climate is hot. They have mostly a fertile soil, and are covered with luxuriant vegetation. Sugar, cotton, coffee, maize, indigo, salt, and tobacco are the staples. The majority of the inhabitants are negroes. Pop. in 1867, 67,347.

Capeville, a post-village and township of Northampton co., Va. The village is 3 miles from Chesapeake Bay. Pop. of township, 2381.

Cape Vin'cent, a port of entry of Jefferson co., N. Y., on the St. Lawrence River and the Rome Watertown and Ogdensburg R. R., 25 miles W. N. W. of Watertown. Extensive shingle manufactories and flouring mills are located here. It has one weekly paper. In the vicinity is good fishing, and it is a favorite resort for summer tourists. Pop. 1450; of township, 3390.

W. W. Ames, Prop. "Cape Vincent Eagle."

Cape Wrath, the north-western extremity of Scotland, projects from Sutherland into the Atlantic Ocean. It is a pyramid of gneiss about 600 feet high, and is remarkable for the wildness and grandeur of its scenery. Here is a lighthouse 400 feet above the sea, in lat. 58° 37′ N., lon. 4° 58′ W.

Ca'pias [Lat. "you may take"], in law, a writ to take a person into custody. It assumes a number of forms, still designated by the leading words in the old writs, which were framed in Latin, such as (1) *Capias ad audiendum*, or (2) *ad respondendum*, (3) *ad satisfaciendum*, (4) *in withernam*, (5) *utlagatum*. The first of these writs is issued to bring up for judgment a defendant who has been found guilty of a misdemeanor or minor crime; the second is resorted to as a mode of commencing an action. This was originally the most important of all these writs, and is frequently called a "capias," without additional words. It has been much modified in England, and altogether abolished in some of the American States. The third writ designates an execution against the person, and commands the sheriff to take the person named, and to have his body before the court on a specified day to *satisfy* the claim of the party resorting to it. The result is that the party is retained in custody until discharged by due course of law. The writ is frequently called, by way of abbreviation, *ca. sa.* The fourth writ (*in withernam*) is used in an action of replevin where the goods in question cannot be found by the sheriff. By means of it he seizes other goods belonging to the party who has removed them, and detains them until restitution is made. These goods cannot be replevied until those which are the subject of the action are restored. The writ *utlagatum* is used to arrest an outlaw.

Capillaire, a name given to simple syrup flavored with orange flowers or orange-flower water; also to a medicinal syrup which is used as a pectoral in chronic catarrhs, and is prepared by adding sugar and orange-flower water to an infusion of the European fern called maiden-hair (*Adiantum capillus-veneris*), the French name of which fern is capillaire. This species also grows in the Southern U. S. Its virtues are said to be shared by the common maiden-hair (*Adiantum pedatum*), and by several European species.

Cap'illaries [from the Lat. *capillus*, a "hair"], the minute blood-vessels intermediate between arteries and veins. They have but a single coat, which is elastic, but not muscular. In size they vary considerably, most of them being too small to admit the passage of more than one or two blood-corpuscles at a time. Their arrangement differs very much in the different tissues and organs. They can be examined only by the aid of the microscope after their injection with colored fluid; hence their existence was not known to the ancients. During life the capillary movement of the blood may be seen in the web of the frog, the tail of the tadpole, or the wing of a bat. The use of the capillaries is to subdivide and distribute the blood among all the organs and tissues of the body. Their importance in nutrition and in the performance of all the organic functions is very great. (See Circulation of the Blood, by Prof. Henry Hartshorne.)

Cap'illary Ac'tion in its primary signification denotes the elevation or depression of liquids in fine hair-like tubes, as compared with the level of liquids in equilibrium in vessels or in wide tubes. If a clean wide open tube be plunged into water, nice observation will show an elevation of the fluid both within and without the tube; but if the tube be very fine the water within rises very considerably above its level outside, and the finer the bore the higher the rise. Careful examination will show that the upper surface of the water in the capillary tube is concave. The concavity, or "meniscus," is greatest in the finest tubes. If two glass plates are united at one edge, the opposite edges being slightly separated, and the plates are placed in water with the united edges vertical, the water will rise between the plates, forming a curve which assumes the form of a right-angled hyperbola, of which the asymptotes are the common vertical edge and a line at right angles to this edge so drawn as to be equidistant from the two panes of glass. If mercury be substituted for water, the capillary action is reversed; the mercury not rising in the tube or between the plates, but being depressed. The meniscus, too, is convex in this case, and the hyperbola is likewise reversed. In the barometer and eudiometer it is necessary to make corrections for this capillarity.

The cause of capillarity is well understood, and its results can be mathematically explained. It depends on the adhesion (or repulsion) which exists between the fluid and the material of the tube; while the degree of cohesion between the particles of the fluid itself must affect the result. As the size of tubes increases, the column within increases with the square of the diameter, while the attracting surface

increases only with the diameter. Attraction is therefore relatively much greater in fine tubes.

The following table exhibits the relative capillary elevation of certain fluids in glass tubes one millimètre in diameter at zero C., according to Frankenheim:

Liquid.	Height of cap. column in millimetres.
Water	15.336
Acetic acid	8.510
Sulphuric acid	8.40
Oil of lemons	7.23
" " turpentine	6.76
Alcohol	6.05
Ether	5.40
Carbon disulphide	5.10

The temperature of the tubes and the liquid exercises an important influence upon capillarity. Heat diminishes the cohesion of the particles of the liquid among themselves, and hence greatly favors capillary action.

Capillarity is, however, not confined to tubes, but is seen in pounded glass, sand, sponge, bread, and other porous substances. The principle in these cases is obviously the same as in the case of fine tubes. It has been proved that the principle of attractive and repulsive capillarity exercises a most important influence upon the circulation of nutritive fluids in both plants and animals.

Cap'ita [Lat. "heads"], in law, is principally used to denote the mode of taking either real or personal property from an intestate in case of several claimants. Personal property is taken under the provisions of statute law, based on a well-known English act termed the "statute of distributions," the provisions of which were derived from the civil or Roman law. Primogeniture having disappeared in the main in the U. S. as to the inheritance of land, the laws of descent also recognize division *per capita*. These words are contrasted with "*per stirpes*." Persons are said to take in the former manner (*per capita*) when, standing in an equal degree of relationship to the intestate, they receive equal shares, as if he had left four children. They take in the latter manner, or *per stirpes*, when the claimants, not being in equal relationship to the intestate, some of them represent one who if he had lived would have stood on an equality with others of nearer relationship to the intestate than themselves. Thus, if the claimants were A, a son, and C, D, E, and F, children of B, a deceased son of the intestate, these children representing B would take his share and no more.

Cap'ital [Lat. *capitalis* (from *caput*, "head"); Fr. *capitale*], pertaining to the head or life; important, principal, chief; affecting life, as capital punishment; large, as capital letters. Capital crimes are those which are punishable with death.

CAPITAL, in geography, the chief city or town of a state, empire, province, or county; the seat of government or residence of the court.

CAPITAL [Lat. *capitulum*; Fr. *chapiteau*], in architecture, is a term applied to the head or uppermost part of a column or pilaster. Each of the orders of ancient classic architecture—viz., Doric, Ionic, Corinthian, Tuscan, and Composite—had a peculiar form of capital. The capitals were the prominent characteristic features of the Corinthian and Ionic orders. They became more ornate in proportion to the development of art, the Doric, the most ancient, being very plain and simple compared with the Corinthian capital. (See CORINTHIAN, DORIC, IONIC, etc., respectively.)

CAPITAL, in political economy, is that portion of wealth which is employed in production. More specifically, it is the sum-total of the products of former labor employed to provide *materials* and *instruments* for the processes of production, and *support* for the laborers during the process. The term is often loosely employed as synonymous with *money*, but, strictly, capital, in some or all of the three forms named, is only represented by money as an instrument of exchange. In the discussion of questions in political economy the term should be held to its technical meaning. In all the operations of productive industry capital and labor must unite as partners—co-operators for a common end, sharers in a joint result. The antagonism between the two, which appears in combinations of capitalists on the one hand and in trades-unions and strikes on the other, is unnatural, and must work ruinous results to both parties. An important problem of political economy is to guard the rights of both, so that their common interest shall bind them in harmonious union; and its solution will come through a better knowledge on the part of all respecting the elementary principles involved. (See INTEREST, and POLITICAL ECONOMY.) A. L. CHAPIN.

Capital Account, a term used especially in connection with railroad or other stock companies, as distinguished from the revenue account. It includes the money obtained for shares of stock and that borrowed upon mortgages (debentures) or the property of the company, and begins with the first preparatory operations of the company; whereas the revenue account commences with the returns from actual traffic or other productive business.

Cap'italist, a person who owns or possesses capital, usually applied to a rich man or one who has a large capital employed in trade or manufactures.

Cap'ital Pun'ishment, the punishment of death (so called from the Latin *caput*, "head," also "life"). As the penalty for murder it has prevailed from the earliest times in all parts of the world. In most nations treason or rebellion against lawful government has also been thus punished; and in England and elsewhere, down to a very recent period, the same has been true of counterfeiting, forgery, mail-robbery, and several other crimes. The manner of execution varies greatly. Military criminals, in modern times, are usually shot. In civil administration the modes most prevalent have been decapitation upon the "block," used for political criminals of rank in Great Britain; the GUILLOTINE (which see) in France; in Spanish countries the GARROTE (which see); and hanging. In Japan, for some offences, the criminal is condemned to take his own life in the presence of officials. (See HARI-KIRI.)

In Christendom the tendency has been in the present century to limit capital punishment to the greatest crimes only, and many intelligent persons believe that it should be abolished altogether. The grounds upon which the question is argued are chiefly—1, common right; 2, Scripture; 3, expediency. The marquis of Beccaria ("Essay on Crimes and Punishments," 1775) denies the right of governments to take human life, under any circumstances, in punishment of crime. It appears to be evident, however, on any theory of society, that such a right exists in all cases in which the safety of the community requires it. As to Scripture, the Old Testament, in accordance with the words, "Whoso sheddeth man's blood, by man shall his blood be shed" (Gen. ix. 6), affords very numerous examples of its enforcement under Divine authority; and the New Testament contains no prohibition of it. It is urged, nevertheless, that the benevolence of Christianity and its high regard for human life oppose the continuance of the death-penalty. In William Penn's code of laws for Pennsylvania it was prescribed for two crimes only—murder and treason. The chief reason for its retention in Christendom is, perhaps, its biblical injunction, especially as this injunction (as above) was given to Noah when he represented the whole human race, and is not therefore merely a Mosaic or Jewish statute, which might be supposed to be superseded, like the Mosaic system generally, by Christianity. It has been plausibly replied, however, that the Noachic law may reasonably be supposed to be subject to modification by the progress of the race, like the Mosaic; and that Christendom has practically recognized this fact by abolishing the capital punishment of *brutes*, which was enjoined in the same Noachic law that enjoins it for man, and without any discriminative qualification whatever. In the early training of the race such means of teaching the value of human life, it is argued, might be necessary; but as one part of the law is now deemed unnecessary, and its execution would be esteemed preposterous, it is inferable that the other is equally subject to change. Beccaria and many others deny the expediency of capital punishment, asserting that it does not lessen the amount of crime. It is well known that in the crowds often assembled in England to witness a public execution, manslaughter has been several times committed. There is no doubt reasonable objection to publicity on such occasions, but this is not necessary. Other objections to capital punishment are the occasional uncertainty of evidence, and the frequent unwillingness of juries to convict in cases where it will follow. On the whole, while the death-penalty would seem to be needful, at least in all imperfectly-settled countries not provided with secure prisons, it may be regarded as an open question whether imprisonment for life might not, with advantage, be substituted for it in the great centres of advanced civilization. This experiment has been tried for a number of years in one or two European countries and in some of the U. S., but the time has not yet been sufficient to afford decisive results. (See BASIL MONTAGU, "On the Punishment of Death," 1809–13; "Memoirs of Sir S. Romilly," 1840; JEREMY BENTHAM, "Rationale of Punishment," 1830; E. G. WAKEFIELD, "Facts Relating to the Punishment of Death in the Metropolis," 1831; F. HILL, "Crime: its Amount, Causes, and Remedies," 1853; BOVEE, "Reasons against Capital Punishment.") (See PUNISHMENT, by J. N. POMEROY, LL.D.) ABEL STEVENS.

Cap'itals, or Capital Letters [Lat. *majuscula*], a term applied in typography and chirography to letters which are larger than the others, and also different in form, except in a few cases, as O, S, V, and W. Every sentence and every proper name should begin with a capital, which is a modern invention. No distinction of capitals and

small letters was made by the writers and scribes of the Middle Ages or by the ancients, but distinction existed between uncial and cursive writing. In German books every substantive (or noun) begins with a capital.

Cap'itol [Lat. *Capitolium*], a term originally applied to the magnificent temple of Jupiter Capitolinus, and the citadel or fortress which occupied the Capitoline Hill (*Mons Capitolinus*), in ancient Rome. These edifices were founded by the Tarquins about 600 B. C., and dedicated in 507 B. C. The temple was burned in the time of Sulla, in 83 B. C., but was soon rebuilt. Here was also the *Tabularium*, containing the public archives. The site of the Capitol is now occupied by the palace called Palazzo del Campidoglio, built by Michael Angelo. The term Capitol is also applied to the magnificent edifice in which the Congress of the U. S. holds its sessions at Washington, and to the State-houses which are erected at the capitals of the several States.

Cap'itoline Hill (*Mons Capitolinus* or *Mons Tarpeius*), one of the seven hills of ancient Rome, was very near the left bank of the Tiber, and adjacent to the Campus Martius. It was occupied by the great temple of Jupiter and the citadel, or Capitol, with some other public buildings. The steepness of its sides rendered it a natural fortress. On one side of it was the Tarpeian Rock, from which traitors and state criminals were thrown. This hill is now occupied by the church Ara Cœli and the Palazzo del Campidoglio. (See CAPITOL.)

Capitoli'nus (JULIUS), a Latin biographer, one of the authors of the "Historia Augusta," lived about 300 A. D. The biographies of the emperors Antoninus Pius, Marcus Aurelius, Pertinax, Opilius Macrinus, the two Maximins, and others, are ascribed to him.

Capit'ularies [Lat. *capitularia*], a name applied to the laws enacted by the Frankish kings from the time of Childebert. These laws were general for all the states of the kingdom, while those called *leges* were issued for the several states. The most celebrated capitularies were those of Charlemagne and St. Louis. After Charles the Simple, in 922, they were no longer issued. The best collections of them are those of Baluze (Paris, 1677 and 1780), and of Pertz, in the "Monumenta Germaniæ."

Capitula'tion [from the Lat. *capitula*, "heads or chapters"], the act of capitulating or surrendering to an enemy upon stipulated terms; a treaty of surrender to an enemy, which is concluded when the garrison or besieged force does not surrender at discretion or unconditionally. The treaty often consists of several specified conditions or articles, and those who surrender are sometimes permitted to retain their arms and to march out with the honors of war.

Ca'po d'Is'tria (anc. *Ægida*), a fortified seaport-town of Austria, in Trieste, is situated on a rocky island in the Gulf of Trieste, 8 miles S. W. of Trieste. It was formerly the capital of Istria. It is connected with the mainland by a bridge about half a mile long. It is the seat of a bishop, has a cathedral and other churches; also manufactures of soap and leather. Pop. 9186.

Capo d'Istria (JOHN ANTHONY), COUNT, the first president of Greece, was born at Corfù in 1776. He entered the diplomatic service of Russia in 1808, and represented that power at the Congress of Vienna in 1814–15. In 1816 he became secretary of foreign affairs in Russia. Though he had little or no sympathy with republican principles, he was elected president of the new republic of Greece in 1827 for five years. His policy was arbitrary, and gave offence to the liberal party. He was assassinated Oct. 9, 1831, by George and Constantine Mauromichali.

Ca'pon [Gr. καπών; Lat. *capo*], a domestic cock castrated when young to improve his size and the flavor of his flesh. Capons' flesh is regarded as much superior to that of ordinary fowls, but is inferior to that of the *poularde* or spayed pullet.

Capon, a township in Hampshire co., West Va. Pop. 1160.

Capon, a township of Hardy co., West Va. P. 1541.

Caponiere, kap-o-neer' [Fr. *caponnière*], in fortification, is a parapet eight or ten feet in height, with a superior slope extending to the ground like a glacis. It is placed in the ditch of a fortified place, to screen its defenders while passing from one part of the works to another. If there is a passage between two such parapets, it is a *full* caponiere—if on one side only, a *half* caponiere. Another kind, the *casemated* caponiere, constitutes one of the most essential features in the modern German (or polygonal) system of fortification. It is a large casemated structure in the main ditch, and usually opposite the middle of the curtain, by which the entire *front* is defended by flanking artillery fires.

Capon Springs, Hampshire co., West Va., 17 miles E. of Romney and 22 N. W. of Winchester, has celebrated and very valuable warm springs, alterative, and useful in a very wide range of diseases. The scenery is fine and the trout-fishing excellent. The hotels and bathing-houses are extensive.

Cappado'cia [Gr. Καππαδοκία], an ancient province of Asia Minor, was bounded on the N. by Pontus and Galatia, on the E. by Armenia, on the S. by Mount Taurus (which separated it from Syria and Cilicia), and on the W. by Lycaonia. It was traversed by the river Halys. Among its chief towns were Comana, Ariarathia, and Tyana. It was conquered by Cyrus the Great of Persia, and was ruled by independent kings from the time of Alexander the Great until 17 A. D., when Tiberius reduced it to a Roman province. The greater part of it is included in the modern Karamania.

Capparida'ceæ [from *Capparis*, the typical genus], a natural order of exogenous plants akin to the Cruciferæ, mostly of tropical and sub-tropical countries, and having four-parted flowers, which are generally very beautiful. The leaves are mostly alternate, and undivided or palmate. The order comprises about 350 species, herbaceous plants, shrubs, and trees. They have a strong pungent or acrid taste, and some species are poisonous. They have long silken stamens, which are in some cases gayly colored, as in the CAPER (which see). Among the interesting species of this order is the *Capparis sodata*, or siwák, a bush or small tree which is a characteristic feature of the vegetation of Africa. It bears pungent berries, which are used as a condiment by the natives. Several species of the caper-bush grow in Florida and the West Indies, and a number of herbaceous plants of the order are found in the U. S.

Capre'ra (literally, "Goat Island"), one of the Buccinarian Islands, in the Mediterranean, 4 or 5 miles from the N. E. coast of Sardinia, belongs to Italy. It is nearly 6 miles long, and abounds in goats and rabbits. The patriot Garibaldi since reaching middle life has often resided here. He built a house here about 1854.

Ca'pri (anc. *Capreæ*), a charming island of Italy, in the Mediterranean, at the entrance of the Bay of Naples and 20 miles S. of the city of Naples. It is about 4½ miles long and 3 miles wide. The shores of the island are steep and inaccessible. The town of Capri is the seat of a bishop. Upon this island is a remarkable cavern called the "Grotto of the Nymphs" or the "Blue Grotto." The emperor Tiberius passed the last ten years of his life here, and built twelve villas or palaces, of which the ruins are still visible. Pop. 3911.

Capri'ccio, an Italian word signifying "caprice," "whim," or "fancy," is a musical term applied to a species of free composition which is not subject to rule as to form or measure.

CAPRICCIO, in art, is a picture or other work which intentionally violates the ordinary rules of composition.

Cap'ricorn [Lat. *Capricornus*], the "Goat," the name of the tenth sign of the Zodiac, which the sun enters at the winter solstice, about the 21st of December. It is denoted by this figure, ♑. Capricorn is also the name of a constellation.

Capricorn, Tropic of, in geography, one of the lesser circles of the earth, a parallel nearly 23° 27′ S. of the equator. At the winter solstice (Dec. 21st) the sun is vertical over this line. There is a corresponding circle on the astronomical sphere. This circle touches the ecliptic in the first point of the sign Capricorn, which therefore gives name to this tropic.

Cap'ridæ [from *capra*, a "goat"], a family of ruminant quadrupeds which, according to some naturalists, consists of the two genera *Ovis* (sheep) and *Capra* (goat). Other naturalists extend the term so as to include the antelope.

Caprifolia'ceæ (see CAPRIFOLIUM), a natural order of exogenous plants which have opposite leaves without stipules, epipetalous stamens, and monopetalous flowers. The fruit is generally a berry, sometimes dry, but not splitting open when ripe. This order is nearly allied to Rubiaceæ, and comprises more than 200 species, mostly natives of temperate and cold climates. Among those that are indigenous in the U. S. are the *Sambucus* (elder), several species of *Viburnum*, and many species of *Lonicera*, called woodbine, honeysuckle, etc.

Caprifo'lium [from *capra*, a "goat;" also a "branch with tendrils" (from the fancied resemblance of the tendrils to a goat's horns), and *folium*, a "leaf"], a genus of plants (twining shrubs) which are natives of Europe and other parts of the northern hemisphere. They mostly have fragrant tubular flowers. The honeysuckle is an example.

Caprimul'gidæ [named from the *Caprimulgus*, or

"goatsucker"], a family of insectivorous birds of the order Insessores and tribe Fissirostres. They have long wings, short legs, and toes united at the base by a membrane. The base of the bill is furnished with long stiff bristles. This family includes the goatsucker (*Caprimulgus*) and the American whippoorwill, as well as the night-hawk, the chuck-will's-widow, the poor-will of the Western States, and other native species.

Capri'no, a town of Italy, in the province of Verona, 15 miles N. W. of Vefona. It has a beautiful church and many fine country-seats. Pop. 5111.

Cap Rouge, a post-village of Quebec and Portneuf cos., province of Quebec (Canada), has extensive manufactures of pottery. Pop. about 800.

Caps and Hats, the name applied to the political parties in Sweden in 1738. The former favored the alliance with Russia, while the latter opposed it. They were both suppressed by Gustavus III. in 1772.

Cap Sante, a post-village, capital of Portneuf co., Quebec (Canada), 30 miles above Quebec, on the N. shore of the St. Lawrence. Pop. about 400.

Cap'sicin, an exceedingly acrid, soft, resinous alkaloid of a reddish color, obtained from the seed-pods of the *Capsicum annuum* or Cayenne pepper, of which it is the active principle.

Cap'sicum, a genus of plants of the order Solanaceæ, natives of the warm parts of America, Africa, and Asia. They are mostly annual or biennial plants, with more or less woody stems, and have a wheel-shaped corolla, with five convergent protruding anthers. The fruits of *Capsicum annuum, frutescens, fastigiatum, baccatum, grossum,* and *cerasiforme,* with perhaps those of other species, form, when pulverized, the Cayenne pepper which is extensively used as a condiment. It is extremely pungent, and is often employed with excellent results in medicine as a derivative and stimulant. The *Capsicum annuum* is a hardy plant, cultivated in the U. S., where pickles are made of its unripe fruit. It is stated that the fruit of *Capsicum toxicarium* of tropical America is a narcotic poison. The *Capsicum frutescens* grows wild in Florida, as well as in most warm countries. It is the true Cayenne pepper.

Cap'stan [Fr. *cabestan*], a strong, massive column of timber, shaped somewhat like a truncated cone, and having its upper part pierced to receive bars or levers for the purpose of winding a rope round it, to raise heavy weights or otherwise exert great power. It is chiefly used in vessels for drawing in cables in order to raise anchors, etc. There are several improved forms in use on ships.

Cap'sule [Lat. *capsula,* dimin. of *capsa,* "a box or case"], in botany, a dry, syncarpous, dehiscent fruit or seed-vessel. The term is applied to all dry fruits which are dehiscent, whether simple or compound, one-celled or many-celled, and whether they open by valves or by pores. The capsule or pod is a general name of dry seed-vessels which split or burst open at maturity. The capsule is the pod of a compound pistil. The poppy, lobelia, iris, and snapdragon afford examples of it.

Cap'tain [Low Lat. *capitaneus* or *capitanus,* a "headman" (from *caput,* the "head"); Fr. *capitaine*], a military term which in a general sense signifies a commander, a man skilled in war or the military art. In some countries the commander-in-chief is called captain-general. In a more limited and technical sense, captain is the title of an officer who commands a troop of cavalry, a company of infantry, or a battery of artillery. He is the next in rank below a major. In the U. S. army a captain is responsible for the camp-and-garrison equipage, the arms, ammunition, and clothing of his company. A captain of the U. S. marines is of a rank corresponding with that of a captain in the army, and that of a lieutenant in the navy.

Captain (of the navy) is an officer of higher rank and holds a more responsible position than a captain of the land forces. He has the command of a ship, and is responsible for everything on board—all that relates to the *personnel* or the *matériel* of the vessel. The commanders of all British vessels, from first-rates down to ship-rigged sloops, are captains. A captain in the royal navy is the next in rank above a commander. A captain in the U. S. navy takes rank with a colonel in the army, and next below a flag-officer. He rises by regular succession to the rank of rear-admiral, but he cannot attain that rank unless he has first served for six years in a sea-going vessel with the rank of captain. Before the civil war (1861–65) there was no definite rank in the U. S. navy higher than that of captain. (See Commodore.) The term captain is also applied to the master of a merchant-vessel.

Cap'tion [Lat. *captio,* a "taking"], in law, is that part of a legal document, such as an indictment or commission, which shows the time and place where, and the authority by which, it was made or executed. It is of considerable consequence in the case of indictments. While a caption is not strictly a part of an indictment, its absence or imperfection may be of serious import. Its office in this case is to state the style of the court, and the time and the place of its meeting, and the time and place where the indictment was found, and the number of the jurors who found it, though their names need not be mentioned. Care that it be properly drawn is particularly requisite where the indictment is removed into a higher court (see Certiorari), in which case it is said that there must be enough in the caption to show that the inferior court has jurisdiction in the case. (The details of the subject will be found in Wharton's "Criminal Law" and in Archbold's "Criminal Pleading and Practice," where useful forms of captions are given.)

Capture. See International Law, by Pres. Theo. D. Woolsey, S. T. D., LL.D.

Cap'ua [Gr. Καπύη], an important city of ancient Italy, the capital of Campania, was situated on a plain about 2 miles from the river Vulturnus, and about 18 miles N. of Naples. It is supposed to have been founded by the Etruscans, who called it *Vulturnum.* It was probably nearly as ancient as Rome itself. Capua was the greatest and most opulent city of Italy about 350 B. C. It was conquered by the Romans in 340 B. C., but it continued to prosper under the Roman power, and in the time of the second Punic war was scarcely inferior to the great cities of Rome and Carthage. Capua was noted for its luxury and refinement. After Hannibal had defeated the Roman army at Cannæ in 216 B. C., the popular party of Capua, in hopes of rendering their city independent of Rome, opened their gates to the Carthaginians, who spent the winter in Capua and became enervated by its luxury. The Romans, having besieged the city and captured it in 211, punished its revolt with severity, nullified its political importance, and reduced it to the condition of a provincial town of the most degraded class. It continued, however, to be a popular city for several centuries, but it was taken and ruined in 456 A. D. by Genseric the Vandal. The site is now partly occupied by a large village called Santa Maria di Capua, with 9733 inhabitants. Here are visible the remains of a grand amphitheatre.

Capua (anc. *Casilinum*), a fortified city of Italy, in the province of Caserta, is beautifully situated on the river Volturno, 27 miles by rail N. of Naples. It is on the railway which connects Naples with Rome, and is a military station of the first class. It was considered one of the keys of the former kingdom of Naples. Capua contains a remarkable old cathedral, a college, and several convents. It was founded on the site of *Casilinum,* 2 or 3 miles E. of the ancient Capua, in 856 A. D. Pop. 12,548.

Capuchin' [Fr. *Cappucin;* It. *Cappuccino*] **Friars,** a branch of the order of Franciscan monks which originated in Italy in 1525. They derived their name from a hood or head-dress (in Italian *cappuccio*). They are a branch of the Minorites of the strictest observance. In 1859 they numbered about 11,300. They are found in most countries of Christendom, and are said to be increasing in numbers. They have a few convents in the U. S. The Capuchins are remarkable for their austere discipline. They have never cultivated learning, and have produced few eminent men. One of the best known of its recent members was the late Father Matthew, the distinguished advocate of total abstinence. There is also an order of Capuchin nuns who are also Franciscans of the strictest observance.

Capuchin Monkey, a species of South American monkeys, *Cebus capucinus,* which receives its specific name from the cowl-like appearance of the hairy covering of its head. Other species of the genus receive the same name.

Capudan' Pasha (*i. e.* "captain-pasha," *capudan* being a corruption of the It. *capitano*), the high admiral or commander-in-chief of the Turkish navy. He has the control of all naval affairs, appoints all the officers of the navy, and is governor of the Turkish islands in the Archipelago.

Ca'put Mor'tuum [Lat.], *i. e.* literally, "dead head," the inert residue of distillation and sublimation. When sulphate of iron is distilled at a red heat, it leaves a residue of red oxide of iron, which the alchemists called *caput mortuum vitrioli.* Its symbol was a death's head and cross-bones; hence *caput mortuum* signified also a "bugbear," a source of groundless terror.

Capyba'ra, or **Capiba'ra** (*Hydrochærus Capybara*), is the largest known quadruped of the order Rodentia, and belongs to the family Cavidæ. It is an aquatic animal, a native of South America, and feeds on vegetable food exclusively. Its dentition resembles that of the cavy, except that the grinding teeth are formed of many transverse

plates, the number of plates increasing as the animal advances in age. It is inoffensive and easily tamed. The

Capybara.

flesh is esteemed good food. It is somewhat smaller than the common hog.

Car. See Railroad Equipment.

Carab'idæ, a family of coleopterous or beetle-like insects, equivalent to the Linnæan genus *Carabus*. Its species are very numerous and of various habits. Most of them are voracious devourers of other insects and of worms; the larvæ have similar propensities. Some of them are more than an inch in length, and with rather long legs, used in pursuing their prey. A few species have only rudimentary wings. Several have considerable beauty of color and lustre.

Carabo'bo, a province of Venezuela, is bounded on the N. by the Caribbean Sea, on the E. by Caracas, Aragua, and Guarico, on the S. by Portugueza, and on the W. by Barinas, Barquisimeto, and Coro. The province of Cojedes has lately been detached from this province, but nothing definite being known of the boundaries of Cojedes, we treat of the two as one. Area, 7300 square miles. The northern part of the province is mountainous, while it is level in the S. The country around Lake Valencia is one of the most fertile districts of the republic. The climate is very warm, but is only unhealthy on the seashore. The chief products are coffee, cacao, and sugar. Chief town, Valencia. Pop. 230,509.

Car'acal (*Felis Caracal*), a species of lynx found in the warm parts of Asia and in Africa, supposed to be the same animal as that which the ancients called lynx. It is larger than a fox, and is powerful enough to kill a hound with ease. The fur of the upper part is of a deep brown or wine-red, its ears being tufted with long black hair. It is naturally fierce, but is capable of being tamed, and has been employed in hunting.

Caracal'la (Marcus Aurelius Antoninus Bassianus), a Roman emperor, a son of Septimius Severus, was born at Lyons in 188 A. D. On the death of his father, in 211 A. D., he ascended the throne, and caused his brother Geta to be murdered. He also massacred several thousand friends of Geta, including Papinian, the great jurist. His reign was disgraced by many acts of cruelty and infamy. He was assassinated near Edessa in 217 A. D., at the instigation of Macrinus, who became his successor. The Baths of Caracalla are among the most striking ruins of Rome.

Caraca'ra, or **Caracara Eagle** (*Polyborus*), a genus of rapacious birds peculiar to America, and regarded as a connecting link between the eagle and the vulture. They feed on carrion, like the vulture. The *Polyborus Braziliensis*, which is found in Brazil and other parts of America, has fine plumage, and measures about four feet from tip to tip of the wings. Other species are known.

Carac'as, a state of Venezuela, South America, is bounded on the N. by the Caribbean Sea, on the E. by Barcelona, on the S. by Guarico, and on the W. by Aragua and Carabobo. Area, 6038 square miles. The surface is mostly mountainous, with fertile valleys in the interior. This state contains the best cultivated districts of the republic. Capital, Caracas. Pop. 173,042.

Caracas, a city, the capital of the above province and of the republic of Venezuela, is situated 12 miles S. of La Guayra, and nearly 3000 feet above the level of the sea: lat. 10° 30′ 50″ N., lon. 67° 5′ W. It is separated from La Guayra, its seaport, by a high mountain-ridge. It is liberally supplied with water by several streams which run through or near the city. The streets are narrow, straight, and well paved. Among the principal edifices are the cathedral and the church of Alta Gracia. Caracas is the seat of a Roman Catholic archbishop, and contains a college and several hospitals. The climate is healthy, but the place is subject to earthquakes, one of which in 1812 destroyed about 12,000 people. The chief articles of export are cacao, cotton, indigo, coffee, hides, etc. Pop. in 1869, 47,597.

Cara'cci, or **Carracci** (Annibal or Annibale), an excellent painter, was born in Bologna in 1560. He was a pupil of his uncle, Ludovico Caracci, with whom he was associated as a founder of the Bolognese school of painting. The pictures which he painted in the Farnese Gallery in Rome, on which he expended eight years, are considered his best works. He is generally regarded as the greatest painter of the Caracci family. Died at Rome in 1609. (See Kugler's "Schools of Painting in Italy.")

Caracal.

Caracci, or **Carracci** (Ludovico), the founder of the Bolognese school of painting, the son of a butcher of Bo-

logna, was born in 1555. He was noted for his fidelity to nature. Among his works are a "Transfiguration" and "The Preaching of John the Baptist." He had several eminent pupils, including Domenichino and Guido Reni. Died in 1619.

Caraccio'li (Francesco), Prince, an Italian admiral, born at Naples about 1748. He entered the service of the Parthenopian Republic formed at Naples in 1798, and obtained the command of a small fleet. He repulsed the Anglo-Sicilian fleet in 1799. After Naples had surrendered to the royalists he was arrested and hung by the order of Lord Nelson in 1799.

Car'acole [Sp. *caracol*], a French term used in horsemanship or the manège to denote a semi-round or half-turn. When cavalry advance to charge in battle they sometimes perform caracoles in order to perplex the enemy, and excite a doubt whether they will attack the flank or the front.

Carac'tacus, or **Cara'doc,** a brave king of the Silures, a tribe of ancient Britons who lived in Wales. He resisted the Roman invading armies for nine years, but was at length defeated, and was carried a captive to Rome in 51 A. D. His deportment in the presence of the emperor Claudius was admired by the Romans, who treated him with clemency.

Cara'doc Sand'stone, a deposit originally described by Murchison as one of the principal members of his lower Silurian series. It is found at Caer Caradoc, in Shropshire, and is remarkably rich in trilobites. Among the other fossils of this deposit are Brachiopoda and Graptolites. The thickness of the beds in some places reaches 9000 feet.

Cara'fa de Colobra'no (Michele), an Italian musician and composer, born at Naples Nov. 28, 1785. He became a resident of Paris about 1821. Among his works are operas entitled "Il Sonnambulo" and "Massaniello." Died July 28, 1872.

Caraites. See Karaites, by Rev. S. Adler, Ph. D.

Car'alis, or **Cal'aris,** the capital or chief town of ancient Sardinia, is said to have been founded by the Carthaginians before the Second Punic war. It had a good port, and was for many centuries an important place. The site of it is now occupied by Cagliari.

Carambo'la, an East India fruit produced by the *Averrhoa Carambola*, a small evergreen tree of the natural order Oxalidaceæ. The fruit is about as large as a duck's egg, and has five longitudinal ribs, with a thin, smooth, yellow rind. The pulp has an agreeable flavor (sweet or acid), and is used in making sherbets, tarts, etc. It is one of the most generally-cultivated fruits in India, and is sometimes called Coromandel gooseberry. The tree has irritable or sensitive leaves, and exhibits in a remarkable degree the phenomenon called sleep of plants. The acid fruit called *bilimbi* grows on another species of *Averrhoa*.

Car'amel [said to be from Lat. *canna*, "cane," and *mel*, "honey" or "sugar," *i. e.* "cane-sugar"], a name given to the dark-brown substance produced by burning sugar or exposing it to a great heat. It is also formed in the process of roasting coffee and malt. It is used to color wine and to adulterate coffee. Caramel is also a sort of confectionery.

Cara'na Resin, or **Gum-Cara'na,** the product of an unknown South American tree. It is soluble in alcohol, and melts at a low temperature.

Cara'pa, a genus of plants of the order Meliaceæ, natives of warm climates. *Carapa Guianensis* is a large tree called anderaba, which grows in Guiana, and has large pinnate leaves. Its bark is reputed a valuable febrifuge, and is used in tanning. Masts of ships are made of the trunks. Lamp oil is obtained from the seeds of this tree and from those of the *Carapa Guineensis*, which is a native of Guinea. Its oil is used to protect the bodies of the natives from the bites of insects.

Car'apace, the upper shell or dorsal shield of chelonian reptiles (turtles and tortoises) and of the Crustacea Malacostraca (crabs and lobsters). In the Chelonia it is chiefly an expansion of the ribs covered by a thick layer of horny substance. The latter is most peculiar in the hawk's-bill turtle, furnishing the tortoise-shell of commerce.

Caraquette, Lower, a port of entry in Gloucester co., New Brunswick, has a good harbor and extensive fisheries. Pop. about 1500.—The settlement of Upper Caraquette, in the same parish, has about 600 inhabitants.

Carasco'sa (Michele), born in Sicily; was an officer successively in the armies of King Ferdinand, the Neapolitan republic, King Joseph, and Joachim Murat; signed the convention of Casalanza; was made minister of war; placed himself at the head of the revolution; was defeated; fled to London, and fell there in a duel. His "Mémoires sur la Révolution de Naples en 1821" appeared in London in 1823.

Car'at [from the Gr. *κεράτιον*, a "little horn;" a "pod" of the locust tree; also a minute weight], a term used by jewellers in weighing gold and precious stones. For diamonds a carat is three and one-sixth troy grains, a "carat grain" being one-fourth of this. In assaying gold, either the pound, ounce, or any other weight is divided into twenty-four parts, in order to designate the proportion of pure gold in an alloy with another metal or metals. That which contains $\frac{2}{24}$ of gold is said to be "twenty-two carats fine." There is here no absolute designation of weight.

Carau'sius, one of the three Augusti who shared the rule of the Roman world between the years A. D. 286 and 294, and emperor of Britain, was one of the most remarkable men of whom so little is known, except results, that scarcely any history does justice to the extraordinary ability which first discovered and developed the real bent of Saxon and Dutch genius for the naval service. He was a Menapian, that is, a member of a confederation (Meenaft) which inhabited the debatable or sea-land at the mouth of the Rhine, Maas, and Schelde, a coast which has given birth to the greatest admiral of the world, Ruyter, and to Tromp, in Holland, and in France, to John Bart and Duquesne. Whether he was of noble and conspicuous or of humble parentage is not certain, neither his real name, for Carausius is most probably a Latin corruption of one whose base was Karl. Nothing is stated of his birth, youth, and education, nor of the steps by which he rose to high rank, extensive influence, and vast power, except a brief notice of his co-operation in putting down the rebellion of the Bagaudæ, A. D. 285, in Gaul. His name, indeed, in general history, is first mentioned in connection with the exalted position of "count of the Saxon shore" "and admiral of the northern seas"—a maritime jurisdiction which would have satisfied even the towering ambition of a Wallenstein. His services were so brilliant in this connection that the Britons, suffering from the depredations of the Saxon and Frank pirates, whom he had first beaten into submission and then converted through admiration into devoted allies, besought him to assume the sovereignty of their island. Having organized a marine victorious against the pirates, which before his advent had filled the "narrow seas," and once in possession of Britain, he established a navy which overthrew so triumphantly all that Rome could marshal against him that the two Augusti, Diocletian and Maximian, acknowledged him as the Third, as contemporary coins attest. Space being denied to do more than flash a telegraphic indication of the magnitude and brilliancy of Carausius, the curious reader is referred to three books which contain all that is known of this wonderful man: Dr. William Stukeley's "Medallic History of Marcus Aurelius Valerius Carausius, emperor in Britain," 1757; Guenebrier's less extensive but even more satisfactory treatise, both in the De Peyster alcove N. Y. Historical Society; and "Carausius," 1858, and "Ancient, Mediæval, and Modern Netherlands," 1859, by the author of this article, the two last the result of the labors of years, without regard to expense in the collection of authorities. Carausius maintained himself as independent monarch of Britain and of a Frank confederation at the mouth of the Rhine for about seven years, during which time he destroyed two Roman fleets or navies; carried his arms into the Highlands of Scotland; chastised the Picts and Scots, leaving a name whose mention in their songs and traditions testified the respect he inspired. Ossian in his poems gives him the most appropriate title of "King of Ships." He rebuilt the wall of Severus, constructed a trophy or triumphal memorial which excited the curiosity of the learned, until it was wantonly destroyed within a century, on the banks of the Carron, a stream which takes its name from him. His munificence attracted the finest artists of the day to his island empire, of whose ability numerous specimens exist in coins exquisite for the period, some of which bear the effigies of Carausius and his empress, Queen Oriuna. He established a fair at Sturbich or Stourbridge, near Cambridge, that continues to exist until this day, and a water-communication between the Humber and the Peterborough rivers by means of a canal known as the Car-dic or dyke, which served for the threefold purpose of obviating the dangerous navigation of the Cimbric Ocean, for military communication, and for drainage, especially of the Lincolnshire fens. Of this vestiges still exist. In the midst of his developing military power, administrative sagacity, general munificence, and prescient organization, he was assassinated at York, the vicarian or Roman capital of Britain, A. D. 293–294, by his prime minister and confidential friend, Allectus—a name by some considered rather as a title indicative of office than a proper appellation. The military and naval preparation of Carausius enabled the traitor to maintain his usurped dominion

for three years, when the Roman power, under the cæsar Constantius Chlorus and his lieutenant-general Asclepiodatus, made a triple invasion up the Bristol Channel from the W., across the Channel from the S., and up the Thames from the E., and put an end to the independent sovereignty of Britain, and reunited it to the empire by a series of conflicts, the last in the streets of London. In the most important, in the W., Allectus was slain. Of all the series of monarchs, two decidedly among the greatest or ablest who have honored the British crown by the wearing of it were the Hollanders Carausius of Menapia and William III. of Orange. J. Watts de Peyster.

Carava'ca, a town of Spain, in the province of Murcia, is on the slope of a hill 40 miles N. W. of Murcia. It has an old castle, a college, and a fine church. Excellent wine is produced in the neighborhood. Pop. 6839.

Carava'ggio, a walled town of Italy, in the province of Bergamo, 38 miles by rail E. of Milan. Here are two handsome churches. The melons of this place are noted throughout Italy. Pop. 5535.

Caravaggio, da (Michael Angelo), an Italian painter, born at Caravaggio in 1569. His proper name was Michael Angelo Amerighi (or Morigi). He imitated no model except nature, and formed an original style. He excelled in chiaroscuro and coloring. His wild and gloomy character is reflected in his works. Among his masterpieces are a "Supper at Emmaus" and "The Fraudulent Gamblers." His temper was quarrelsome. Died in 1609.

Car'avan [Arabic and Persian *karawân*], a company of merchants or pilgrims who associate together in order to traverse with greater security the deserts of Africa and Asia. The commercial intercourse of those regions has been from the remotest ages carried on chiefly by caravans of camels. In Mohammedan countries large caravans of pilgrims are annually assembled to perform the journey to Mecca. The most important regular caravans are those which annually travel to Mecca from the three following points—Damascus, Cairo, and Babylon. The caravan of Damascus is said to consist of more than 30,000 pilgrims and merchants, many of whom are Europeans. Each caravan is under the command of a chief.

Caravan'serai', or **Caravan'sary** [Arabic *karawân*, a "caravan," and *serâi*, a "palace" or "inn"], also called **Khan,** an Oriental public-house or unfurnished inn for the shelter and lodging of travellers in Asia and Africa. The travellers in those regions usually carry their own food with them. Each of these inns is commonly a square building of four wings built round a courtyard, in which the beasts of burden are confined. There is always a well or spring of water in it. The wings are divided into small lodging-rooms, in which the traveller finds no bed or furniture but that which he carries with him. In many caravanserais the hospitality is gratuitous. It was in the stable of one of them (called *inns* in the Bible) that our Saviour was born.

Car'away (*Carum Carui*), a plant of the order Umbelliferæ, grows wild in Southern Europe and in some parts of Asia. It is cultivated in Europe and America for its aromatic seeds (carpels), which are used in medicine as a carminative and tonic. They are also used as a condiment by confectioners, pastry-cooks, and perfumers. Their aromatic principles depend on a volatile oil called oil of caraway, which is obtained by distilling the crushed seeds with water. It is administered by physicians to correct the nauseating and griping tendencies of some cathartic medicines.

Carbazo'tic Ac'id, or **Pi'cric Acid** ($C_6H_3(NO_2)_3O$), a bitter crystallizable acid, composed of carbon, nitrogen (azote), and oxygen, and obtained by the action of nitric acid on indigo, on carbolic acid, and on many other organic substances. It occurs in the form of yellow crystals, which are soluble in alcohol, and dissolve in eighty or ninety times their weight of cold water. It is an important dyestuff. When silk which has been treated with a mordant of alum is immersed in a solution of this acid, it is dyed of a beautiful permanent yellow color. The picrate (carbazotate) of potassium, when heated, explodes with tremendous violence, and was used in the Franco-Prussian war in blowing up bridges, etc. As this salt is nearly insoluble in water, the acid has been proposed as a test for potash. It is sometimes called nitro-phenisic acid.

Car'bides, formerly called **Carburets,** are chemical compounds of carbon with a metal. None of them occur in a natural state.

Car'bine, or **Car'abine** [It. *carabina*, probably from *carabin*, a light-horseman among the Arabs], a light musket, a firearm used by cavalry and artillery, is shorter in the barrel than the infantry musket or rifle. The best carbines are now rifled. The American breech-loading carbine has usually a barrel about twenty-two inches long, has a long range, and may be fired with rapidity. (See Small-arms, by Gen. P. V. Hagner, U. S. Army.)

Car'bo (Cneius Papirius), a Roman general who was elected consul in 86 B. C., and was a partisan of Marius in the civil war that ensued. He commanded in a battle against Sulla at Clusium, and soon after that event was defeated by Metellus at Faventia. Having fled to Africa, he was taken prisoner and put to death in 82 B. C.

Carbohy'drogens, or **Hydrocar'bons,** in organic chemistry, a series of compounds, composed of carbon and hydrogen in such proportions that the members of the group differ from each other in definite and regular numbers of atoms. The best-marked group of carbohydrogens commences with methylene (CH_2), which may be regarded as the first step in the series, and by the successive addition of two atoms of carbon and hydrogen we obtain ethylene or olefiant gas (C_2H_4), propylene or propene (C_4H_8), etc.

Carbol'ic Acid, also called **Phen'ic Acid, Phe'nol,** and **Car'bol,** a substance discovered by Runge in 1834, is obtained by repeated distillation of coal-tar at a moderately elevated temperature. Its formula (new notation) is C_6H_5OH. When pure it crystallizes in colorless needles, which liquefy on the addition of a small amount of water. It dissolves in twenty parts of water by weight, and also in alcohol, ether, and the oils. Specific gravity, 1.066. It melts at 95° F., and boils at 356°, and is inflammable. In odor, taste, and caustic property it resembles wood-creasote, for which, indeed, it is often sold. It is not, chemically, an acid, being more allied to the aromatic alcohols. When applied to the skin it causes at first a sense of burning, with the appearance of a white spot, and then the loss of sensibility in the part. This anæsthetic action has been recently applied in medicine and surgery.

The most important property of carbolic acid is its influence upon organic matter and living organisms as an antiseptic and disinfectant. It coagulates albumen (when warm) by abstracting its water. This enables it to preserve animal tissues from putrefaction for some time, but not so effectually as alcohol. It is destructive to minute forms of life, and has hence been generally supposed to be one of the most useful of disinfectants. Lister of Glasgow has especially advocated its use in connection with the "germ-theory" of disease. Doubts have been recently cast upon its value by the observations of Dr. Parkes in England, Dr. Bill in the U. S., and others. It is certainly a feeble deodorizer as compared with chlorine. Internally, it has been used in the treatment of many diseases with benefit, especially in cancer. Locally applied, in solution with water or oil, it lessens considerably the tendency to suppuration. (See Angus Smith, M. D., "On Disinfection," Edinburgh, 1869; A. E. Sansom, M. D., "The Antiseptic System," London, 1871; and I. H. Bill, M. D., "American Journal of Medical Sciences," July, 1872.) (See also the article Phenol, by Prof. C. F. Chandler, Ph. D., LL.D.)
Henry Hartshorne.

Car'bon [Lat. *carbo*, "a coal"], symbol C, an important chemical element or simple substance which is abundant in the mineral, vegetable, and animal kingdoms. It occurs in a great variety of forms and combinations, being the combustible base of charcoal and fossil coal. It also occurs uncombined in the diamond, which is pure crystallized carbon, and in graphite or plumbago. Its atomic weight is 6, or, according to the new notation, 12. It is remarkable for its allotropic character, and is extremely infusible and unalterable at ordinary temperatures. It is the only element that is always present in animal and vegetable substances. In its ordinary forms it is a good conductor of electricity, but the diamond is a non-conductor. United with oxygen, it forms carbonic acid (CO_2), which occurs in the atmosphere, in limestone, marble, dolomite, etc. (See Carbonic Acid.) With nitrogen it forms an important compound called cyanogen. In plants and animals it occurs as one of the principal constituents of wood, gum, starch, sugar, oil, gelatin, fibrin, etc., in which it is combined with hydrogen and oxygen. The various forms of carbon are combustible, but they are not affected by any degree of heat except in the presence of air or oxygen. Carbon resists the action of many reagents which alter other simple substances. It is insoluble in all known liquids. In the classification of the elements it is arranged with sulphur, phosphorus, and boron, which are called tetratomic metaloids, or non-metallic substances. A compound of carbon with a metal is called a carbide or carburet. Coke and lampblack are more or less impure artificial forms of carbon.

Carbon, a county in Eastern Pennsylvania. Area, 400

square miles. It is intersected by the Lehigh River, and also drained by the Mahoning and other creeks. It is bounded on the S. E. by the Kittatinny or Blue Mountain, and traversed by several other high ridges. This county derives its name and its prosperity from its rich mines of good anthracite coal. The stratum or bed of coal near the top of Mauch Chunk Mountain is about fifty feet thick. Wheat, corn, rye, buckwheat, and potatoes are the chief crops raised. Lumber is manufactured quite extensively. Carbon county is intersected by the Lehigh Valley R. R. Capital, Mauch Chunk. Pop. 28,144.

Carbon, a county of Wyoming Territory, bordering on Colorado. It is intersected by the North Fork of the Platte River, and also drained by the Medicine Bow River. The surface is diversified and mountainous, and partly occupied by elevated plains. The southern part is traversed by the Medicine Bow Mountains. Iron and good lignitic coal abound here. The Union Pacific R. R. passes through this county. Capital, Rawlings Springs. Pop. 1368.

Carbon, a township of Huntingdon co., Pa. Pop. 2233.

Carbon, a post-village of Carbon co., Wy., on the Union Pacific R. R., 83 miles N. W. of Laramie, has coal-mines which give employment to a large number of men. It is 7008 feet above the sea.

Carbona'ri is the name of a secret political society, founded during the French rule in Naples in the beginning of the present century. After the restoration of the Bourbons in Naples the society rapidly increased. In 1820 they organized branches in France, and after the defeat of the revolutionary party in Naples and Piedmont, Paris became their head-quarters. After the revolution of 1830 the society disappeared, although as late as 1841 a society of Carbonari was found to exist in Southern France. In the revolution of 1848 they took no part.

Car'bonated (or **Acid'ulous**) **Wa'ters** are those which contain a large proportion of carbonic acid gas. The term is applied to mineral springs, as those of Seltzer, Pyrmont, Salzbrunn, and Reinerz. Such waters sparkle much when poured from one vessel to another. They are refreshing and exhilarating, and are useful in some disordered states of the stomach. At St. Nectaire, in France (Puy-de-Dôme), the proportion of gas condensed in the water is said to be as four volumes to one; in most waters it is much less.

Car'bonates, salts containing carbonic acid. They may be easily identified by the effervescence which results when they are brought into contact with dilute hydrochloric or nitric acid. Of this numerous class of salts the most important are carbonate of lime, which occurs in the form of limestone, marble, etc., carbonate of potash, and carbonate of soda. (See POTASH and SODA, by PROF. C. F. CHANDLER.) Crystallized carbonate of lime is called CALCAREOUS SPAR (which see).

Carbon Bisulphide is a heavy, clear liquid compound of carbon and sulphur, very volatile and very inflammable. It is composed of one atom of carbon and two of sulphur, and is obtained by passing the vapor of sulphur over red-hot charcoal. Its symbol is CS_2. It has great solvent power, and is largely used in chemistry and the arts as a solvent of caoutchouc and other organic matters. This compound is a sulphur acid, and when combined with sulphur bases it produces compounds of the class known as sulpho-carbonates.

Car'bondale, a city of Jackson co., Ill., at the junction of the Illinois Central, Grand Tower and Carbondale, and Carbondale and Shawneetown R. Rs., 27 miles E. of the Mississippi, is the seat of the Southern Illinois Normal University. It has an active trade in cotton, tobacco, fruit, lumber, building-stone, and farm produce, and has one weekly newspaper. Pop. 2400; of township, 3370.

ANDREW LUCE, ED. "OBSERVER."

Carbondale, a post-village of Osage co., Kan., at the junction of the Atchison Topeka and Santa Fé and the Lawrence and South-eastern R. Rs., 68 miles from Atchison. It has extensive mines of coal.

Carbondale, a city of Luzerne co., Pa., is on the Lackawanna River, and at the head or north-eastern end of the Lackawanna Valley. It is on the Delaware and Hudson R. R., about 17 miles N. E. of Scranton, and is the southern terminus of a branch railroad which connects with the Erie R. R. at Susquehanna. It contains about nine churches, one national bank, one savings bank, and two newspaper-offices. Large quantities of anthracite coal are mined in this vicinity. Pop. 6393, or, including Carbondale township, 7114. ED. CARBONDALE "ADVANCE."

Carbonear', a port of entry of Newfoundland, on the N. side of Conception Bay, 31 miles from St. John's. It has an extensive trade in fish, a commercial and a grammar school. Pop. about 2000.

Carbon'ic Acid is the popular and former scientific name of a compound of carbon and oxygen, in the proportion of one atom of carbon to two of oxygen. It is called in the new chemical nomenclature CARBONIC OXIDE, CARBON DIOXIDE, or CARBONIC ANHYDRIDE. It is easily prepared by putting marble-dust or chalk into dilute sulphuric or hydrochloric acid. The latter acid, combining with the lime, sets free the carbonic acid as a colorless, slightly pungent gas of the specific gravity 1.524. When this gas is submitted to a pressure of thirty-six atmospheres at 32° F., it becomes a light limpid liquid, without acid properties, readily miscible with alcohol and ether, but not with water or fixed oils. When this liquid is allowed to evaporate in the open air, it produces cold so intense that the unevaporated residue of the liquid solidifies into a snow-like substance, below 100° F. in temperature. By evaporating this substance in a vacuum the spirit-thermometer can be made to fall to —166° F. Carbonic acid gas is regarded by many authorities as poisonous, while others assert that it destroys life by exclusion of oxygen, like water in drowning. These last authorities state that the narcotic effects attributed to this gas are really due to the presence of carbonous oxide (CO), which is an undoubted poison. (See article next below.) The choke-damp of coal-mines contains both these gases. Carbonic acid is a constant result of ordinary combustion and fermentation, and of the respiration of animals. It furnishes to plants, through their leaves, a very important part of their nourishment.

Carbon'ic Ox'ide, called in the new nomenclature **Carbonous Oxide** or **Carbon Monoxide** (symbol CO), a compound of one atom of carbon with one atom of oxygen, has the atomic weight of 14 or (new) 28. It is fatally deleterious to animals if they inhale it, and extinguishes flame, but it burns with a blue flame in contact with air, and thus forms carbonic acid. It is a colorless and insipid gas, which has never been liquefied nor solidified. Specific gravity, .967. It does not occur naturally, but may be obtained by the action of sulphuric acid on oxalic acid, by passing carbonic acid over red-hot charcoal, or by heating to redness chalk or pounded marble with iron-filings or zinc. Even when largely diluted with air, it acts as a narcotic poison to those who inhale it. This gas does not perform any active part in natural phenomena, but in the reduction of ores, as in the blast furnace, it is of the greatest importance.

CARBONIC OXIDE, in the new nomenclature, is a name for CARBONIC ACID (which see).

Carboniferous [from the Lat. *carbo*, "coal," and *fero*, to "bear"], producing or containing carbon or coal, a geological term applied to the strata of rocks which are connected with the coal-beds and are interstratified with them. The period which followed the Devonian age is called by some geologists the carboniferous age. It was the third and last age of the palæozoic era.

Carboniferous Formation, the series of rocks (sandstones, shales, limestones, etc.) which occur in connection and alternation with the coal-beds, and were deposited during the carboniferous age. (See COAL and ANTHRACITE, by PROF. J. S. NEWBERRY, M. D. LL.D.)

Carboniferous Limestone, sometimes called **Sub-Carboniferous** or **Mountain Limestone,** is one of the lower and older rocks of the carboniferous system. It mostly contains magnesia, is of coralline formation, and is rich in organic remains, among which are many encrinites or Crinoidea and marine shells. This limestone is largely developed in Yorkshire and Derbyshire in England, in Russia, Germany, Illinois, Missouri, and other parts of the U. S. Some varieties of it are valuable for building-stone.

Carboniferous System, the name given to the strata which were deposited during the carboniferous age of geology, and which are interposed between the Devonian system and the Permian strata. Most of the great coal-fields of the world belong to this system of formation, which is largely developed in Pennsylvania, Ohio, Illinois, and other States of the Union.

The chief characteristic of the lower and older member of the carboniferous system in England and Western Europe generally, as well as in North America, is a vast deposit of coralline limestone, crystalline for the most part, and abounding in shells, encrinites, and corals. It has long been known as the mountain limestone, from its large development in the mountain districts of Yorkshire, Derbyshire, and Lancashire, where it is the source of much picturesque beauty. (See CARBONIFEROUS LIMESTONE.) Among the limestones are many bands of coal, some thick enough and good enough to pay for working. In other parts of England, and in Russia, very poor and imperfect coal-

measures represent the carboniferous limestone. In Ireland there is a peculiar sandy deposit of the same age.

Over the carboniferous limestone lies the millstone grit, a rock occasionally represented by bituminous shales and covered by pebbly grits. Here come in some of those valuable deposits of iron more common among the coal-measures, but helping to give value to the middle part of the carboniferous system. Here also are valuable building-stones.

The natural divisions between the beds of limestone and its numerous crevices and caverns are often filled, more or less completely, with ores of lead and zinc. Rich masses of galena occupy the fissures, large deposits of calamine fill the interspaces between the beds, and where none of these valuable minerals exist, large bodies of water accumulate, and occasionally make their way out in springs or are available when tapped by accident or intention.

Much of the carboniferous limestone is of organic origin, and appears to have been deposited in a coral sea, not far from islands covered with luxuriant vegetation. The almost perfect identity of species observable when fossils obtained from the quarries in Central Europe are compared with others from high northern districts either in Europe or North America renders it highly probable that a remarkable uniformity of climate prevailed at that time over the whole northern hemisphere. The nature of the prevailing fossils—goniatites, orthoceratites, etc. among the univalves, and the numerous species of terebratula and spirifer among the bivalves—points to conditions different from any that have since affected the same districts.

Over the millstone grit come the sandstones and shales that contain the coal-measures, the lower part of which in England is most prolific in coal. At least a quarter of a million of square miles of the earth's surface in the various tracts of land now above the water are covered with sandstones and shales of the carboniferous period, among which coal is buried; and this coal is for the most part accessible. As in each square mile of country there are upwards of three millions of square yards of surface, and a cubic yard of coal weighs nearly a ton, while in many coal-fields there is an average of workable coal from ten to twenty yards thick, the reader may obtain for himself a rough but sufficient estimate of the possible extent of supply of this mineral. (See Coal, by Prof. J. S. Newberry.)

The coal-measures abound in the remains of plants of extinct species, which mostly grow in marshes or low places. The principal fossil plants found in this system are Coniferæ, Equisetaceæ, the Lepidodendrons, the Sigillaria, Calamites, and ferns of colossal size.

Revised by J. S. Newberry.

Car'boy, a large globular bottle of green glass protected by basket-work or enclosed in a wooden box. Carboys are used to contain acids and other corrosive liquids. A carboy of sulphuric acid (oil of vitriol) usually contains about 160 pounds of that acid.

Car'buncle [Lat. *carbunculus*], a name given by lapidaries to a beautiful mineral which mineralogists call pyrope. The carbuncle of the ancients appears to have been either pyrope or a deep-red variety of precious garnet which is very similar to pyrope.

Carbuncle [Lat. *carbunculus*, a "small coal"], the *anthrax* of surgical writers, is a violent and painful inflammation, larger than a boil, on any part of the skin, most frequently on the back. The part swells and hardens, and, as the disease advances, assumes a livid redness. The cuticle often rises in blisters, and a number of small openings may occur, through which matter escapes. The origin of carbuncle seems to be constitutional, and it is usually attended by great suffering and considerable prostration. It is sometimes fatal, especially to old people. In its treatment, besides supporting the patient's strength and softening the skin by warm poultices, it is usual to divide the skin early and freely with a knife, or to destroy its surface with caustic.

Car'buret [Fr. *carbure*], the generic term formerly applied to compounds of carbon with the simple elements. (See Carbides.)

Car'buretted Hy'drogen, a chemical term applied to two gaseous compounds of carbon and hydrogen. The light carburetted hydrogen or methane is known by the popular names of marsh-gas and fire-damp. It is a nearly odorless gas, evolved abundantly in some coal-mines, where it has caused tremendous and fatal explosions. When pure it is not poisonous. Its symbol is CH_4. A mixture of one volume of this with three volumes of oxygen explodes with great violence when inflamed. It is one of the principal constituents of the coal-gas which is used for illuminating houses and streets. The bicarburetted hydrogen or ethene (C_2H_4) is the same as Olefiant Gas (which see).

Carcajen'te, a town of Spain, in the province of Valencia, 22 miles by rail S. S. W. of Valencia. It is on a fertile plain near the river Juncar, and is well built. Here are manufactures of linen and woollen fabrics. Pop. 8812.

Carcassonne (anc. *Carcaso*), a city in the S. of France, capital of the department of Aude, is on the river Aude and the Canal du Midi, 56 miles by rail E. S. E. of Toulouse. The river is here crossed by a bridge of ten arches, and separates the old from the new town. The old town, which stands on high ground, is enclosed by walls of great solidity, has an ancient castle, and retains in a remarkable degree the aspect of a fortress of the Middle Ages. Carcassonne is the seat of a bishop, and has a cathedral, a town-hall, a theatre, a public library with about 22,000 volumes, and a college. Here are extensive manufactures of fine woollen cloth which have long been celebrated. This city suffered much in the crusades against the Albigenses. Pop. 22,173.

Car'cel Lamp, one in which oil is pumped up by internal machinery, so as to be constantly overflowing the wick. The invention originated in France.

Carcinoma. See Cancer.

Car'damom [Lat. *Cardamomum*], a name of the capsule and seed of several species of plants of the genera *Amomum* and *Elettaria* and natural order Zingiberaceæ. The capsules are three-celled, and contain numerous seeds, which are aromatic and pungent, with a peculiar and agreeable taste. They are used as a condiment in Asia and Germany. Having mild cordial and stimulant properties, they are used in medicine and in combination with cathartics. The officinal cardamom of the U. S. and British Pharmacopœias is the seed of the *Elettaria Cardamomum*, a native of India. The cardamoms of commerce are produced in India, Ceylon, Madagascar, and the Malayan Archipelago.

Car'dan [It. *Cardano*], (Jerome), a celebrated Italian philosopher, author, and physician, was born at Pavía Sept. 24, 1501, graduated as M. D. at Padua in 1525, and became professor of mathematics at Milan. He also practised medicine, and acquired a wide reputation as a physician. In 1552 he visited Scotland and cured the primate of that country of asthma. He afterwards resided successively at Pavía, Bologna, and Rome. He was an astrologer, and professed to be an adept in magical arts. In 1545 he published in his "Ars Magna" a formula for the solution of cubic equations, which is called "Cardan's Formula." He wrote numerous works on physics, astrology, medicine, astronomy, etc. Among them are "De Rerum Subtilitate" ("On the Subtilty of Things") and "De Rerum Varietate" ("On the Variety of Things"). He died at Rome Sept. 20, 1576. (See his autobiography, entitled "De Vita Propria," 1643; H. Morley, "Life of Cardan," 1854.)

Card'board is made by pasting and pressing together a number of layers of paper, making either three-, four-, six-, or eight-sheet boards. Bristol board, used by artists, is entirely of white paper; common card-board is white on the outside only. Mill-board, employed in bookbinding, is composed of coarse brown paper, glued and pressed between iron rollers. The enamelling of cardboard is effected by brushing over it a mixture of white lead (China or Kremnitz white) with size. After drying, the surface is lightly rubbed with flannel which has been dipped in powdered talc; it is then polished with a hard, fine brush.

Car'denas, a seaport-town of Cuba, on the N. coast of the island, 120 miles E. by S. from Havana, with which it is connected by railroad. It has a good harbor. P. 7225.

Car'diac [Lat. *cardiacus*], belonging to the heart or connected with the heart. Stomachic and stimulating remedies or cordials are called cardiac medicines; the cardiac orifice is the superior opening of the stomach.

Cardi'adæ, a numerous family of lamellibranchiate bivalve mollusks, includes those species in which the mantle is open anteriorly for the foot, and has two orifices, one for respiration and the other for excretion, as the cockle (*Cardium edule*).

Cardial'gia, or **Car'dialgy** [from καρδία, the "heart," and ἄλγος, "pain"], literally, "pain in the heart." The term is commonly applied, however, to the uneasiness (heartburn) connected with indigestion, the seat of which is really in the stomach.

Car'diff, a seaport-town of South Wales, the capital of Glamorganshire, is on the river Taff, 171 miles by rail W. of London. It contains a town-hall, a fine old castle owned by the marquis of Bute, a theatre, and about thirty churches and chapels. Railways extend from this town to the mining districts of South Wales, the products of which are exported from Cardiff. It has a good harbor, improved by the construction of a magnificent basin and

docks. Coal and iron are the chief articles of export. The population has increased rapidly since 1840. Cardiff Castle, built in the eleventh century, is partly in ruins. Robert, duke of Normandy, was confined in it about twenty-seven years by Henry I. Cromwell obtained possession of it in 1648 by stratagem, after bombarding it for three days. Pop. in 1871, 39,675.

Cardiff, a post-village of Lafayette township, Onondaga co., N. Y., on Onondaga Creek, is the place of the pretended discovery of the "Cardiff giant," a statue of a man ten and a half feet long, which was cut from a block of gypsum quarried at Fort Dodge, Ia., sculptured at Chicago, buried for some months at Cardiff, and "accidentally" discovered Oct. 16, 1869. It was exhibited for many months with great success as a petrified giant, but the fraud was finally confessed by its perpetrators. Pop. 147.

Car'digan, a seaport of South Wales, the capital of Cardiganshire, is on the river Teify, 240 miles by rail W. by N. from London. It has an old and stately church, and the ruins of a castle which is supposed to have been founded in 1160. Romantic scenery occurs in the vicinity of Cardigan. Pop. in 1871, 3535.

Cardigan (James Thomas **Brudenell**), Earl of, an English general, born Oct. 16, 1797, was obliged to leave the service when a lieutenant-colonel on account of bullying conduct towards a brother officer, but was restored to his rank, became known as a daring dragoon officer, and rose in India to be a major-general. At the battle of Balaklava Lord Cardigan led the famous charge of the "six hundred." Died Mar. 27, 1868.

Car'diganshire, a maritime county of South Wales, is bounded on the N. by Merioneth, on the N. E. by Montgomery, on the E. by Radnor and Brecknock, on the S. by Carmarthen and Pembroke, and on the W. by Cardigan Bay. Area, 693 square miles. The surface is diversified with rugged hills, fertile valleys, and small lakes. The rocks which underlie this county are lower Silurian slates and shales, in which rich veins of copper, lead, and zinc occur. The chief articles of export are cattle, sheep, oats, barley, butter, slates, and pigs. Capital, Cardigan. Pop. in 1871, 72,245.

Car'dinal [Lat. *cardinalis*, from *cardo, cardinis*, a "hinge"], an epithet implying importance, and applied to the principal virtues, the four points of the compass, and other objects. The numbers 1, 2, 3, etc. are called "cardinal" numbers, to distinguish them from 1st, 2d, 3d, etc., which are called "ordinal" numbers.

Cardinal [It. *cardinale;* for etymology see above], the title of an ecclesiastic in the Roman Catholic Church. The cardinals are the highest dignitaries of the Church, except the pope, of whom they are the electors and the counsellors. They are distinguished by a scarlet hat and a short purple mantle worn over the rochet. Pope Urban VIII., in 1630, gave them the title of Eminence, which is still used. They are appointed by the pope, who often employs them as ambassadors, and a cardinal so employed is called a legate *a latere*. The body of cardinals is called the Sacred College. The total number of these prelates has been for several centuries limited to seventy, of whom six are bishops of certain Italian dioceses; fifty, styled cardinal-priests, hold their titles from parishes in Rome (many of them being at the same time bishops of foreign dioceses); and fourteen are cardinal-deacons. The actual number of cardinals is often less than seventy. When the pope dies, a successor is chosen by the cardinals, who are assembled in conclave at Rome, and who must elect one of their own number to the vacant pontificate. During the election, which is sometimes protracted several months by their inability to agree, they are confined in a certain building, formerly the Quirinal Palace, and debarred from intercourse with the public. (See Conclave.)

Cardinal, a post-village of Boulder co., Col., 2 miles from Caribou. It has rich silver-mines.

Cardinal Bird (*Cardinal* or *Cardinalis Virginianus*), called also **Red Bird, Cardinal Grosbeak, Cardinal Finch,** and **Virginia Nightingale,** a native of the U. S., is one of the finest of American song-birds, and is remarkable for the beauty of its form and plumage. The bill is thick and broad, but not long. It belongs to the family Fringillidæ. The back of the male is a dusky red, and the rest of the plumage is a bright, vivid scarlet. It has on the crown long feathers erected into a conical or pointed crest, which it is said to raise and lower at pleasure. The total length is about eight inches. It visits the Northern States as a summer bird of passage, and passes the winter in the Southern States, where some of them remain all the year. Many of them are taken to England and kept in cages.

Cardinal Flower [so called from its bright red flowers, in color like a cardinal's hat], the name of the *Lobelia cardinalis*, a perennial herbaceous plant of the order Lobeliaceæ, common in most parts of the U. S. in wet places, in the Atlantic region. There is a similar species or a new variety of it in Mexico. The color is a most intense red.

Cardinal Virtues, those regarded as of primary importance to character. Among the ancients they were justice, prudence, temperance, and fortitude.

Car'dington, a post-village of Morrow co., O., on the E. branch of the Olentangy River, and on the railroad which connects Cleveland with Columbus, 41 miles N. by E. from Columbus. It has a national bank. Pop. 918; of Cardington township, 2199.

Cardin'ia, a genus of fossil Conchiferæ, comprising about eighty-five species, which extend from the Silurian formation to the lower oolite. They have an oval or oblong shell, attenuated posteriorly, and marked with lines of growth and an external ligament.

Cardi'tis, inflammation of the heart. (See Endocarditis and Pericarditis.)

Cardoon' (*Cynara cardunculus*), a perennial plant of the same genus as the artichoke, is a native of Southern Europe. It is cultivated for the sake of the leaf-stalks and midribs of the leaves, which are blanched and used as a salad or as a boiled vegetable.

Cardo'zo (Isaac N.), born at Savannah, Ga., June 17, 1786, became in 1816 editor, and some years later proprietor, of the "Southern Patriot," a free-trade journal of his native town. In 1820 he published "Notes on Political Economy." He established the "Evening News" in 1845. He was active in commercial affairs, and, though opposed to the tariff of 1828, was not of the extreme nullification party. He was drowned in Virginia Aug. 26, 1850.

Cards. See Playing Cards.

Cards, a device for preparing the fibres of wool, cotton, or other textile material for the spinning process. The operation was formerly performed by hand-cards, but at present machines of surprising ingenuity are employed. The manufacture of cards is itself accomplished by wonderfully perfect mechanism. The subject is more fully discussed under Spinning (which see). Other forms of cards are employed for currying or cleaning the hair of domestic animals.

Carduus Benedictus. See Blessed Thistle.

Card'well, a county in the Dominion of Canada, in the central part of Ontario, was formed out of parts of Simcoe and Peel counties. Pop. in 1871, 16,500.

Cardwell (Edward), an English statesman, born in Liverpool in 1813. He was elected to Parliament in 1842, joined the party called Peelites, and was president of the board of trade from 1852 to 1855. In the latter year he was returned to Parliament for Oxford. He became secretary for Ireland in 1859, and secretary of state for the colonies in April, 1864. Having resigned with his colleagues in June, 1866, he entered the cabinet of Gladstone as secretary of state for war in Dec., 1868.

Career' [Fr. *carrière*, literally, a "track or course for carriages or cars"], the ground on which a race is run; a course; a race; the entire course of one's public life. The term was often applied to the course which was run in a tournament or tilt by two mounted knights from the starting-place to the place where they encountered in the middle of the lists.

Ca'ret [from Lat. *careo*] signifies "it is lacking." It is the name of a character formed thus ∧, and denotes that some word or letter has been omitted.

Carew' (Thomas), an English poet and courtier, born in 1589. He was patronized by Charles I., in whose court he served as gentleman of the chamber. He wrote sonnets and short lyrical poems which are remarkable for elegance and ease. Died in 1639. (The name Carew is by some English families of the name pronounced like Carey.)

Ca'rex (gen. *caricis*), [a classical Latin word signifying "sedge"], is the botanical name of a vast genus of coarse grass-like plants of the order Cyperaceæ. They abound in temperate and cold climates, and are perennial herbs, often growing in dense tufts in swamps and wet places. The genus is characterized by male and female flowers, separated (mostly monœcious), with an ovary enclosed in an inflated sac called a *perigynium*. Stamens three, rarely two. More than 450 species of *Carex* are known, and 150 species are described in Gray's "Manual of Botany" as natives of the Northern U. S. The *Carex arenaria* is planted in Holland on the dikes for the purpose of binding the sandy shores with its spreading roots (rhizomes) and resisting the encroachments of the sea. Few of the species are good for pasture, but they tend to convert swamps

gradually into fertile soil. In the U. S. they are harvested in large quantities from wet lands, but produce a poor quality of hay.

Ca'rey, a post-village of Crawford township, Wyandot co., O., at the junction of the Findlay branch with the Cincinnati Sandusky and Cleveland R. R., 50 miles S. by W. of Sandusky. Pop. 692.

Carey (Henry Charles), a political economist and writer of distinction, was born in Philadelphia Dec. 15, 1793. He became in 1821 the head of the firm of Carey & Lea, publishers. He has advocated a protective tariff, and has written, besides other works, "The Principles of Political Economy" (3 vols., 1837–40), "The Past, the Present, and the Future" (1848), and "The Principles of Social Science" (3 vols., 1858–59). He is the founder of a school of political economy whose principles are considered more progressive and liberal than those of Malthus and Ricardo. He has been distinguished especially for the zeal with which he has urged the principle of protection as opposed to that of free trade.

Carey (Matthew), a writer, born in Dublin, Ireland, Jan. 28, 1760, was the father of the preceding. He emigrated to Philadelphia in 1784, and became a bookseller. He published "The American Museum" (1787–95), wrote several political pamphlets and "Essays on Political Economy," and had much influence in public affairs. Died Sept. 16, 1839.

Carey (William), D. D., born in Northamptonshire, England, in Aug., 1761, was a shoemaker in early life, but becoming impressed with the duty of giving the gospel to the heathen, he went to India in 1794 and founded the Baptist mission at Serampore; became (1800) professor of Sanscrit, Bengalee, and Mahratta at the College of Fort William; published a Sanscrit grammar, a Bengalee-English dictionary, and other works, besides assuming the principal labor in the translation of the Scriptures into several Oriental languages. Died in 1834. He takes rank among the most distinguished of modern missionaries for his fidelity, success, and learning. (See "Life," by J. C. Marshman, also by F. Carey.)

Car'go [Sp. *cargo, i. e.* "load"], a general name for all the merchandise carried by a merchant-vessel. It is nearly synonymous with freight. The master of every British coasting-vessel is required to keep a cargo-book, in which are recorded the name of the vessel, the name of the owner, the port of departure, the port of destination, the goods which constitute the cargo, etc.

Ca'ria [Gr. Καρία], an ancient province in the extreme S. W. part of Asia Minor, was bounded on the N. by Lydia, on the E. by Phrygia, on the S. by the Mediterranean, and on the W. by the Ægean Sea. The surface is mountainous. It was drained by the river Meander. The chief towns were Miletus, Halicarnassus, and Cnidus, which were founded by the Greeks, and were important places. The natives of Caria were called *Cares*.

Caria'ma, a wading bird of South America, akin to the cranes, is thirty inches high, brown above and whitish beneath. It is easily domesticated, and associates peaceably with other fowls. It is the *Microdactylus cristatus*.

Caribbe'an Sea, a grand inlet of the Atlantic Ocean, is between North and South America, and is separated from the Pacific by the Isthmus of Darien (or Panamá) and by Central America. It separates the West India Islands from South America, and communicates with the Gulf of Mexico by a passage about 120 miles wide, which divides Cuba from Yucatan, and is called the Channel of Yucatan. The water accumulated in the Caribbean Sea by an oceanic current flows continually into the Gulf of Mexico, from which it can only escape by the narrow passage between Florida and the Bahamas, thus forming the great Gulf Stream. The depth of this sea is generally more than 500 fathoms. Its navigation is not obstructed by reefs, rocks, or islands.

Car'ibbee Bark, or **Piton Bark,** is obtained from the *Exostemma Caribbæum*, a small tree of Mexico, Florida, and the West Indies. It belongs to the cinchona tribe, and, although possessing none of the active principles of cinchona, it resembles it so much as to be sometimes substituted for it. The flower differs from that of the cinchona in having its stamens exserted, instead of their being included in the corolla.

Caribou', or **Cariboo** (*Rangifer caribou*), the American reindeer, inhabits Maine, New Brunswick, and other cold regions of North America. The caribou is remarkable for the great development of the brow-antlers or branches, which extend in both sexes forward over the forehead. The color of its hair in summer is a rich reddish-brown. The average weight of this animal is about 250 or 300 pounds. Its flesh is much esteemed as food, and its skin is of value. The "barren ground caribou" (*Rangifer grœnlandicus*) is found farther N.

Caribou, a post-village of Boulder co., Col., in the "Grand Island District," has valuable placer gold-mines and one weekly newspaper.

Caribou, a post-village of Lyndon township, Aroostook co., Me. It has one weekly newspaper.

Ca'ribs, the former Indian inhabitants of the Caribbee Islands. Remnants of the Caribs exist at the present time in the West Indies, Guiana, Honduras, and near Panama.

Ca'ries, a Latin term signifying "rottenness," applied to a disease of the bones analogous to the ulceration of the soft tissues; a term used to designate both open ulcer of bone and chronic ostitis or inflammation of the connective tissue of bone, with solution of the earthy part. It begins as an inflammation, accompanied by periostitis, followed by exudation of new materials and softening. Sometimes the bone-cells are filled with a reddish fluid, and there are masses of tubercle. After caries has existed for some time the abscess bursts; its aperture remains open, discharging a fluid which contains particles of bone. If a probe be passed through this opening, it will be felt to sink into a soft, gritty substance; this is carious bone. Pathologists give different names to the somewhat various forms of the disease. Thus we have "osteoplastic," "tuberculous," and "suppurative" caries, etc. It is molecular death of bone, while necrosis is death of a large mass of bone.

Caries usually selects the vertebræ, the bones of the wrist and foot, and the soft ends of long bones forming joints. Carious vertebræ yield under the weight of the trunk, and the spine curves forward or to one side. In joints the part enlarges, the cartilages become affected, matter forms, and amputation of the limb or excision of the joint is frequently necessary. The causes of caries

Cariama.

are constitutional, such as bad nutrition, syphilis, old age, and other depressing conditions. It may be accidentally determined by any irritation, such as a blow or exposure to atmospheric changes. The treatment consists in supporting the patient by judicious change of air, by the use of tonics, such as cod-liver oil, which in scrofula appears to combat the constitutional predisposition. In

those parts where the diseased bone can be reached it may be carefully removed, so as to leave a healthy surface.

Caries of the teeth is a very common disease. It is believed to be caused by dyspepsia and the use of too hot food and drink, but especially by neglect to clean the teeth after eating. (For its treatment see DENTISTRY, by Dr. C. N. PIERCE.) REVISED BY WILLARD PARKER.

Carillon, a post-village of Argenteuil co., Quebec (Canada), on the Ottawa River, has an academy, and is connected with Grenville by canal and railway. Pop. about 500.

Carima'ta, a group of small islands in the passage between Borneo and Billiton.

Carimo'na, a post-township of Fillmore co., Minn. Pop. 788.

Cari'na, a Latin word signifying the keel of a ship or boat; also a botanical term applied to the sharp thin ridge or keel of any organ, and to the two anterior petals of a papilionaceous flower, which adhere by their lower edges and form a body somewhat like the keel or prow of a boat.

Carina'ria [from the Lat. *carina*, a "keel"], a genus of gasteropodous molluska, characterized by having the heart, liver, generative organs, etc. protruded from the body, and encased in an extremely fragile and beautiful shell, which is sub-transparent, symmetrical, and compressed. The convexity of the shell is terminated by a single keel.

Cari'ni, a town of Sicily, in the province of Palermo, beautifully situated 10 miles W. N. W. of Palermo. It has a Gothic castle. Near it are the ruins of the ancient *Hyccara*. Pop. 12,539.

Carin'thia [Ger. *Kärnthen*], a division of the Austrian empire, is bounded on the N. by Salzburg and Styria, on the E. by Styria, on the S. by Carniola and Italy, and on the W. by the Tyrol. Area, 4006 square miles. It is intersected by the river Drave, the valley of which separates the Noric from the Carinthian Alps. The Noric Alps extend along the N. border of Carinthia, which is mostly mountainous. It was comprised in the ancient *Noricum*. Its inhabitants were anciently called Carni. Chief town, Klagenfurt. Pop. in 1869, 337,058.

Cari'nus (MARCUS AURELIUS), a Roman emperor, was the son of the emperor Carus. On the death of Carus, in 284 A. D., Carinus and Diocletian became competitors for the throne. The former gained an advantage in Mœsia over Diocletian in 285, but was killed by his own soldiers, whom he had offended by his cruelty.

Caris'sa, a genus of plants of the family Apocynaceæ. *Carissa Carendas* is a thorny shrub much used for fences in India, and its fruit is eaten.

Carl, a post-township of Adams co., Ia. Pop. 301.

Carlén' (EMILIE FLYGARE), a popular Swedish novelist, born at Stockholm Aug. 8, 1807. She published in 1838 her first novel, "Waldemar Klein." She was married a second time in 1841 to a lawyer named Carlén. Translated into English, among her works, are "Home in the Valley," "The Lover's Stratagem," "The Professor," and "Woman's Life."

Carleton, a county of New Brunswick (Dominion of Canada), bordering on Maine. Area, about 900 square miles. It is intersected by the river St. John and the New Brunswick and Canada Railway. The soil is fertile. Lumber is produced, and excellent iron ore is mined and smelted. Manganese is also found. Capital, Woodstock. Pop. 19,938.

Carleton, a thriving suburb of St. John, New Brunswick, and within the city limits, but separated from the main city by the St. John River. It is the S. E. terminus of the European and North American Railway, and has seven churches, a large foundry, and several steam sawmills. A steam ferry here crosses the river. Carleton has extensive fisheries.

Carleton, a county in the E. part of Ontario (Canada). Area, 647 square miles. It is bounded on the N. by the Ottawa River, and drained by the Rideau. It is intersected by the St. Lawrence and Ottawa Railway. The county-town is Ottawa, which is also the capital of the Dominion of Canada. Pop. 21,739.

Carleton, a small post-village and township of Bonaventure co., Quebec (Canada), on the Bay of Chaleurs. It is a port of refuge, has fine mountain-scenery, extensive herring-fisheries, a convent of Sisters of Charity, and is a place for holding the circuit courts.

Carleton (Sir GUY), LORD DORCHESTER, a British general, born at Strabane, in Ireland, Sept. 3, 1724. He became governor of Quebec in 1772, which he defended against the American army in Dec., 1775. He invaded New York in 1776, and fought a battle against Arnold on Lake Champlain. In 1777 he was relieved of the command, but he succeeded Sir Henry Clinton as commander-in-chief in North America in 1781. Died Nov. 10, 1808.

Carleton (WILLIAM), an Irish novelist, born in Tyrone county in 1798. His first work was "Traits and Stories of the Irish Peasantry" (1830), which was received with favor. In 1839 he published "Fardorougha the Miser," which was very successful. He described Irish life and manners with much vigor and accuracy in other works, among which are "Rody the Rover" (1846) and "Willie Reilly" (3 vols., 1855). Died Jan. 30, 1869.

Carleton Place, a post-village of Beckwith township, Lanark co., Ontario (Canada), at the junction of the Brockville and Ottawa and the Canada Central Railways, 28 miles from Ottawa, on a navigable stream called the Mississippi River. It has manufactures of woollen cloth and iron castings, and very extensive lumber-mills. It has one weekly paper. Pop. about 1500.

Car'li, or **Car'li Rub'bi** (GIOVANNI RINALDO), COUNT, an Italian political economist, born at Capo d'Istria April 11, 1720. He acquired a high reputation by an important work entitled "Delle Monete e delle Instituzione delle Zecche d'Italia" ("On Italian Coins and the Institution of Mints in Italy," 4 vols., 1754–60). He was appointed president of the council of commerce and public economy at Milan. Among his other works is a treatise "On Italian Antiquities" (1788). Died Feb. 22, 1795.

Car'lin, a township of Calhoun co., Ill. Pop. 534.

Carlin, a post-village of Elko co., Nev., is on the Humboldt River and the Central Pacific R. R., 583 miles N. E. of San Francisco. Pop. of township, 295.

Car'linville, a post-village, capital of Macoupin co., Ill., on the Chicago and Alton R. R., 57 miles N. N. E. of St. Louis and 38 miles S. W. of Springfield. It has one national bank, six churches, and is the seat of Blackburn University, connected with which is a theological seminary. Its court-house cost $1,800,000, and is said to be the finest in the U. S. Coal is mined here. It has one semi-weekly and two weekly newspapers. P. of Carlinville township, 5808.

Carlisle, kar-līl' (anc. *Luguvallio* or *Luguvallum*), an ancient episcopal city of England, the capital of Cumberland county, is situated on an eminence at the confluence of the Eden and Caldew rivers, by which it is nearly surrounded. It is 301 miles by rail N. N. W. of London, 98¾ miles by rail S. of Edinburgh, and 12 miles E. of Solway Frith. Several railways converge to this point, which also has communication by steamboats with Liverpool and Belfast. It has a cathedral founded by William Rufus, dedicated in 1101, greatly damaged by fire in 1292, and restored about 1854. The choir, which is 138 feet long and 72 feet high, is one of the finest in England. Here is a castle founded in 1092. Carlisle sends two members to Parliament. It has manufactures of ginghams and cotton checks, print-works, iron-foundries, etc. It was the residence of the ancient kings of Cumbria, and was destroyed by the Danes in 900. During the wars between the English and Scotch it was an important fortified border-town, and was often besieged. Pop. in 1871, 31,074.

Carlisle, capital of Cumberland co., Pa., is situated in the fertile limestone valley between the Kittatinny and South Mountains, and on the Cumberland Valley R. R., 18 miles W. by S. from Harrisburg and 125 miles W. of Philadelphia. It is well built, and has wide streets and a public square. It contains about twelve churches, one national bank, one other bank, two weekly newspapers, one car-factory, and two machine-shops. Carlisle is the seat of Dickinson College, founded in 1783. This town was shelled by the Confederates July 1, 1863. It contains also Carlisle (U. S. A.) Barracks. Pop. 6650.

Carlisle, a post-village of Haddon township, Sullivan co., Ind. Pop. 499.

Carlisle, a post-village of Warren co., Ia. Pop. 200.

Carlisle, a post-village, capital of Nicholas co., Ky., about 35 miles N. E. of Lexington. It has a normal school and one weekly newspaper. Pop. 606.

Carlisle, a post-township of Middlesex co., Mass. Pop. 569.

Carlisle, a post-township of Schoharie co., N. Y. Pop. 1730.

Carlisle, a township of Lorain co., O. Pop. 1219.

Carlisle, EARLS OF, Viscounts Howard of Morpeth and Barons Dacre of Gillesland (England, 1661).—WILLIAM GEORGE HOWARD, eighth earl, rector of Londesborough, born Feb. 23, 1808, succeeded his brother in 1864.

Carlisle Springs, a post-village of Cumberland co., Pa. It has good hotels and mild sulphurous waters.

Car'lists, a political party of Spain, consisting of the followers of Carlos of Bourbon and his descendants. (See CARLOS OF BOURBON.)

Car'loman, or **Karloman,** a French prince, was a son of Charles Martel, at whose death, in 741 A. D., he became king of Austrasia, Suabia, and Thuringia. He abdicated in favor of his brother, Pepin le Bref, in 747, and became a monk. Died in 755 A. D.

Carloman, a son of Pepin le Bref and a brother of Charlemagne, was born in 751 A. D. On the death of his father in 768 he began to rule over Neustria and Burgundy. He died in 771, and Charlemagne then obtained possession of Carloman's dominions.

Car'los, a township of Douglas co., Minn. Pop. 116.

Carlos, DON, infante of Spain, the son and heir-apparent of Philip II., was born July 8, 1545. He was a youth of violent temper and sickly constitution, and appears to have been deficient in intellect. He attacked or menaced the duke of Alva with a poniard in 1567. The king regarded him with suspicion, and ordered him to be tried by the Inquisition, which pronounced him guilty. He died in 1568, but the cause and manner of his death are involved in mystery. He is the subject of Schiller's tragedy of "Don Carlos." (See PRESCOTT, "History of Philip II.")

Carlos of Bourbon, DON, count de Molina, born Mar. 29, 1788, was the second son of King Charles IV. of Spain. He was the heir-presumptive to the throne until the birth of Isabella in 1830. On the death of his brother, Ferdinand VII., in 1833, Don Carlos claimed the throne, and was supported by a party called Carlists, between whom and the partisans of Isabella a civil war ensued. The priests and absolutists mostly preferred Don Carlos, but his claim was rejected by the Cortes in 1836. The Carlist army was defeated in 1839, and Don Carlos fled to France. He abdicated in favor of his son, Don Carlos, count de Montemolin, in 1845. Died Mar. 10, 1855.

CARLOS, DON, count de Montemolin, a son of the preceding, was born Jan. 31, 1818. After the death of his father he was a pretender to the throne of Spain, and was recognized as Charles VI. by the Carlists, who revolted in 1860 without success. Died in 1861.

CARLOS, DON, duke of Madrid, a nephew of the preceding, son of Don Juan of Bourbon and grandson of Don Carlos, count of Molina, was born in 1848. His father, Don Juan, abdicated in his favor on Oct. 3, 1868, and from that time he was recognized by the Carlists as Charles VII. He made in 1870, and again in 1872, unsuccessful efforts to overthrow the government of King Amadeus, and in 1873 waged war against the republican government. His eldest son, Jayme, prince of Asturias, was born June 27, 1870.

Carlovin'gian [Fr. *Carlovingien*], the name of the second dynasty of French or Frankish kings. The origin of the family is traced to Arnulph, bishop of Metz, who died in 631. The dynasty derived its name from Charles Martel or his grandson Charlemagne. Charles Martel became in 714 A. D. mayor of the palace and king in reality, but he permitted Childeric to retain the name and form of royalty. The Merovingian dynasty ended in Childeric, a *roi fainéant*, who after a merely nominal reign was deposed in 752 by Pepin le Bref, a son of Charles Martel. Pepin usurped the throne, and was the first Carlovingian who took the title of king. He was succeeded by his son Charlemagne, who began to reign in 771, extended his dominions by conquest, was the most powerful European monarch of his time, and the founder of the Germanic empire. He was crowned as emperor of the West by Pope Leo III. in 800 A. D., and died in 814. Under his descendants the empire continually declined in power. His son and successor, Louis le Débonnaire, divided his dominion among his three sons, Lothaire, Pepin, and Louis. Louis le Débonnaire, who died in 840, had another son, Charles the Bald, who became king of France. He died in 877, and was followed by a succession of feeble princes. The last of the Carlovingian dynasty was Louis V., who died in 987. Hugh Capet then assumed the royal power. This house included a number of German and Italian monarchs.

Car'low, a county of Ireland, in Leinster, is bounded on the N. by Kildare and Wicklow, on the E. by Wicklow, on the S. E. by Wexford, on the W. by Queens county and Kilkenny. Area, 353 square miles. The surface is mostly level or undulating; the soil is fertile. The rocks found near the surface are granite and limestone. It contains many dairies, and exports grain, flour, and butter. Coal is mined near the western border of this county. Chief town, Carlow. Pop. in 1871, 51,472.

Carlow, a town of Ireland, capital of the above county, is on the navigable river Barrow, at the mouth of the Burren, 57 miles by rail S. S. W. of Dublin. It is well built, has two bridges, a Roman Catholic cathedral, a college for students of divinity, a lunatic asylum, and a handsome court-house; also extensive flour-mills. Here are the picturesque ruins of a large Anglo-Norman castle founded in 1180. This castle was taken and dismantled by the army of Gen. Ireton in 1650. Pop. in 1871, 7773.

Car'lowitz, a town of Austria, on the right bank of the Danube, 8 miles S. E. of Peterwardein. It contains a Greek cathedral, and is the seat of the Greek archbishop of the Serbian nationality. It is noted for its excellent wine, the product of which sometimes amounts to 1,750,000 gallons in a year. An important treaty was concluded here in 1699, between Turkey on one side and Austria, Russia, and Venice on the other. Pop. in 1869, 4419.

Car'lowville, a post-township of Dallas co., Ala. Pop. 800.

Carls'bad, or **Karlsbad** (*i. e.* "Charles's Bath"), a town in Bohemia famous for its hot springs, is on the right bank of the river Eger, about 76 miles W. N. W. of Prague. It belongs to the emperor of Austria, and is said to be the most aristocratic watering-place in Europe. It is in a narrow valley between steep granite mountains, and is surrounded by very beautiful scenery. It contains a theatre, several reading-rooms, and good hotels. The temperature of the waters varies from 117° to 165° F. They contain sulphate of soda and other salts, and about 2,000,000 gallons are discharged daily. The number of annual visitors here is from 12,000 to 15,000. Carlsbad was a favorite resort of Goethe. A congress of German powers was held here in 1819. Pop. in 1869, 7291.

Carls'burg, or **Karlsburg,** a fortified town of Austria, in Transylvania, on the right bank of the Maros, 46 miles S. S. E. of Klausenburg. Saltpetre is manufactured here. It is the seat of a Roman Catholic bishop, and has a gymnasium, a theological seminary, a normal school, and several convents. Pop. in 1869, 7955.

Carlscro'na, or **Karlskro'na** (*i. e.* "Charles's Crown"), sometimes called in English **Carlscroon',** a seaport in the S. of Sweden, is situated on several small islands, which are connected by bridges with each other and with the mainland, 258 miles S. S. W. of Stockholm; lat. 56° 10′ N., lon. 15° 36′ E. It has an excellent and safe harbor, with sufficient depth of water to float the largest ships, and is the principal station of the Swedish navy. The entrance to the harbor is defended by two strong forts. Here are dry-docks blasted out of the granite rock, and a naval arsenal. It has manufactures of linen cloths, naval equipments, etc. Pop. 17,564.

Carls'hamn, a seaport of Sweden, on the Baltic, 27 miles W. of Carlscrona. It has a small but secure harbor, and an active trade in iron, timber, etc.; also manufactures of sailcloth, hats, soap, and tobacco. Pop. in 1868, 5578.

Carls'ruhe, or **Karlsruhe** (*i. e.* "Charles's Rest"), a city of Germany, capital of the grand duchy of Baden, 46 miles by rail S. of Mannheim. It is connected by railways with all parts of Germany. The streets are arranged like the radii of a semicircle, converging towards a central point, which is occupied by the palace of the grand duke. Connected with this palace is a museum and a library of 80,000 volumes. The town also contains a large public library, a botanic garden, a mint, a theatre, an arsenal, and several hospitals. Here are manufactures of carpets, jewelry, chemical products, carriages, etc. Carlsruhe was founded in 1715 by Charles William, margrave of Baden. Pop. in 1871, 36,622.

Carl'stad, a town of Sweden, on the island of Tingvalla, in Lake Wener, about 141 miles W. of Stockholm. It is connected with the mainland by a large and handsome bridge. It has a cathedral, a college with an observatory, and a cabinet of natural history. Copper, iron, timber, and grain are exported from this town through Lake Wener and the Gotha Canal. Pop. 5433.

Carl'stadt, a fortified town of Croatia, in the county of Agram, 33 miles S. W. of Agram, has a large garrison and an active transit trade. Pop. in 1870, 5175.

Carlstadt, a post-village of Bergen co., N. J. It has two weekly newspapers.

Carl'ton, a county of Minnesota, bordering on Wisconsin. Area, 860 square miles. It is drained by the St. Louis and Nemadji Rivers. The surface is moderately diversified, and partly covered with forests of pine and other trees. It is intersected by the Northern Pacific R. R. Capital, Thomson. Pop. 286.

Carlton, a township of Tama co., Ia. Pop. 812.

Carlton, a township of Barry co., Mich. Pop. 1125.

Carlton, a township of Freeborn co., Minn. Pop. 378.

Carlton, a post-village and township of Orleans co.,

N. Y., 33 miles N. W. of Rochester and 1 mile from Lake Ontario. Pop. 2327.

Carlton, a post-township of Kewaunee co., Wis. P. 1185.

Carlton (Thomas), D.D., a clergyman of the Methodist Episcopal Church, was born at Derry, N. H., in 1809. He began his ministry in the Genesee (now Western New York) Conference in 1829, and occupied important pulpits in Rochester, Buffalo, and other places during some years. His superior administrative and financial abilities led to his appointment as agent, for three years, of the Genesee Wesleyan Seminary, as presiding elder of important districts for seven years, was twenty years principal agent or publisher of the "Methodist Book Concern" in New York, and treasurer of the Methodist Missionary Society. Died April 16, 1874.

Carludovi'ca Palma'ta, a tree or shrub of the order Pandanaceæ, grows in the tropical parts of South America. It produces the leaves of which Panama hats are made. Those of the best quality are plaited from a single leaf without any joints. As this process requires several months, the price of such a hat is very high.

Carlyle, kar-lil', a post-village, capital of Clinton co., Ill., on the Kaskaskia River and the Ohio and Mississippi R. R., 47 miles E. of St. Louis, has fine churches and school-houses, two newspapers, and considerable iron manufactures. The public library contains 5000 volumes. It has a new female seminary. Pop. 1364.

Hardin Case, Ed. Carlyle "Constitution and Banner."

Carlyle, a post-village of Allen co., Kan., on the Leavenworth Lawrence and Galveston R. R., 73 miles S. of Lawrence.

Carlyle (Thomas), the famous English historian and philosopher, was born in 1795 at Ecclefechan in Scotland. He was educated in the University of Edinburgh, which he entered at the age of fourteen, and very early he embraced literature as a profession. In 1824 he wrote a "Life of Schiller." Soon after he translated Goethe's romance "Wilhelm Meister;" and these books, as well as his biographical essays on Fichte and Jean Paul, contributed very much to call the attention of the English public to the German literature, of whose ideas he himself is the English representative. In 1834 he moved from Craigenputtock, near Dumfries, where he had led a very secluded and almost solitary life, to London, and his literary activity soon widened and became more varied. In 1837 he wrote the "History of the French Revolution" (3 vols.). In 1840 he delivered his celebrated course of lectures on "Heroes and Hero-Worship." In 1845 he published "Oliver Cromwell's Letters and Speeches, with Elucidations and a Connecting Narrative" (5 vols.). In 1851 he wrote "The Life of John Sterling," and from 1858 to 1864 published the "Life of Frederick the Great" (6 vols.), besides producing a great number of essays, reviews, and pamphlets of a miscellaneous character. Carlyle's stand-point as a historian and philosopher is not one of conviction, but of temperament. He can only write when in the attitude of an opponent. What all the world hates he will defend, admire, and love. What all people strive after he will mock and scorn and deride. But he can keep the attitude through six volumes without vacillating, and he is as eloquent and brilliant when he defends as he is grotesque and sardonic when he attacks. Taken as a whole, his writings are one maze of glaring confusion. In 1837 he represented history as an evolution of natural forces according to necessary laws, against which all efforts of individual passion or shrewdness are ridiculous. In 1840 he represented history as the work of the great men, of the heroes, in whose track the mass of the people have to follow like sheep. In all his writings he tells us that human greatness is truth, and truth alone. A man is great in proportion to the amount of truth there is in him. But his heroes happen to be among the greatest liars history knows of—as, for instance, Frederick the Great and Mirabeau. With Carlyle his ideas contradict his ideals. His ideas are those of the German philosophy as it culminated with Hegel—lofty, but without power of progress, radiant like the stars, but like them indifferent to what they shine upon. His ideals are those of the English middle class: what has power must be revered; what is successful, must be admired. To bring these ideas into harmony with these ideals is impossible, and the undercurrent of sadness and sourness which flows through all Carlyle's writings, and which now and then bursts forth to the surface with weird chants, is the natural result of such an attempt. But the almost violent mental vigor which is Carlyle's nature, and the perfect veracity which is his character, have produced a combination of these inconsistent elements which, in the details, is always stirring and exciting, even when it makes us sick at heart, and which in our days of harmony of mediocrity is exceedingly refreshing. Carlyle is never mediocre. Even when he plays the part of a clown, he is unsurpassed. Indeed, there is only one thing in history which he cannot master—the fact. He likes to mock the German historians, and addresses them generally as Mr. Dryasdust; but whenever he himself tries to state a fact and keep it intact, he at once becomes a Mr. Drierthandust. Clemens Petersen.

Carmagnole, the name of a political song which was sung by the popular party of Jacobins in the French Revolution. The term was also applied to a popular dance of that period, and to a jacket which was worn by the revolutionists as a symbol of patriotism.

Carmar'then, or **Caermarthen** (anc. *Maridunum*), [Welsh, *Caer Fyrddyn*], a seaport-town of South Wales, the capital of Carmarthenshire, is on the river Towy, 8 miles from its entrance into the Bristol Channel. It has a picturesque situation, but the streets are steep and narrow. The Towy, which is here crossed by a bridge, is navigable for vessels of 200 tons from its mouth to this point. Tin plates, cast iron, timber, slates, lead ore, marble, and grain are exported from it. The famous prophet Merlin is said to have been born here. Pop. in 1871, 10,499.

Carmar'thenshire, or **Caermarthenshire,** a county of South Wales, is bounded on the N. by Cardigan, on the E. by Brecon, on the S. E. by Glamorgan, on the S. by the Bristol Channel (here called Carmarthen Bay), and on the W. by Pembroke. Area, 974 square miles. The surface in the northern and eastern parts is mountainous; the soil of the valley is fertile. It is bounded on the N. by the river Teify, and intersected by the Towy, which flows through the celebrated Vale of Towy, 30 miles long. Among its mineral resources are copper, coal, iron, lead, slate, and marble. Capital, Carmarthen. Pop. in 1871, 116,944.

Car'mel, a post-village of Penobscot co., Me., on the Maine Central R. R., 15 miles W. of Bangor. Pop. of Carmel township, 1348.

Carmel, a township of Eaton co., Mich. Pop. 2504.

Carmel, a post-village, capital of Putnam co., N. Y., is in Carmel township, about 50 miles N. by E. from New York City and 15 miles E. of the Hudson River, on the New York Boston and Montreal R. R. It has one national bank, three churches, two newspapers, and a young ladies' seminary. Pop. 590; of township, 2796.

J. D. Little, Ed. "Putnam County Courier."

Car'melites, or the **Order of St. Mary of Mount Carmel,** a celebrated monastic order of the Roman Catholic Church. It was probably founded on Mount Carmel in the twelfth century, but the Carmelites claim to have been instituted by the prophet Elijah. They were compelled by the Saracens to wear a striped dress, whence they were formerly called in England Barred Friars. They were at first under the rule of Saint Basil, but afterwards a part of them came under the mitigated rule of Innocent IV.; hence these were called Mitigated Carmelites. In the tenth century a part of the Carmelites sought and obtained a severer rule. These are called Barefooted Carmelites (*Discalceati*). They are entirely independent of the former. Their manner of life is very austere. The Carmelite monks and nuns (who were first admitted to the order in 1452) are found, both Mitigated and Discalceate, in almost every country, though in numbers they are much reduced. The best known member of the order in modern times is the French pulpit orator, Father Hyacinthe.

Car'mel, Mount, a mountain-ridge of Palestine, extends from the plain of Esdraelon to the Mediterranean, and terminates in a steep promontory in that sea, about 9 miles S. W. of Acre; lat. 32° 51′ 10″ N., lon. 34° 57′ 42″ E. It is formed of limestone, and has an altitude of nearly 1400 feet above the sea. Oaks, pines, olives, and laurels grow on its summit and sides. Carmel is mentioned in Scripture as the place where the prophet Elijah slew the priests of Baal. The meaning of the word in Hebrew is a *park* or *garden*. Near the top of this mountain is a monastery, the inmates of which are called Carmelites (which see). The Order of Mount Carmel was a body of one hundred knights, all of noble descent, instituted by Henry IV. of France.

Carmen'ta, a prophetic divinity of ancient Italy, was one of the Camenæ, and was worshipped by the Roman matrons at a festival called Carmentalia.

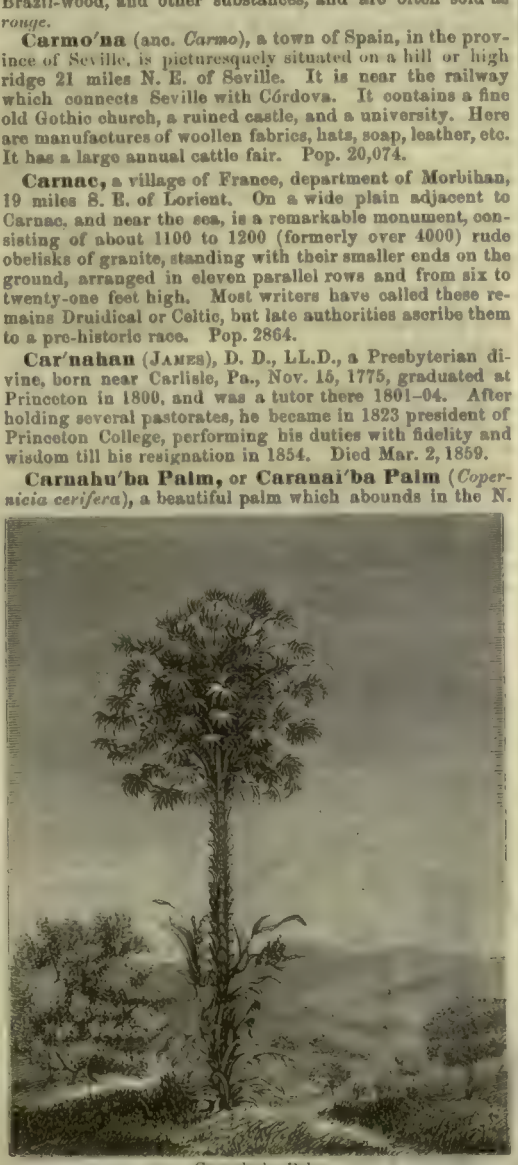
Car'mi, a city, capital of White co., Ill., at the junction of the St. Louis and South-eastern and the Cairo and Vincennes R. Rs., is at the head of navigation on the Little Wabash River, 150 miles S. E. of Springfield. It has iron and woollen manufactures and several flour-mills. It has two weekly newspapers. Pop. 1369; of township, 3669.

W. F. Palmer, Ed. "Carmi Courier."

Car'michael, a township of Marion co., S. C. P. 910.

Car'michael's, a post-borough of Greene co., Pa. P. 491.

Carmin'atives [from Lat. *carmen*, a "charm"], medicines to relieve flatulence and pain in the bowels, such as cardamoms, peppermint, ginger, and other stimulating aromatics.



Car'mine [Fr. *carmin*, from the Arabic KERMES (which see)], a beautiful red pigment composed chiefly of cochineal, mixed with alumina and a little oxide of tin. It is employed by artists and silk-dyers, and is an ingredient in the best red inks. It is considered the most beautiful of all red pigments, and has been in use since the middle of the seventeenth century. Under the name of *rouge* it is used by ladies to paint their cheeks. One of the processes by which it is prepared is as follows: Digest one pound of cochineal in three gallons of water for fifteen minutes; add one ounce of cream of tartar, heat gently for ten minutes, add half an ounce of alum, and boil it for several minutes. After the impurities have settled, the clear liquid is placed in clean glass pans or shallow glazed dishes, in which it is allowed to stand while the carmine is slowly deposited. Imitations of carmine are made of red sandal-wood, Brazil-wood, and other substances, and are often sold as *rouge*.

Carmo'na (anc. *Carmo*), a town of Spain, in the province of Seville, is picturesquely situated on a hill or high ridge 21 miles N. E. of Seville. It is near the railway which connects Seville with Córdova. It contains a fine old Gothic church, a ruined castle, and a university. Here are manufactures of woollen fabrics, hats, soap, leather, etc. It has a large annual cattle fair. Pop. 20,074.

Carnac, a village of France, department of Morbihan, 19 miles S. E. of Lorient. On a wide plain adjacent to Carnac, and near the sea, is a remarkable monument, consisting of about 1100 to 1200 (formerly over 4000) rude obelisks of granite, standing with their smaller ends on the ground, arranged in eleven parallel rows and from six to twenty-one feet high. Most writers have called these remains Druidical or Celtic, but late authorities ascribe them to a pre-historic race. Pop. 2864.

Car'nahan (JAMES), D. D., LL.D., a Presbyterian divine, born near Carlisle, Pa., Nov. 15, 1775, graduated at Princeton in 1800, and was a tutor there 1801–04. After holding several pastorates, he became in 1823 president of Princeton College, performing his duties with fidelity and wisdom till his resignation in 1854. Died Mar. 2, 1859.

Carnahu'ba Palm, or **Caranai'ba Palm** (*Copernicia cerifera*), a beautiful palm which abounds in the N.

Carnahuba Palm.

part of Brazil. It seldom attains a height of more than forty feet. The fruit is edible, and the timber is valuable for several purposes. The leaves of this tree are covered beneath with wax, which is collected, and, like the wax of certain other species of palm, is an article of commerce. Its timber is exported to England, where it is used for veneering.

Car'nallite, a hydrated chloride of potassium and magnesium, which occurs in coarse granular masses, mixed with rock-salt, near Magdeburg, in Prussia. It is used as a fertilizer of the soil.

Carnar'von, or **Caernarvon** (anc. *Segontium*), a seaport-town of North Wales, capital of Carnarvonshire, is on the E. side and near the S. W. end of the Menai Strait, which separates it from the island of Anglesey. It is 7 miles S. W. of the Menai Bridge, and about 60 miles W. S. W. of Liverpool. The harbor will admit vessels of 400 tons, and steamboats ply between this port and Liverpool. Carnarvon is a much-frequented watering-place, and has beautiful scenery in the vicinity. Here is a castle founded by Edward I. in 1282, which now forms one of the most imposing ruins in the kingdom. It has thirteen embattled towers surmounted by turrets. Carnarvon is about half a mile from the site of *Segontium*, an ancient Roman town or station. Pop. in 1871, 9370.

Carnarvon (HENRY HOWARD MOLYNEUX HERBERT), EARL OF, an English conservative statesman, born in London June 24, 1831. He was appointed secretary of state for the colonies in June, 1866, and he framed a plan for the confederation of the British North American colonies, which was approved by Parliament. He resigned in Mar., 1867, because he was opposed to the Reform bill which Disraeli introduced.

Carnar'vonshire, or **Carnarvon,** a county of North Wales, bordering on the Irish Sea, has an area of 544 square miles. It is bounded on the N. W. by Menai Strait and Carnarvon Bay, on the N. by the Irish Sea, on the E. by Denbigh, and on the S. by Merioneth and Cardigan Bay. The surface is very mountainous, and the scenery is remarkably grand. Here is Snowdon, which is the highest mountain in Wales, and rises 3571 feet above the level of the sea. Among the minerals of this county are copper, lead, zinc, coal, and roofing-slate. The chief branch of rural industry is the rearing of black cattle for the dairy. Carnarvonshire is traversed by the Chester and Holyhead Railway, which crosses the Menai Strait. Capital, Carnarvon. Pop. in 1871, 106,122.

Carnat'ic, The, a former division or region of India, on the coast of Coromandel, was bounded on the E. by the Indian Ocean or Bay of Bengal, and extended from Cape Comorin to about 16° N. lat. Its other dimensions were not well defined. It contains numerous large temples, and other monuments which attest its former splendor.

Carna'tion [Lat. *carnatio*, from *caro*, gen. *carnis*, "flesh"], "flesh-color." This term is used in painting, and is applied to the flesh-tints or natural color of flesh, also to the parts of a picture which represent the nude human figure. The art of producing a good carnation appears to be difficult, and not well understood by most modern painters.

Carnation, a beautiful and fragrant double-flowering variety of the *Dianthus Caryophyllus*, or clove pink. It is a universal favorite of florists, and exists only in a state of cultivation. Scarlet, purple, and pink are the prevailing colors of the flowers, which are often three inches in diameter. Florists prefer those in which the colors are perfectly distinct. The numerous varieties which have been produced by the florist's art are arranged in three classes—*flakes*, *bizarres*, and *picotées*. The flakes have only two colors, disposed in broad stripes; the bizarres have three colors, in irregular spots and stripes, and the picotées have an edging of scarlet, red, or purple on a white or yellow ground. Carnations prefer a rich soil, and should have free access to the fresh air. They are propagated either by layers or *pipings*—*i. e.* short cuttings.

Carne'ades [Gr. Καρνεάδης], a Greek philosopher and orator, born at Cyrene, in Africa, in 213 B. C. He opposed the doctrines of the Stoics, was the founder of a school called the New Academy, and maintained that man has no criterion of truth. He was distinguished for his subtle dialectic and powerful and specious eloquence. In 155 B. C. he was sent as ambassador from Athens to Rome, where he gained much applause by his orations. One day he eulogized justice, and the next day refuted himself by a sophistical argument tending to confound the distinction between justice and injustice. This offended Cato, who caused him to be expelled from Rome. Died at Athens about 129 B. C.

Carne'lian, or **Corne'lian** [Fr. *cornaline*], a name given to a fine variety of chalcedony which is composed chiefly of quartz. The color is red or flesh-color, and rarely milky white. It has a conchoidal fracture. Fine specimens of it are found in Hindostan, where they are highly prized, and are manufactured into various ornamental articles. Carnelians are also found in Europe and the U. S. The bright, clear red are most valued.

Carnesville, a post-village, capital of Franklin co., Ga., about 90 miles N. E. of Atlanta. Pop. 266.

Car'nifex Ferry, over the Gauley River, Nicholas co., Va., about 8 miles below Summerville, gives its name to the severe action on the N. bank of the river near this ferry, Sept. 10, 1861. The Confederates under Gen. Floyd, numbering about 5000, had strongly intrenched themselves in this position, where they were attacked by the forces under Gen. Rosecrans on the afternoon of the 10th Sept. Darkness terminated the battle of the day, and during the night Gen. Floyd, being largely outnumbered, escaped with his command across the Gauley River, destroying his bridge behind him, which prevented pursuit. All the camp equipage and munitions of war fell into the hands of the Federal forces.

Carnio'la [Ger. *Krain*], a division or crown-land of the Austrian empire, is bounded on the N. by Carinthia, on the N. E. by Styria, on the S. E. and S. by Croatia, and on the S. W. by the Adriatic Sea and the Littoral province. It was formerly a part of the kingdom of Illyria. Area, 3857 square miles. The surface is mountainous, and partly occupied by the Carinthian Alps. Among its remarkable physical features is Lake Zirknitz, and the rock-bridge of St. Kanzian, which is 130 feet high. The chief river is the Save. Carniola contains the quicksilver-mine of Idria, which is one of the richest in the world. Iron, coal, and marble also occur here. Among the products are flax, silk, honey, and wine. The chief town is Laybach. Pop. in 1870, 466,334.

Car'nival [from the Lat. *caro*, gen. *carnis*, "flesh," and *vale*, "farewell"], a festival in the Roman Catholic countries of Europe just preceding Lent. It was formerly most brilliantly celebrated at Venice; later, especially in Rome. Like many other usages in modern Europe, the customs connected with the Carnival probably originated in the heathen spring-time festivals, as the Lupercalia and Bacchanalia of the Romans, and the Yule-feasts of the Germans. During the Middle Ages costly banquets with the rich, and drinking-bouts amongst others, marked the time. Recently, the Carnival at Rome has lasted eight days, during which the whole city is given up to revelry, the centre of which is the street called the *Corso*. In this all the houses are hung with crimson drapery, and each afternoon a constant line of carriages and promenaders is passing through it. Most of those who appear in the street are masked, and an incessant interchange of bouquets, *confetti*, and other harmless missiles makes a scene of extreme liveliness. At six o'clock, after the firing of cannon and the clearing of the Corso by troopers, a number of horses are let loose at one end of the street, and are urged by the shouts of the people to full speed. The last event of the Carnival week is the celebration of the *Moccoletti*. For this, after dark, all the revellers, on foot, in carriages, and at the windows of the Corso, provide themselves with a number of small lighted tapers, which each endeavors to preserve, while he puts out as many as possible of those of his neighbors. The political disturbances of Italy threw, for a time at least, somewhat of a cloud over these festivities from 1859 to 1870.

Carniv'ora [Fr. *carnivores*, from Lat. *caro*, gen. *carnis*, "flesh," and *voro*, to "devour"], devouring flesh, feeding on flesh; applied to animals which prefer flesh and eat little or no vegetable food. They belong to the class Mammalia, and are synonymous with the old order Feræ. It is characteristic of them to have sharp cutting teeth, simple stomachs, very muscular bodies, and active habits. This order includes, among other animals, all those quadrupeds which are properly called beasts of prey, excepting a few of the marsupials of Australasia, which are carnivorous in their habits, and resemble in their external characters certain animals of this order, which they may be said to represent in the native fauna of that region. Interesting fossil remains of Carnivora are referred to the eras just preceding and just following the glacial period. The order is divided into several families, as Felidæ, Mustelidæ, Ursidæ, Canidæ, Phocidæ, etc. (which see).

Carnot (Lazare Hippolyte), a French radical republican, son of the following, born at Saint-Omer April 6, 1801. He was a member of the Chamber of Deputies from 1840 to 1848, and was minister of public instruction from February to July of that year. From 1864 to 1868 he was again a member of the legislative assembly. In 1871 he was again elected to the Assembly, where he voted with the extreme left. He wrote an able work on Saint-Simonism, and published the memoirs of his father (2 vols., 1860–64).

Carnot (Lazare Nicolas Marguerite), Count, a celebrated French statesman and geometer, born at Nolay, in Burgundy, on the 13th of May, 1753. He was educated at the military school of Mézières, and published in 1783 an "Essay on Machines," in which he gave a new and important theorem on the loss of force. As an earnest friend of the popular cause he was elected to the National Convention in 1792. He voted for the execution of Louis XVI., and was chosen a member of the Committee of Public Safety in Aug., 1793; but he took no part in the contest between the Girondists and Jacobins, nor in the cruel excesses of the Reign of Terror. He rendered important services to the republic as war minister by the formation of plans of the campaigns, the selection of generals, and the organization of the army. In this arduous labor he displayed administrative abilities of the highest order. In 1795 he was elected a member of the Institute, and also one of the five members of the Directory. He was proscribed by Barras and the majority of the Directors, and condemned in 1797 to deportation, but escaped to Germany. He was Bonaparte's minister of war in 1800, but he soon resigned, being too independent and too earnestly republican to serve under that chief. After the emperor had suffered reverses, he returned to his aid, and defended Antwerp heroically in 1814. During the Hundred Days (1815) he was Napoleon's minister of the interior. He went into exile on the restoration of 1815, and died at Magdeburg Aug. 3, 1823. He published, besides other able works, "Geometry of Position" (1803), which contains several new theorems. (See D. F. Arago, "Biographie de Carnot," 1850; P. F. Tissot, "Mémoires historiques sur Carnot," 1824.) As a military engineer he is referred to by all subsequent writers upon the art of fortification. His own "system," and his great work, "Sur la défense des places fortes" (the latter written to stimulate a more protracted defence of fortresses during the decline of Napoleon's power), though open to criticism, have exerted no small influence upon the progress of the art.

Revised by J. G. Barnard, *U. S. Army.*

Carn'wath, Earls of (1639), Barons Dalzell (Scotland, 1628), and baronets (1666).—Henry Arthur Hew Dalzell, twelfth earl, born in 1858, succeeded his father in 1867.

Car'ny, a township of Montgomery co., Kan. Pop. 361.

Ca'ro, a post-village, capital of Tuscola co., Mich., on Cass River, about 80 miles N. E. of Lansing. It has two weekly newspapers.

Caro (Annibale), born in 1507 at Citta Nuova, near Ancona, in the Papal States; was for several years a tutor in the family of Lodovico Gaddi; entered after the latter's death (in 1543) the service of Lodovico Farnese, a natural son of Pope Paul III., and since 1545 duke of Parma and Piacenza, and accompanied in 1548 Cardinal Alessandro Farnese to Rome, where he died in 1566. His works were not published until after his death, but occupy a foremost place in the Italian literature of the sixteenth century; they comprise a translation of the "Æneid," "Rime" (1569), "Lettere familiari" (2 vols., 1572–75), etc. A collected edition appeared in 1757 in 6 vols.

Car'ob, or **Algaro'ba** [Arabic, *kharoob*], (*Ceratonia*

Carob.

Siliqua), a tree of the natural order Leguminosæ, is a native of the countries around the Mediterranean. It has

pinnate, evergreen leaves, with two or three pairs of large oval leaflets. The fruit is a brown pod, four to eight inches long, having a fleshy or mealy pulp of an agreeable taste, which is extensively used as food by the Arabs, Moors, and Italians. This fruit or pod is supposed to be the same as the article translated "husks" in the parable of the Prodigal Son; and it is thought by some that the locusts eaten by John the Baptist were these pods. They are imported into England and the U. S. under the name of locust beans; also called "St. John's bread." The wood of the carob is hard and valuable.

Caro'ga, a township of Fulton co., N. Y., contains numerous lakes and forests, and has manufactures of lumber and leather. Pop. 828.

Caroli'na Mari'a, queen of Naples, born Aug. 13, 1752, was a daughter of Francis I. and Maria Theresa of Austria. She was married in 1768 to Ferdinand, king of the Two Sicilies, over whom she obtained great influence. She persuaded him to join the coalition against Bonaparte, who expelled King Ferdinand from his kingdom in 1806. She died in Vienna Sept. 8, 1814.

Carolina, North. See North Carolina.

Carolina, South. See South Carolina.

Car'oline, a county of Maryland, bordering on Delaware. Area, 330 square miles. It is intersected by the Choptank River, and partly bounded on the W. by the Tuckahoe. The surface is level; the soil is mostly sandy. Wheat, corn, and fruit are the chief crops. It is intersected by the Maryland and Delaware R. R. Capital, Denton. Pop. 12,101.

Caroline, a county in the E. of Virginia. Area, 480 square miles. It is bounded on the N. by the Rappahannock, and on the S. W. by the North Anna River, and is intersected by the Mattapony. The surface is undulating. Corn, tobacco, and wheat are raised. The county is traversed by the Richmond and Fredericksburg R. R. Capital, Bowling Green. Pop. 15,128.

Caroline, a township of Pulaski co., Ark. Pop. 2802.

Caroline, a post-township of Tompkins co., N. Y., has several villages, ten churches, and is on the Delaware Lackawanna and Western R. R. It has beds of iron ore. P. 2175.

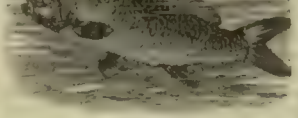
Car'oline Ame'lia Eliz'abeth, queen of England, born May 17, 1768, was a daughter of the duke of Brunswick and a niece of George III. of England. She was married in 1795 to the prince of Wales, afterwards George IV., who regarded her with aversion, and separated from her soon after the birth of their daughter, the princess Charlotte. On the accession of George IV. in 1820, she was prosecuted on a charge of adultery, was defended by Mr. Brougham, and was not convicted. Died Aug. 7, 1821.

Car'oline Islands, or **New Phil'ippines,** an archipelago of Oceanica, is situated between the Philippines, the Ladrones, the Marshall Islands, and New Guinea, and extends from lat. 3° 5′ to 12° N. Area, 872 square miles. They number about 500 islands. The greater portion of the inhabitants are of the Malay race. They are ruled by numerous petty chiefs, and are noted for their commercial enterprise. The islands were discovered in 1543, and named after Charles V. The Spaniards have always claimed them as forming part of the Philippines. On July 9, 1868, this archipelago was taken possession of by England. Pop. estimated by Dr. Gulick in 1872 at 25,000–30,000.

Caron'delet, a former village of Missouri, on the Mississippi River, about 5 miles S. of St. Louis. In 1860 it was annexed to St. Louis. (See South St. Louis.)

Carondelet, a township of St. Louis co., Mo. Pop. 5387.

Carot'id [perhaps from the Gr. *κρά*, the "head," and *οὖς*, gen. *ὠτός*, the "ear," because it passes to the head under the ear] **Ar'tery,** the great anterior artery which on each side distributes blood to the head. In man, each primitive or common carotid at the upper margin of the larynx or organ of voice separates into two of nearly equal size—the external and the internal carotid. The external carotid supplies the larynx, tongue, face, and scalp; its principal branches are the superior thyroid, the lingual, the facial, the occipital, the posterior aural, the internal maxillary, and the temporal. The internal carotid enters the cavity of the skull through a tortuous canal in the temporal bone, and separates into the anterior and middle cerebral arteries, which are the principal arteries of the brain; in its course through the dura mater it gives off the ophthalmic artery, which subdivides into small branches which afford the eye its principal supply of blood.



Wounds of the carotids are generally from stabs or cuts. Those attempting suicide often try to cut them, but rarely cut sufficiently deep by the side of the windpipe. But should either vessel be wounded, death results almost immediately. Punctured wounds may not be immediately fatal; they may heal, or a false aneurism may result.

Sir Astley Cooper was the first to tie the common carotid for aneurism, in Nov., 1805; Abernethy had tied it for a wound in 1798, and others probably had tied it before him, and the operation has been successfully performed in a number of cases. Owing to the interchange of branches between the two sides, cutting off the blood through one carotid is seldom followed by affections of the brain. Dr. Mussey tied both carotids within twelve days of each other without any such result. Revised by Willard Parker.

Carouge, a town of Switzerland, in the canton of Geneva, on the river Arve, 1½ miles S. of Geneva, is beautifully situated, and surrounded by elegant villas and orchards. It has manufactures of watches, leather, pottery, and thread. Pop. in 1870, 5873.

Carouse, a township of Ouachita co., Ark. Pop. 528.

Carp (*Cyprinus carpio*), a fresh-water fish of the family Cyprinidæ, is a native of Europe and Asia, and has been long naturalized in countries in which it is not indigenous. It is found in lakes and rivers, prefers still waters, and feeds on aquatic plants, worms, insects, etc. Its length in some cases is two feet or more, but it is generally less than a foot long. It is very tenacious of life, and is said to attain the age of 200 years. The flesh of the carp is highly esteemed as food, but it is not a very valuable fish to the angler, because it does not bite freely. It is remarkable for its fecundity, and 700,000 eggs have been found in a carp of moderate size. The gold-fish is a species of carp.

Carp.

Carpa'thian (or **Karpathian**) **Mountains** [Ger. *Karpathen;* anc. *Carpates*], a long curvilinear range of mountains, chiefly in the Austrian empire. It separates Hungary from Galicia, and Transylvania from Moldavia and Wallachia, and is nearly in the form of a semicircle, one end of which meets the Danube at Presburg, and the other touches the same river at New Orsova. This chain, which is about 800 miles long, is divisible into two portions, called the Eastern and the Western Carpathians, the latter of which extend along the N. border of Hungary. The highest points of the Eastern Carpathians, which are of primitive formation, are Negui, 8573 feet, and the Kuhhorn, 7303 feet. Among the Western Carpathians the Eisthalerspitze rises 8875 feet above the sea. Many of the Hungarian mountains are formed of limestone. The sides of the Carpathians are mostly covered with forests of pine, beech, and other trees. They are rich in minerals, including gold, silver, copper, iron, and quicksilver.

Carpeaux (Jean Baptiste), a French sculptor, born in Valenciennes in 1827. He established his reputation in 1863 by the group "Ugolino and his Children." His most celebrated works are a group representing "The French Empire spreading Light over the World, and protecting Agriculture and Science," made for one of the pediments of the Flora Pavilion of the Tuileries in 1865, and another representing "La Danse," made in 1869 for the New Opera. He was one of the most prominent representatives of the naturalistic school. Died Oct., 1875.

Car'pel [from the Gr. *καρπός*, "fruit"], a botanical term applied to a transformed leaf which becomes a simple pistil or one of the elements of a compound pistil. The upper surface of the leaf forms the inner surface of the carpel. The number of ovaries and stigmas of a pistil depends on the number of carpels of which it is composed, but several are often united so as to appear as one.

Carpenta'ria, Gulf of, is a broad and deep indentation of the N. coast of Australia, and is a portion of the South Pacific Ocean. It extends from Cape Arnhem to Cape York, and is about 500 miles long from N. to S. and 350 miles wide. It is mostly included between lat. 10° 40′ and 17° 30′ S., and between lon. 138° and 142° E. Its shores are generally low. It encloses numerous islands. It is visited by vessels for the *bêche de mer*, which is found in its waters. It was named in honor of Peter Carpenter, who from 1623 to 1627 was governor-general of the Dutch possessions in the East Indies. It has been explored by Cook (1770), Flinders (1802), Stoke (1841), Leichardt (1845), Gregory (1856), Landsborough (1861–62), and McKinlay (1862).

Car'penter, a township of Jackson co., Ala. Pop 903.

Carpenter, a township of Jasper co., Ind. Pop. 1081.

Carpenter (Charles C.), U. S. N., born Feb. 27, 1834, in Greenfield, Mass., entered the navy as a midshipman Oct. 1, 1850, became a passed midshipman in 1856, a lieutenant in 1858, a lieutenant-commander in 1862, and a commander in 1869. While attached to the iron-clad Cats-

kill as executive officer he participated in the attacks upon the forts of Charleston harbor of April 7 and July 10, 1863, and is honorably mentioned in the reports of his commanding officer, Commander George W. Rodgers. He was in the severe engagement with Fort Wagner on the 17th of Aug., 1863, when the Catskill was struck thirteen times and Commander Rodgers killed, and bore himself bravely and well. FOXHALL A. PARKER, U. S. N.

Carpenter (FRANCIS B.), an American artist, born at Homer, Cortland co., N. Y., Aug. 6, 1830. His portrait of President Lincoln and his "Emancipation Proclamation" are esteemed his best works. He published an interesting narrative entitled "Six Months at the White House."

Carpenter (GEORGE W.), born at Germantown, Pa., July 31, 1802, became a successful merchant of Philadelphia, and was from 1823 till his death treasurer of the Academy of Natural Sciences in that city. He took a great interest in science, particularly in geology, mineralogy, and the medical sciences. He was a member of many learned societies. Died June 7, 1860.

Carpenter (LANT), LL.D., an English theologian, born at Kidderminster April 5, 1780. He published an "Introduction to the Geography of the New Testament" and "Unitarianism the Doctrine of the Gospel." In 1817 he became minister of a Unitarian church at Bristol. He was drowned in 1840 in the passage from Naples to Leghorn.

Carpenter (MATTHEW H.), an American lawyer, born at Moretown, Vt., in 1824, was at the U. S. Military Academy two years, studied law with Rufus Choate, and was admitted to the bar in 1845. In 1848 he removed to Wisconsin, where he resumed his profession; elected to the U. S. Senate Mar. 4, 1869.

Carpenter (WILLIAM BENJAMIN), M. D., LL.D., F. R. S., an eminent English physiologist, a son of Dr. Lant Carpenter, born in 1813, studied medicine and graduated as M. D. in Edinburgh in 1839. In the same year he published an important work entitled "Principles of General and Comparative Physiology." His reputation was widely extended by an excellent work called "Principles of Human Physiology" (1846). This has gone through several editions, and is considered by many to be the best work extant on that subject. He became professor of medical jurisprudence in University College, London, and for many years edited the "British and Foreign Medico-Chirurgical Review." Among his works are "Zoology, and the Instinct of Animals" (2 vols., 1838), and "The Microscope: its Revelation and Uses" (1856). He has few living equals in acquaintance with natural science, capacity for original inquiry, and skill as a scientific writer. Some of his latest investigations have been in regard to oceanic currents. He was president of the British Association for the Advancement of Science in 1872.

MARY CARPENTER, sister of the above, born in 1807, a distinguished philanthropist, has been especially known in connection with "ragged schools," and other agencies for juvenile reform. She visited the U. S. in 1873.

Car'penter Bee is a name popularly applied to various hymenopterous insects of the bee family, distinguished from other bees by their skill in working wood. They mostly inhabit warm countries. Perhaps the most celebrated of the tribe is the *Xylocopa purpurea* of Southern Europe, a beautiful insect of a rich blue color, about the size of a large humble bee. It attacks dry wood, especially when partly decayed, cutting a longitudinal canal about a foot deep and more than a third of an inch wide. After finishing one of these canals, it lays an egg at one extremity of the hole, and places near it a mass of pollen and honey as food for the future larva. The egg and its accompanying store of food are then hermetically sealed up by a thin wall composed of powdered wood, formed into a very hard compound by being mixed with a substance secreted by the insect. In this manner the mother-bee divides her house into many little chambers with one egg in each. In due time the eggs hatch, each of the larvæ devours the food prepared for it, and then passes into the chrysalis state. At last, when the perfect insects are developed, they destroy the partitions made by the parent bee, and escape into the air; the one produced from the egg first laid escaping first, through an opening made for it by the mother, and the others following in order. The genus is also American.

Carpenter Bee.

Carpenter, Ship's, is a warrant officer whose duty it is to repair the hull, masts, and spars of a ship of war. During a battle he watches for shot-holes, and is prepared to stop them with plugs.

Car'pentersville, a post-village of Kane co., Ill.

Carpentras (anc. *Carpentoracte*), a town of France, department of Vaucluse, is on the river Auzon, 15 miles by rail N. E. of Avignon, and near the base of Mont Ventoux. It is surrounded by walls which were built about 1365, and are flanked by towers, and is mostly well built. It has a Gothic cathedral, part of which was erected in the tenth century, and a public library of 22,000 volumes, containing also a large collection of medals and antiquities; also manufactures of cotton and woollen fabrics, brandy, etc. Here are remains of a Roman triumphal arch. Pope Clement V. removed the papal court to this town in 1313. Pop. 10,848.

Car'pentry implies the art of building structures in wood, and signifies more especially that branch of industry which is applied to the construction of wooden buildings, wooden bridges, and the framings of heavy machines. The labors of the carpenter are necessarily directed by some knowledge of the forces which may be brought to act upon the structure when completed; that is, by some knowledge of the principles of engineering.

The lesser and lighter works of wood, such as furnish the interiors of dwellings, are the products of another branch of labor, termed *joinery*. The work of the joiner is guided more or less directly by the artist, and bears less reference to strength, rigidity, and the forces concerned than to external proportion and æsthetic fitness to surroundings.

The skill of the carpenter is directed towards giving two distinct qualities to the structures he builds—viz. *strength* and *rigidity*. The first is secured mainly by *dimensions* assigned to the different parts, and the skill with which these parts are united; and the latter depends largely upon the *arrangement* of the several members.

We will treat these two topics more fully.

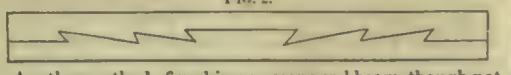
Strength.—Timbers designed for structures are subjected to one or more of the following varieties of strain: transverse, tensile, compressive. A transverse strain is a force applied to a beam in a direction more or less perpendicular to its length; the timbers of a floor afford examples. A tensile strain is one that tends to elongate, and a compressive strain one that, acting in the direction of the length of the member, tends to shorten or crush it.

When the entire structure is of such dimensions that each member of it may be formed of a single stick of timber, the work of the artisan is comparatively simple, and is guided by plain and brief rules. But when by reason of the size of the entire work single parts are required of greater dimensions than can be supplied by single pieces of timber, then skilful joining of smaller parts must be relied upon to meet the emergency. Now, to so combine separate pieces of timber as to form a single member, and thereby employ the available strength of the component parts, at the same time to form such a connection with adjacent portions of the structure as to transmit properly the force assigned to the position, is to apply in the fullest sense the science of carpentry.

It may be remarked here that even in our most important bridges no special effort is made to secure solid timbers for the larger members, because the quality of thorough soundness can be more easily secured by a judicious selection of smaller parts, and then a proper combination can be made to ensure the requisite strength.

When a beam is subjected to transverse strain the fibres

upon the side that tends to become convex under the action of the strain are subjected to a tensile or pulling force, while upon the opposite side they are at the same time compressed. The simple experiment of bending a twig that has bark upon it will illustrate this fact. The bark on the convex side is torn asunder and on the other side compressed into wrinkles. It becomes evident upon slight reflection—1st, that the extreme upper and lower fibres are most severely strained; and 2d, that the central portion of the stick is acted upon by forces comparatively slight. The obvious conclusion is, that the original force is best sustained by portions of the stick at some distance from the middle of its depth, and consequently that beams acted upon by transverse forces should present considerable width in the direction of the bearing force. It is easily demonstrated that the strength of a beam of given length and breadth, to bear a weight between two supports, varies as the square of the depth of the beam. Floor-beams are accordingly made narrow and deep.



To secure depth of beam without employing material which is comparatively of little use the method has been employed of joining two sticks by blocks and bolts, as shown in Fig. 1.

Fig. 1.

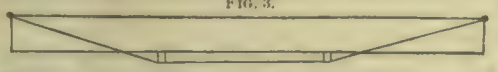
It will readily be seen that the condition of providing material where the strains are greatest has been secured, provided the combination when under strain acts as a single stick. The plan fails when through want of secure bolting there is any motion among the component parts. The chances of failure increase very rapidly as the halves of the compound beam are separated by larger space, as the point is soon reached where each half acts like a simple beam; and whereas in the perfect system the upper half is urged by compressive and the lower by tensile strains only, when by insecure joining there is a slipping among the parts, each of these halves is acted upon by both kinds of force, and has near its centre material of but little use.

Fig. 2.

Another method of making a compound beam, though not often employed, is represented in Fig. 2. In either of the cases above represented some advantage is gained by employing different kinds of timber for the upper and lower members.

The most common way of reinforcing the strength of a simple beam is by the addition of iron rods, as shown by

Fig. 3.



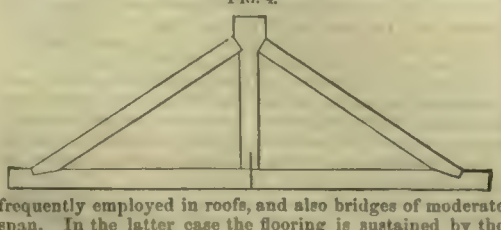


Fig. 3. The consideration of such a combination belongs to the subject of *trusses*.

When a stick of timber is employed so as to resist a tensile force, the manner of connecting it with the portions of the structure through which or to which the force is to be transmitted becomes a matter of great importance. In the case of an iron rod, which can be furnished with a head, an eye, or a nut, the problem of attaching it so as to resist a tensile force is easily solved; but when the conditions require a wooden *tie-beam*, the problem of uniting the various parts so that the strength of the stick shall not be too largely sacrificed requires consideration, because to join timbers implies more or less cutting of their substance, and this in turn sacrifices material.

In the common king-post truss, as the combination represented in Fig. 4 is termed, the methods of uniting parts that fulfil different functions are employed. This truss is

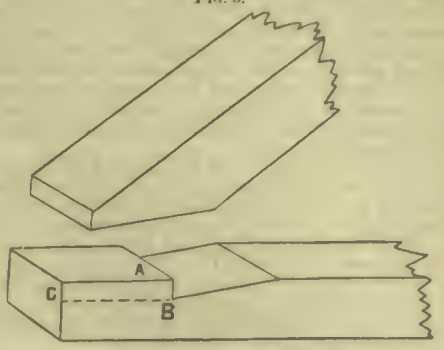

Fig. 4.

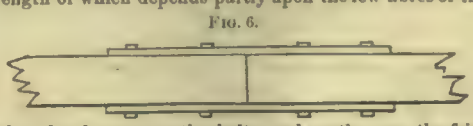
frequently employed in roofs, and also bridges of moderate span. In the latter case the flooring is sustained by the horizontal member or tie-beam; a large portion of the weight sustained is transmitted through the upright, and is received by the inclined pieces or *struts* and conveyed to the extremities of the tie-beam. The tie-beam and post are thus subjected to tensile, and the struts to compressive, strain.

In order that the tie-beam shall properly receive the thrust of the struts, the former must be notched to receive the ends of the latter. Fig. 4 shows the method usually employed; an enlarged view of the ends of the strut and tie-beam is given in Fig. 5. In constructing this truss it

Fig. 5.



is necessary to regard the tendency which the strut exerts to split off the portion ABC. It is considered sufficiently secure in most kinds of timber if the length BC is ten times the depth AB, as, when this proportion is observed, the cohesion which resists splitting off is equal to that which resists the crushing of the fibres exposed to the direct pressure on the lesser surface.

When the length of the tie-beam is such as to require the uniting of two or more pieces, the skill of the carpenter is again called in requisition to produce such a joint as shall safely resist the forces to be met.

The simplest of all is the so-called *fish-joint* (Fig. 6), the strength of which depends partly upon the few fibres of the

Fig. 6.

timber that bear upon the bolts, and partly upon the friction arising from the pressure of the fish-plates. These latter are sometimes made of iron, and furnished with projections that are let or forced into the timber when bolted on. But the expedient is regarded as a clumsy one, and is only tolerated where, as in some roofs, the subsequent additions to the structure hide it from view.

Another and a common form is the *single-lock joint* or *scarf*, shown in Fig. 7, in which the resistance to direct tensile strain depends upon the surfaces opposed to each other at *a*, and which may be one-third the sectional area of the beam. A modification of this method of scarfing is exhib-

Fig. 7.

ited in Fig. 8, in which one-half of the beam is made available in resisting tensile strain, as the joints A and B are each

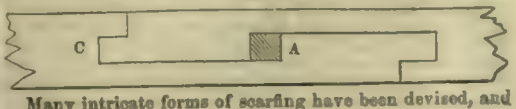


Fig. 8.

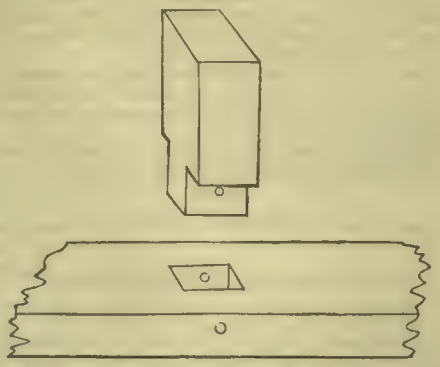
one-fourth of the depth of the beam. The method of Fig. 8 has the advantage over Fig. 7 of greater strength, but it is also far more difficult of construction, as there are two bearing surfaces that must act together; the fitting of the joint therefore requires especial care. This difficulty is sometimes met by leaving spaces at A and B, into which wedges or keys are driven as the scarf is bolted together.

Fig. 9 represents a form of scarf in which no bolts are used, the method of locking at C being employed instead: the *key* at A is made of hard wood, and forced in so as to bring the surfaces of the scarf to a firm bearing. Of course this method of locking the scarf can be equally well applied to the methods shown in Figs. 7 and 8.

Fig. 9.

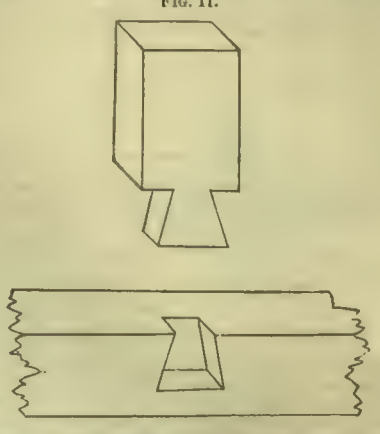
Many intricate forms of scarfing have been devised, and



are exhibited in treatises on carpentry. They belong mostly to the time when but little iron was employed as an adjunct to timber construction; and even then most of the elaborate forms were rather fanciful than useful.

When timbers are united to resist thrust or compressive strain only, less skill is required than in the constructions just described. But little more is required than to bring the opposing surfaces fairly together, and secure them by the simplest possible means. Hence the "fished joint" shown in Fig. 6 will fully satisfy the conditions, and will employ the full available strength of the timber. Care must be taken, however, that the joint is not strained by a tendency which is manifested in long columns or struts to bend sideways when under pressure.

When a strut is joined to its neighboring member at an angle, as in the case shown in Fig. 4, the precaution is taken to so form the joint as to present either the whole of the end surface to the end pressure, as in the upper end of the strut of the king-post truss, or a part of it, as in the lower end shown more fully in Fig. 5. To prevent any displacement in such joints through accidental forces, they are secured by various methods, either a bolt, a notch, a tenon, or even a few nails, being employed according to the liability to lateral forces.



The *tenon* employed is exhibited in Fig. 10; the cut which receives it is called the *mortise*.

Fig. 10.

If the joint is liable to be urged by a force tending to pull it asunder, some security is obtained by the use of a stout pin through the tenon. A dove-tail joint is also employed for the same purpose (see Fig. 11). This form is common in joinery, but should not be relied upon in carpentry.

Fig. 11.

Rigidity, a quality which was referred to as somewhat distinct from *strength* in structures, is secured by such a disposition of material that no change of form of the entire system can occur without bringing into action the tensile or compressive resistances of certain members of it. A plain square frame, fastened however securely at the corners, may be lengthened and shortened cornerwise without calling into action the strength of the materials of the framing, except such as is concerned in fastening the corners. If, however, a stick be firmly secured to the frame, diagonally across it, no change of form can take place without extending or compressing this added *brace*. A triangular frame will not admit of change of form without a change in the length of at least one of its sides Hence diagonal braces are important members of timber framings, inasmuch as they ensure stiffness or rigidity The braces themselves are secured by mortising, by iron straps, or more rudely by outside pieces fastened after the manner of the joint shown in Fig. 6.

(For extended treatises on carpentry see Tredgold's "Carpentry," by Hurst; also Emy's "Traité de la Charpentéric.")

Geo. W. Plympton.

Car'pet-Bag'ger (in recent American politics) is a Republican born and reared in the North or West, who went South with or after the Federal armies, planted himself in one of the States lately reconstructed, and aided in organizing and drilling the negroes to vote the Republican ticket. Of course the term originated with those of adverse politics, who applied it as a stigma, and with considerable looseness, any one not a native of the South being denounced as a "carpet-bagger" if an active Republican; if "native there and to the manor born," he was termed a "scalawag."

Horace Greeley.

Car'pets. The word "carpet," denoting floor-covering, is of unknown origin; it is supposed, by some, to be derived from "Cairo," probably because Egypt is the country credited with first using floor-coverings as articles of luxury in her ancient days of splendor.

As a commercial term, "carpet" or "carpeting" is the generic name for the various grades of goods in that line, whatever their material, mode of construction, or technical appellation. The original form of the carpet was that of a large rug, which was spread upon the floor when occasion required; and the Eastern carpets, the manner of whose manufacture has undergone but little change for many centuries, are invariably made so to this day. The modern way of weaving carpeting in long, narrow strips, to be sewn together, doubtless had its origin in the greater convenience and cheapness which that form admits of through its adaptation to the ordinary loom.

Before the invention of the Jacquard loom, however, carpets were either of very simple pattern, or, if elaborate in their designs, necessarily very expensive. The ancient royal manufactory of the Gobelins in Paris has always occupied the first place in regard to artistic perfection. Some of the carpets produced there cost from 100,000 to 200,000 francs, requiring five to ten years for their completion. None of them have been for sale since the year 1791; they have been presented to the different sovereigns of Europe, and are only to be found in the palaces of courts. The invention of Jacquard, so peculiarly adapted to the weaving of various grades of carpets, together with the still more recent improvements in looms, has greatly facilitated the production of carpeting at once beautiful and durable, and at the same time cheap enough for persons of moderate means or economical tastes; so that the use of carpets has probably increased more during the last fifty years than that of any other commodity of equally ancient origin. At present, the U. S., in proportion to population, is by far the greatest consumer of carpets of all the nations in the world.

The principal grades of carpeting known to commerce (leaving out the Gobelins, Turkish, Persian, and others of similar rug-like make) are Aubusson, Moquette, Axminster, Wilton, velvet, Brussels, tapestry Brussels, ingrain (two or three ply), and Venetian, taking rank, as to value and general desirability, in the order named.

Aubusson, Moquette, and Axminster are very similar in appearance and construction, and are made with a high, tufted pile, thick, durable, and expensive. They are constructed with a firm groundwork of linen or cotton, upon which the pile, containing the design, is fastened in tufts of soft woollen yarn. As these tufts are supplied from a series of rollers corresponding in number to the picks or wefts completing one pattern, and in length to the width of the carpet, and in their action entirely independent of the warp and woof composing the body of the fabric, the employment of an almost unlimited number of colors is admissible, and the designs in those grades are therefore generally of the most perfect and elegant description. They are principally manufactured in England and France. One factory of Axminster carpets is in operation in the U. S.; it has been very successful, and its productions rank well with the imported articles as regards quality and beauty.

Wilton and Brussels are woven alike and of the same materials (linen back and worsted face); the face of both is formed by inserting wires between the warp threads in such a manner that on their withdrawal a series of raised loops of the worsted warp is formed, upon which the design appears. In Wilton these loops are cut open and sheared smooth, while in Brussels they remain uncut. The worsted portion of the carpet being exclusively in the warp, the threads of which are of continuous color throughout the piece, each particular color requires a special set of threads, worked in an independent manner by what is technically called "frame." This arrangement secures great perfection and clearness of design, for each color being

brought to the surface entirely by itself, while the others are carried under or through the linen back until brought up in their turn, the work has the appearance of embroidery on canvas. But as the colors in the direction of the warp are limited to five (no larger number of frames being convenient), the designs in these goods are of necessity simple, and no patterns requiring elaborate shading can be attempted in them. From the number of colors thus employed, the different qualities of these carpets receive the names of two, three, four, and five frame respectively.

Velvets and tapestry Brussels are also manufactured alike in a manner corresponding to Wilton and Brussels, with the difference that only one set of worsted warp threads is used, upon which all the colors are printed by means of color-rollers before the fabric is woven, and upon the correct proportioning of spaces of the various colors the perfection of the goods is in a great measure dependent. In designing patterns for these goods the artist is allowed free scope as to the number and arrangement of colors, and profuseness in that respect does not add very greatly to the cost; hence we find these goods usually much more elaborate of design and more lavishly colored and shaded off than Wilton and Brussels. The manufacture of tapestry (both velvet and Brussels) was commenced in England in 1842. It was soon after introduced in this country, but for twenty years, by reason of patent restrictions, two establishments monopolized the business here. Since the expiration of the patents new concerns are rapidly organizing, and the indications are that in a few years this will be the most important branch of carpet manufacture in the country. Tapestry carpets are now used to an extent greater than that of all other grades combined, with the exception of ingrains. The largest concern in the world manufacturing these goods (in connection with the other principal grades) is that of John Crossley & Sons', Halifax, England, a stock company. They employ nearly 6000 hands.

The ingrain carpet (also called Kidderminster, after the city which formerly manufactured it largely) is the only kind of carpet made exclusively of all wool, and it may be worn on either side, though usually one side is more desirable in coloring than the other. The names "ingrain" and "three-ply" are derived from the modes of their construction. The former is composed of two distinct thicknesses, interwoven or "ingrained" wherever the colors change or mingle; the latter of three layers, also interlacing each other. The design is very similar on both sides, but the colors are reversed. The American consumption of these goods is supplied by home manufacture. Philadelphia has upwards of 5000 looms employed on them, and very large establishments in Connecticut, Massachusetts, and New York State turn out the better qualities. Venetian is the name given to a fabric composed of woollen warp and coarse hemp filling, usually striped in color, and made in widths suitable for stair coverings. Philadelphia furnishes in that grade nearly all the cheap stair carpets used throughout the country.

The carpet manufacturing business of the U. S. has been rapidly growing since the close of the civil war, and is now a very important industry. The capital invested is upwards of $15,000,000; the last census sums up the principal products per annum:

Ingrains (two and three ply),	yards	16,924,711
Tapestry Brussels,	"	1,711,000
Venetian,	"	1,350,017
Brussels,	"	806,505

WILLIAM BERRI, JR., EDITOR OF "THE CARPET."

Car'pi, a fortified town of Northern Italy, province of Módena, is on the canal of Carpi, 12 miles N. N. W. of Módena. It is the seat of a bishop, and has a citadel, a fine cathedral, a seminary for priests, and manufactures of silk. Pop. 5076.

Carpi'no, a town of Italy, in the province of Foggia, and on Mont Gargano, 30 miles N. E. of Foggia. P. 6264.

Carp Lake, a township of Ontonagon co., Mich. P. 25.

Carpoc'rates, or **Car'pocras,** a heretic who lived at Alexandria in the reign of the emperor Hadrian, and founded a Gnostic sect about 130 A. D. He believed in the transmigration of souls, and maintained that the world was created by angels. He is accused of teaching principles that tend to subvert morality. His followers existed as late as the sixth century.

Car'polite [from the Gr. *καρπός*, "fruit," and *λίθος*, a "stone"], a name applied to fossil fruits. Many such have been described, mostly belonging to the carboniferous formation.

Car'pus, a Latin term signifying the wrist, in anatomy denotes the series of bones between the fore arm and hand. In man there are eight small bones in two rows; the upper row consists of the scaphoides, lunare, cuneiforme, and pisiforme; the lower, of the trapezium, trapezoides, magnum, and unciforme. The upper row is articulated with the radius of the fore arm; the lower with the metacarpal bones of the HAND (which see). The number and form of the bones of the carpus vary much in different animals, but rudiments of them, at least, appear in all mammals. They are quite distinct in the flipper or paddle of the whale, as well as in the fore leg of the ox and the horse.

Carp'zov, a Saxon family of the seventeenth century celebrated for learning, of which the most distinguished members were BENEDICT, professor of Wittenberg, author of "Definitiones forensis," "Practica nova rerum criminalium," "Jurisprudentia consistorialis," and "Processus juris"—works which had an extended influence on German laws; died Aug. 30, 1666; JOHANN BENEDICT, professor of theology at Leipsic, brother of the above, who wrote "Systema theologicum," born in 1607; died in 1657; JOHANN GOTTLOB, born Sept. 20, 1679, grandson of the above, professor of Oriental languages at Leipsic, who wrote "Introductio in libros canonicos" and "Critica sacra Veteris Testamenti." Died April 7, 1667.

Carqui'nez (written also **Karquenas**), a strait of California which connects the Bay of San Pablo with Suisun Bay; lat. 38° 04′ 16″ N., lon. 122° 15′ 19″ W. It is from 1 to 2 miles wide and 7 miles long, and is navigable for steamboats. Large ships can ascend it to Benicia. It has sixteen feet of water at low tide. It forms the boundary between Solano and Contra Costa counties.

Carr, a township of Clarke co., Ind. Pop. 692.

Carr, a township of Jackson co., Ind. Pop. 1665.

Carr (EUGENE A.), an American officer, born Mar. 20, 1830, in Erie co., N. Y., graduated at West Point 1853, and July 17, 1862, major Fifth Cavalry. He served on frontier duty 1850–61; scouting against Lipan Indians 1854 (severely wounded in skirmish near Diablo Mountain); on Sioux expedition 1855, Utah 1858, and Kiowa and Camanche expedition 1860, engaged in several skirmishes. In the civil war became colonel Third Illinois Volunteer Cavalry Aug. 15, 1861, and was promoted brigadier-general U. S. volunteers Mar. 7, 1862, serving in operations in Missouri 1861–62, engaged at Wilson's Creek; in command of division in pursuit of Price into Arkansas 1862, engaged at Pea Ridge (thrice wounded); in command of the army of S. W. Missouri 1862, and of district of St. Louis 1862–63; in command of division in Vicksburg campaign, engaged in operations against the place; at Port Gibson, Champion Hill, Edward's Station, Black River Bridge (brevet colonel), and capture of Vicksburg; in the department of Arkansas, commanding cavalry division on Camden expedition 1864, engaged at crossing of Little Missouri; in command of the district of Little Rock 1864 (brevet brigadier-general), engaged at Clarendon and Camden; in command of a division of the Sixteenth corps in operations against Mobile 1865, engaged at Spanish Fort; and in various districts and post commands since 1865. Brevet major-general U. S. A. Mar. 13, 1865, for gallant and meritorious services in the field. GEORGE W. CULLUM, *U. S. Army.*

Carr (JOSEPH B.), an American general of volunteers, born in Albany, N. Y., Aug. 16, 1828, educated at Troy, N. Y. On the outbreak of the recent civil war he was commissioned (April 14, 1861) lieutenant-colonel of the Second New York Volunteers, and colonel May 10, 1861. The Second regiment was the first volunteer regiment to leave the State. In 1862 Carr was commissioned a brigadier-general of volunteers; he was at the battle of Big Bethel, and bore a conspicuous part in all the battles of the Army of the Potomac up to the final surrender of Lee's army, April, 1865. He was brevetted major-general Mar., 1865, and mustered out of service Sept., 1865. He holds at present the commission of major-general third division National Guard State of New York, head-quarters at Troy, where he is engaged in the manufacture of chain cable.

Carr (Sir ROBERT), a British gentleman who was appointed by Charles II. in 1664 one of the royal commissioners to New England. He assisted in the capture of New Amsterdam from the Dutch, and changed its name to New York in honor of the duke of York, afterwards James II. Died June 1, 1667.

Car'rageen', or **Irish Moss,** is a name given to several species of sea-weed which are not mosses, but algæ. The species which yields the greater part of the carrageen of commerce is the *Chondrus crispus*. It is used as medicine and as an article of food, and is esteemed for its emollient and demulcent properties. It grows on the rocky coasts of several countries of Europe and on the eastern shores of North America. It is from two to twelve

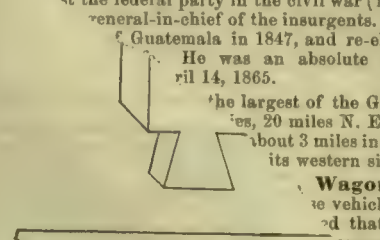
inches long, branched, cartilaginous, flexible, and reddish-brown in color. It is considered easy of digestion. Jelly and blanc-mange are made by boiling the carrageen in water or milk, with an addition of sugar and spices. The Iceland moss (*Cetraria Islandica*) is a wholly different plant, though used in a similar way. It is not a true moss, but a lichen.

Carra'ra (anc. *Cararia*), a town of Italy, in the province of Massa-Carrara, is on the Avenza, near the Mediterranean, 133 miles by rail N. W. of Pisa. It has an old collegiate church, a ducal palace, and an academy of fine arts. Here are celebrated quarries of white statuary marble, which have been worked for two thousand years or more. Many foreign artists come here to work, in order to save the expense of transporting the marble. The quarries, of which there are more than thirty in the vicinity, are in high hills or mountains formed chiefly or entirely of marble. Pop. 6797.

Carrara Marble is a white, fine-grained, saccharine marble obtained at Carrara, Italy, and well adapted for statuary. It is a metamorphic limestone of the oolitic formation. Besides this fine white marble, several inferior varieties are obtained in the quarries of Carrara. Some of these are veined and blue.

Carratra'ca Springs, a post-village of Plantagenet township, Prescott co., Ontario (Canada), has large hotel accommodations, and a copious mineral spring whose waters are very highly esteemed for their alterative effects.

Carratunk Plantation, a township of Somerset co., Me. Pop. 214.



Carrel (Nicolas Armand), an eminent French writer and leader of the republican party, was born at Rouen May 8, 1800. He served in the army in his youth. He gained distinction by an able "History of the Counter-Revolution in England." Carrel, Mignet, and Thiers became in 1830 chief editors of the "National," a liberal daily paper of Paris. In 1830 Thiers and Mignet retired from the editorship, and Carrel obtained the control of the "National," which he edited with great ability. He was an eloquent and popular writer, and was qualified by sound judgment and moderation to be the leader of a party. He was mortally wounded in a duel by Émile de Girardin, and died two days after, July 24, 1836.

Car'rell (Rt. Rev. George Aloysius), D. D., born at Philadelphia, Pa., June 13, 1803, studied at Mount St. Mary's College, became in 1829 a Roman Catholic priest, was stationed in Philadelphia, Pa., Wilmington, Del., and St. Louis, Mo., where he was a professor and afterwards rector in the university; in 1849–53 was president of the in ...rcell Mansion College at Cincinnati, O.; in 1853 he was ...rated bishop of Covington, Ky. Died Sept. 25, 1868.

and finally (though not till near the close of the Assyrian or Medo-Persian monarchy) twelve spokes, the diverging ends of which were inserted in a rim of wood, which was bound with a tire of bronze. Whether this rim was originally whole or composed of several pieces or felloes is uncertain, but at the period of the Assyrian monarchy felloes were in use. The chariot was box-shaped, but open in the rear, the front being about four feet in height. It was probably three or four hundred years later that those intended as state carriages were provided with a back, and a seat in which the nobles or royal personages sat or reclined, while a charioteer stood in front and drove the horses.

The chariots were used for two purposes: first, as an evidence of the great dignity and exalted station of the king or prince who occupied them, as when Pharaoh made Joseph "ride in the second chariot which he had" (Gen. xli. 43), and as when the funeral procession for Jacob went up out of the land of Egypt, and "there went up with Joseph both chariots and horsemen," in token of the high rank of the deceased (Gen. l. 10). It is noteworthy that during the time which elapsed between these two incidents we find Joseph sending wagons (probably carts, or simple two-wheeled vehicles, drawn by oxen) from Egypt to Canaan for his brethren to bring their wives and children to Egypt (Gen. xlv. 19). A second use of these chariots was for war-purposes. It is hardly probable that they were used in this way so soon as for regal pomp and display. There is a tradition that Erichthonius of Athens built the first war-chariot about 1586 B. C. At the time of the Exodus (B. C. 1491) Pharaoh had 600 war-chariots, and it is implied (Ex. xiv. 7) that besides these there were other chariots in Egypt which were employed for the same purpose. These war-chariots had on their sides cases for the bow and sheaf of arrows, and also for the spears or lances, and usually an archer or a spearman stood on either side of the charioteer, and shot his arrows or hurled his spears at the enemy as the charioteer drove furiously to the conflict. The Canaanitish kings and the kings of

Fig. 1.

Assyrian War-Chariot.

Moab in the next 150 years after the Exodus are often spoken of as having numerous chariots of iron; by which is generally understood, not chariots constructed of iron, but having iron or bronze scythes attached to the axles of their chariots. These, driven at great speed against a force of footmen or cavalry, proved terribly destructive. The Israelites under the theocracy were prohibited the use of chariots, but in the time of David, and still more in that of Solomon, they began to accumulate them, and Solomon maintained a force of 1400 chariots; these and the horses which drew them were mostly imported from Egypt at a cost of about 1050 shekels for each chariot—about $650, or, reckoning the difference in the value of money then and now, equivalent to at least $3000 of our money; so that his force of chariots must have been worth at least $4,200,000. But another item in the cost of these establishments were the richly embroidered housings and trappings for the horses and the cloths for the chariots, manufactured for a long period in Tyre or in some of its tributary states (Ezek. xxvii. 20).

Until near the close of the Assyrian monarchy the chariot was generally drawn by three horses. At that time the third horse was withdrawn, but the Persians a little later drove four horses, attached, like our stage horses, to the chariot in pairs. The chariot continued to be a two-wheeled vehicle until near the Christian era, when its use for war-purposes was discontinued, and among the Romans, Greeks, and the Sybaritic nations of the Orient it became the synonym of luxury and effeminacy. It was mounted on four wheels, and drawn by four or six horses elegantly caparisoned, and the chariot itself was trimmed and cushioned with the most luxurious embroidered cloths of the East. Usually but two persons besides the driver occupied it, though there was often room for six. There were chariot-races in the Olympian and Isthmian games, and the nobles of Greece and Rome drove at full speed along the magnificent Roman roads and highways. It was prob-

ably in one of the more modest of these vehicles that the Ethiopian treasurer of Candace, queen of Ethiopia, was returning to his country from his visit at Jerusalem when he met Philip (Acts viii. 27, 28). During the period of the later Roman empire and the decline of its power these richly decorated carriages multiplied, with the other indications of the luxury and effeminacy of the people. There was not, however, even in the most costly of these vehicles, anything answering to the springs of our modern coaches and carriages. Leather and steel of the best quality were both abundant, but the idea of using either for rendering the motion of these carriages easier did not occur to the carriage-builders of those days.

During the Dark Ages the roads were so rough and poor that carriages were almost entirely abandoned as a means for the conveyance of persons, the only method of land-travel being on horseback, and even the broad-wheeled heavy wagons or wains, used to some extent for the transportation of goods, moved over the highways with the greatest difficulty. On the Continent, asses, mules, and the large but slow and sure-footed Norman horses were used for the packing of goods from one country to another, the huge panniers on either side of the animal almost concealing him from sight. In 1280, according to Beckman, Charles of Anjou and his queen entered Naples in a *carretta*, a small but highly decorated chariot. Fourteen years later, in 1294, Philip the Fair issued an ordinance forbidding the wives of citizens to use carriages, or perhaps more accurately *cars*, probably open two or four-wheeled vehicles, which seem to have come into use about that time. For the next 200 years their use was very infrequent, and seems to have been confined to royal personages. Yet in this time there had been introduced one change which was perhaps an improvement. The canopy (probably borrowed from the Oriental umbrella held over the monarch in his chariot), which had hitherto been sustained by four pillars, and had been open at the sides, now gave place to a close drapery, which concealed the occupant from view except when looped up. The emperor Frederic III. attended the council or diet at Frankfort in 1474 and 1475 in close or covered carriages, that of the latter year being magnificently decorated. Soon after this time the German princes seem to have entered upon a rivalry to outshine each other in the splendor of their equipages. In 1509, at a tournament in Rappin, the electress of Brandenburg's carriage was completely covered with gold, and those of the other duchesses were ornamented with crimson and purple curtains and draperies of the richest satin. From this time the use of coaches by the nobility, and especially by the feudal lords, spread gradually over continental Europe; but, though the coaches were low and broad-wheeled, the condition of the roads was a serious obstacle to their use. In 1550 there were only three coaches in Paris. In 1610, Henry IV. was assassinated in his coach. Rude carriages

Fig. 2.

Henry IV.'s Coach.

called whirlicotes, two-wheeled vehicles without straps or springs, and having the horses attached to them by ropes, had been occasionally seen in England as early as the time of Richard II. (1377–99), and it is recorded that his mother was conveyed in one at the time of the rebellion of 1399. But the state coach was first introduced in the time of Queen Elizabeth, in the year 1555, it is said, by Walter Rippon, a Dutchman, who built one in that year for the earl of Rutland, and in 1564 another for the queen, who made him her coachman. Of this coach, and a later one built by the same man for her when attended by her maids of honor or her ministers, we give an illustration copied

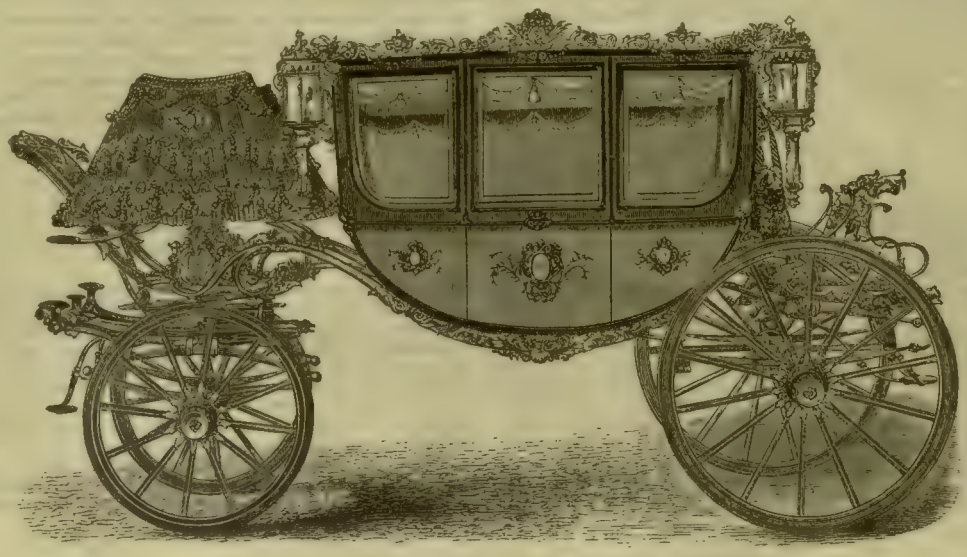
Fig. 3.

Queen Elizabeth's State Carriage.

from Höfnagel's print of Nonsuch Palace. These coaches were without springs of any kind, though that of Henry IV., figured above, appears to have been suspended on heavy bands of leather or steel.

The English nobility soon set up their carriages, and, as Buckingham quaintly expresses it, "within twentie years there became a great trade of coachmaking." Some of the nobles increased the number of horses attached to these coaches to six, or even eight. The use of private carriages was confined to the aristocracy for the next hundred years,

Fig. 4.



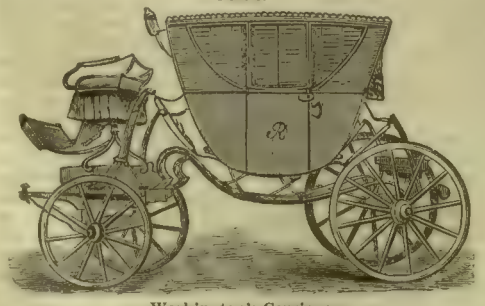
Private Carriage of the Seventeenth Century.

but a few hackney-coaches (so called from the French *coche-à-haquenée*, a vehicle with a hired horse) were kept for hire after 1625. Fifty years later there were twenty of these in Edinburgh, but such was the condition of the roads and streets that there was not much demand for them, and a hundred years later the number had dwindled to nine. During nearly the whole of the eighteenth century these hackney-coaches, the heavy and slow-going stage-coaches, and the post-chaises, were the only vehicles in England for the accommodation of those travellers who did not own horses or coaches. There was, indeed, one other mode of travelling, very slow and inconvenient, which was resorted to by the common people, and sometimes by the middle classes. The huge broad-wheeled covered wagons used for the transportation of goods, and drawn by six, eight, or twelve of the great Normandy horses, had a space partitioned off at the hinder end and strewn with straw, in which they could carry six or eight passengers, all of whom had to sit on the straw on the floor of the wagon. This was called "riding in the tail of the wagon." But even this limited accommodation was only to be found on the great thoroughfares, as away from these goods were carried on pack-horses. Even as late as in 1750 the journey from London to Birmingham by stage-coach, a distance of 116 miles, occupied nearly the whole of three days and nights. In 1754 the first line of stage-coaches was established between London and Edinburgh, and the advertisement stated that "a two-end glass coach machine, hung on steel springs, exceeding light and easy, would go through in ten days in summer and twelve in winter, the passengers lying over during the Sabbath at one of the villages on the route." The distance between the two cities is about 400 miles, and it is now run by the ordinary fast trains of the Great Northern Railway in ten or eleven hours. The introduction of steel springs for coaches dates from about 1750, but these were not at that time the elliptic or the C spring, but a bow of steel, the two ends of which were secured to the axle, and the centre reinforced by shorter strips of steel, much like the heavy springs we see on some of the passenger cars on the railways. The leather thorough-braces, whether attached to a crossbar, as they were at first, or to the C spring, as was done later, did not come into use till near the close of the eighteenth century.

The great improvement in the public highways in Great Britain, which was the result of the labors of Macadam, Telford, and other civil engineers at the close of the last and

the commencement of the present century, and the reorganization of the postal arrangements, led to the establishment of those lines of stage-coaches on all the principal thoroughfares which De Quincey has so eloquently described as "the glory of England" and "the poetry of motion." These coaches were well built, strong, and so well provided with springs that their motion was easy, and did not weary the traveller even on long journeys. They were run by time-tables, and made their ten miles an hour regularly. From about 1795 to 1835 these vehicles were the favorites of travellers, and carried hundreds of thousands of passengers annually; but when the railway lines were constructed between the large towns the stage-coaches began to fall into disuse, and they are now only employed on short and subordinate routes, and their number is decreasing every year. But with their decrease there has been a vast increase in the number of private carriages of all descriptions, till now these are numbered by hundreds of thou-

FIG. 5.



The Viceroy of Egypt's Carriage, built in Paris in 1867; cost $15,000.

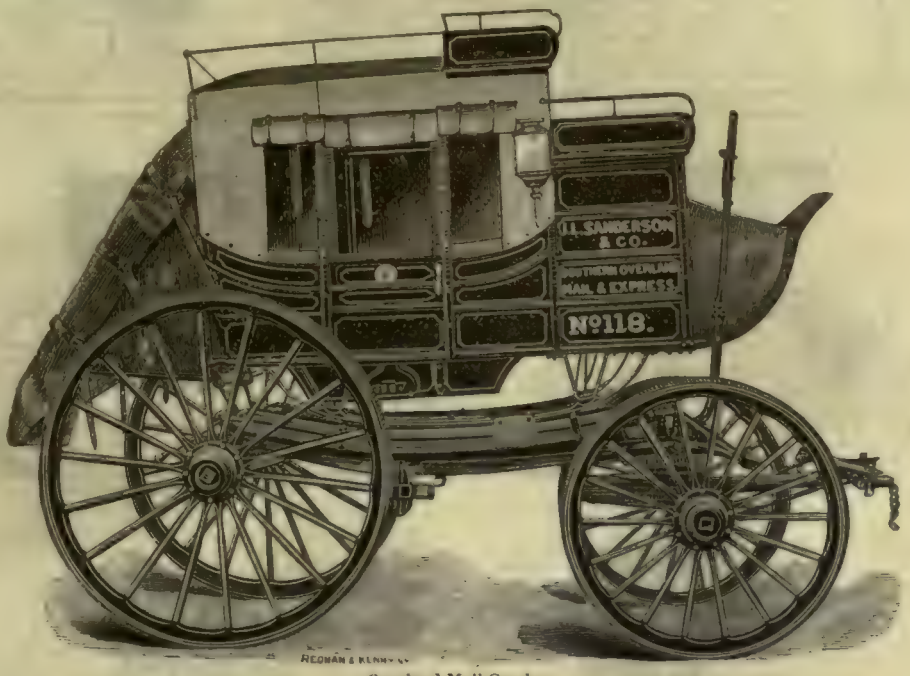
sands. They are of a great variety of designs, and are intended for one, two, four, or even six horses, and vary in their capacity from the skeleton or sulky for a single passenger, who is his own driver, to the family coach, phaeton, or carryall, into which from eight to a dozen can be stowed. The hackney-coaches have very generally given place to cabriolets or *cabs*, as they are generally called, vehicles drawn by a single horse and carrying two or four passengers besides the driver, which were introduced about 1820. There are now nearly 60,000 of these vehicles in use in London. Omnibuses, introduced about 1831 from France, have been used to some extent.

In this country the prevalent mode of travelling for the first two centuries was on horseback, the roads preventing any very extensive use of wheeled vehicles. There were, however, even at the time of the Revolution and for some decades before, a few family coaches, maintained by the wealthy and aristocratic families of the larger towns. These were heavy, lumbering affairs, drawn by six large horses, and seldom moved faster than a very slow trot. In New

FIG. 6.

Washington's Carriage.

York, Pennsylvania, and New Jersey the great Conestoga wagon, broad-wheeled, and with its huge canvas-covered body elevated both in front and rear, drawn sometimes by the Normandy horses, sometimes by four or six yokes of oxen, crept at a slow pace over the rough roads to carry goods from the seaports into the rural districts. These same wagons in our times have been used in the Mississippi Valley and on the Western plains, as well as in Western Pennsylvania, West Virginia, the mountain districts of North and South Carolina, Georgia, and East Tennessee, to transport both goods and emigrants, and have received the name of "prairie schooners." At the time of the Revolution the stage-coach was unknown on this continent. In 1791 there were but 1905 miles of post-roads in the U. S., and over the greater part of these the mails were carried in heavy wagons, occupying three or four days in the trip from Philadelphia to New York, or making the round trip in a week, while they took ten days for the journey from New York to Boston. The improvements in the roads led to improvements in the vehicles, and on the great thoroughfares from 1810 to 1845 the stage-coaches were, of their kind, admirable vehicles. Accommodating nine inside, and usually six, including the driver, on the outside, with a good supply of baggage covered with a heavy leather boot in the rear, and drawn by four or six spirited horses, these vehicles, though not making quite as good time as the English stage-coaches, were the admiration of all beholders. Troy, N. Y., became celebrated for its coaches, as it has since for its horse-cars, and the stage-proprietor who could assure his customers that he used only the best Troy coaches was sure of ample patronage. For the travel in newer regions and over somewhat rougher roads what were called the Concord wagons or coaches, originally made in Concord, N. H., but now manufactured also in Chicago and in other Western cities and towns, were preferred. The coaches of the Overland Mail, and indeed most of those in use in the Pacific States, are of this description. They are furnished with strong brakes to check their too rapid descent of the mountain declivities. We give an illustration of one of the Overland coaches.



The omnibus has not been used to any great extent except in cities and large towns, but in these, until the street-cars of the horse-railroads began to take its place, it was the favorite vehicle for public travel. At one time, about 1857 or 1858, there were nearly 500 plying on the streets of New York City. The present number is not more than 120. The omnibus is too well known to need description or illustration. It is a French invention, introduced into Paris about 1827, and into New York in 1830.

The other public carriages for hire have been hackney-coaches, or hacks, as they are generally called, four-wheeled close carriages, drawn by two horses, and of which there are now several styles, such as the close coach, the caleche, the quarter coach, the C-spring coach, the double caleche, the barouche, the six-seat rockaway, and the clarence, the last having a glass front and sides. Cabriolets or cabs, either two or four-wheel vehicles drawn by one horse, are also used to some extent, but have never been as popular here as in London. The hansom cab, with a caleche top and the driver's seat at the back, the reins extending over the top, has been very little used here. A style called crystal cabs,

having a glass front like the clarence, but on a very much smaller scale, was for a time much liked.

As the country has increased in wealth, and the highways, drives, boulevards, and city and town streets have improved, the demand for private carriages has grown, until now this constitutes by far the largest department of the trade. It is stated by the organ of the trade that there are now about 1,000,000 carriages and wagons of all descriptions sold annually, and the annual product is valued at nearly or quite $100,000,000. The variety as well as the quality of these vehicles is almost infinite. A single manufacturing house had in their catalogue in 1862 more than 300 styles, and now number about 500, yet there are hundreds of styles which they never attempt to manufacture. The great seats of carriage manufacture are—for strong and heavy top-wagons, Concord, N. H.; for buggies, open wagons, and light cheap wagons, which are yet very serviceable, Amesbury and Belchertown, Mass.; for private coaches and carriages of all styles, New Haven and Bridgeport, Conn. (there are in the former of these cities thirty-six manufacturing establishments); Troy, now mostly restricted to stage-coaches, street-railroad cars, and omnibuses, but doing a moderate share of other work; New York City, which has a high reputation for the excellence of the work of some of its

A Glass-Quartered Coach.

manufactories; Newark, N. J., where are manufactured many of the lighter class of carriages; Philadelphia, which has long maintained a reputation for good work in some styles; Wilmington, Del.; Pittsburg and Chicago, both largely engaged in the manufacture of various styles, both heavy and light. But there are very few cities or large towns in the U. S. in which there is not a considerable number of carriages and wagons produced.

It would occupy too much of our space to enumerate a tenth of the styles of carriages which are now or have recently been most popular. For family use, to be drawn by two horses, the preference seems to be for some form of the clarence, the phaeton, the brett, the coupé, the landau, or of late the landaulette, or the higher grades of four or six-seat rockaways. Some of the latter are very light and graceful. For a single horse there are rockaways with four or five sittings, light octagon-front coupés, broughams, stanhope-phaetons, victorias, chariotees, English, French, and American styles, top buggies, with or without jump seats, tilburies, doctors' gigs and carriages; and among the open wagons the French, English, and American dog-carts, the dos-à-dos, the two-wheeled dog-carts and stanhopes, the turn-out seat and drop-front buggies, the road sulky, etc. etc. The illustrations show a few of these styles.

The manufacture of children's carriages on any considerable scale has been only attempted within the past twenty-five years, and has only become an extensive industry within the last fifteen years. There has been added to it within that time the production of dolls' carriages, which is also rapidly extending. The following table exhibits the progress of the carriage manufacture in the U. S. within the past thirty-four years:

Census Year.	No. of Establishments.	Persons Employed.	Wages Paid.	Carriages Produced.	Value of Raw Material.	Value of Annual Product.
1840	92	2,274	.....	13,331	.....	$1,708,741
1850	1,822	14,000	.....	95,000	.....	12,000,000
1860	7,234	37,457	$13,547,356	270,000	$12,008,675	35,927,192
1870	11,944	56,294	21,749,625	800,000	23,385,683	67,003,730
1873	*12,500	75,000	29,500,000	1,000,000	30,000,000	100,000,000

* Estimated by editors of the "Hub." This is exclusive of the manufacture of sleighs, which is of itself a vast industry.

For many of the facts and estimates in this article, as well as for a considerable number of the illustrations, we are indebted to the courtesy of Messrs. William H. Bradley & Co. of New Haven, successors to Brewster & Lawrence.

L. P. BROCKETT.

Carrical', or **Karrical**, a French town and seaport of Hindostan, on the Bay of Bengal, 152 miles S. of Madras. It was formerly fortified, and was captured by the British, who restored it to the French in 1814, on condition that it should not be fortified or garrisoned.

Car'rick, EARLS OF (1748), Viscounts Ikerrin (1829), and Barons Butler (Ireland, 1607).—SOMERSET ARTHUR BUTLER, fifth earl, born Jan. 30, 1835, succeeded his brother in 1846.

Carrickfer'gus, a seaport-town and borough of Ireland, on Belfast Lough, 10 miles by rail N. N. E. of Belfast, is situated in the county of Antrim, but forms a county by itself, called "the county of the town of Carrickfergus." It has a fine old parish church, said to have been founded in 1164; also several spinning-mills and manufactures of linen and starch. Here is a remarkable and picturesque castle, supposed to be 700 years old, standing on a high rock and on the sea. It is used as an arsenal, barracks, and a fort for the defence of the harbor. Carrickfergus has important fisheries, and is celebrated for its oysters, lobsters, and scollops. It has considerable trade with

Liverpool, though its harbor is shallow and poor; it might, however, be easily improved. The people are mostly Protestants of Scotch descent. A part of the ancient wall is still standing. The town is connected with Larne by railway. It returns one member to Parliament. There are mines of salt in the vicinity. Pop. in 1871, 9452.

Carrickmacross', a town of Ireland, in the county Monaghan, Ulster, is 46 miles N. W. of Dublin. One of its churches serves as the cathedral for the Roman Catholic archbishop of Clogher. It has a savings bank and a well-endowed grammar school, and has a fair held five times a year. Pop. 2063.

Carrick-on-Shannon, a town of Ireland, the capital of the county Leitrim, Connaught, is situated on both sides of the navigable Shannon River, 85 miles W. N. W. of Dublin. It is partly in the county Roscommon, and is on the Midland Great Western Railway. It has considerable trade, chiefly in provisions. A canal has been cut from this place to Lough Erne. Pop. 1587.

Car'rick-on-Suir, a town of Ireland, in the county of Tipperary, is on the river Suir, 13 miles by rail E. of Clonmel. It has an old bridge, a parish church of high antiquity, a hospital, a convent, and a picturesque ruined castle built about 1310. Grain and other products of the soil are exported from this place by the navigation of the river. Pop. in 1871, 4986.

Car'rick's Ford, a point on the Cheat River near St. George, Tucker co., West Va. The Confederate forces under Gen. R. B. Garnett, in retreat from Laurel Hill, where they had abandoned most of their artillery and stores, were here attacked by three regiments of U. S. troops under Gen. T. A. Morris. A brisk engagement ensued, in which the Confederates were routed and Gen. Garnett killed. The Unionists captured the Confederate wagon-train and one piece of artillery. This affair occurred July 13, 1861.

Carrier (Jean Baptiste), a French Jacobin notorious for his cruelty, was born near Aurillac in 1756. He was elected to the National Convention in 1792, and was sent in 1793 to Nantes, where he found many Vendean prisoners. He murdered multitudes of men, women, and children by various modes. Many of these victims were crowded into boats which were scuttled and sunk in the Loire. This was called *republican baptism*. The cruelties and obscenities related of this worst of Jacobin leaders are almost incredible. More than 15,000 persons were put to death by him in a single month. He was guillotined Dec. 16, 1794.

Carrier (Joseph Auguste), a French painter of portraits, miniatures, and forest scenery, was born in 1800 at Paris, and studied under Gros, Prud'hon, and the chevalier Saint. He first exhibited in 1824, has won several medals, and in 1866 was decorated with the cross of the Legion of Honor.

Carrier (Thomas), died May 16, 1735, at Colchester, Conn., aged 109. He was a native of the west of England, settled in Andover, Mass., and married Martha Allen in 1664. His wife was hung at Salem in 1692 on a charge of witchcraft, she having, it was alleged, appeared to her daughter in the form of a black cat. About 1715, Carrier removed to Colchester. He retained his strength and faculties in a surprising degree till his death.

Carrière (Joseph), a French *abbé* and theologian, born at Aveyron Feb. 19, 1795, was especially noted for a Latin work treating upon marriage, upon justice and law, and upon contracts. This work is highly esteemed. Died April 23, 1864.

Carrière (Moritz), a German *littérateur*, born at Griedel, in Hesse, Mar. 5, 1817, studied philosophy at Giessen, Göttingen, Berlin, and in Italy. In 1849 he became professor of philosophy at Giessen, and after 1853 held that position at Munich. He has published "Der Kölner Dom als freie deutsche Kirche" (Stuttgart, 1843), "Abälard und Heloise" (Giessen, 1844), "Die Religion in ihrem Begriff," etc. (1841), "Die philosophische Weltanschauung der Reformationszeit" (1847), "Die letzte Nacht der Girondisten" (a poem, 1849), "Religiöse Reden und Betrachtungen für das deutsche Volk" (1850), "Das Characterbild Cromwells" (1851), "Das Wesen und die Form der Poesie" (1853), "Deutsche Geisteshelden im Elsass" (1871), "Die Kunst im Zusammenhange der Culturentwickelung und die Ideale de. Menschheit" (1863–71), and other works. He defends Christianity, opposes Ultramontanism, and is of the liberal school. As an art-critic he takes a high rank.

Car'rier Pig'eon, a variety of the domestic pigeon (*Columba livia*), is remarkable for the sagacity with which it returns to its home after it has been conveyed to a distant place. It is trained to carry messages in various countries. The letter sent by this mode is sometimes enclosed in a quill and tied to the bird's leg, neck, or wing. Pigeons are trained by a progressive system, the young birds being at first taken to a small distance from their home and set loose. The distance to which they are taken is gradually increased to thirty miles or more. When they are liberated and thrown up for a journey, they first rise spirally to a great height in the air. Before the invention of the electric telegraph they were often employed to carry news of the changes in the prices of stocks. The balloons which the Parisians sent up during the siege of Paris in the winter of 1870–71 carried each a number of these birds, which were employed as bearers of despatches in the public service. Some of them, after being taken more than 100 miles, returned to Paris, notwithstanding the inclemency of the season. They have been known to fly 1000 miles or more, and at times to fly more than 100 miles an hour. They have been sent home from great distances at sea, with no possible guide as to direction—a seeming demonstration of the theory that these birds are prompted as to the direction in which to fly by some instinct at present altogether inexplicable. Some birds, however, are puzzled by foggy weather or by a coating of snow upon the ground. Many pigeons fly well only in a general N. and S. direction, others E. and W. There are several breeds of the carrier pigeon, the Belgian stock being generally regarded as affording the best messenger birds. There are, however, various forms of the Belgian breed, but most of the birds have considerable family likeness. They should be over fourteen inches long, and in weight should exceed one pound. A wattle of larger or smaller size generally extends across the bill. Most Belgian birds have a short head, long neck, and very broad, muscular shoulders. Many have a wide circle, without feathers, around the eye. The Turks are regarded as training this bird most successfully. The Asiatics, it is stated, have employed the carrier pigeon from the earliest times. Anacreon mentions it as a carrier of letters; Pliny mentions its use at the siege of Modena. The Turks employed it during the Crusades, but the crusaders kept falcons which were flown at the pigeons with some success. The English merchants in Aleppo, in the palmy days of the Turkey Company, had regular communication with Scanderoon, 80 miles distant, by means of this bird. It is related that in the East regular relays of pigeons were formerly flown from towers thirty or forty miles apart, the birds being trained to carry messages both ways. The message was transferred from bird to bird, and thus great distances were traversed in a short time. Before the electric telegraph was invented there were lines of birds flown from Halifax, N. S., to Boston, Mass., and from Sandy Hook to New York, with the European news. In the Franco-German war very long documents were micro-photographed, and sent in packages of only a few grains weight with complete success.

Revised by Charles W. Greene.

Carrières, de (Louis), a Roman Catholic theologian, was born in 1662 at Cluvilé, near Angers, France. He became a soldier, and in 1689 joined the Congregation of the Oratory. He became distinguished as a theologian, and published, at the request of Bossuet, a "Commentaire Littéral" (24 vols. 12mo, 1701–16). This work is very popular in France even at the present day. Most of the comments are made in the translated words of the Bible itself. It has been often reprinted. Died at Paris June 11, 1717.

Car'riers, Com'mon, those who undertake for hire to transport from one place to another the goods or persons of such as choose to employ them. They are distinguished from *private* carriers by this readiness to afford accommodation to the public generally, and are subjected in law to a different responsibility. They may be either carriers by land or carriers by water. Familiar examples of the former kind are stage-coach proprietors, railway companies, express companies, wagoners, and teamsters, etc.; of the latter, the owners and masters of steamships, ferry-boats, and vessels of all kinds engaged in a general transportation business. The principles of law exhibiting the rights and duties of common carriers form a subordinate department under the general subject of Bailment, and, as in other varieties of the same legal relation, the degree of care necessary in the custody and treatment of whatever is received by the bailee is not dependent in all respects for its determination upon the contract of the parties, but arises by force of established legal rules. The difference in these requirements, depending upon the circumstance whether there be a carriage of goods or a carriage of passengers, demands that these two branches of the subject be examined separately.

Common carriers of goods are placed under a responsibility of excessive stringency. They are held liable for all loss or damage which occurs during transportation except

that occasioned by "the act of God or the public enemy." They are made virtually insurers of the goods against all perils except those arising from these two sources, and the infrequency of exemption must be so great as to afford relief but very rarely. The reasons for imposing a duty so severe grow out of considerations of public policy. The facility with which the carrier or those who may collude with him can purloin or injure goods entrusted to his oversight and disposal, and the difficulty of ascertaining the true cause of the loss, are thought to place the members of the community so entirely at his mercy that their interests demand the most ample protection. Moreover, the fact that the application of this rule has not proved detrimental to the growth and prosperity of transportation companies indicates that its apparent undue severity, while conducing greatly to the advantage of the public, has worked no practical injustice even to the carriers themselves. The phrase "act of God" is held to extend only to such inevitable accidents as occur without the intervention of human agency. Thus, losses directly occasioned by winds, floods, lightning, and earthquakes would be properly included under this designation, and the carrier would be relieved from liability. But robbery, even if committed unexpectedly and by an irresistible force, or fire occasioned by some incendiary, wholly without the carrier's negligence or connivance, would be causes of loss containing that element of human agency which makes the exemption inapplicable. Damage resulting from natural causes, such as frost, fermentation, evaporation, the natural decay of perishable articles, or the inherent viciousness of animals, are placed upon the same footing as losses caused by the "act of God." By the phrase "public enemies" is meant those with whom the nation is at war or pirates on the high seas. Thieves, robbers, and mobs would not be included under this term.

It is a carrier's duty to receive for transportation all goods offered of the kind which it is his usual custom to carry. He may, however, demand the payment of freight in advance, and may refuse all articles of a dangerous quality. All persons who engage his services must be charged for the same service equably. Suitable vehicles for transportation must be provided, in charge of competent servants; the goods must be carried safely to the proper place of destination by the usual route and with all reasonable despatch, and there delivered, or held ready for delivery, to the owner or consignee. Reasonable instructions given by the owner or his agent relative to the mode of carriage of the goods must be followed, unless compliance is impracticable. The carrier is also held accountable for all acts of his employés within the scope of their employment, even though they violate his instructions as to the mode of performance. He cannot escape from his obligations as to the carriage of the goods by attributing default to his own agents.

The responsibility of common carriers begins upon the delivery of the goods for transportation. A delivery at the usual place of receiving freight or to the employés in the usual course of business is sufficient. But where goods are transferred to carriers with instructions not to transport them until further notice, the extraordinary liability already considered does not attach in the mean time, and it is only necessary that the ordinary care which is obligatory upon warehousemen be exercised until carriage really commences. The responsibility terminates when the goods have reached their destination and been actually delivered. But if, upon the lapse of a reasonable time after arrival, they are not claimed and removed, the carrier's liability is not entirely ended, but only modified in degree. It is then his duty to store the property in a safe and secure warehouse to await the owner's demand, and he is only accountable thereafter for ordinary care. Important distinctions are drawn between various classes of carriers in reference to the proper mode of delivery. These are rendered necessary by the different kinds of transportation adopted in the several cases. Thus, express companies employ conveyances which can be readily sent from dwelling to dwelling, and they are consequently held bound to make actual personal delivery at the owner's place of business or residence. Carriers by water, on the other hand, can proceed no farther than the wharf. Hence, according to a well-settled usage clearly applicable to seagoing ships, no other delivery is demanded than can be made there; but the convenience of the consignee is still regarded, as far as practicable, by imposing upon the carrier the obligation, rendered necessary by the uncertain time of arrival, that notice be given when the vessel has reached her place of discharge of the cargo. In railway transportation, again, the circumstances are still different. The cars are confined to a given line, have a regular terminus, and trains are run uniformly in accordance with published time-tables. Hence, according to some authorities, personal delivery is so completely excused that not even notice of arrival is necessary. The better opinion seems to be that notice is required, and that the consignee has a reasonable time within which to take the goods before the strict liability of the carrier is modified into that of the warehouseman.

The purpose of these various regulations manifestly is, that the interests of both carrier and owner be promoted. The "reasonable time" after arrival during which the carrier's heavy responsibility as insurer is to continue will be most speedily terminated when the owner has immediate knowledge that the goods lie at his disposal.

There are instances, however, in which delivery is sufficient to discharge the carrier, though not made to the owner himself. This occurs when several parties are engaged successively in the transportation of the same articles. The liability of each, in the absence of special circumstances, terminates when the next undertakes the duty of carriage. At least, such is the doctrine upheld generally by the decisions of the American courts. In England, on the contrary, the rule is maintained that the first carrier who receives the goods, if he accepts them for a destination beyond his own route, continues liable until the entire journey is completed, and the subsequent parties, though the injury or loss may occur on their own lines of travel, are exempted from liability on the contract. This proceeds upon the notion that the contract for transportation is tacitly made with the first carrier. According to the prevailing opinion in the U. S., the cases in which these views should be followed are those in which the first carrier engages by special contract for the entire route. It should be added that there may be such a business connection between various parties concerned in continuous transportation as to make them all liable as partners for the entire transportation.

Questions of much importance arise as to how far a carrier's duty and responsibility may be modified by usage or custom, or by specific contract entered into with the owner, or by notice given him. It is well established that common usage, if uniform and reasonable, may be pleaded in justification of peculiar regulations adopted. Thus, the nature of the goods which will be received or the route which will be generally pursued may be determined in this manner.

But these common modes of reducing responsibility are comparatively insignificant in view of those qualifications established by contract or notice. The policy of allowing the carrier to so limit his liability has been much questioned, but the validity of such agreements is now generally recognized. Bills of lading and instruments of an analogous character, given by the carrier on accepting goods for transportation, contain almost invariably stipulations in regard to exemptions from loss by fire and other enumerated perils, and are regarded as constituting a contract between the carrier and shipper. In like manner, notice brought home to the knowledge of the owner of the goods and assented to by him will have in general the same effect. At this point there is a great practical difficulty. The question is, What will be sufficient evidence of assent on the owner's part to a notice? It is plain, at least, that the notice must be so given by the carrier as naturally to attract the attention of the shipper, and must be so precise and clear that he can readily acquaint himself with its contents. Assuming this to be so, *can the carrier shake off his extraordinary responsibility by notice?* It is now quite clear that he cannot. He may make in this manner reasonable regulations in the nature of by-laws, pointing out the articles that he will carry, or requiring a statement of their value, so as to know what care will be properly demanded of him, and what reasonable charge he should make. But when all this is done he cannot shake off his character of insurer by notice. To do this there must be a contract—some evidence of assent; and notice by the carrier is no evidence of assent by the shipper. He, by his silence, should fairly be assumed to insist on the carrier's common-law responsibility. The English courts held otherwise at one time, but the salutary doctrine here maintained is now substantially established in England by statute. Under its legislation the carrier may relieve himself to a considerable extent by notice, but cannot escape entirely the consequences of his own neglect or misconduct. The notice must not only be really or presumptively known to the owner of the goods, but must also be reasonable in its character.

Common Carriers of Passengers.—These are not held to as stringent a liability as carriers of goods. They are not made insurers of the passengers' safety, but are nevertheless required to use the utmost care, and are responsible for even the slightest negligence. The reason for this difference is, that they can have no such complete control over persons as over goods. Passengers must largely retain freedom of movement and self-direction. It is no more than just, therefore, that the carrier's duty should be

correspondingly modified. Extreme vigilance may be demanded, but not the duty of preventing injuries to which the passenger's own heedlessness may expose him. In accordance with this principle, injuries occurring from any defect in the construction of machinery or vehicles which proper care could have guarded against, or from their unskilful management, subject the carrier to responsibility. He is answerable for the acts of his agents, whether negligent or wilful, done within the scope of their employment. It is his duty to exclude lawless and disorderly persons from his conveyances, or, failing to do so, he may, according to some authorities, be held responsible for any violence they may perpetrate on the passengers.

When, however, the passenger's own negligence is the proximate cause of the injury, the carrier is not liable. Thus, if an attempt should be made to get upon a train while the cars were in motion, or a passenger's head or arm should be thrust from a window, and accidents occur in consequence, his own imprudence would be fatal to any claim for damages. This proposition leads to an important branch of the law termed "contributory negligence," which may be defined to be that negligence without which the injury would not have happened, while at the same time, on the part of the carrier, on being made aware of the passenger's negligence, there must be reasonable care used to avert its effects.

The common duties of passenger carriers are, to receive all who offer to take passage as long as their vehicles suffice, to carry them the entire route, to treat all with civility and propriety, and bring them to their destination within the stipulated time. They are not, however, compelled to receive persons of offensive or disorderly conduct, or any who by reason of disease or disgusting habits are unfit associates for the other passengers. Reasonable regulations may be adopted concerning the control of passengers, such as that fares must be paid in advance, tickets must be exhibited when called for, and the like. Expulsions of persons in a suitable manner and without unnecessary force from their vehicles for refusing to comply with such rules are considered justifiable.

The liability of passenger carriers for baggage committed to their charge is in general the same as that of common carriers of goods. In other words, they are held bound as insurers. If, however, the passenger prefers to retain exclusive control of his own property, as a coat, an umbrella, or a satchel, the carrier's responsibility is modified. The liability continues until delivery is made, either to the owner at the final destination or to another carrier in a continuous line of transit, and the duty of storing and preserving goods is the same that has been already detailed in the ordinary case of carriage of goods. The effect of contract or notice is also similar. The obligation to convey baggage arises independently of any special agreement in relation thereto, being considered as incidentally connected with the undertaking to carry the passenger himself, and no additional payment is necessary. But some measure of relief is granted to the carrier on account of this lack of remuneration by defining his accountability more narrowly. He is only liable for articles properly denominated baggage, and not for everything which the passenger may choose to consider such. Articles of necessity or personal convenience are reasonably included within the meaning of the term, but not merchandise or large sums of money or silver plate, and the like. For instance, jewelry used for personal ornament, a reasonable amount of money for travelling expenses, the instruments of a surgeon required in practice in the course of his journey, have all been considered "baggage," and the carrier made accountable for the loss. But the samples of a traveller acting for a commercial house would not be baggage, but merchandise, unless the carrier was made aware of their nature, and then without objection received them as baggage. The principle governing this matter is that concealment of the true nature of the package presented as baggage is a fraud on the carrier. All inference of fraud is dispelled if the contents be disclosed, and there is no objection to the carrier accepting merchandise in trunks if he see fit.

Appropriate remedies exist in favor of carriers. They may detain goods for the freight. They have an action against strangers who interfere with their possession, and may even recover the full value of the goods, holding the surplus above their charges in trust for the owner.

In this brief summary of the rights and duties of common carriers attempt has only been made to exhibit common-law provisions and principles. Statutory enactments exist in England and in various States relating to the subject, the details of which must be sought by reference to the acts themselves. In particular, the so-called English "Carriers' Act" may be referred to. (The subject is treated in much detail in such works as REDFIELD "On Railways," and ANGELL "On Common Carriers." The rules of damages will be found in SEDGWICK or MAYNE "On Damages.")

T. W. DWIGHT.

Car'rion Flowers, a name given to the flowers of several species of *Stapelia*, the smell of which resembles that of carrion. They are natives of the Cape of Good Hope. The genus *Stapelia* belongs to the order Asclepiadaceæ, and is remarkable for an excessive development of the cellular tissue of the stem at the expense of the leaves.

Car'roll, a county of Arkansas, bordering on Missouri. Area, 700 square miles. It is drained by King's River and other small affluents of White River, which touches its N. E. extremity. The soil is fertile, producing excellent crops of grain. Tobacco and wool are also staple products. The timber and pasturage are unsurpassed. Fine variegated marble, iron, and lead ore are found here. Capital, Carrollton. Pop. 5780.

Carroll, a county of Georgia, bordering on Alabama. Area, 572 square miles. It is bounded on the S. E. by the Chattahoochee River. The surface is partly hilly. Grain, wool, and cotton are staple crops. Among the minerals found here are gold and granite. Capital, Carrollton. Pop. 11,782.

Carroll, a county of Illinois, bordering on Iowa. Area, 425 square miles. It is bounded on the W. by the Mississippi River. The surface is undulating; the soil is fertile. Lead is found here. A large portion of the county is prairie. Grain, cattle, and wool are largely produced. The most numerous manufactories are those of saddlery and harnesses. It is intersected by the Western Union R. R. Capital, Mount Carroll. Pop. 16,705.

Carroll, a county in N. W. Central Indiana. Area, 378 square miles. It is intersected by the Wabash River, and also drained by the Tippecanoe. The surface is nearly level; the soil is productive. Wheat, corn, wool, and dairy products are staple exports. Lumber and flour are manufactured. The Toledo Wabash and Western R. R. passes through it. Capital, Delphi. Pop. 16,152.

Carroll, a county in W. Central Iowa. Area, 576 square miles. It is drained by the Raccoon River and the Middle Coon. The soil is fertile. Grain and cattle are raised extensively. It is intersected by the railroad which extends from Cedar Rapids to the Missouri River. Capital, Carrollton. Pop. 2451.

Carroll, a county in the N. of Kentucky. Area, 200 square miles. It is bounded on the N. by the Ohio River, and intersected by the Kentucky River. The surface is mostly undulating; the soil is fertile. Wheat, corn, wool, and tobacco are the chief products. Limestone occurs here as a surface-rock. It is intersected by the Louisville Cincinnati and Lexington R. R. Capital, Carrollton. P. 6189.

Carroll, a parish which forms the N. E. extremity of Louisiana. Area, 1000 square miles. It is bounded on the E. by the Mississippi River and on the N. W. by Bœuf Bayou. The surface is nearly level; the soil produces cotton and maize. Capital, Lake Providence. Pop. 10,110.

Carroll, a county of Maryland, bordering on Pennsylvania. Area, 453 square miles. It is drained by the sources of the Patapsco and Gunpowder rivers. The surface is hilly; the soil is good. Tobacco, grain, and butter are extensively produced. It has manufactures of leather, metallic wares, flour, clothing, carriages, saddlery, etc. Soapstone quarries and iron and copper mines have been opened. It is intersected by the Western Maryland R. R. Capital, Westminster. Pop. 28,619.

Carroll, a county in N. W. Central Mississippi. Area, 900 square miles. It is bounded on the W. by the Tallahatchie and Yazoo rivers, and also drained by the Yallobusha. The soil is fertile. Corn and cotton are the chief crops. Cattle and wool are largely raised. It is intersected by the Mississippi Central R. R. Capital, Carrollton. P. 21,047.

Carroll, a county in N. W. Central Missouri. Area, 670 square miles. It is bounded on the E. by Grand River, and on the S. by the Missouri. The surface is partly undulating; the soil is fertile. Corn, tobacco, and dairy products are the staple crops. It contains prairies, with groves of oak, hickory, and other trees. Limestone abounds here. A branch of the St. Louis Kansas City and Northern R. R. passes through it. Capital, Carrollton. Pop. 17,446.

Carroll, a county in E. Central New Hampshire. Area, 500 square miles. It is partly bounded on the S. W. by Lake Winnipiseogee, and drained by the Ossipee and Saco rivers. The surface is hilly; the soil is productive. Grain, wool, and butter are the chief products. The manufacturing interests are varied. It is intersected by the Portland and Ogdensburg R. R. Capital, Ossipee. Pop. 17,332.

Carroll, a county in the E. of Ohio. Area, 360 square miles. It is drained by Conotten and Sandy creeks. The

surface is diversified by hills of moderate height; the soil is fertile. Wool, grain, and dairy products are extensively produced. Coal and iron ore abound in this county, which is traversed by a branch of the Cleveland and Pittsburg R. R. Capital, Carrollton. Pop. 14,491.

Carroll, a county of West Tennessee. Area, 625 square miles. It is intersected by the Big Sandy River, and also drained by the South Fork of the Obion. The surface is nearly level; the soil is very fertile. Cotton, corn, tobacco, and wool are staple products. It is traversed by the Nashville and North-western and Memphis and Louisville R. Rs. Capital, Huntingdon. Pop. 19,447.

Carroll, a county in the S. W. of Virginia. Area, 440 square miles. It is drained by the New River or Kanawha, and bounded on the S. E. by the Blue Ridge. The surface is hilly. Grain and wool are the chief products. Copper, lead, and iron are found here. Capital, Hillsville. Pop. 9147.

Carroll, a township of Ouachita co., Ark. Pop. 713.

Carroll, a township of Vermilion co., Ill. Pop. 2032.

Carroll, a post-village and township of Carroll co., Ia. It has one weekly newspaper. Pop. 384; of township, 578.

Carroll, a township of Tama co., Ia. Pop. 382.

Carroll, a post-township of Penobscot co., Me. P. 632.

Carroll, a township of Platte co., Mo. Pop. 2691.

Carroll, a township of Reynolds co., Mo. Pop. 605.

Carroll, a township of Texas co., Mo. Pop. 519.

Carroll, a post-township of Coos co., N. H. It has manufactures of lumber and starch, and is one of the principal places of resort in the White Mountain region. P. 378.

Carroll, a township of Chautauqua co., N. Y. It has manufactures of lumber. Pop. 1548.

Carroll, a post-village of Greenfield township, Fairfield co., O. Pop. 187.

Carroll, a township of Ottawa co., O. Pop. 1036.

Carroll, a township of Cambria co., Pa. Pop. 1780.

Carroll, a township of Perry co., Pa. Pop. 1425.

Carroll, a township of Washington co., Pa. Pop. 3178.

Carroll, a township of York co., Pa. Pop. 898.

Carroll, a township of Lincoln co., West Va. P. 1123.

Car'roll (Charles) **of Carrollton,** an American patriot, born at Annapolis, Md., Sept. 20, 1737. He inherited a large estate in land, and was regarded as the richest man in Maryland. He was chosen a delegate to the Continental Congress in 1776, and signed the Declaration of Independence. To distinguish himself from another man of the same name, he signed himself "Charles Carroll of Carrollton." He was elected to the Senate of the U. S. in 1788. He was of the Roman Catholic faith, and was a man of great dignity and worth. He was a lawyer by profession, educated in France and England, and was especially honored as the last survivor of the signers of the Declaration of Independence. Died Nov. 4, 1832.

Carroll (John), D. D., LL.D., first Roman Catholic bishop of the U. S., and cousin of the preceding, born Jan. 8, 1735, at Upper Marlborough, Md., became in 1773 professor at Bruges, in Belgium. In 1786 he was, at the instance of Franklin, appointed vicar-general, and in 1790 he was consecrated as bishop of Baltimore. In 1791 he founded St. Mary's College. A few years before his death he was raised to the archiepiscopacy. Died Dec. 3, 1815.

Car'rollton, a post-village, capital of Pickens co., Ala., on Lubbub Creek, 172 miles W. N. W. of Montgomery. It has one weekly newspaper. Pop. of Carrollton township, 1841.

Carrollton, a township of Boone co., Ark. Pop. 577.

Carrollton, a post-village in a township of the same name, capital of Carroll co., Ark., on Long Creek, 125 miles N. N. W. of Little Rock. Pop. of township, 808.

Carrollton, a post-village, capital of Carroll co., Ga., is on the Little Tallapoosa River, about 50 miles W. S. W. of Atlanta, at the intersection of three railroads, one recently completed. It has two schools and one weekly newspaper.

Edwin R. Sharpe,
Ed. "Carroll County Times."

Carrollton, a city, capital of Greene co., Ill., on the Chicago and Alton R. R., 34 miles N. N. W. of Alton. It has a fine public-school building, an academy, seven churches, a library association, and various manufacturing industries. It has two weekly newspapers. Pop. of township, 2760.

G. B. Price's Sons, Pubs. "Carrollton Gazette."

Carrollton, a township of Carroll co., Ind. Pop. 1046.

Carrollton, a post-village, capital of Carroll co., Ia., is on the Middle Coon (or Raccoon) River, about 70 miles W. N. W. of Des Moines. Pop. 384.

Carrollton, a post-village, capital of Carroll co., Ky., on the Ohio River, at the mouth of the Kentucky River, 62 miles above Louisville, manufactures cloth, flour, etc. It has five churches and a newspaper. Pop. 1098.

Ed. Carrollton "Democrat."

Carrollton, a city in Jefferson parish, La., on the left bank of the Mississippi River, above and adjoining New Orleans. It contains the court-house and public buildings of Jefferson parish, and is connected with the centre of New Orleans by street-cars, which start every three minutes. Here are public gardens which attract many visitors. It has one weekly newspaper. Pop. of ward, 6495.

Amos S. Collins, Ed. "Louisiana State Register."

Carrollton, a post-township of Saginaw co., Mich. Pop. 1564.

Carrollton, a post-township of Fillmore co., Minn. Pop. 1646.

Carrollton, a post-village, capital of Carroll co., Miss., will be soon connected with the Mississippi by a railroad. It has one weekly newspaper. Pop. 377.

P. W. Robertson, Ed. "Mississippi Conservative."

Carrollton, a post-village, capital of Carroll co., Mo., on the St. Louis Kansas City and Northern R. R., 207 miles N. W. of St. Louis and 66 miles E. N. E. of Kansas City. It contains nine churches, a school-house built at a cost of $40,000, two banks, two flour-mills, a woollen factory, and two weekly newspapers. Pop. 1832.

Jos. H. Turner, Ed. "Wakanda Record."

Carrollton, a township of Cattaraugus co., N. Y., has manufactures of leather and lumber and an oil-well. Pop. 1142.

Carrollton, a post-village, capital of Carroll co., O., is about 125 miles E. N. E. of Columbus. A branch railroad, twelve and a half miles long, extends from this place to Oneida, which is on a branch of the Cleveland and Pittsburg R. R., and the Ohio and Toledo R. R. is being built through it. It has two weekly newspapers. Pop. 813.

J. V. Lawler, Pub. Carroll County "Chronicle."

Car'rolltown, a post-borough of Cambria co., Pa. Pop. 416.

Carronade, a short iron cannon for naval service, invented by Mr. Gascoigne, and named after the Carron Iron-works in Scotland, where it was first made. It is lighter than the ordinary guns, and has a chamber for powder like a mortar. Carronades are now little used, and are nearly obsolete. In the war of 1812 the carronades of the American navy did excellent service. They have a short range, and are only suitable for fighting at close quarters.

Car'ron Brook, a post-village of Hibbert township, Perth co., Ontario (Canada), on the Buffalo and Goderich branch of the Grand Trunk Railway. It has various manufactures, of which the most important is that of salt from salt-wells. There is one weekly paper. Pop. about 1000.

Carron Oil, a mixture of lime-water and oil, useful as an application to burns. It was named from the Carron Iron-works, where it has been much used. (See Lime, Medicinal Uses of.)

Car'rot (*Daucus*), a genus of plants of the order Umbelliferæ. The common carrot (*Daucus carota*) is a biennial plant, a native of the East, but naturalized both in Europe and America. Its leaves are pinnately compound; the flowers creamy white. The root of the cultivated plant is much thicker and more agreeable to the taste than the wild. It is largely given to cattle, for which, as well as for men, it is a wholesome and moderately nutritious article of food. The plant has some beauty, its leaves having been, during the reign of Charles I., worn in England by ladies instead of feathers. The root is used for poultices.

Carrou'sel, a knightly exercise, in imitation of the tournament, common in Europe until the beginning of the eighteenth century. It consisted in contests of skill, in horsemanship, and in the use of the sword, lance, or other weapon. The Place du Carrousel in Paris was named from a fête of this kind held in honor of Mademoiselle de la Vallière in 1662. The Eglinton tournament, so called, at Eglinton Castle, in Scotland, in 1839, was really a carrousel.

Car'ryall, a post-township of Paulding co., O. Pop. 1087.

Carse, a term applied in Scotland to low alluvial land adjacent to rivers. In Perthshire it is extended to the whole of the slightly undulating land on the north of the Tay, which is called the Carse of Gowrie. Carse soils usually consist of argillaceous deposits, which produce crops of great luxuriance, but in some cases they are rather sterile.

Car'son (Alexander), LL.D., of Tubbermore, descend-

ed from the Covenanters who sought the same kind of an asylum in North Ireland as the Puritans found in North America. Probably the world has had no grander type of men than those produced by colonizing Scots in Ireland; and perhaps of all the men that grew from this rugged grafting, no one was a more characteristic scion than Alexander Carson. He was born in 1776, in county Tyrone, Ireland. His father and mother were Presbyterians, and in his youth they set him apart for the ministry, and gave him his education at the University of Glasgow. Here he was *facile princeps*. He paid especial attention to Greek, and drove his studies in all departments so hard that his firm constitution seemed ready to sink. His tremendous power of concentration was fully shown in his college life, and was of the highest service in all his life's work. He became pastor of the Presbyterian church in Tubbermore when he was in his twenty-second year. In the same year he was married to the companion of his life, Margaret Ledlie. The Unitarian controversy which shook the Presbyterian churches in North Ireland during the early part of this century was to him a cause of great mental anguish. The prevailing worldliness and evil practices of many members of the synod of Ulster constrained him at last to say that all the wealth of the Indies could not induce him to celebrate another communion service when he must share in the responsibility of such doctrines and practices. About the year 1805 he drew up his "Reasons for Separating from the Synod of Ulster." In this he argues for the independence of each church from all others. Thus he became a Congregationalist, or an Independent, as the term is used in Great Britain. In doing this he resigned all the earthly support he had. The majority of his congregation clave to him, and the law decided that the church property should be theirs, but as they could not retain it without strife, he gave it up, and "preached for many years in cold, incommodious barns, and often in the open fields." Afterwards a rude stone building was raised in the village of Tubbermore. Its interior was neither painted nor plastered, and the seats were hard benches. Here he preached for thirty years. Not long after his views on church government were changed, one of the Baptist missionaries supported by the Haldanes of Scotland came over to the north of Ireland, and Carson's congregation were much troubled in mind by the new-comer. The pastor attempted to confute the Baptists, but after a month spent in prayer, reading the New Testament, and ransacking the Greek language, he burned his manuscripts and proclaimed himself a Baptist. He devoted all his scholarship and much of his time to enforcing the views of the Baptists.

His preaching was entirely expository. During his long ministry in Tubbermore he expounded the entire Scriptures, and was well on his way through them a second time when death silenced him. His custom was to take a chapter in course, in the Old Testament, for his morning discourse, and a verse or two of the New Testament, in course, for the afternoon. He was scrupulous to observe whatever was ordained by Christ and the apostles and practised in the Church, including the ceremony of the kiss of holiness and love. The singing of his great congregation was of the most artless kind. A few of the old minor tunes and the Scotch metrical Psalms, with Watts' and some other hymns, was the whole apparatus from year to year. He taught that the ordinance of the Lord's Supper should be observed every Lord's Day, and the church, in common with nearly all the Baptist churches in Ireland, so practised. It is said that the salary he received from the church did not average more than thirty pounds a year. He sustained his large family chiefly by farming, teaching, and whatever he realized from time to time by the sale of his books. He was a wonder to many, in that he was able to educate his sons and provide for his daughters. He had thirteen children. Many of his congregation came many miles every Lord's Day to hear him. Old women there were who walked, on going and returning, distances varying from five to twenty miles. In the doctrines of the gospel Dr. Carson held the very highest ground. He maintained the federal headship of Christ, the actual imputation of his righteousness to the redeemed, and the actual imputation of their sins to the atoning Saviour. He believed and maintained the verbal inspiration of the Scriptures; that the atonement of Christ was made for his Church only; that man is entirely powerless to do good, yet entirely responsible for sin; that the gospel is to be preached to all; and that the sinner's guilt is increased by rejecting it. There were five great subjects which chiefly occupied his pen: the mode and subjects of baptism, the Godhead of Jesus Christ, the Romish controversy, the inspiration of the Scriptures, the harmony of God's attributes in the gospel, and the wonders of God's providence towards his Church. He was most diligent in the use of his time, and testified of himself that he had scarcely ever lost an hour. He had such a power of abstraction that he wrote some of his profoundest treatises while his children were climbing over his chair. His style of writing is remarkable. His sentences are short, and of the simplest possible construction. He was a reasoner who would as soon be guilty of a larceny as of an intentional fallacy. He very rarely attempted anything like fine writing, but sometimes a few words are so used as to produce a sublime effect. He preached always entirely without notes. His eloquence has been described as "volcanic." He threw such light upon the most recondite parts even of the Old Testament that there grew up under his ministry a multitude of people unlearned in everything else, but mighty in the Scriptures. So rapt was his auditory in his discourses that many times they half rose from their seats. The common people thronged to hear a man who hardly ever spoke a word they could not understand, and yet who dealt with the deepest things that can busy the mind of man. In unfolding the glory of the gospel his face absolutely shone; he seemed to be caught up to heaven, and to be ministering between a living God and a dying world.

In person, Dr. Carson was well fitted for his laborious life. He was of middle height, broad-shouldered, deep-chested, stout-limbed. His eye was clear and piercing, his features of a noble Roman cast, and when he died, nearly seventy years old, he had scarcely a gray hair. His voice was very powerful, and so tireless that four hours of almost continuous exercise did not weary it, week after week. His delivery was lively and natural. Those who only knew him from his controversial writings, thought of him as a fiery and unrelenting polemic, and indeed he treated any thing like a weak argument without mercy; yet in private life he was gentle and kindly, without a tincture of pride or vanity. His Christian character was remarkable. He prayed like a little child. His spirit may be judged from the words with which he closed his essay on the "Doctrine of the Trinity:" "Lord Jesus, I own thee before men—deny me not before thy Father and the holy angels!" He resolved at one time to come to America, but after his preparations were well advanced his congregation were so apparently broken-hearted at the thought of his leaving them that, to use one of the beautiful, homely idioms of the north of Ireland, "he could not find it in his heart to leave them."

He died in Belfast in 1844: his death was the result of a fall into the water from a steamer's plank. He was making way for a lady to go aboard, and lost his balance; he was rescued, but somewhat injured, and a fever ensued, which in a few days ended his life. He was a man of rare and saintly self-denial, of zeal that was bounded only by strength, of learning vast and varied, of logic keen to divide between truth and error, and of singleness of purpose to know nothing but Christ crucified. And this man lived for thirty years the pastor of a humble village church in Ireland, and desired no title among men but that of "minister of the gospel!" THOMAS ARMITAGE.

Carson (CHRISTOPHER), an American trapper, commonly called KIT CARSON, was born in Kentucky Dec. 24, 1809. He served as a guide to Fremont in his Rocky Mountain explorations. He was an officer in the U. S. service in both the Mexican war and the great civil war. In the latter he received a brevet of brigadier-general. Died May 23, 1868.

Carson City, the capital of the State of Nevada and county-seat of Ormsby co., is situated near the E. base of the Sierra Nevada, about 3 miles W. of Carson River and 15 miles S. S. W. of Virginia City. It is surrounded by grand and picturesque scenery, and is about 10 miles E. of Lake Tahoe. It has several churches and schools, State and Odd Fellows' libraries, and one daily paper. Pop. of the township, 3042.

Carson Lake, a township of Mississippi co., Ark. Pop. 74.

Carson River, Nevada, rises in the Sierra Nevada, flows nearly north-eastward, passes through Ormsby and Lyon counties, and enters Carson Lake in Churchill county. Length, estimated at 150 miles. Carson Lake has no outlet, and is about 15 miles long.

Car'stairs, or **Carstares** (WILLIAM), a Scottish negotiator distinguished for learning and sagacity, was born near Glasgow Feb. 11, 1649. He became chaplain to William, prince of Orange, who trusted him as a confidential adviser in affairs relating to Great Britain. Having been sent to England in 1682 as the secret agent of William of Orange, he was arrested as an accomplice in the Rye-House plot, and was put to the torture, which could not extort from him any confession, although he was the depository of important secrets. After the accession of William to the throne, Carstairs had great influence in Scottish affairs, and was five times chosen moderator of the General Assembly. He became minister of Gray Friars' Church, Edinburgh, in 1704. Died Dec. 28, 1715. His virtues and abilities are

highly extolled by Macaulay. (See McCormick, "Life of W. Carstairs," 1774.)

Car'stens (Asmus Jakob), a German painter, born May 10, 1754, at St. Jürgen, Sleswick, the son of a poor miller, travelled on foot to Rome to study art. His great drawing, "The Fall of the Angels," procured him a professorship at the Berlin Academy of Arts. He took the lead in reforming taste in Germany, but painted few pictures. His drawings have been engraved by Müller, 43 plates, 1869. Died May 25, 1798.

Cart. See Carriages, etc., by L. P. Brockett, M. D.

Cartage'na, a city and fortified seaport of Spain, is in the province of Murcia and on a bay of the Mediterranean, 27 miles S. S. E. of Murcia; lat. 37° 36′ N., lon. 1° 1′ W. It occupies the declivity of a hill, and a small plain which is between the hill and the sea. The harbor, which is one of the best in the Mediterranean, is capacious enough to hold the largest fleets, and is protected from winds by highlands which enclose it on several sides. The entrance to the harbor is defended by a fortified island. Cartagena was formerly the chief naval arsenal of Spain, and had a population of 60,000, but its importance has declined. It has a Moorish cathedral, numerous churches and convents, a theatre, and an observatory; also manufactures of sailcloth and glass. Red marble is abundant here, and is used for building. Mines of silver and lead have been opened in the vicinity. Pop. 54,315. The ancient *Carthago Nova* was founded by Hasdrubal in 242 B. C. (See Carthago Nova.)

Cartage'na, written also **Carthagena,** a fortified city and seaport of the United States of Colombia, in South America, the capital of the state of Bolivar, is on the Caribbean Sea, about 275 miles E. N. E. of Panamá; lat. 10° 25′ 36″ N., lon. 75° 38′ W. It was founded in 1532, and was formerly the chief mart of New Granada and Central America, with over 25,000 inhabitants. It stands on a sandy peninsula, is well built, and has well-paved streets. The houses are mostly stone, and two stories high. It contains numerous churches, some of which are said to be splendid, several convents, a theatre, and a college. The climate is very hot, damp, and unhealthy. Cartagena has a good landlocked harbor. Sugar, coffee, tobacco, hides, and bullion are exported from this place. Pop. estimated at 9000.

Carta'go, a town of Central America, the former capital of Costa Rica, one of the oldest cities in Central America, having in 1823 over 37,000 inhabitants, is about 20 miles E. of San José. It once contained eight churches and about 3000 houses, but it was ruined by an earthquake in Sept., 1841, which is said to have destroyed seven churches and 2900 houses. Present pop. estimated at from 3000 to 5000. Near this place is Mount Cartago, 11,480 feet high.

Cartago, a town of the United States of Colombia, in the state of Cauca, and on the river Cauca, about 135 miles W. of Bogotá. It has a cathedral, and a trade in coffee, cacao, dried beef, tobacco, etc. Pop. 7000.

Carte, a French word, signifies a "card," a "ticket," a "map," a "chart." *Carte blanche* (literally, "white card") is a blank paper signed by a person and given to another, that he may prescribe or insert such conditions as he pleases.

Carte (Thomas), an English historian, born at Clifton in April, 1686. He became a priest and Jacobite. During the rebellion of 1715 a large reward was offered for his arrest, but he escaped to France. His chief work is a "History of England" (4 vols., 1747–55), which is prized for its facts, but is not well written. Many volumes of his manuscripts are preserved in the Bodleian Library at Oxford. Died April 2, 1754.

Car'tel, an Anglicised French word which in France signifies a "challenge." As a military term it is used to denote an agreement between two belligerents for the exchange of prisoners. A vessel used in exchanging prisoners or carrying proposals to an enemy is called a cartel-ship.

Car'ter, a county in the N. E. of Kentucky. Area, 550 square miles. It is intersected by the Little Sandy River. The surface is hilly. Iron ore and coal are found here. Indian corn is the chief agricultural product. Capital, Grayson. Pop. 7509.

Carter, a county in the S. E. of Missouri. Area, 500 square miles. It is intersected by the Current River. The surface is diversified by hills and valleys. It contains mines of copper and quarries of limestone. Corn, wool, and tobacco are the chief products. Capital, Van Buren. Pop. 1455.

Carter, a county of Tennessee, bordering on North Carolina. Area, 350 square miles. It is intersected by Watauga River, and bounded on the S. E. by the Iron Mountain. The surface is mountainous. Corn, wool, oats, and wheat are raised. Iron abounds here. Capital, Elizabethtown. Pop. 7909.

Carter, a township of Ashley co., Ark. Pop. 960.

Carter, a township of Spencer co., Ind. Pop. 1420.

Carter, a township of Carter co., Mo. Pop. 760.

Carter, an important military and commercial point on the Union Pacific R. R., in Uintah co., Wy. Ter., 53 miles N. E. of Evanston, has a large warehouse for the Montana trade.

Carter (Elizabeth), a learned English authoress, born at Deal, in Kent, Dec. 16, 1717, was a friend of Dr. Johnson. She was a good classical scholar, and gained a wide reputation by a translation of Epictetus from the Greek (1758), which, according to Warton, is better than the original. She wrote two numbers of Johnson's "Rambler" (Nos. 44 and 100) and a number of poems, among which is an "Ode to Wisdom" (1746). Died Feb. 19, 1806.

Carter (James Gordon), an American educator, born at Leominster, Mass., Sept. 7, 1795, and graduated at Harvard in 1820. He was chairman of the committee on education in the legislature of Massachusetts, and drafted the bill which appointed the Massachusetts board of education. He became chairman of that board. Died July 22, 1849.

Carter (Nathaniel Hazeltine), an American author, born at Concord, N. H., Sept. 17, 1787, and graduated at Dartmouth in 1811. In 1820 he became editor of the "New York Statesman." He afterwards published "Letters from Europe," in two volumes. Died at Marseilles Jan. 2, 1830.

Carter (S. P.), U. S. N., born Aug. 6, 1819, in Carter co., Tenn., entered the navy as a midshipman Feb. 14, 1840, became a passed midshipman in 1846, a lieutenant in 1855, a lieutenant-commander in 1862, a commander in 1865, and a captain in 1870. He served on the E. coast of Mexico during the Mexican war. While attached to the steamer San Jacinto in 1856 he participated in the attack on the Barrier Forts at the mouth of the Canton River, China, which resulted in their capture. In July, 1861, Carter was ordered to report to the secretary of war for duty, and proceeded at once to East Tennessee, where he organized the Tennessee brigade. He was now appointed a brigadier-general of volunteers, and continued on active duty with the army during the entire war, doing most important and gallant service in Tennessee, Kentucky, Virginia, and North Carolina, and receiving the brevet of major-general "for gallant and distinguished services."

Foxhall A. Parker, U. S. N.

Car'teret, a county in the S. E. of North Carolina. Area, 450 square miles. It is bounded on the E. and S. by the Atlantic Ocean. The surface is level, and partly covered with pine forests. Indian corn is the principal crop. It is intersected by the Atlantic and North Carolina R. R. Capital, Beaufort. Pop. 9010.

Carteret (Philip), an English navigator who took part in the expedition to the South Sea commanded by Wallis, in 1766. He discovered a number of small islands, one of which he called by his own name.

Carter's Crossing, a township of Sumter co., S. C. Pop. 947.

Car'tersville, a post-village, capital of Bartow co., Ga., is on the Western and Atlantic R. R., 48 miles N. N. W. of Atlanta. Gold, copper, and other minerals are found in this vicinity. It has one weekly newspaper. Pop. 2232.

Carte'sian Philos'ophy, the name of the system of philosophy brought forward by Réné Descartes (1596–1650), one of the most original thinkers of France or of any country. The scholastic philosophy which had prevailed in the Middle Ages, though based upon the teachings of Aristotle, had so far departed from the spirit of its great master as to have become almost vain and fruitless. What Descartes and his contemporary, Bacon, did, was, each in his own way, to help arouse a spirit of independent research in philosophy and in science. It must not be forgotten, however, that the independence of Bacon and Descartes was a result as well as a cause of this new spirit. The new current had begun to flow before their day, but they each contributed largely to swell that current.

Descartes proposed as a basis for his system, and as a ground for all knowledge, the act of conscious thought, as necessarily involving the idea of existence. His celebrated dictum, "*Ego cogito, ergo sum*"—*i. e.* "I think, therefore I exist"—is the starting-point of his philosophy. And although the dictum itself has been severely criticised, it may be fairly questioned whether the fault be not in the expression rather than in the thought intended to be expressed, and whether the appeal to our consciousness be not indeed the ultimate ground of philosophy. Those writers who deny the validity of the testimony of consciousness are nevertheless continually appealing to the same testimony when it serves their purpose. Descartes was a firm believer in the

existence of a personal God, and attributed all the phenomena of nature to the continual and actual presence of an all-pervading Deity.

The ultimate conclusions reached by Descartes need not be stated here. Founded to some extent upon unwarranted hypotheses, many of his opinions are now known to have been fallacious. But the great value of his philosophy has been in the grand stimulus of thought which it has given to others. Spinoza, Malebranche, and even the modern German philosophers, are confessedly much indebted to him.

Carte'sians [from *Cartesius*, the Latin name of DESCARTES], the name given to the disciples of Descartes, or to those who adopted his system of philosophy. In the seventeenth century nearly all the philosophers of France were ranged under two parties, Cartesians and Gassendists.

Car'thage [Gr. ἡ Καρχηδών; Lat. *Carthago*], an ancient and celebrated commercial city of Africa, and the capital of the republic of Carthage, was a Phœnician colony founded by emigrants from Tyre about 850 B. C. It was situated on a bay of the Mediterranean about 20 miles S. of Utica, and near the site of the modern town of Tunis. Lat. about 36° 47′ N., lon. 10° 6′ E. The Punic or native name of Carthage is said to have been *Carthada* or *Karth Hadtha*. According to a tradition which has been immortalized by the genius of Virgil, it was founded by Dido, a sister of Pygmalion, king of Tyre, and she purchased of the natives the site of the new city. Ancient authorities concur in affirming that it was founded many years later than Utica, which was also a Phœnician colony. No record of the early history of Carthage has been preserved. "This great city," says P. Smith, "furnishes the most striking example in the annals of the world of a mighty power which, having long ruled over subject peoples, taught them the arts of commerce and civilization, and created for itself an imperishable name, has left little more than that name behind it, and even that in the keeping of the very enemies to whom she at last succumbed. Vast as is the space which her fame fills in ancient history, the details of her origin, her rise, her constitution, commerce, arts, and religion, are all but unknown. Of her native literature we have barely the scantiest fragments left. The treasures of her libraries were disdained by the blind hatred of the Roman aristocracy, who made them a present to the princes of Numidia, reserving only the thirty-two books of Mago on agriculture for translation, as all that could be useful to the republic." Our information respecting the Carthaginians is derived mostly from Roman historians, who were deficient in impartiality, and from Polybius, who has preserved some genuine Punic documents.

Carthage seems to have been almost from its foundation independent of Tyre, but friendly relations were maintained between the colony and the metropolis, and the religious supremacy of the latter was recognized by an annual offering to the temple of Hercules at Tyre of a tithe of all the revenues of Carthage. The Carthaginians gradually acquired a dominion over the other Phœnician colonies of Northern Africa, and also over the Libyans and Numidians or nomadic tribes who occupied this region before the foundation of Carthage. This city became one of the greatest commercial emporiums of the world before the first Punic war. During the period of her greatest prosperity, Carthage was probably the greatest maritime power in the world. The population of the city amounted to about 700,000 in 150 B. C. The Carthaginian (or Punic) language resembled the Hebrew, and belonged to the Semitic or Aramaic family. The government was a republic or an oligarchy, in relation to which our information is very scanty.

A condensed summary of all that is known on this subject is given by Grote, from which we extract the chief points: "Respecting the political constitution of Carthage, the facts known are too few and too indistinct to enable us to comprehend its real working. The magistrates most conspicuous in rank and precedence were two kings or *suffetes*, who presided over the senate. They seem to have been renewed annually, though how far the same persons were re-eligible we do not know; but they were always selected out of some few principal families or *gentes*. There is reason for believing that the genuine Carthaginian citizens were distributed into three tribes, thirty curiæ, and 300 gentes. From these gentes emanated a senate of 300, out of which, again, was formed a smaller council or committee of thirty *principes*, representing the *curiæ*. . . . The purposes of government were determined, its powers wielded, and the great offices held—suffetes, senators, generals, or judges—by the members of a small number of wealthy families. In the main, the government was conducted with skill and steadiness, as well for internal tranquillity as for systematic foreign and commercial aggrandizement. Within the knowledge of Aristotle, Carthage had never suffered either the successful usurpation of a despot or any violent intestine commotion."

At a period little later than her first distinct appearance on the stage of recorded history, Carthage possessed an imperial authority, in a greater or less degree, over the northern coast of Africa from the Pillars of Hercules to the Great Syrtis, a distance of about 16,000 stadia (2000 miles). But the only part of this extensive territory that was entirely subject to the dominion of Carthage was the country which extended S. of the city about ninety miles, and the boundaries of which were nearly the same as those of Zeugitana, and the strip of coast along which lay Byzacium and Emporia. Like other great commercial states, Carthage found that her maritime enterprise led her on almost inevitably to engage in foreign conquests and to contend for the dominion of the sea. The first foreign province that she acquired appears to have been the island of Sardinia, which belonged to Carthage at the time of her first treaty with Rome, 509 B. C. This island was the principal emporium of her trade with Western Europe, and always ranked as the chief among her foreign possessions. Among the earliest objects of the military enterprise of the Carthaginians was Sicily, then occupied by several Greek colonies. For the conquest of this island they sent a fleet of 3000 ships, with an army of 300,000 men, commanded by Hamilcar. He was defeated by Gelon, tyrant of Syracuse, at Himera, in 480 B. C., and was killed in this action, which was one of "the decisive battles of the world," and was important in a degree which no contemporary could estimate. The Carthaginians in 410 B. C. renewed the war against the Greeks of Sicily, and obtained possession of part of that island, where they were involved in a long contest with Dionysius of Syracuse. They planted colonies in Hispania (Spain), and derived much riches from the gold and silver mines of that peninsula, but their relations with the natives were peaceful, and they did not attempt to subjugate Spain before the Punic wars. Polybius states that all the islands of the Western Mediterranean belonged to Carthage at the commencement of the Punic wars, 264 B. C. In 509 B. C. a commercial treaty was concluded between Carthage and Rome. This celebrated document has been preserved by Polybius. The second treaty between these two powers was made in 348 B. C. It appears that the Carthaginians never came into hostile contact with the Athenian republic, although the latter was a great maritime power while Carthage was near the zenith of her prosperity.

The army of Carthage was composed chiefly of Libyan conscripts and slaves and foreign mercenaries. This defect in her military system was probably one of the chief causes of her ruin. This system could not afford the republic internal security, for the soldiers had little devotion to the cause for which they fought, and the enemies of Carthage found it their best policy to "carry the war into Africa." It would be an error to regard the Carthaginians as a merely commercial people. Agriculture was a favorite pursuit of the nobles, citizens, and colonists, and the soil of her African territory was extremely fertile. Her prosperity was also promoted by manufactures and mechanical arts. Gold and silver were the standard of value at Carthage, but we have no evidence that the republic coined money, as no Punic coins are now extant which were struck before the Romans conquered that state. Her merchantships passed beyond the Pillars of Hercules and made voyages to the British Islands. The Carthaginians also carried on an extensive inland trade by caravans, which traversed the deserts to the valleys of the Nile and Niger.

Carthage and Rome were the two greatest powers of the world when their competition for the rich island of Sicily involved them in the first Punic war, 264 B. C. The Romans, who had no navy when the war began, suffered several defeats at sea, and one of their generals, Marcus Regulus, who invaded Africa, was taken prisoner. They gained a great naval victory near Lilybœum in 241 B. C., which ended the war. The Carthaginians obtained peace by ceding Sicily and Sardinia to the victors. Carthage was so impoverished by this long war that she could not pay her armies. The mercenaries revolted in 240 B. C., and were joined by most of the subject Libyans in a civil war which brought Carthage to the brink of ruin. After the suppression of this revolt the peace and stability of the state were menaced by a feud between Hanno and Hamilcar Barca, who became respectively the leaders of the aristocratic and democratic parties. The great abilities and sagacity of Hamilcar restored the prosperity of the republic by the conquest of Spain, which, says Heeren, "was then the richest country of the known world." He invaded Spain in 237 B. C., and gained several victories, but he subdued the Spaniards by kindness rather than force. Before he had conquered all the Peninsula he died in 229, leaving the completion of the enterprise to his son-

in-law, Hasdrubal, and his own son, the famous Hannibal. The latter succeeded to the chief command of the army in Spain in 221 B. C. His conquests provoked the hostility of the Romans, and he began the second Punic war by marching across the Alps and invading Italy in 218 B. C. After he had defeated the Romans at several places in Northern Italy, he gained a most signal and complete victory at the great battle of Cannæ in the summer of 216 B. C. The second Punic war seems to have been conducted by Hannibal rather than the state, from which he received little aid or co-operation. By his military genius and personal resources he maintained himself in Italy for about fifteen years. (For the details of this war, which was ended by the victory of the Roman general Scipio at Zama in 202 B. C., the reader is referred to the article HANNIBAL.) The treaty which the victors dictated in 201 B. C. deprived Carthage of all her dominions outside of Africa. Hannibal, who soon obtained the ascendency in Carthage, made important reforms, which reduced the power of the aristocracy and the judges, but he was driven into exile by a hostile faction in 195 B. C. The Romans, who resolved to destroy Carthage, found a pretext to commence the third Punic war in 150 B. C. The Carthaginians made an heroic and desperate resistance, but their capital was taken and utterly ruined in 146 B. C. On the commanding site of the Punic Carthage the emperor Augustus founded a Roman town, which was also called Carthage, and became a very rich and populous city. Herodian states that in his time it was next to Rome in population and wealth. In 439 A. D. it was taken by Genseric, who made it the capital of the Vandal kingdom in Africa. It was captured and finally destroyed by the Arabs in 647 A. D. Few vestiges of its ancient grandeur remain to indicate its site, except some broken arches of a great aqueduct which was fifty miles long. (See ARNOLD, "History of Rome," vol. ii.; HEEREN, "Historical Researches into the Politics, Commerce, etc. of the Ancient Nations of Africa," 1824; BÖTTIGER, "Geschichte der Carthager," 1827; MÜNTER, "Religion der Karthager," 1821.) WILLIAM JACOBS.

Car'thage, a post-township of Hale co., Ala. P. 960.

Carthage, a post-village, capital of Hancock co., Ill., is at the crossing of the Keokuk branch of the Toledo Wabash and Western R. R. and the Burlington and Quincy R. R., 13 miles E. of Keokuk. It has one national bank, seven churches, a Lutheran college, and two newspapers. Pop. 1448; of Carthage township, 2448.

THOS. C. SHARPE, ED. CARTHAGE "GAZETTE."

Carthage, a post-village of Ripley township, Rush co., Ind. Pop. 481.

Carthage, a township of Franklin co., Me. Pop. 486.

Carthage, a small town, capital of Leake co., Miss., is about 60 miles N. E. of Jackson, and is on the line of the Natchez Jackson and Columbus R. R., which is now in course of construction. It has one weekly newspaper.

L. M. GARRETT, ED. OF "THE CARTHAGINIAN."

Carthage, a city, capital of Jasper co., Mo., on Spring River and on the line of the Memphis Carthage and Northwest R. R., situated in the centre of the rich lead-regions of South-west Missouri, with numerous manufactories, an academy, two public schools, two parks, a public library, and one national bank. Four newspapers are published in this place. On the morning of July 5, 1861, a force of Confederates under Gov. Jackson and Gen. Price, numbering about 3500 men, while retreating from the army of Gen. Lyon, were confronted about 7 miles E. of this town by a body of Federal troops under Gen. Sigel, numbering about 1500. Gen. Sigel was superior in artillery, while the Confederates, largely outnumbering him, had the advantage also of a body of cavalry. Gen. Sigel, availing himself of his superior strength, opened fire with his artillery, which he continued, to the severe loss of the Confederates, for several hours, when, to avoid being outflanked by the Confederate cavalry, and to protect his baggage-train, he was obliged to fall back, which he accomplished in good order, continuing his retreat to Carthage and to Sarcoxie, 15 miles eastward. The Federal loss was less than 50 killed and wounded, while the Confederate loss was reported to be 50 killed and about 150 wounded.

J. A. BODENHAMER, ED. "PEOPLE'S PRESS."

Carthage, a post-village of Wilna and (West Carthage) of Champion townships, Jefferson co., N. Y., on the Utica and Black River R. R., and on Black River and its canal, 23 miles by rail E. of Watertown. It has extensive water-power, lumber-mills, forges, foundries, and manufactories of nails, machinery, leather, furniture, wooden-ware, etc., and has also a bank, a weekly newspaper, and seven churches.

Carthage, a post-village, capital of Moore co., N. C., about 60 miles S. W. of Raleigh. Pop. of Carthage township, 1786.

Carthage, a township of Athens co., O. Pop. 1272.

Carthage, a post-village, capital of Smith co., Tenn., is on the Cumberland River, 50 miles by land E. N. E. of Nashville. Pop. 477.

Carthage, a post-village, capital of Panola co., Tex., about 45 miles S. of Jefferson.

Cartha'go No'va [the Lat. for "New Carthage"], an ancient and celebrated city of Hispania (Spain), on the Mediterranean, was founded by Hasdrubal in 242 B. C. It had an excellent harbor, and became a great commercial city of the Carthaginians. It also derived much prosperity from its rich silver-mines, in which 40,000 men are said to have been employed, In 210 B. C. it was captured by Scipio Africanus. Strabo informs us that it was in his time a great emporium of exports and imports. It was destroyed by the Goths before 550 A. D. The site is occupied by CARTAGENA (which see).

Car'thamine, a dyestuff obtained from the *Carthamus tinctorius*, a plant which is a native of India and Egypt, and is sometimes called saffron or safflower. This is the plant used in domestic medicine and known as saffron, but it is very different from the true saffron, or *Crocus sativus*. It is used to dye cotton and silk, to which it imparts a beautiful red color which is not very permanent.

Carthu'sians [Lat. *Carthusiani*; Fr. *Chartreux* (fem. sing. *Chartreuse*)], a monastic order founded in France by Saint Bruno in 1086. It was sanctioned by the pope in 1170, and was propagated in England and Italy. The monasteries of these monks in England were called Charterhouses, a corruption of the French *Chartreuse*. Their rules require them to perform manual labor, to abstain from eating flesh, and to observe ascetic practices, among which is a vow of continual silence. They built near Grenoble a magnificent convent called La Grande Chartreuse. Their houses are few at present. The Carthusian nuns were dispersed during the French Revolution. They have been restored, but are very few in number.

Cartier (Sir GEORGE ETIENNE), BART., an eminent Canadian statesman, a descendant of the following, was born Sept. 6, 1814. He became distinguished as the leader of the French Canadian conservatives, and was the author of many legal and political reforms. Died May 20, 1873.

Cartier (JACQUES), a French navigator, born at St. Malo Dec. 31, 1494. He discovered the river St. Lawrence in 1534, and ascended it as far as the site of Montreal. He returned to France in 1536. Died about 1554.

Cart'ilage [Lat. *cartilago*] is a firm, opaque, highly elastic substance of a pearly white or bluish-white color (rarely yellow), presenting to the eye a homogeneous appearance, but in reality composed of cells (corpuscles) variously combined with a fibrous, granular, or structureless intercellular substance. Cartilages may be classified as the temporary, the permanent, and the accidental. The temporary cartilages are substitutes for bone in the earlier periods of life, and after a time become ossified. At birth the extremities and larger eminences of the long bones and the margins of the flat bones are still cartilaginous, and this cartilage does not altogether disappear till puberty. Permanent cartilages are articular or non-articular. Articular cartilages are attached to the extremities of bones and enter into the formation of joints. Non-articular cartilages are usually more flexible than the articular. They are sometimes attached to bones to lengthen them out, as, for instance, in the nose and some of the ribs. In other cases they form the basis of distinct organs, as the larnyx, the Eustachian tubes, the external ear, the trachea, and the eyelids. Accidental cartilages are cartilaginous concretions which are occasionally found in situations where they do not normally occur, and are of little general interest, except as the basis of chondromata or cartilage-tumors. There is also a substance called fibro-cartilage, composed of cartilage mixed with white fibrous tissue. There is another substance known as spongy cartilage found in a few organs. Osseine (ostein) is frequently but incorrectly called bone-cartilage.

Cartilag'inous Fishes, those whose skeletons are destitute of true bone. (See FISHES.)

Cartoogacha'yo, a township of Macon co., N. C. Pop. 480.

Cartoon' [Fr. *carton*; It. *cartone*, from the Lat. *charta*, "paper"*], a term applied in the fine arts to a design drawn on paper for a fresco, oil picture, or a tapestry. The cartoon is of the same size as the subsequent work, and is sometimes primed or washed with ground-color. The artist draws the cartoon in order that he may adjust the

* The French *carton* and the Italian *cartone* are properly augmentatives from *carta*, "paper," and signified originally large, coarse, strong paper.

drawing and composition of his subject in circumstances in which alterations can be made with facility. The drawing is made either in chalk or in distemper. The cartoon when finished is transferred to the canvas or plaster, either by tracing with a hard point or by pricking with pins, charcoal in both cases being used.

The use of cartoons is particularly important in fresco paintings, of which only a small portion can be executed at a time, because the plaster must be moist when the pigment is applied to it, and it would be impossible to sketch the whole design on the plaster in the first instance. Therefore the cartoon must be traced in compartments so small that the artist can finish one before the plaster becomes dry. The most famous works of this kind are seven cartoons of Raphael which are preserved at Hampton Court in England. These are a part of a set of twenty-five in number which were sent to Flanders to be copied in tapestry for Pope Leo X. After the fabrication of the tapestry, which is said to be extant in Rome, the cartoons lay neglected at Brussels, and many of them were destroyed. The seven which were purchased by Rubens for Charles I. of England represent the following subjects: 1, Saint Paul preaching at Athens; 2, the death of Ananias; 3, Elymas the sorcerer struck with blindness; 4, Christ delivering the keys to Saint Peter; 5, the sacrifice at Lystra; 6, the apostles healing the sick in the temple; 7, the miraculous draught of fishes. These have been engraved by Dorigny and Audran. When the collection of Charles I. was sold these cartoons were purchased for the nation by Cromwell's special command.

Car'tridge, a case containing the proper quantity of powder or ammunition required to charge a gun or firearm. Cartridges for muskets are usually paper tubes, each containing a small amount of powder and a leaden ball. These are called ball cartridges. The paper used for this purpose is strong, and is made into a tube by means of a mandrel. Thinner paper is applied to certain parts of the tube, so that the powder has two or three thicknesses of paper around it, but the ball has only one. Besides this form there are several patent cartridges. A cartridge which contains powder only is called a blank cartridge. Cartridges for cannon or large guns are chiefly made of serge or flannel sewed up in the form of a bag, which, filled with a given weight of powder, is tied around the neck and strengthened by iron hoops. Cartridges for pistols are usually copper cylinders, having at the base the proper amount of fulminating powder, which inflames the charge of gunpowder upon being struck by the hammer, and these cartridges are used in most breech-loading firearms.

Cart'wright, a twp. of Sangamon co., Ill. Pop. 1851.

Cartwright (Edmund), an English clergyman, noted as the inventor of the power-loom, was born at Marnham April 24, 1743. He wrote "Arminia and Elvira" and other poems. In 1785 he exhibited his first power-loom, the introduction of which was violently opposed by the operatives, who burned a mill containing 500 of his looms. In 1809 he received a gift of £10,000 for his invention. Died Oct. 30, 1823.

Cartwright (John), Major, a brother of the preceding, was born at Marnham Sept. 28, 1740. He became an officer in the navy, but he refused to fight against the U. S. He gained distinction as an advocate of parliamentary reform and as a friend of liberty. Died Sept. 23, 1824.

Cartwright (Peter), D. D., a Methodist preacher, born in Amherst co., Va., Sept. 1, 1785. He labored with great success for upwards of sixty years, and is said to have preached 18,000 sermons. His labors were chiefly in the Mississippi Valley. Died Sept. 25, 1872.

Cartwright (Samuel A.), M. D., one of the most distinguished physicians of the South-west, and who was chief surgeon during Andrew Jackson's campaigns. He was born in Virginia in 1793, studied medicine under the celebrated Dr. Rush, and graduated at the University of Pennsylvania. He commenced the practice of his profession in Huntsville, Ala., but soon moved to Natchez, Miss., which became his field of labor for a quarter of a century. His numerous contributions to medical science may be found scattered through the journals of his day; he received valuable medals and prizes on medical topics—for he was a vigorous writer—especially for his labors on yellow fever, cholera infantum, etc., and a golden testimonial from the planters of his own county for his successful treatment of the Asiatic cholera. In 1836 he visited Europe, and in 1848 he removed to New Orleans. During 1862 he was consulted by Mr. Davis how to improve the sanitary condition of the Southern troops stationed near Port Hudson and Vicksburg. It was while in the discharge of this duty that he contracted the disease of which he died. Cartwright's treatment of hæmorrhoids by the sulphate of iron was generally adopted in the army; and that for prevention of the constitutional symptoms of syphilis was confirmed in the New York Hospital. Of him it has been said, "Full of charity and good-will towards all men, he fulfilled faithfully his station in all the relations of life." His last days, as all his life had been, were passed in doing good. Paul F. Eve.

Carus (Karl Gustav), a celebrated German physiologist, was born at Leipsic in 1789. His lectures on comparative anatomy, delivered in his native town in 1812, attracted great attention, and still more his book on the circulation of the blood in insects. It is, however, his writings on subjects belonging partly to science, partly to art—as, for instance, "Psyche"—which have gathered a brilliant circle of the greatest scientists and artists to his house in Dresden, where he lives as court-physician.

Car'ver, a county in S. E. Central Minnesota. Area, 375 square miles. It is bounded on the S. E. by the Minnesota River, and is also drained by the South Fork of the Crow River. The surface is undulating and the soil is fertile. Wheat, corn, wool, and oats are extensively raised. It contains several small lakes. Cap., Chaska. P. 11,586.

Carver, a post-township of Plymouth co., Mass. Iron ore is here obtained, and castings extensively manufactured. Pop. 1092.

Carver, a post-township of Carver co., Minn., on the N. Pacific and the Hastings and Dakota R. Rs., and on the Minnesota River, 25 miles S. W. of Minneapolis. P. 521.

Carver (John), a native of England, came in the Mayflower to America in 1620, and was elected first governor of the Plymouth Colony. Died in 1621.

Carver (Jonathan), an American traveller, born in Connecticut in 1732. He made an exploring expedition across North America to the Pacific Ocean in 1766–68, and published "Travels through the Interior Parts of North America." Died in London in 1780.

Carver's Creek, a twp. of Bladen co., N. C. P. 996.

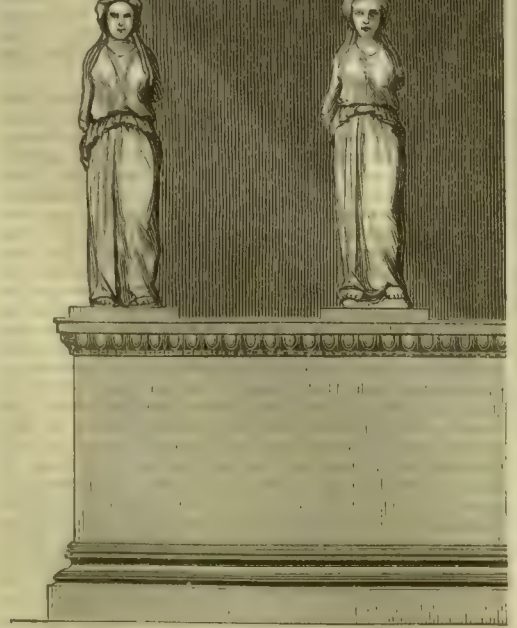
Carver's Creek, a twp. of Cumberland co., N. C. P. 1391.

Carvin-Épinoy, a town of France, in the department of Pas-de-Calais, is on a railway 11 miles S. S. W. of Lille. It has manufactures of beet-root sugar, starch, and earthenware. Pop. 6546.

Car'ving, a branch of sculpture, performed on metals, bone, stone, wood, and ivory. It is a branch of sculpture, but the latter term more especially denotes the construction of independent figures of men and animals, while carving represents designs of all kinds on the surface of various objects, such as furniture, doors, walls, goblets, crucifixes, etc. Ivory was the favorite material in the East from an early period. During the palmy days of Grecian art ivory was largely employed. The earliest statues of the gods were generally of wood, different kinds of wood being appropriated to different divinities. Carvings in ivory form an important branch of early Christian sculpture. During the seventeenth and eighteenth centuries we find ivory again extensively employed. Ornamental carving is now executed on a large scale by various machines. (See Wood Carving.)

Ca'ry (Alice), a talented poet and prose-writer, born April 26, 1820, 8 miles from Cincinnati, O., was the daughter of one of the first settlers of Cincinnati. Her family was of New England origin, and her parents were persons of cultivation and in good circumstances, but, as they lived in a newly-settled country, the daughters had but imperfect school advantages. When eighteen years of age she commenced writing for the press, both in prose and verse. Her sketches, signed "Patty Lee," in the "National Era," attracted much attention. In 1850, with her sister Phœbe, noticed below, she published a successful volume of poems. In 1851 the first series of her "Clovernook Papers" appeared. In 1852 the two sisters removed to New York and devoted themselves to literature. In this they were successful, for, without becoming wealthy, they were able to maintain a pleasant and comfortable home, made not less pleasant by the genial hospitality and good taste which distinguished its owners—a hospitality which was highly prized by all who had the good fortune to share it. Among her earliest and most constant friends was the late Hon. Horace Greeley. A place at the tea-table of the Cary sisters was always reserved for him, and he was one of their most frequent and welcome guests. Their Sunday evening receptions were for years the resort of members of the guild of letters, both authors and publishers making it a place of pleasant social intercourse. Besides several volumes of poetry and a great number of contributions to periodical literature, she published two additional series of "Clovernook" (1853–54), "Hagar, a Story of To-day" (1852), "Married not Mated" (1856), "Pictures of Country Life" (1857), "The Lover's Diary" (1867), "Snowberries" (1869), and several

other works. Her poetical style is graceful and of a high order of merit. Her prose is perhaps even better than her verse. She delighted in the description of simple domestic scenes, which she presented with much felicity. She was an untiring worker, though many years of her life were passed in great suffering, which she endured with remarkable patience. She died at New York Feb. 12, 1871.



Cary (Col. Archibald), an American patriot, born in Virginia about 1730, took an active part in the convention of 1776 which framed the constitution of Virginia, and was afterwards a member of the Senate. Died in Sept., 1786.

Cary (Rev. Henry Francis), an English poet, born at Birmingham in 1772, was educated at Oxford. He became in 1797 vicar of Bromley Abbots. His reputation is founded on an admirable translation of Dante's "Divina Commedia" (1814), which is very accurate and expressive, and is generally considered the best translation of that celebrated poem. He was for some years assistant librarian of the British Museum. Died Aug. 14, 1844.

Cary (Phœbe), a younger sister of Alice Cary, noticed above, was born near Cincinnati, O., Sept. 4, 1824. One of her earliest productions, written at the age of seventeen, was the well-known poem commencing "One sweetly solemn thought comes to me o'er and o'er." Of the first volume of poems published by the two sisters, her share was much the smaller in bulk, though in the opinion of many critics her poetry was in no way inferior to that of her sister, being characterized by more variety, spirit, and humor than that of Alice. She published "Poems and Parodies" (1854), "Poems of Faith, Hope, and Love" (1868), besides numerous hymns and occasional contributions to periodicals. Phœbe Cary was remarkable for genial and ready wit in conversation. She did not long survive the death of Alice. Worn out by anxiety during her sister's long illness, and overwhelmed by grief after her death, her system was unable to throw off an attack of malarial fever, of which she died at Newport, R. I., July 31, 1871. The sisters were buried in Greenwood Cemetery, where a beautiful monument has been erected to their memory at a cost of about $1000, Mr. Greeley heading the subscription for the purpose. (See "Alice and Phœbe Cary," by M. C. Ames, 1873.)

Cary (Samuel F.). See Appendix.

Caryat'ides [Gr. Καρυάτιδες], the Latin plu. of *Caryatis*,

Caryatides, from the Erechtheum at Athens.

i. e. a woman of Caryæ (a city of Laconia), or a virgin dedicated to the service of the Caryan Diana. The term is applied in Greek architecture to female figures which were used instead of columns to support a roof or entablature. They were usually dressed in long robes. The corresponding male figures are called Atlantes and Telamones.

Cary'ocar, a genus of large trees of the order Rhizobolaceæ, which comprises but few other genera. They are natives of Brazil and Guiana, and are sometimes called pekea trees and butter trees. The fruit is a drupe or nut which has a soft, edible, and delicious kernel, and is known by the names of butter-nut and souari-nut. The drupe contains, besides the kernel, a pulp which is like butter, and is used in cookery as a substitute for it. Oil of good quality is obtained from the kernels. The timber of the caryocar is good for shipbuilding. The *Caryocar nucifera* is cultivated in the island of St. Vincent.

Caryophylla'ceæ [from the specific name of the carnation (*Dianthus Caryophyllus*)], a natural order of exogenous plants, mostly herbaceous and natives of temperate and cold countries. They have opposite, entire leaves, often united at the base, regular flowers, and stems usually swollen at the articulations. The fruit is a 1-celled capsule or pod. The order comprises nearly 1000 species, some of which have beautiful flowers, as the pink (*Dianthus*). Among the other genera are the *Silene, Lychnis, Arenaria, Stellaria* (chickweed), and *Saponaria* (soapwort), which is said to be a substitute for soap.

Caryop'sis [from the Gr. κάρυον, a "nut," and ὄψις, "appearance"], in botany, a fruit in which the seed and pericarp are so closely united as to be inseparable and undistinguishable. The fruit or grain of wheat, barley, maize, and other graminaceous plants is a caryopsis. It is a 1-celled, 1-seeded, and indehiscent pericarp.

Caryo'ta, a genus of palm, sometimes called the jaggery-palm or sugar-palm, growing in India and Ceylon. *Caryota urens,* a lofty, spreading tree, yields a large amount of fermentable juice (toddy) when its spathes are incised; this is boiled down to produce sugar. Its farinaceous pith resembles sago, and its fibres are used for making ropes.

The quantity of sugar produced in India from this and a few other palm trees is very great, but the quality is inferior. The cultivation of the jaggery-palm is entirely in the hands of a caste, or sub-caste, of Soodras, who devote their whole labor to this crop. The genus *Caryota* is botanically very distinct from all other known palms.

Ca'rysfort Reef, a dangerous coral-reef at the edge of the Gulf Stream, near the S. point of Florida, lat. 25° 13′ 15″ N., lon. 80° 12′ 45″ W., has an iron-pile lighthouse 112 feet high, with a flashing light of the first order 106 feet above the sea.

Ca'ryville, a village of Oakfield township, Genesee co., N. Y., is the seat of Cary Collegiate Institute (Episcopalian).

Ca'sa, an Italian and Spanish word signifying a "house," a "home," a "family," and forming a part of many Italian and Spanish names.

Casacalen'da, a town of Italy, in the province of Campobasso, is about 18 miles N. E. of Campobasso. It has three churches and a convent. Silk and wine of good quality are produced in this vicinity. Pop. 6000.

Casa'le, a fortified town of Italy, in the province of Alessandria, is on the river Po, 37 miles E. of Turin. It has an iron bridge across the river, an old castle, and a cathedral founded in 1474; also several convents, a college, a public library, a theatre, and two hospitals. Here are manufactures of silk twist. Casale is the seat of a bishopric, and was formerly the capital of the duchy of Montferrat. Many Roman remains are found here. Pop. in 1871, 27,514.

Casal' Pusterlen'go, a town of Italy, in the province of Milano, on the Brombolo, 29 miles S. E. of Milan. It has manufactures of silk and linen and earthenware, and a trade in Parmesan cheese, which is made here. Pop. 5437.

Casamas'sima, a town of Italy, in the province of Bari, 12 miles S. E. of Bari. It has a convent and two abbeys. Pop. 5941.

Casano'va de Seingalt' (Giovanni Giacomo), a celebrated Italian adventurer, born at Venice April 2, 1725. He travelled extensively, passed his life successively in many European capitals, and mixed with aristocratic society. He fought several duels, and was confined in the dungeons of Venice for nearly two years. About 1790 he became librarian to Count Waldstein in Bohemia. He is said to have been witty, dissipated, and greatly addicted to intrigues. Died June 4, 1798. He left autobiographic memoirs, which were published in 1822.

Cas'areep', **Cassareep,** or **Casaripe,** a sauce or

condiment made of the juice of the bitter cassava or manioc root. It is highly esteemed in Guiana, where it is employed to flavor nearly every dish. It is the basis of the West Indian *pepper-pot*, and is imported into Great Britain. It is a powerful antiseptic, by means of which meat can be kept fresh for a long time. The fresh juice is poisonous, but its noxious properties are removed by cooking.

Ca'sas, de las (Bartolomé), a benevolent Spanish Dominican missionary, born at Seville in 1474. He accompanied Nicolas d'Ovando, governor of San Domingo, to America in 1502, and preached the gospel in Hispaniola. His sympathies were excited by the cruelty with which he found that the Indians were treated, and he directed untiring efforts to the improvement of their condition, interceding with the governor, Velasquez, and the emperor Charles V. The statement that he suggested the introduction of African slaves is not now accepted. After he had officiated as bishop of Chiapa in Mexico, he returned to Spain in 1551. Died July, 1566. (See Arthur Helps, "Life of Las Casas," 1868.)

Casaubon (Isaac), an eminent Protestant scholar and critic, born of French parents at Geneva Feb. 18, 1559. He was appointed professor of Greek at Geneva in 1582, and married, about the year 1585, Florence, a daughter of the well-known Henri Étienne (or Stephanus). He displayed great critical sagacity and learning in editions of classical authors, including Athenæus, Polybius, and Aristotle. In 1599 he removed to Paris, where he taught Greek, and was made royal librarian by Henry IV. Among his works is a treatise on religious liberty, "De Libertate Ecclesiastica" (1607). Having emigrated to England in 1610, he was appointed prebendary of Canterbury by James I. Died July 1, 1614. (See C. Nisard, "Le Triumvirate littéraire, Juste Lipse, Scaliger, et Casaubon," 1851.)

Cascade, a post-township of Dubuque co., Ia. Pop. 1289.

Cascade, a post-township of Kent co., Mich. Pop. 1157.

Cascade, a post-township of Olmsted co., Minn. Pop. 812.

Cascade, a township of Lycoming co., Pa. Pop. 595.

Cascade Range, a chain of mountains in Oregon and Washington Territory, is nearly parallel with the coast of the Pacific Ocean, and is a continuation of the Sierra Nevada of California. The direction of the range is nearly N. and S. Its distance from the sea-coast is in Oregon about 120 miles. The Columbia River breaks through this range, forming the cascades from which the name is derived. Among the highest summits of this range are Mount Hood, which rises about 14,000 feet above the sea, and Mount Jefferson, both in Oregon. Some of the peaks are volcanic, as Mount St. Helen, about 12,000 feet high.

Cascades, a post-village, capital of Skamania co., Washington Territory, on the N. bank of the Columbia River, about 50 miles W. of Dalles City.

Cascaril'la [diminutive of *cáscara*, the Spanish word for "bark"], a name given in South America to different kinds of bitter medicinal barks, including Peruvian bark. European and American physicians and apothecaries apply the term to the bark of the *Croton Eleutheria*, a small West Indian tree. This bark is imported into Europe and the U. S., and is used in medicine as a stimulant tonic.

Cas'co, a post-township of Cumberland co., Me. It has manufactures of canned goods, leather, lumber, starch, etc. Pop. 998.

Casco, a township of Allegan co., Mich. Pop. 1264.

Casco, a post-township of St. Clair co., Mich. Pop. 1991.

Casco, a post-township of Kewaunee co., Wis. Pop. 794.

Cas'co Bay, in Maine, washes the shore of Cumberland county, and is about 20 miles long. The city of Portland is at the western extremity of this bay, which encloses about 300 islands.

Case [Fr. *cas*; Lat. *casus*, a "fall," an "accident," a "casualty," from *cado*, *casum*, to "fall"], a term used in various senses, signifies an event; a condition in which a person is placed; the state of the body with respect to health or disease; a predicament; a situation or contingency; in grammar, the inflection of nouns or a change of termination; in law, a cause or a suit in a court. A wooden box in which dry goods and hardware are packed is called a case. *To be in good case* signifies "to be fat." Case, in printing, is a receptacle for types: this is divided into compartments, each of which contains the types of but one letter. Commonly there is an upper and a lower case; the upper holding the capitals, small capitals, and *sorts* little used; the lower, the small letters, points, figures, etc.

Case, in law, is used in a number of significations. (1) It indicates a form of action, called "an action on the case." This action did not exist in the early English law, but was introduced by a statute of the reign of Edward I. (Westminster 2d). It is founded on the peculiar circumstances of the case, and supplies a remedy for such wrongs as cannot be included under the term "trespass," and which are in their nature indirect and consequential. It applies to such wrongs either committed against one's person or property, whether real or personal. The action is sometimes called "trespass on the case," and at other times simply "case." Out of this action grew the modern action of "assumpsit," which is really instituted to recover damages for breach of contract. (2) It sometimes means a suit or action in court. Thus, in the U. S. Constitution it is said that the judicial power of the Federal courts shall extend to all *cases* in law and equity. The meaning of the word has been settled by adjudication, as shown in approved treatises on the Constitution. (3) Another sense is a written or printed statement of facts for the opinion of counsel or for the decision of a court without regular trial. The question then to be decided is a question of law, and the facts are sometimes presented by agreement, and at other times through the formal intervention of a jury. This is frequently called a "case stated." (4) In legal practice the word is used to denote the mode of presenting the facts which occurred at a trial to an appellate court for review. If the respective parties fail to agree on a statement of facts, the court before which the trial occurred passes definitively upon them in a prescribed manner, and is thereupon said to "settle" the case.

Case (Augustus Ludlow), U. S. N., born Feb. 3, 1831, in Newburg, N. Y., entered the navy as a midshipman April 1, 1828, became a passed midshipman in 1834, a lieutenant in 1838, a commander in 1855, a captain in 1863, a commodore in 1867, and a rear-admiral in 1872. He served on the E. coast of Mexico during the Mexican war, participating in the capture of Vera Cruz and Tobasco. Early in 1861, Commander Case was appointed fleet-captain of the North Atlantic blockading squadron, in which capacity he took part in the capture of Forts Hatteras and Clarke, Aug. 29, 1861, and in the operations in the sounds of North Carolina in the winter of 1862. In 1863, in command of the Iroquois, and assisted by the steamers James Adger and Mount Vernon, he cut out the blockade-runner Kate, under the fire of the forts and batteries at New Inlet, N. C. Referring to the capture of Forts Hatteras and Clarke, Flag-officer Stringham, in his official report of Sept. 2, 1861, writes: "I here take the opportunity of mentioning with great pleasure the name of Commander A. Ludlow Case, my fleet-captain, for very prompt and efficient services during all the time we have been occupied in the expedition so successfully terminated." And Flag-officer Goldsborough, in a letter to the navy department dated Feb. 18, 1862, says: "It is really difficult for me to state, in adequate terms, how largely I feel myself indebted to Commanders Rowan and Case for their constant and signal services. They, hand in hand, with their marked ability and sound sense, and in the absence of all ordinary facilities, brought about, at Hampton Roads, the arming, manning, and equipment of the many vessels sent to us, from necessity, in an unprepared condition; and subsequently they both labored, most conspicuously and faithfully, in their respective spheres of action, to vanquish difficulties . . . at Roanoke. In short, their assistance has been invaluable to me." He was chief of the bureau of ordnance from Aug., 1869, to May, 1873; in June, 1873, he was appointed to the command of the European squadron.

Foxhall A. Parker, U. S. N.

Case-hardening is forming a covering of steel on the surfaces of gun-locks, tools, the upper surface of railroad iron, grates, fenders, etc. The articles are first heated to redness, sprinkled with yellow prussiate of potash, and heated again. The heat decomposes the prussiate of potash, and the liberated carbon combines with the iron, forming a coating of steel on the surface. Another mode is to surround the articles with a layer of animal matter, such as powder from charred hoofs or waste leather, with a little common salt, and heat them in an iron case to redness, retaining them at that temperature for half an hour or more; the articles are then taken out and cooled in cold water or in oil. The coating of steel is very thin, seldom exceeding one-sixteenth of an inch. The steel covering makes the articles more durable, and admits of a better polish.

Ca'seine [from the Lat. *caseus*, "cheese"], a nitrogenous organic substance allied to albumen, found in milk, and most abundantly in that of flesh-eating animals. It is said to be occasionally found in the fluid of cysts. It is

also found (as legumine, and probably as amandine, both being regarded as identical with it) in peas, beans, almonds, and other seeds. Vegetable and animal caseines behave exactly alike with chemical tests, and when pure cannot be distinguished by the taste. The proportion in cow's milk is about 4 per cent.; in dried peas, 25 per cent. Caseine is coagulated (curdled) by acids or by rennet, and is the chief constituent of CHEESE (which see). It also forms insoluble precipitates with corrosive sublimate, with nitrate of silver, and with acetate of lead. Hence, copious draughts of milk afford a ready antidote in cases of poisoning with either of the above salts. Caseine is also used in calico-printing. The probable proportions of the constituent elements of caseine in 100 parts have been given as follows: carbon, 53.83 parts; oxygen, 22.52; nitrogen, 15.65; hydrogen, 7.15; sulphur, 0.85, with perhaps a little phosphorus; but its composition is not exactly known.

CHARLES W. GREENE.

Casemate [from the Sp. *casa*, "house," and *matar*, "to kill"] was originally a loopholed gallery excavated in a bastion, from which the garrison could fire on an enemy who had obtained possession of the ditch. The term was afterwards applied to a bomb-proof vault in a fortress, which is designed for the protection of the garrison, and is sometimes used as a barrack or hospital. A casemated battery consists of such a vault or vaults, with openings for the guns, called "embrasures" or ports. The term casemate is also applied to the part of an iron-clad vessel armored to protect broadside guns.

Casement, a portion of a window-sash made to open or turn on hinges; a frame with hinges enclosing part of the glazing of a window. Such windows are very common on the continent of Europe. The term is also applied to a deep, hollow circular moulding, similar to the *scotia* of classical and the *cavetto* of Italian architecture.

Caseno'via, a township of Muskegon co., Mich. Pop. 1094.

Caserta. See TERRA DI LAVORO.

Caser'ta, a town of Italy, capital of Terra di Lavoro, is situated on a plain about 21 miles by rail N. E. of Naples. It has, besides numerous churches and a military school, a magnificent royal palace, which was built by Vanvitelli about 1755, and is one of the largest in Europe. Connected with the palace is a fine park and an aqueduct. Here is a royal silk-factory, in which about 700 persons are employed. Pop. in 1871, 29,142.

Case-Shot [Fr. *mitraille;* Ger. *Kartätschenschuss* (*i. e.* "cartridge-shot")] is the name of a projectile, consisting of several balls or bullets of lead or iron packed in a case. When the case is a cylinder of tin with a wooden bottom, the whole is called cylindrical-case or canister. The number of shot in each canister varies from 40 to 126. Some armies use canister with an explosive charge in the centre, but more commonly it has no such charge. When the balls are affixed to a central spindle without a case, or enclosed in a canvas bag, they are called grape-shot. This is especially used in garrison-artillery. Against advancing lines the effect of grape and canister at close range is often terrible, but solid shot and shell are preferred against columns. Spherical-case or shrapnel (so named from its inventor) is a thin cast-iron shell, containing a chamber with a light or bursting charge of gunpowder, around which are packed bullets of lead or iron. It should burst at least forty yards in advance of the enemy. This missile is effective at three times the range of canister, but at long distances its effect is often lost from lack of precision in the aim or in the cutting of the fuse.

Caseville, a post-township of Huron co., Mich. P. 382.

Ca'sey, a county in S. Central Kentucky. Area, 350 square miles. It is intersected by Green River. The surface is uneven or hilly. Wheat, tobacco, and corn are the chief crops; cattle and wool are also raised. Capital, Liberty. Pop. 8884.

Casey, a post-village of Cumberland township, Clark co., Ill., on the St. Louis Vandalia Terre Haute and Indianapolis R. R., 18 miles W. S. W. of Marshall. It has one weekly newspaper.

Casey, a post-village of Thompson township, Guthrie co., Ia., on the Chicago Rock Island and Pacific R. R., 82 miles E. by N. of Council Bluffs. It has one weekly newspaper.

Casey (SILAS), an American officer, born July 12, 1807, at East Greenwich, R. I., graduated at West Point 1826, and Oct. 9, 1861, became colonel Fourth Infantry, and May 31, 1862, major-general U. S. volunteers. He served on western and northern frontiers 1826–36, in Florida war 1837–41, engaged at Pilaklikaka, on northern frontier 1842–47, in war with Mexico 1847–48, engaged at Contreras and Churubusco (brevet major), Molino del Rey, and Chapultepec (wounded in leading assault, and brevet lieutenant-colonel), on the Pacific frontier 1848–54, on tactical and arms boards 1854–55, and at Puget Sound post 1856–61, engaged in several Indian skirmishes. During the civil war he served in preparing volunteers for the field at Washington, D. C., 1861–62, in the Virginia peninsula 1862, engaged at Fair Oaks (brevet brigadier-general), as president of board for examination of officers of colored troops 1863–65, in command at Detroit, Mich., 1865–67, and commissioner to examine war-claims of Ohio. Brevet major-general U. S. A. Mar. 31, 1866, for gallant and meritorious services. Compiled and edited a system of "Infantry Tactics" for the U. S. service 1862, and "Infantry Tactics for Colored Troops," 1863, and was retired from active service July 8, 1868. GEORGE W. CULLUM, *U. S. Army.*

Casey (SILAS, JR.), U. S. N., born Sept. 11, 1841, in Rhode Island, graduated at the Naval Academy in 1860, became a master in 1861, a lieutenant in 1862, a lieutenant-commander in 1866. In 1861 he was attached to the steamer Wissahickon, South Atlantic blockading squadron, and participated in the first attack on Fort Sumter, and in various engagements with the forts and batteries in Charleston Harbor. FOXHALL A. PARKER, U. S. N.

Casey (THOMAS LINCOLN). See APPENDIX.

Ca'seyville, a post-village of St. Clair co., Ill., on the Ohio and Mississippi R. R., 9 miles E. of St. Louis. Coal is here extensively mined.

Caseyville, a post-village of Union co., Ky., on the Ohio River, 13 miles below Shawneetown. Pop. 560.

Cash [Fr. *caisse;* Ger. *Kasse*], money; coin or current bank-notes; ready money. It is often used to denote immediate payment, and goods are said to be sold for cash when they are not sold on credit.

Cash-book, a book in which merchants, bankers, and others keep an exact and methodical account of each sum of money received or paid by them.

Cash'el, a town of Ireland, in the county of Tipperary, is 105 miles by railway S. W. of Dublin and 49 miles N. N. E. of Cork. It is built on the slopes of an isolated limestone hill rising abruptly from a rich plain. Cashel was the residence of the kings of Munster, and is now a bishop's see. The top of the hill called the "Rock of Cashel" is occupied by the most interesting ruins in Ireland. These consist of a round tower ninety feet high, the palace of the kings of Munster, a chapel of Saxon and Norman architecture, and a cathedral which was founded in 1169, and is said to have been the largest in the country. It was built of limestone. Pop. in 1871, 3976.

Cash'er's Val'ley, a post-township of Jackson co., N. C. Pop. 509.

Cashew'-nut (*Anacardium occidentale*), a tree of the order Anacardiaceæ, is a native of the tropical parts of America, and perhaps of Asia. It abounds in a clammy, milky, and acrid juice which turns black on exposure to the air, and is used in India as a varnish. The fruit is a kidney-shaped nut attached to the larger end of a pear-shaped, fleshy stem, from which the botanical character of the genus is derived. The shell, which is double, encloses an oily kernel which is very agreeable and wholesome, and is a common article of food in tropical countries. The fleshy stem, sometimes called the cashew-apple, is also edible and refreshing, having an acid taste. In size it is nearly equal to an orange. A pleasant vinous beverage is prepared from its fermented juice. The oil is used as a remedy for leprosy. Cashew is a corruption of the French *acajou.*

Cash'gar, the former capital of Chinese Toorkistan, on the side of a mountain and on a stream 140 miles N. W. of Yarkund. It is encircled by an earthen wall, and is divided into the Chinese and Mohammedan cities, the latter much the larger. There is considerable luxury among the people, as well as an industrious and skilful artisan class, workers in gold and jasper, weavers of silk and carpets, and dyers of calico. It has a trade with Bokhara, exchanging tea, porcelain, silk, etc. for European merchandise. The Chinese acquired dominion over this place about eighty years ago, and have here a garrison of 8000 men. Pop. 40,000 to 50,000.

Cashier' [Fr. *caissier*], a cash-keeper, a person who has charge of the cash in a bank, counting-house, or other place of business. The president and the cashier are the highest officers of a bank, and they write their signatures on each bank-note. The cashier superintends the books and transactions of the bank, under the order of the directors.

Cashmere, kash-meer', written also **Kaschmir** and **Kachemir** (anc. *Caspira*), a country and valley of Northern Hindostan, bordering on Thibet, belongs to the domin-

ion of Gholab Sing, which comprises Baltistan, Cashmere, and Loday, the whole of which is sometimes called the empire of Cashmere, and has an area of 60,100 square miles, and a population of 3,000,000. The valley of Cashmere is surrounded on all sides by lofty mountains (the Himalayas). It is mostly included between 33° 30′ and 34° 35′ N., and between 74° 20′ and 75° 40′ E. Area, estimated at 5100 square miles. Pop. about 400,000. The bottom of the valley is about 5500 feet above the level of the sea. Among the highest peaks on the frontier of Cashmere is the Pir Panjal, which rises about 15,000 feet above the level of the sea. The mountains are partly of basaltic formation, and limestone is abundant in the valley. The mountain-barrier is indented by several passes, none of which are practicable for wheel-carriages. The chief river is the Jhylum, which rises in the S. E. part, traverses the middle of the valley, and flows out through the Baramoola Pass. Cashmere may be said to equal or surpass almost every other portion of the earth in the beauty of its scenery. Cashmere contains several lakes, and is admirably supplied with the means of irrigation. The soil is mostly alluvial and exceedingly fertile. The staple production is rice, besides which wheat, maize, and barley are cultivated here. This valley is renowned for the abundance and fine quality of its fruits—apples, pears, apricots, cherries, etc. Among the forest trees is the deodar (*Cedrus Deodara*), the pine, and the walnut. The inhabitants are mostly Mohammedans. In physical qualities they excel the natives of the other parts of Hindostan. They manufacture shawls which are widely celebrated and bring high prices. The material of these is the wool of the Cashmere Goat (which see). The Cashmerians are excellent lapidaries, and are noted for the fabrication of firearms. Chief town, Serinagur or Cashmere.

Cashmere was conquered by the emperor Akbăr in 1586, and annexed to the Mogul empire. The Afghans became masters of it in 1752, and held it until 1819, when it was subjugated by the Sikhs. In 1849 it was ceded to the British, who transferred it to Gholab Sing.

Revised by A. J. Schem.

Cashmere Goat, a variety of the goat remarkable for its long, fine, and silky hair, from which Cashmere shawls are made. This goat is found in Thibet, from which the finest hair is imported into Cashmere, to be there manufactured. The hair is longer than that of the Angora goat, and not, like it, curled, but straight, and about eighteen inches long. A single goat does not yield more than three ounces, and the fleeces of ten goats are requisite for a shawl a yard and a half square. The hair is spun by women, and dyed after it is spun. Some 16,000 looms are in constant employment in Cashmere, producing annually about 30,000 shawls. Woven in rude looms, a pair of shawls sometimes occupy three or four men a year in weaving. Plain shawls are simply woven, but those with varied patterns are worked with wooden needles. These shawls are in the highest request, but the hair of other breeds of goats is employed for the manufacture of shawls called by the same name. Imitations are manufactured in France, some from the Thibet wool, and others of a mixture of this with silk and cotton.

Attempts have been made to introduce the Cashmere goat into Europe and America. In Northern South Carolina and the neighboring regions it thrives well, as also in California. A mixed race, produced by crossing the Cashmere and the Angora goat, possesses valuable qualities, the hair being long, fine, and more abundant than in the parent breeds.

Cas'imir III., surnamed the Great, king of Poland, born in 1309, was a son of Ladislaus, king of Poland, whom he succeeded in 1333. He enlarged his dominions by the conquest of Red Russia about 1366, and repelled the aggressions of the Tartars. He promoted education and founded colleges and hospitals. He died Nov. 8, 1370, and was succeeded by his nephew, Louis of Hungary.

Casimir IV., son of the prince Jagello of Lithuania, born Nov. 29, 1427, was in 1444 elected king of Poland. He carried on, for nearly twenty years, a war with the Teutonic Order, which in the peace of Thorn (1466) had to cede West Prussia to Poland; and by convoking in 1468 the nobility became founder of the Polish constitution. Died June 7, 1492.

Casi'no [diminutive of Italian *casa*, a "house"] signifies a place for social reunions. Italian nobles have long had casinos detached from their palaces, and public casinos were the result of an attempt made by the middle classes to imitate them. A casino is generally a place where musical or dancing soirées are held, containing a conversation-room and rooms for amusement, as well as apartments where refreshments may be had. They are numerous in Italy and Germany, and have been introduced into England. In general, they are not believed to exert a good moral influence.

Casi'no, or Mon'te Casi'no, a mountain of Italy, in Terra di Lavoro, about 55 miles N. N. W. of Naples. It is close to the town of San Germano, and is the site of a celebrated Benedictine abbey founded in 529 A. D. by Saint Benedict. This abbey is remarkable for its architecture, its wealth, its library, and the learning of its monks. Several valuable works have been issued from the press of Monte Casino.

Cask's, a township of Talladega co., Ala. Pop. 737.

Caso'ria, a town of Italy, in the province of Napoli, 6 miles N. N. E. of Naples. It has four fine churches. Silk is produced in this vicinity. Pop. 6934.

Cas'pe, a town of Spain, in Aragon, province of Saragossa, is situated near the river Ebro, 53 miles S. E. of Saragossa. It has three churches, a town-hall, and manufactures of oil and soap. Pop. 9402.

Cas'per, a township of Union co., Ill. Pop. 2718.

Cas'pian Sea [Lat. *Mare Caspium*, or *Mare Hyrcanium*; Gr. Κασπια Θάλασσα], a large inland sea forming part of the boundary between Europe and Asia. It has on the N. European Russia, on the E. the Khirgees steppe, or Toorkomania, on the S. Persia, and on the W. Persia and Georgia. It is about 690 miles long from N. to S., and has an average width of near 200 miles. The area is estimated by Berghaus at 156,800 square miles. The depth of water towards the S. is said to be 3000 feet, but towards the N. it is generally shallow, seldom being more than 3 feet deep at a distance of 100 yards from the shore. According to some authorities, the greatest depth is only 600 feet. The depression of the surface of the Caspian below that of the Black Sea is about eighty-four feet. The Caspian receives several large rivers—viz. the Volga, the Ural, and the Koor. It has no outlet, and its superfluous water can only escape by evaporation. Between the Caspian and the Sea of Aral is a low flat tract forming part of the steppes of Western Asia. This tract, which is said to be lower than the surface of the Atlantic Ocean, was probably once covered by the Caspian Sea. This region is considered one of the most interesting subjects in the physical geography of the globe. That the Caspian and the Sea of Aral were once connected is rendered evident by the nature of the rocks in the vast plains which extend from them in several directions. Great numbers of sturgeons and salmon are caught in this sea, in which various other kinds of fish are also abundant. A communication has been opened between the Caspian Sea and the Baltic by a canal which connects the Volga with the rivers Tvertza and Schlina. Steam-packets navigate the Caspian, the commerce of which is mostly in the hands of the Russians. The chief ports are Astrakhan and Derbend.

Cass co., Dak. See Appendix.

Cass, a county in W. Central Illinois. Area, 350 square miles. It is bounded on the N. W. by the Illinois River and on the N. by the Sangamon. The surface is nearly level; the soil is very fertile. Corn, oats, wool, and live-stock are largely raised. It is intersected by the Peoria Pekin and Jacksonville and the Rockford Rock Island and St. Louis R. Rs. Capital, Beardstown. Pop. 11,580.

Cass, a county in N. Central Indiana. Area, 420 square miles. It is intersected by the Wabash River, and also drained by the Eel River. The surface is nearly level; the soil is fertile. Grain, wool, and dairy products are extensively raised. Iron ore and good building-stone are found here. The most numerous manufactories are of cooperage. The county is traversed by the Toledo Wabash and Western R. R., and by a railroad which connects Chicago with Cincinnati. Capital, Logansport. Pop. 24,193.

Cass, a county in S. W. Iowa. Area, 576 square miles. It is intersected by the East Nishnabatona River, and also drained by Turkey and other creeks. The surface is undulating; the soil is fertile. Grain and dairy products are staple crops. It is traversed by the railroad which connects Des Moines with Council Bluffs. Capital, Lewis. Pop. 5464.

Cass, a county of Michigan, bordering on Indiana. Area, 528 square miles. It is drained by the Dowagiac River, and contains several small lakes. The surface is nearly level; the soil is very fertile. Grain, cattle, and wool are largely produced. The county has extensive prairies and "oak openings." Lumber, wagons, etc. are manufactured. It is intersected by the Central and Peninsular R. Rs. Capital, Cassopolis. Pop. 21,094.

Cass, a large county in N. Central Minnesota. A large part of its boundary is formed by the Mississippi River, which rises on its north-western border. It contains numerous lakes, among which are Leech and Itasca Lakes. The surface is partly covered with forests. Pop. 380.

Cass, a county of Missouri, bordering on Kansas.

Area, 700 square miles. It is drained by the two main branches of Grand River. The surface is undulating, and diversified with groves and extensive prairies; the soil is fertile. Corn, oats, tobacco, wool, and live-stock are extensively raised. Limestone is abundant here. The county is intersected by the Osage division of the Missouri Kansas and Texas R. R. Capital, Harrisonville. Pop. 19,296.

Cass, a county in the E. of Nebraska. Area, 570 square miles. It is bounded on the E. by the Missouri River, and on the N. by the Platte River. The greater part of it is undulating prairie, the soil of which is calcareous and fertile. Grain and wool are staple products. Limestone occurs here as a surface-rock. The county is traversed by the Burlington and Missouri River R. R. Capital, Plattsmouth. Pop. 8151.

Cass, a township of Fulton co., Ill. Pop. 1283.

Cass, a township of Clay co., Ind. Pop. 470.

Cass, a township of Greene co., Ind. Pop. 819.

Cass, a township of La Porte co., Ind. Pop. 1214.

Cass, a township of Ohio co., Ind. Pop. 772.

Cass, a township of Pulaski co., Ind. Pop. 460.

Cass, a township of Sullivan co., Ind. Pop. 1488.

Cass, a township of White co., Ind. Pop. 451.

Cass, a township of Boone co., Ia. Pop. 895.

Cass, a township of Cass co., Ia. Pop. 1200.

Cass, a township of Cedar co., Ia. Pop. 591.

Cass, a township of Clayton co., Ia. Pop. 1272.

Cass, a township of Guthrie co., Ia. Pop. 1754.

Cass, a township of Hamilton co., Ia. Pop. 433.

Cass, a township of Harrison co., Ia. Pop. 217.

Cass, a township of Huntingdon co., Pa. Pop. 599.

Cass, a township of Schuylkill co., Pa. Pop. 4621.

Cass, a township of Monongalia co., West Va. Pop. 1449.

Cass (George W.), an engineer, born in 1810 at Brownsville, Fayette co., Pa., graduated at West Point in 1832. He served while lieutenant of infantry on topographical and engineer duty till he resigned Oct. 26, 1836. Civil engineer 1836–41; merchant of Brownsville, Pa., 1842–52; president of Adams Express Co., 1854–57; of Ohio and Pennsylvania R. R. 1856; of Pittsburg Fort Wayne and Chicago R. R. 1856–58 and since 1859, and of Northern Pacific R. R. since 1873.

George W. Cullum, *U. S. Army.*

Cass (Lewis), LL.D., an American statesman, born at Exeter, N. H., Oct. 9, 1782. He studied law, which he began to practise at Zanesville, O., in 1802. Having entered the army as a colonel in 1812, he served in Canada under Gen. Hull, and was taken prisoner. He was raised to the rank of brigadier-general in 1813, and appointed governor of Michigan Territory in 1814. After he had held that office sixteen years, and negotiated many treaties with the Indians, he was appointed secretary of war by President Jackson in 1831. He was sent as minister to France in 1836, returned home in 1842, and was elected a Senator of the U. S. for Michigan in 1844. Having opposed the Wilmot Proviso, he was nominated as Democratic candidate for the presidency of the U. S. in 1848, but he was defeated by Gen. Taylor, the Whig candidate, who received 163 electoral votes; Gen. Cass received 137 electoral votes. In the winter of 1850–51 he was re-elected to the Senate of the U. S. He supported Douglas's Kansas-Nebraska bill in 1854, and became secretary of state in Mar., 1857. He resigned in Dec., 1860. Died June 17, 1866.

Gen. Cass's history well illustrates the great possibilities which have justly served as an encouragement to young men of this country born in humble circumstances. Without fortune or friends, and with an imperfect education, he went to Ohio on foot when seventeen years old. Elected to the legislature, his zeal against the suspected treason of Burr brought him to the favorable notice of President Jefferson and the people. His services in the war with Great Britain were useful to the nation, and greatly increased his popularity. During his long governorship of Michigan his success in managing the disaffected Indians, and in developing the resources of the Territory, demonstrated his great abilities. To his power of making strong personal friends much of his success was due. He was democratic in his tastes and habits, as well as in his political opinions. He attained a large fortune and much political influence. Throughout the civil war he was in favor of the maintenance of the Federal union. Gen. Cass was a man of literary tastes. His published writings are not numerous, but are well written and display much ability. (See H. R. Schoolcraft, "Life of General Cass," 1848; W. L. G. Smith, "Life of Lewis Cass," 1856.)

Cassada'ga, a post-village of Stockton township, Chautauqua co., N. Y., on Cassadaga Lake. Pop. 225.

Cassan'der [Gr. Κάσσανδρος], a Macedonian prince, was a son of Antipater, regent of Macedonia. When Antipater died, in 318 B. C., Cassander and Polysperchon became competitors for the regency, and appealed to arms. Cassander was victorious, and having taken Athens, restored the aristocracy under Demetrius Phalereus in 316 B. C. He married Thessalonice, a sister of Alexander the Great, and obtained possession of Alexander's infant son, whom he put to death in 309, and usurped the throne. He joined Seleucus and Ptolemy in a coalition against Antigonus, whom these allies defeated at the battle of Ipsus in 301 B. C. He died in 297, and was succeeded by his son Philip.

Cassan'dra [Κασσάνδρα], an ancient Trojan princess, a daughter of Priam, was celebrated for her prophetic inspiration. According to the poetical legend, Apollo was enamored of her, and taught her the secrets of fate, but he ordained that her prophecies should not be credited. During the siege of Troy she predicted the ruin of that city, but she was regarded as a lunatic by the Trojans. She was carried away as a captive by Agamemnon.

Cassandra, Gulf of (anc. *Toronaicus Sinus*), is a part of the Ægean Sea, in European Turkey, and extends between two peninsulas, the extremities of which are called Cape Drepano and Cape Pailluri. It is nearly 25 miles long.

Cassa'no, a town of Italy, in the province of Calabria Citeriore, 30 miles N. of Cosenza. It stands in the concave recess of a steep mountain, in the midst of beautiful scenery. It has a cathedral, several convents, and an old castle; also manufactures of silk, linen, cotton, and leather. Pop. 7456.

Cassation. See Courts, by George Chase, LL.B.

Cassa'va, a West Indian name of the plant called manioc or manihot, and of the starch or fecula prepared from its root. It is known in the U. S. by the name of Tapioca (which see). (See Manioc.)

Cassay', Munnipoor', or **Munepoor,** a country of Farther India, is bounded on the N. W. by Assam, and E. and S. by the Burmese dominions and the country of the independent Kookies. It is mostly included between lat. 24° and 26° N., and between lon. 93° and 95° E. The area is said to be 7584 square miles. The surface is diversified by valleys and high mountains which are covered with forests. The staple productions are tea, rice, cotton, indigo, sugar, opium, and tobacco. The finest pineapples in the world are produced here. The Cassay ponies are celebrated throughout the East, and much sought in Burmah for cavalry horses. Capital, Munipoor. Cassay became independent in 1826, before which it was part of the Burmese empire. It is governed by a native rajah.

Cass co., Tex. See Davis co., Tex.

Cassel (anc. *Castellum*), a town of France, department of Nord, is on an isolated hill 550 feet in height, 27 miles N. W. of Lille, with which it is connected by a railway. It was formerly fortified, and was the scene of several military events. Here are manufactures of lace, hosiery, and linen thread. It commands a very extensive view of the level surrounding country. Pop. 4242.

Cas'sel (anc. *Castellum Cattorum*), a walled city of Prussia, the capital of the province of Hesse-Cassel, is pleasantly situated on both sides of the river Fulda, about 132 miles W. of Leipsic and 28 miles S. W. of Göttingen. It is connected by railways with Leipsic, Frankfort, and other towns. It has several public squares, in the largest of which, called Friedrichsplatz, stands the palace of the electors of Hesse. Near this palace is a handsome museum with a library of about 100,000 volumes. Cassel contains an observatory, a valuable picture-gallery, a theatre, several hospitals, a normal school, and academies of painting and sculpture. It has manufactures of cotton, silk, and woollen fabrics, lace, gloves, carpets, hardware, etc. In the environs of Cassel is the royal palace of Wilhelmshöhe,

with beautiful gardens and fountains. This palace was occupied by the emperor Napoleon III. while he was a captive in the autumn of 1870 and the ensuing winter. Pop. in 1871, 46,375.

Cas'sel (Douglas R.), U. S. N., born Oct. 9, 1845, in Ohio, graduated at the Naval Academy as ensign in 1863, became a lieutenant in 1866, and a lieutenant-commander in 1868. While attached to the steam-sloop Brooklyn was slightly wounded at the battle of Mobile Bay, but remained at his quarters until the close of the action. He is thus honorably noticed by his commanding officer, Capt. James Alden, in his report of Aug. 6, 1864: "The other division officers—Capt. Houston of the marines, Lieut. Charles F. Blake, Ensigns Cassel and Sigsbee, with their assistants, Master's Mates Duncan and Stevens—fought their guns nobly and well." He served in the Brooklyn during both the Fort Fisher fights, and led the seamen of the Brooklyn in the assault on the fort of Jan. 15, 1865.

Foxhall A. Parker, U. S. N.

Cas'serly (Eugene), born in Ireland in 1822. In 1824 he emigrated to America with his parents, became a lawyer and journalist of New York, and removed to California in 1850, where he became a Democratic politician and editor in San Francisco. In 1860 he was chosen U. S. Senator from that State, but resigned in 1873.

Cas'sia, a fragrant bark mentioned in the Bible, and supposed to be the cassia-bark of the shops, a coarse variety of cinnamon from China, Anam, and other eastern countries. It is generally sold as cinnamon, which it much resembles, though cheaper and generally inferior in quality. It yields the oil of cinnamon. "Cassia buds" are the dried flower-buds which are brought from China and used in confectionery.

Cassia is the name of a genus of leguminous herbs, shrubs, and trees, natives of both continents. Several African and Asiatic species are valuable for their leaves, which when dried constitute the drug *senna*. The U. S. have numerous species, one of which (*Cassia Marilandica*) yields leaves which have the cathartic properties of senna in a milder degree. "Cassia pulp" or "purging cassia" comes from the pods of *Cathartocarpus Fistula* or *Cassia Fistula*, a tree of India and Egypt, now naturalized in most tropical countries. It contains a large percentage of sugar, and is used in making laxative conserves for medicinal use.

Cas'sian [Lat. *Cassianus*], (John), a monk noted as a promoter of monachism and as an opponent of Saint Augustine, was born about 360 A. D. He founded a large monastery at Marseilles (about the year 415), which was a model for many others in Gaul and Spain. He differed from Saint Augustine respecting grace, and taught doctrines which were called semi-Pelagian. Among his works is a "Treatise on Monastic Institutions." Died about 433 A. D.

Cas'sican, a name applied to the baritas of Australasia and other birds, but appropriately belonging to the genus *Cassicus*, resembling the orioles. The best known species is the *Cassicus cristatus* of South America, a bird twenty inches long, which makes a large nest exhibiting great skill in construction. The nests are often three feet long, and are hung upon the branches of trees. They are gregarious birds, and often build several of their huge nests upon the same tree.

Cas'simere [formerly *kerseymere*, not improbably derived from *Cashmere*; Fr. *casimir*; Ger. *Kasimir*], a twilled woollen or cotton and woollen fabric, either plain or figured, much used for men's clothing. Cassimeres are largely woven in England and the U. S., but especially on the continent of Europe.

Cas'sin (John), an American naturalist, born in Delaware co., Pa., Sept. 6, 1813. He published, besides other works, "American Ornithology: a General Synopsis of North American Ornithology, containing Descriptions and Figures of all North American Birds not given by former American Authors" (1856). Died Jan. 10, 1869.

Cassi'ni (Giovanni Domenico), an eminent astronomer, born near Nice, June 8, 1625. He discovered in 1665 that Jupiter performs a rotation in nine hours and fifty-six minutes, and published in 1668 his ephemerides of the satellites of Jupiter. Invited by Colbert, he removed to Paris in 1669, and became director of the observatory of that city. In 1684 he discovered four satellites of Saturn. His descendants for several generations were able astronomers. Died Sept. 14, 1712. (See his "Autobiography;" also Fontenelle, "Éloge de J. D. Cassini.")

Cassi'no, a town of Italy, in the province of Caserta, 49 miles by rail N. W. of Caserta. Large ruins of Roman theatres and palaces are in the neighborhood. Just above the city, on a high mountain, is the celebrated monastery Monte Cassino, connected with which is a seminary, a gymnasium, and a large library containing many valuable manuscripts. Pop. 5641.

Cassiodo'rus (Magnus Aurelius), a Latin historian and minister of state, was born at Scylacium (Squillace), in Italy, about 468 A. D. He entered the service of Theodoric, king of the Ostrogoths, about 494, and became his chief minister. He had a high reputation for ability and learning, and continued in power for many years. He wrote, besides works on grammar and rhetoric, a "History of the Goths," and a valuable collection of state papers entitled "Variarum Epistolarum Libri XII.," which was printed in 1533.

Cassiope'a, or -pia, Cassiepe'a, or **Cassi'ope** [Gr. Κασσιόπεια, Κασσιέπεια, Κασσιόπη], in classic mythology, the wife of Cepheus and the mother of Andromeda. She was said to have been transformed into a constellation.

Cassiope'ia, or "Lady in the Chair," a constellation in the northern hemisphere, has several stars of the third magnitude. It is represented on the celestial globe as a lady sitting in a chair. Five of its most conspicuous stars are arranged in a figure like a W. In 1572 a new and brilliant star suddenly appeared in Cassiopeia. It was observed by Tycho Brahe in November, and is said to have surpassed all the fixed stars in splendor. It disappeared in Mar., 1574, after a gradual diminution of lustre.

Cassiquia're, or **Cassiquia'ri,** a river of South America, in Venezuela, is a deep and rapid stream, forming the S. bifurcation of the Orinoco. It issues from the Orinoco about lat. 3° 10′ N. and lon. 66° 20′ W., and flowing south-westward about 130 miles, enters the Rio Negro near San Carlos. This remarkable river opens a navigable communication between the Orinoco and the Rio Negro. It is 600 yards wide at its entrance into the latter.

Cassis, the French name of the black currant bush and its fruit. A liqueur called *liqueur de cassis* is made from the fruit, and is used in Europe very extensively.

Cassiter'ides [from the Gr. κασσίτερος, "tin"], the ancient name of certain islands (supposed to be the Scilly Isles) from which the Phœnicians procured tin.

Cas'siterite [from the Gr. κασσίτερος, "tin," and λίθος, a "stone"], native peroxide of tin, composed, when pure, of 21.62 per cent. of oxygen and 78.38 of tin. It is the common ore of tin, and the only one from which the metal is obtained. It occurs massive (as tin-stone), disseminated and fibrous (as wood tin), in rolled pieces, and in grains as sand (stream tin); also crystallized in quadrangular prisms, terminated by four-sided pyramids. Its lustre is splendent. It is obtained chiefly in Cornwall, Banca, Sweden, France, Spain, Chili, and California.

Cas'sius Longi'nus (Caius), a famous Roman conspirator and general, was a friend of Marcus Brutus, whose sister he married. He served as quæstor under M. Crassus, and distinguished himself in the expedition against the Parthians in 53 B. C. After the death of Crassus he defeated the Parthians. In the civil war that ensued he fought for Pompey against Cæsar. He was one of the conspirators who killed Cæsar in 44 B. C., soon after which event he commanded with success in Syria. His army was subsequently united with that of Brutus. Brutus and Cassius, who were the principal leaders of the republican party, were defeated by Antony and Octavius at Philippi in 42 B. C., and then killed themselves. (See Plutarch, "Life of Brutus.")

Cas'sius Parmen'sis, or **Ca'ius Cas'sius Seve'rus,** a Latin poet who wrote epigrams and elegies. He was one of the conspirators who killed the dictator Cæsar, 44 B. C. Having entered the service of Mark Antony, he fought against Augustus, by whose order he was put to death about 30 B. C. Only small fragments of his works are extant.

Cassivelau'nus, or **Cassibelau'nus,** sometimes Anglicised as **Cassib'elan,** a chief of the ancient Britons who ruled over the country N. of the Thames. He fought bravely against Cæsar when the latter invaded Britain in 54 B. C., but Cæsar took his capital and compelled him to pay tribute.

Cas'sock, a long loose garment like a frock-coat, worn under the surplice by the clergymen of the Anglican and Roman Catholic churches. It has a single upright collar. The Catholic priests wear cassocks of various colors, but those of the Anglican clergy are always black, except the purple cassocks which are sometimes used by bishops.

Cassop'olis, a post-village of Cass co., Mich., at the junction of the Chicago and Lake Huron and the Michigan Central R. Rs., 98 miles S. W. of Lansing. It has a national bank, three churches, and two newspapers. P. 728.

Prof. "Vigilant."

Cas'sowary (*Casuarius*), a genus of birds nearly allied to the ostrich (see BREVIPENNES and OSTRICH), but distinctively characterized by still greater shortness of wing, by a laterally compressed bill, by a bony crest, by pendent wattles on the naked neck, and by three toes on each foot, all furnished with claws, the inner toe short, and armed with a very long and sharp claw. Only one species is known, *Casuarius galeatus*, sometimes called emu by the older naturalists before that name was appropriated to the Australian bird, which now alone receives it. The cassowary is a native of the Moluccas, New Guinea, and other Asiatic islands, chiefly inhabiting deep forests. In appearance it is not unlike the ostrich, but has a much shorter neck. It is the largest known bird except the ostrich, and its height is about five feet. It feeds on fruit, eggs, and succulent herbage. When attacked, it defends itself by kicking obliquely backward with its feet, and by striking with its short wings, the rigid barbless shafts of which are otherwise useless, even to aid it in running.

Cass'town, a post-village of Lost Creek township, Miami co., O. Pop. 241.

Cass'ville, a township of Neosho co., Kan. P. 1070.

Cassville, a post-village and capital of Barry co., Mo., 200 miles S. W. of Jefferson City. It has one weekly newspaper. P. 287. JOHN RAY, ED. CASSVILLE "DEMOCRAT."

Cassville, a post-village of Paris township, Oneida co., N. Y. Pop. 152.

Cassville, a post-borough of Huntingdon co., Pa. Pop. 416.

Cassville, a post-village of Grant co., Wis., on the Mississippi River, about 32 miles above Dubuque. Lead is shipped here in steamboats. Pop. 551, or, including Cassville township, 1318.

Casta'lia, or **Cas'taly** [Gr. Κασταλία], a fountain which issued at the base of Mount Parnassus, near Delphi, and was sacred to Apollo and the Muses. The ancient poets imagined that it filled the minds of those who drank of it with poetic inspiration. All persons who visited the temple of Delphi for any religious object were obliged to purify themselves by bathing their bodies or their hair in this sacred fountain. It is now called the fountain of St. John.

Casta'lia, a post-village of Erie co., O., on the Cincinnati Sandusky and Cleveland R. R., 5 miles S. W. of Sandusky. Here is a spring which petrifies vegetable substances.

Casta'nea, the classical Latin name of the chestnut; also the botanical name of a genus of trees of the order Cupuliferæ. Three species of this genus are indigenous in the U. S.—viz. *Castanea vesca* (chestnut tree), the *Castanea pumila* (chinquapin), and the golden chinquapin, or chestnut of the Pacific coast. (See CHESTNUT.)

Cas'tanets, a musical instrument consisting of two hollow shells of ivory or wood, which are bound together on the thumb, and struck by the fingers to produce a trilling sound in keeping with the rhythm of dances. Castanets were introduced into Spain by the Moors. They take their name from the Lat. *castanea*, a "chestnut," from their being made of chestnut wood. The castanets are used in the ballet and in the opera.

Casta'ños, de (FRANCISCO XAVIER), duke of Baylen, a Spanish general, born April 22, 1756. He obtained the command of a corps in 1808, and defeated the French general Dupont at Baylen in July of that year. Dupont then surrendered his army, amounting to 18,000 men. Castaños distinguished himself at the battle of Vitoria, June, 1813. He was appointed captain-general in 1823. Died Sept. 24, 1852.

Caste [from the Port. *casta*, a "race"], a term originally applied to the distinct classes of society established under the Brahmanical régime in India. When the Portuguese first visited that country, at the close of the fifteenth century, they found their intercourse with the natives seriously interfered with by arbitrary social laws; certain pursuits were invariably followed by persons of a certain class, and any attempt to induce a man to perform offices which did not, according to the prevailing notions of the country, belong to his class, was obstinately resisted. The difference in appearance between some of these classes—as, for example, between the Soodras and persons of the priestly or military class—was so striking as to suggest the idea of an original difference of race; and hence the Portuguese employed the word *casta* ("race") as a general term to designate the distinctions above referred to.

According to the "Institutes of Manu" (considered by the Hindoos to be a work of divine authority, and regarded by them, indeed, in much the same light as the Law of Moses was regarded by the Israelites), there are four pure castes or classes: 1st, the priestly class, fabled by the Brahmans to have proceeded from the mouth of Brahmâ, the Creator; 2dly, the military class (called Kshatriyas, or Chuttrees), supposed to have sprung from his arm; 3dly, the mercantile class (Vaisyas), said to have been produced from his thigh; and lastly, the servile class (Soodras or Sudras), fabled to have sprung from his foot. There is reason to believe that the three higher classes were composed of persons of the original Aryan race (see ARYA), but that the Soodras came from the tribes which the Aryas had conquered. Besides the four pure classes, there are various mixed or impure classes, some of which (the Chandâlas, for example) are so vile that their very shadow is pollution, and a Brahman is forbidden to take shelter under the same tree with one of these miserable outcasts. The term *pariah* (a word said to be derived from the Tamul, and to signify "inhabitant of the mountains;" see PARIAH) is used in the south of India in a more general sense to denote any of the impure or degraded classes.

The Brahmans or priestly caste having (as they claim) proceeded from the mouth of Brahmâ, became his spokesmen or the interpreters of his will. The appropriate occupation of a Brahman is to teach the Vêda. It is proper to observe that the Brahmans are not all priests, but from their class alone priests are to be chosen. Many of them at the present day follow the profession of arms.

The military class is composed of warriors, chieftains, and kings. To the members of this class (Kshatriyas) only is the *executive* power of the state properly to be entrusted, though in some rare instances Brahmans have performed the part of princes, and, as already intimated, they share, at the present time, the profession of arms with the Kshatriyas.

The Vaisyas are supposed to compose the mercantile class, and also to include agriculturists, herdsmen, etc.; but in point of fact members of the two upper classes also not unfrequently engage in mercantile pursuits. Manu expressly states that in case a Brahman is unable to support himself by the offices appropriate to his calling—viz. "assisting to sacrifice, teaching the Vêdas, and receiving gifts from a pure-handed giver"—he may follow the profession of a soldier or engage in mercantile pursuits.

It is the duty of Soodras to serve the superior classes, and especially the Brahmans. It is their place to perform various menial duties, but the lowest offices in the community (that of scavenger, for example) are invariably performed by persons of the impure or mixed classes.

With respect to the first origin of caste, there can be no reasonable doubt that the institution was the invention of the Brahmans. This is shown by the manner in which the Brahmans are spoken of in the "Institutes," more particularly in those parts which treat of the duties of the other classes. "From his high birth alone a Brahman is an object of veneration even to the gods" (chap. xi. 85). "Though Brahmans occupy themselves with all sorts of mean occupations, they must invariably be honored, for they are something transcendentally divine" (ix. 319). "Let not a king, although in the greatest distress for money, provoke Brahmans to anger by taking their property; for they, once enraged, could immediately, by sacrifices and imprecations, destroy him, with his troops, elephants, horses, and cars" (ix. 313). "No greater crime is known on earth than slaying a Brahman" (viii. 381). "A Brahman is born above the world, the chief of all creatures. . . . Whatever exists in the universe is all, in effect, though not in form, the wealth of the Brahman" (i. 100). In order to guard the sanctity of the priestly caste against all encroachments, a man of any of the lower castes is strictly prohibited from marrying a Brahmanî (a Brahman woman), and the children of such marriages are irredeemably base. The offspring of a Brahmanî and Soodra (called a Chandâla) is accounted the vilest of mortals. By thus affixing an indelible mark of abhorrence upon the children, they inspire perhaps a stronger fear of such marriages than they could do by the most terrible punishments inflicted upon the parents themselves.

Whether the regulations respecting caste, as they are laid down in the "Institutes of Manu," were ever strictly enforced, has been doubted by many. Respecting this interesting question, in the entire absence of all historical testimony,* we can only reason from probabilities. The great reverence with which the "Institutes of Manu" seem to have been always regarded among the Hindoos who accept the Brahmanical religion renders it not improbable that at one time those regulations may have been as strictly observed as the ritual of the Levitical law was observed by the ancient Israelites. It would certainly be unreasonable to infer that because such an observance has not obtained

* It is scarcely necessary to inform the intelligent reader that nothing deserving the name of history can be found in any of the ancient Hindoo writings, if we except those relating to the little state of Cashmere.

in modern times, when the entire Hindoo nation has been subjugated first to one foreign despotism and then to another, it may not have prevailed in a remote antiquity, when (as there is every reason to believe) a large part of India was under the rule of sovereigns professing the Brahmanical religion. Nor can we safely argue against such an observance from the state of society represented in Hindoo dramas written near the time of the Christian era, for that was after the rise of Booddhism had broken the Brahmanical yoke, and though the new religion was subsequently displaced, the influence of the freedom which it had introduced was not wholly lost upon the people of India; in the same manner as the influence of the Revolution was felt in France even after the restoration of the Bourbons.

The doctrine of the transmigration of souls (which appears to have been almost universally accepted in India among all classes and in all ages of which we have any definite knowledge) became the principal and a most terrible engine in the hands of the Brahmans for curbing and breaking the spirit of the other classes. It may well be doubted whether the comparatively vague fear of eternal punishment taught among the nations of the West was calculated to exert anything like so powerful an influence on the mind as the definite, though infinitely varied, terrors which the priests of India presented to the imagination of the laity. Thus, one who steals the gold of a priest (unless he makes expiation in this life by some voluntary and cruel penance) will be born a thousand times in the form of a spider or some disgusting reptile; he who kills a Brahman, after having passed a long period in terrible torture will be born as a boar or some other low animal, or as a Chandâla. The poet Lucretius expressed his anxiety lest his friend Memmius, through fear of "eternal punishment after death," should be prevented from a candid and dispassionate examination into the false religious views then prevailing, because in the face of such awful terrors the mind has no means or power of standing firm. But the terrors to which the Hindoos were exposed were still more difficult to be resisted, because they appeared naturally, if not inseparably, connected with a belief (that of transmigration) which seemed indigenous, so to speak, in the Hindoo mind. There is great reason to believe that it was the intolerable tyranny of caste under the Brahmans which prepared the people of India for the rise and rapid spread of Booddhism. (See GAUTAMA.) At all events, there can scarcely, we think, be a reasonable doubt that the rise of Booddhism, which absolutely rejected all the distinctions of caste, has essentially contributed to mitigate the extreme rigor of the system as it originally prevailed.

J. THOMAS.

Castel'-a-Ma're (*i. e.* "fortress on the sea"), or **Castellama're di Stabia,** a fortified city and seaport of Italy, in the province of Naples, is finely situated on the Gulf of Naples, 17 miles by rail S. E. of Naples. It has a royal palace, a cathedral, several convents, a military hospital, and a royal dockyard; also manufactures of cotton, linen, silk, and sailcloth. The castle from which the town takes its name was built in the thirteenth century by the emperor Frederic II. It is near the site of the ancient *Stabiæ*, where Pliny was killed by an eruption of Vesuvius in 79 A. D. Pop. in 1872, 26,381.

Castel-a-Mare del Golfo, a seaport-town of Sicily, in the province of Trápani, is on a gulf of its own name, 20 miles E. of Trápani, near the site of the ancient *Segesta*. It exports cotton, wine, fruit, and manna. Pop. 8986.

Castelar' (EMILIO), an eminent Spanish orator and republican, was born in 1832. He founded in 1864 a journal called "La Democracia," in which he developed his social and political principles. He was condemned to death in 1866, but he escaped to France. In 1868 he returned to Spain, and became a member of the Cortes and a leader of the republican party. He is considered the most eloquent political orator in Spain. He has contributed articles to the "Fortnightly Review," published in London. He became minister of foreign affairs Feb. 12, 1873, and president of the Spanish republic Sept., 1873 to Jan. 3, 1874.

Castel'-Buo'no (*i. e.* "good castle"), a town of Sicily, in the province of Palermo, is in the Madonian Mountains, 4 miles S. S. E. of Cefalú. It has mineral springs, and a trade in manna. Pop. 7948.

Castel'-Gandol'fo, a village of Italy, picturesquely situated on the N. W. side of Mont Albano, about 13 miles S. E. of Rome. Here are numerous villas and the pope's summer residence.

Castella'na, a town of Italy, in the province of Bari, 24 miles S. E. of Bari. Pop. 9061.

Castellane'ta, a town of Italy, in the province of Lecce, 21 miles N. W. of Taranto. It has a cathedral and several convents. Pop. 6363.

Castel'lo Bran'co (*i. e.* "white castle"), a town of Portugal, in the province of Beira, 55 miles S. E. of Coimbra. It is a bishop's seat, and has a ruined castle. Pop. 6585.

Castel'lo de Vi'de, a walled town of Portugal, in Alemtejo, about 124 miles E. N. E. of Lisbon. It has a castle, and manufactures of woollen cloth. Pop. 5285.

Castellon', a province of Spain, bounded on the N. by Tarragona, on the E. by the Mediterranean, on the S. by Valencia, and on the W. by Teruel. It is a wild mountainous region, and contains many mines and mineral springs. Area, 2447 square miles. Capital, Castellon de la Plana. Pop. 288,981.

Castellon' de la Pla'na, a town of Spain, capital of the province of the same name, is in an extensive and fertile plain about 2 miles from the Mediterranean, and 40 miles N. N. E. of Valencia, with which it is connected by a railway. It is well built, with wide and straight streets, and is supplied with water by a magnificent aqueduct. It has a handsome episcopal palace, a theatre, a hospital, and several convents; also manufactures of linen, woollen, and hempen fabrics, sailcloth, paper, firearms, glass, soap, etc. Francisco Ribalta, the famous painter, was a native of this town. Pop. 20,123.

Castelnaudary (anc. *Sostomagus*), a town of France, department of Aude, is on an eminence near the Canal du Midi, 22 miles W. N. W. of Carcassonne. It has manufactures of silk and woollen fabrics and earthenware. The canal here expands into a commodious basin 1300 yards in circumference. This town was founded on the site of *Sostomagus* by the Visigoths, who called it *Castrum Novum Arianorum*. It was taken by the English Black Prince in 1355. Pop. 9075.

Castelnuo'vo, a city in Austria, province of Dalmatia, on the canal of Cattaro and the Bay of Topla, has ancient walls and towers. Pop. 7423.

Castelnuovo, a market-town of Northern Italy, in the province of Alessandria, 14 miles N. W. of Asti. It has a mineral spring. Pop. 5011.

Castel-Sarrasin, a town of France, department of Tarn-et-Garonne, is near the river Garonne, 14 miles W. of Montauban. It was formerly fortified. It has manufactures of serge and worsted stockings. Pop. 6838.

Castel Ter'mini, a town of Sicily, in the province of Girgenti, 16 miles N. of the city of Girgenti. It has mines of rock-salt and sulphur. Pop. 7346.

Castel'-Vetra'no, a town of Sicily, province of Trápani, 23 miles S. E. of Trápani. It has several convents and an old castle and cathedral. Articles of coral and alabaster are made here. Pop. in 1872, 20,420.

Castiglio'ni (CARLO OTTAVIO), COUNT, an Italian philologist, known as the editor of Ulfila's Gothic Bible (1819), was born in 1784. He also wrote a memoir upon the history of the Arab cities of Africa (1826). Died April 10, 1849.

Castile, kas-teel' [Sp. *Castilla*, the "land of castles"], a former kingdom of Spain, occupied the central table-land of the peninsula, and was the nucleus and central seat of the Spanish monarchy. The kingdom of Castile was founded about 1035 by Ferdinand I., who conquered Leon and annexed it to Castile. By the marriage of Ferdinand the Catholic with Isabella of Castile in 1469, Castile and Aragon were united into one kingdom. The Castilians have been long distinguished for their pride or haughtiness. The Castilian dialect is considered purer than the dialects spoken in other parts of Spain. Pop. 3,270,516. Castile was divided into two portions, OLD and NEW CASTILE (see below).

Castile, a post-village and township of Wyoming co., N. Y., on the Erie R. R., 75 miles N. W. of Corning. Pop. of village 712; of township, 2186.

Castile, New [Sp. *Castilla la Nueva*], an old province of Spain, the S. portion of the kingdom of Castile, has an area of 21,081 square miles. Former capital, Madrid. It is a table-land, bounded on the N. by the Sierra Guadarrama and on the S. by the Sierra Morena. This range of mountains is rich in minerals. The soil of this region is partly sterile and not well watered. The plains receive little rain, and are nearly destitute of trees. Large flocks of sheep are raised here. New Castile is divided into four provinces—viz. Madrid, Toledo, Cuenca, and Guadalajara. Pop. 1,289,145.

Castile, Old [Sp. *Castilla la Vieja*], an old province of Spain, is bounded on the N. by the Cantabrian Mountains, on the E. by Aragon, on the S. by New Castile, and on the W. by Leon. Area, 25,412 square miles. The surface is diversified by several ranges of mountains and high table-lands, which are arid and nearly destitute of forests.

The soil in many parts is rendered sterile by deficiency of water. The chief rivers of this region are the Douro and the Ebro. Sheep and cattle constitute the principal riches of the inhabitants. Old Castile is divided into the provinces of Burgos, Valladolid, Palencia, Avila, Logroño, Segovia, Santander, and Soria. Pop. 1,716,193.

Casti'lla (Don Ramon), a general in the Peruvian war of independence, born Jan. 31, 1797, after the annexation of Peru to Bolivia in 1835 fled the country. He returned upon the restoration of independence in 1839, and became finance minister. In the second war with Bolivia he was taken prisoner and exiled; he returned in 1844, deposed the dictator Vivanco, and became president of Peru 1845–51, to which dignity he was re-elected in 1855, and again in 1858. Died May 30, 1867.

Castille (Charles Hippolyte), a French author, born Nov. 8, 1820. He wrote a number of romances in which the interest is of a dreadful character, and later biographical parallels, a history of the Second Republic (1854), and political portraits (1856–60).

Castine, kas-teen', a port of entry of Hancock co., Me., is on the E. side of Penobscot Bay, at the mouth of the Penobscot River, 34 miles S. of Bangor. It is 9 miles E. of Belfast, which is on the opposite side of the bay. It has a good harbor, a custom-house, and manufactures of boats, ships and ship furniture, cordage, brick, etc. It has a State normal school. Pop. including Castine township, 1303.

Cast'ing Vote, the vote of the president or chairman of a public assembly, or the Speaker of a legislative body. This vote decides the question whenever there is a tie—*i. e.* when the votes of the assembly are equally divided. The Vice-President of the U. S. never votes except in case the Senators are equally divided. The Speaker of the British House of Commons never votes except in a similar contingency. It is usual for the Speaker to give a casting vote in such a way that the House will have an opportunity of reconsidering its decision.

Castings. See Metallurgy.

Castle (kas'l), [Sax. *castel;* Lat. *castellum*, dimin. from *castrum*, a "camp"], a name given to a building constructed as a dwelling, as well as for the purpose of repelling attack. The name is especially given to buildings of this kind constructed in Europe in the Middle Ages. The *castella* of the Romans were constructed on the model of their stationary encampments, and may have suggested the castles of the Middle Ages, though designed for military purposes only. Traces are found in various parts of Great Britain of castles which are ascribed to its aboriginal or early inhabitants. Traces of Saxon, and even Norman, workmanship are found in structures originally Roman. But of castles for residence as well as defence few are of higher antiquity than the Conquest. The absence of strongholds was one reason why William the Conqueror so easily became master of England; as a protection against the resentment which the conquest occasioned most of the great Norman castles were built. As these castles grew in strength they afforded their possessors not only security from their fellow-subjects and their subordinates, but independence as regarded the monarch. Similar conditions in other countries led to similar results. No small portion of the history of Europe during the feudal period consists of an account of the attempts which were made by the monarchs to extirpate these dens of thieves.

The castle was generally surrounded by a moat, foss, or ditch; and that the ditch might be readily filled with water, the site was usually the bank of a river or a lake. Inside the ditch mounds were constructed, with walls and towers, both supplied with battlements and bastions. The gates were protected by towers usually of great strength. The bridge across the moat was made to draw up and down, and the entrance, in addition to thick doors, was protected by a portcullis, dropped down through grooves at the sides. The gate was further defended by a barbican and by machicolations. Passing the external wall, one entered the bailey, or ballium, which consisted of several courts, and contained the barracks, magazine, well, and chapel. Within the ballium was the donjon, keep, or citadel, a species of internal castle, placed in the most advantageous position to afford a last chance to the garrison when driven from the external works. The protection which the castle afforded to the retainers of a baron led to the construction of houses around the moat, and to this custom a very large number of the towns in Europe owe their origin.

Cas'tlebar, a town of Ireland, capital of the county of Mayo, is on the Castlebar River, about 160 miles W. N. W. of Dublin. It has an old castle, once a stronghold of the De Burgh family; also manufactures of coarse linen. The earl of Lucan has a country-seat near this town. Castlebar was taken by the French under Humbert, in 1798. Pop. 3508.

Castle Grove, post-township of Jones co., Ia. P. 839.

Castle Hill Plantation, a township of Aroostook co., Me. Pop. 237.

Cas'tlemaine, a city in Australia, province of Victoria, in the neighborhood of rich gold-mines, connected by rail with Melbourne, 70 miles distant. Pop. 9683.

Cas'tle Peak, California, is a peak of the Sierra Nevada, about lat. 38° 10′ N. Its height is estimated at 13,000 feet.

Cas'tlereagh (Robert Stewart), Viscount, marquis of Londonderry, an able British Tory statesman, born in the county of Down, Ireland, June 18, 1769. He was the eldest son of the first marquis of Londonderry. He entered the House of Commons in 1794, and efficiently promoted the union of Ireland with England in 1800. In 1802 he was appointed president of the board of control by Mr. Pitt. He became secretary of state for the department of war and the colonies in 1805, and fought a duel with George Canning in 1809. About this time he was the favorite leader of the Tory party, and a political rival of Canning. He entered the ministry of Lord Liverpool as secretary for foreign affairs in Feb., 1812, and as such was a powerful director of the coalition against Napoleon. He represented Great Britain at the Congress of Vienna, 1814, and the Congress of Paris, 1815. On the death of his father, in 1821, he inherited the title of marquis of Londonderry. He committed suicide Aug. 12, 1822, and left no issue. (See his "Memoirs and Correspondence," 8 vols., 1848.)

Castle Rock, cap. of Douglas co., Col., at the foot of the celebrated Castle Rock, 32 miles S. of Denver, on Plum Creek and the Denver and Rio Grande R. R. Has a court-house, 1 school-house, 1 newspaper, 2 hotels, 1 church, etc. Principal business, cattle-raising and dairying.

E. H. Sturdy, Ed. "Douglas Co. News."

Castle Rock, post-tp. of Dakota co., Minn. Pop. 703.

Cas'tleton, a township of Barry co., Mich. Pop. 1738.

Castleton, a township of Richmond co., N. Y., on the N. side of Staten Island. The township contains the villages of New Brighton and Tompkinsville, and a "Sailor's Snug Harbor," an asylum for the children of seamen, several extensive dyeing and color-printing establishments, and other manufacturing interests. It has many elegant residences of New York merchants and manufacturers. Pop. 9504.

Castleton, a post-village of Schodack township, Rensselaer co., N. Y., on the Hudson River and the Hudson River R. R., 9 miles S. E. of Albany. It has a national bank. Pop. 580.

Castleton, a post-village of Rutland co., Vt., on Castleton River and on the Rensselaer and Saratoga R. R., 11 miles W. of Rutland. It is the seat of Castleton Seminary and a State normal school, and has five churches, a national bank, and manufactures of agricultural implements, marbleized slate, etc. Pop. of Castleton township, 3243.

Cas'tletown, an English town, capital of the Isle of Man. It has a Danish fortress, Castle Rushen.

Cas'tlewood's, a township of Russell co., Va. Pop. 1886.

Castor. See Beaver.

Cas'tor, a remarkable binary or double star of the second magnitude in the constellation Gemini, is called also α Geminorum. The two stars rotate around their common centre of gravity, and according to Sir John Herschel perform a rotation in 253 years.

Castor, a township of Madison co., Mo. Pop. 1000.

Castor, a township of Stoddard co., Mo. Pop. 2785.

Castor and **Pol'lux** [Gr. Κάστωρ and Πολυδεύκης], heroes of classic mythology, called also **Dioscu'ri** ("sons of Jove"), were twin brothers. They were supposed to be sons of Jupiter and Leda, or, as some say, of Tyndareus and Leda. They took part in the Argonautic expedition and the Calydonian hunt. Castor excelled in horsemanship, and Pollux in pugilistic contests. According to tradition, Pollux was immortal, and when Castor was killed offered to share his fate, and they were permitted to enjoy life by turns. They were translated into or identified with the constellation Gemini, "The Twins."

Castor and Pollux, the name given to an electrical meteor which sometimes appears at sea, attached to the extremities of the masts of ships, under the form of two balls of fire. Sailors consider this phenomenon a sign of fair weather, but a single ball, which is called Helena, is supposed to portend a storm.

Castor (Antonius), an ancient physician of high reputation who lived at Rome in the Augustan age, and died about 80 A. D. Pliny states that he had a botanic garden, the first mentioned in history.

Casto'reum, or **Cas'tor,** a substance secreted in glandular sacs closely connected with the reproductive organs of the beaver (*Castor fiber*). Each beaver produces two of these sacs or pouches. This substance is used by perfumers, and was formerly esteemed a valuable remedy for hysteria, catalepsy, and other diseases. It is an antispasmodic.

Casto'ria, a township of San Joaquin co., Cal. Pop. 1184.

Castor'idæ, a family of Mammalia of the order Rodentia, comprises the beaver (*Castor*), which is the typical genus, the coypu (*Myopotamus*), and the musquash.

Cas'tor Oil (*Oleum Ricini*), a fixed oil from the seeds of the castor-oil plant. The best variety is obtained by pressure in the cold, and is known as *cold-pressed* castor oil. But the warm-pressed Italian oils are the pleasantest as a medicine. In the Indies great quantities are prepared by boiling the seeds, but the oil is irritating, dark in color, and not fit to use as a medicine. Exposure to the sun's light bleaches the oil. When pure, castor-oil is of a light-yellow color, but when of inferior quality, it has a greenish, and occasionally a brownish, tinge. It is sometimes thick and viscid. Its specific gravity is about 960 (water being taken as 1000). It has a nauseous smell and a disagreeable taste. The principal acid present in it is ricinolic, allied to oleic acid.

The best castor oil is one of the mildest of purgatives. In doses of one or two tea-spoonfuls it forms a gentle laxative, while a dose of a table-spoonful will almost always open the bowels freely. The only objection to the use of castor oil is its disagreeable flavor; some attempt to get over this difficulty by floating the oil on hot coffee, or mixing it with twice its bulk of spiced syrup of rhubarb. It is also much used in the arts as a lubricant for machinery, carriage-wheels, and leather. In Hindostan it is extensively employed as a lamp oil.

The Castor-oil Plant (*Ricinus communis*) is a native of the south of Asia and of Northern Africa, naturalized in the south of Europe and in other warm regions. It belongs to the order Euphorbiaceæ, and has panicled flowers; the fruit a three-celled capsule, with one seed in each cell. The castor-oil plant is often cultivated in gardens in Europe and the U. S., where except in Southern Florida it is only an annual, attaining a height of three to ten feet, highly ornamental by its stately growth, its large, broad, palmate peltate leaves and its purplish hue. In warmer climates it is perennial, and becomes arborescent, attaining even thirty feet in height. From the resemblance of its seeds to an insect called ricinus, it received that name from the Romans. The seeds are oval, and about four lines long. They are chiefly valued for the oil which they yield, on account of which the plant is cultivated in the Levant, Spain, Provence, the Indies, Brazil, and the U. S. Illinois and Missouri are the chief seats of its culture, and St. Louis of the oil manufacture in the U. S.

Castres, an ancient town in the S. of France, department of Tarn, on the river Agout, 34 miles by rail N. E. of Castelnaudary. It is the most populous town in the department, and is the seat of a Protestant consistory, having been one of the strongholds of the early Huguenots. Castres has important manufactures of cassimeres, military clothing, cotton goods, paper, soap, and copperware. Pop. 21,357.

Cas'tro (anc. *Mytilene*), a seaport town of Asiatic Turkey, capital of the island of Mytilene, is on its E. coast, 55 miles N. W. of Smyrna. It has a large castle and several churches and mosques. Some remains of the ancient *Mytilene* are visible here. Pop. 6000.

Cas'tro del Rí'o, a town of Spain, in Córdova, on the river Guadajoz, 21 miles S. E. of Córdova. The streets are mostly wide and regular, and lined with well-built houses. It has a spacious church with a high tower, two colleges, two hospitals, and several convents; also manufactures of linen and woollen fabrics, brandy, wine, etc. Pop. 8852.

Cas'tro Giovan'ni (anc. *Enna*), a town of Sicily, in the province of Caltanisetta, is on a fertile plateau 4000 feet above the level of the sea, 14 miles N. E. of Caltanisetta. Here is a feudal fortress of Saracenic origin. The ancient *Enna* was the site of the most famous temple of Ceres, and was supposed to be a favorite resort of that goddess. Pop. 14,084.

Castrovilla'ri, a fortified town of Italy, in the province of Cosenza, 32 miles N. of Cosenza. It has an old castle, and a trade in silk, manna, and wine. Pop. 7931.

Cas'troville, a post-township of Monterey co., Cal., near the mouth of the Salinas River. It is connected with San Francisco by steamboat. Pop. 1302.

Castroville, a post-village, capital of Medina co., Tex., on the Medina River, 25 miles W. S. W. of San Antonio. It has one weekly newspaper. Pop. 515.

Cast Steel. See Steel, by A. L. Holley, C. E.

Castue'ra, a town of Spain, in the province of Badajoz, 75 miles E. S. E. of Badajoz, near the river Guadiana. It has manufactures of earthenware and a trade in fruit and wine. Pop. 6221.

Casuari'na, "the cassowary tree," a genus of trees of the order Amentaceæ, sub-order Casuarineæ, mostly natives of Australia. Some of them are large trees, producing hard and heavy timber of excellent quality, which is called beef-wood, from its resemblance to the color of raw beef. One species, the *Casuarina equisetifolia*, grows wild in the South Sea Islands, the peninsula of Malacca, and other places. It is a lofty tree, which is valued in India for its timber, which is very durable and hard. All the trees of this genus have a peculiar appearance, having long, slender creeping or drooping branches, which are jointed, and bear scales instead of leaves. The flowers have neither calyx nor corolla, and the stamens and pistils are in separate flowers.

Cas'uistry [from the Lat. *casus*, a "situation"] is that branch of ethics which deals with delicate or perplexing moral questions, and which supplies rules for resolving the same, partly from natural equity, and partly from the authority of Scripture, the councils, Fathers, etc. Casuistry has been studied chiefly by ancient Jewish, and later by Roman Catholic writers, who generally call it "moral theology." Traces of it are, however, found in the philosophers of ancient Greece, but the healthy reason of antiquity could not enter into the refinement of morals found in certain Jewish and Christian writers. The Schoolmen elaborated it into a science, and the Jesuits Molina, Escobar, Sanchez, etc. became notorious for their ingenuity in the construction of moral puzzles, and for the immorality of their solutions. Certain Protestant writers, as Baxter, Jeremy Taylor, and others, have written much on these subjects with a different animus. The University of Cambridge has a professorship of this science, which is now generally regarded as practically obsolete, for most modern authorities are of the opinion that an educated moral sense is the best practical guide in cases of conscience.

Ca'sus Bel'li (a "case of war," or, in other words, a "case justifying war"), a Latin phrase used to denote an act or event which involves war or justifies a declaration of war. It is the reason alleged by one power for waging or declaring war against another.

Cas'well, a county of North Carolina, bordering on Virginia. Area, 400 square miles. It is drained by the Dan and Hycootee rivers. The surface is undulating; the soil is fertile. Iron ore is found. Grain, tobacco, and wool are important products. The Richmond and Danville R. R. crosses the N. W. part of the county. Capital, Yanceyville. Pop. 16,081.

Caswell, a township of Calhoun co., Ark. Pop. 220.

Caswell, a township of New Hanover co., N. C. P. 1087.

Caswell (Alexis), D. D., LL.D., an American educator, born Jan. 29, 1799; was a professor of mathematics in Brown University from 1828 to 1864. He was president of that institution from 1868 to 1872, and was one of the corporators of the National Academy of Sciences.

Caswell (Richard), an American patriot and statesman, born in Maryland Aug. 3, 1729, removed to North Carolina, where he served with distinction against the British, and subsequently became governor of the State. He assisted in framing the Federal Constitution in 1787. Died Nov. 9, 1789.

Cat [a word found in various forms in many Indo-European and in some other languages], a name sometimes extended to the whole family Felidæ, including the lion, tiger, lynx, etc., sometimes limited to the smaller species of that family, and sometimes to the genus *Felis* proper, which is distinguished from the rest of the family by having a longer tail and four molar teeth on each side of the upper jaw, while the others have but three. This genus includes the lion, tiger, and all the larger Felidæ, as well as the domestic cat and the wild-cat of Europe, but not the wild-cat of America, which is a lynx.

It is not easy to say what was the original abode of the domestic cat (*Felis domestica*). It not unfrequently escapes to a wild state, but no properly wild species exactly resembles it. It is asserted that the domestic cat of ancient Egypt was the *Felis maniculata*, a species differing considerably from ours. The cat is scarcely mentioned in the

authors of ancient Greece, Rome, and Judæa, and it is known that in the earlier mediæval period of Europe cats were comparatively rare and costly animals. They seem to have been long known in China, which affords a fine variety with a soft and beautiful fur and pendulous ears. It is, however, regarded as probable that the wild-cat of

European Wild Cat.

Europe and Asia, though somewhat different anatomically, may be the progenitor of the domestic cat. Among the more remarkable varieties are the Manx or Cornish cat, with a merely rudimentary tail; the Angora cat, with long hair; the Maltese and Chartreuse cats, with a bluish-slate color, etc.

Catacaus'tics [from the Gr. *κατά*, "down" or "back," and *καίω*, "to burn"] are the caustic curves formed by the reflection of the rays of light, and are so called to distinguish them from the diacaustic, which are formed by refracted rays. (See CAUSTIC.)

Cat'acombs [probably from the Gr. *κατά*, "down," and *κύμβη*, a "hollow"], a pit or excavation under ground, employed usually as a receptacle for the dead. The name is applied especially to those at Rome, but also to those of Egypt, Naples, Syracuse, Malta, and other places. Even the quarries under Paris, now used as charnel-houses, are often called by this name. The earliest catacombs of Rome are believed by many to date from the persecution of Nero, and they were probably all finished before the fifth century. It has been held that the catacombs of Rome were originally quarries, but most writers now admit that they were executed principally to serve the purpose of burial-places for the dead, tombs or *loculi* being cut on either side of the long galleries and transverse corridors, which run to great distances through the tufa. Some writers assign them a Jewish origin. They were also places of refuge in times of persecution, and Christian worship was no doubt often held there. Still, the traditions of the "Church in the catacombs," of Pope Stephen's subterranean court, and his final martyrdom there, are thought by many to be greatly exaggerated. The catacombs abound in symbols and inscriptions, mostly of Christian origin and commemorative of the dead. They have been of late explored with much care, and the results are very important in the study of Christian archæology. (See BOSIO, "Roma Sotterranea," 1532; PERRET, "Les Catacombes de Rome," 1852–53; ROSSI, "Roma Sotterranea Christiana," 1864 *seq.*; KIP, "The Catacombs of Rome," 1854.)

Catahou'la, a parish of Louisiana. Area, 1200 square miles. It is bounded on the E. and S. E. by the navigable Tensas and Washita Rivers, and also drained by other streams. The soil in some parts is fertile. Cotton, corn, and live-stock are raised. This parish contains Catahoula Lake, which is nearly twenty miles long. Capital Harrisonburg. Pop. 8475.

Catala'ni (ANGELICA), a celebrated Italian singer, born at Sinigaglia in 1784. She had a voice of immense volume, range, and flexibility. Having made her *début* in Italy at an early age, she afterwards performed with great applause in Paris and London, and amassed large sums of money. She was married to a Frenchman named Valabrègue, with whom she resided for some years in Paris. In 1830 she retired from the stage. Died June 13, 1849.

Catalau'nian Plain [Lat. *Campi Catalaunici*], the ancient name of the wide plain surrounding Châlons-sur-Marne, in France. On this plain the Roman general Aetius and his ally, Theodoric the Visigoth, gained a great victory over Attila in 451 A. D.

Cat'alepsy [from the Gr. *κατά*, intensive, and *λαμβάνω*, to "take"], a condition in which a person becomes more or less completely unconscious, but does not fall. If standing at the commencement, he remains so during the attack, the countenance retaining the expression the patient wore at the outset. If the limbs of the patient be placed in a new position by attendants, the position is retained. This disease is a rare one, and indeed is probably not so much a peculiar disease as a symptom of other diseases. It has been observed in both sexes, and may occur in insane persons or in those suffering with chorea and other nervous affections. It has been described as sometimes epidemic. The immediate attack is seldom fatal, and is usually short, but may be indefinitely prolonged. Treatment must be addressed to the general condition. Catalepsy is so rare that its character is not well understood.

REVISED BY WILLARD PARKER.

Catali'na, a port of entry of Newfoundland, on the N. side of Trinity Bay, has an excellent harbor, though difficult to approach. It has a lighthouse and a fine Anglican church. Pop. 1300.

Cat'alogue [Gr. *κατάλογος*; Lat. *catalogus*], a list; an enumeration of the names of books, stars, or other things. The term is used to denote a list of the books contained in a library, or of the works kept for sale by a bookseller.

CATALOGUE RAISONNÉ (rà-zon-ā'), a French term used in statistics, natural science, bibliography, etc., signifies a catalogue of objects arranged in appropriate classes. For example, books are arranged under their several subjects, with a general abstract of the contents of the works where the title does not sufficiently indicate it, thus serving to direct the reader to the sources of information on any topic. The want of alphabetical arrangement is supplied by an index at the end.

CATALOGUES OF BOOKS.—There is nothing connected with the management of any large public library which can compare in importance with the character of its catalogues of books. However large and select its stores, however able its administration, however accessible its contents to the student, its usefulness will be much diminished if its catalogues be not well arranged, frequently revised, and thoroughly at the command of those who use them. "A library," says Carlyle, "is not worth anything without a catalogue; it is a Polyphemus without any eye in his head; and you must front the difficulties, whatever they may be, of making proper catalogues."

And these difficulties are neither few nor small. "There is," says the late Mr. C. C. Jewett (a most competent authority), "no species of literary labor so arduous and perplexing." Indeed, many of the largest libraries of this country and Europe have entirely abandoned the issue of catalogues; and the trustees of the New York State Library in 1872 contented themselves with issuing a catalogue of the authors whose works are in their library, the names of the authors being arranged under the various subjects treated of. Even this meagre subject-catalogue is a large volume. Not one of the first-class libraries of Europe, it is said, has a complete catalogue; and many of those which are most complete are, from their defective arrangement, of little value to the student.

Catalogues may be arranged in an alphabetical table of the names of books and of their authors. But the same author may have issued books under two names, as White and Albius. It is the librarian's duty to be so well informed in bibliography as to be able to bring the works of such an author under one head, and make all necessary references. Again, the number of anonymous, pseudonymous, apocryphal, and suppositious works is very great. Even Voltaire saw fit to publish works under the names of other famous men. All such matters it is the part of the catalogue to explain. Others, again, prefer to have books catalogued under the heads of the various subjects of which they treat. This plan is of very great use to editors and compilers, and indeed to all literary men. Much discussion has prevailed, especially in France, as to the relative merits of the two plans just referred to; and among the numerous class who prefer the arrangement by subjects there is great difference of opinion as to how the subjects themselves shall be arranged. For example, under the head of theological books, there must be many minor heads to enable the reader conveniently to find in a large library the book he may desire.

The plan of combining into one both the above systems of cataloguing was perfected by Mr. Lloyd P. Smith, the accomplished librarian of the Philadelphia Library. His catalogues are arranged according to subjects, and at the

end of the volume is a full alphabetical index, as well of authors as of all the important words of each title. Good judges pronounce his catalogues the best yet published.

In rapidly-growing libraries there is much difficulty and expense in keeping the catalogues up with the times. Various plans have been proposed to overcome the difficulty. The British Museum has catalogues interleaved with blank pages, on which the names of new books are written—a clumsy and unsatisfactory arrangement. Mr. Jewett in 1850 brought forward the plan of having the name of each book stereotyped on a separate block, so that it is easy to insert the names of new books in their proper places in a new catalogue without the great expense of setting up type anew for the whole volume.

The present approved plan of keeping up a manuscript catalogue is to write the title of each book on a card, and to keep the cards so prepared, together with those containing the necessary cross references, arranged alphabetically in drawers. (For the subject of general catalogues of books, see BIBLIOGRAPHY.) CHAS. W. GREENE.

Catalo'nia [Sp. *Cataluña*], an old province of Spain, is bounded on the N. by France, on the E. by the Mediterranean, on the S. by Valencia, and on the W. by Aragon. Area, 12,514 square miles. Pop. in 1867, 1,744,052. Capital, Barcelona. The Pyrenees extend along the northern border of this region, which is extremely mountainous. The highest summits are covered with perpetual snow. The soil of the valleys is fertile, and this is said to be the best cultivated part of Spain. The orange, the olive, the grape, and cereal grains flourish here. The principal rivers are the Ebro and Llobregat. Among its minerals are copper, cobalt, lead, zinc, coal, sulphur, and marble. Catalonia surpasses every other province of Spain in the importance of its manufactures, the chief products of which are cotton, silk, and woollen fabrics, paper, firearms, cordage, and leather. Catalonia is divided into the provinces of Barcelona, Tarragona, Lerida, and Gerona. The Catalans speak a peculiar language, different from the Castilian, and nearly related to the Provençal. They surpass the other Spaniards in energy and industry. This region was in ancient times a Roman province called *Hispania Tarraconensis*. The Goths and Moors successively became masters of it. In 1137 it was united with Aragon by a marriage of the sovereigns.

Cataloo'cha, a township of Haywood co., N. C. P. 198.

Catal'pa, a genus of trees of the order Bignoniaceæ. The *Catalpa bignonioides* is indigenous in the Southern U. S., and is planted as an ornamental tree in the Northern States and in Europe. It has large cordate and pointed leaves, and showy flowers in open compound panicles. The fruit is a pod which is often one foot long, and usually remains on the tree all winter.

Catalpa, a township of Culpeper co., Va. Pop. 3388.

Catal'ysis [from the Gr. *κατά*, intensive, and *λύω*, to "dissolve"] is a term applied in chemical physics to a force exerted by one substance upon a second, whereby the latter is subjected to change or decomposition, whilst the former, or acting substance, remains comparatively unaltered, and does not combine with it. The force, indeed, has been ascribed to the mere "action of contact." No satisfactory theory has been brought forward to account for these changes, or to define what the force of catalysis is.

Catamaran' [said to mean "floating trees" in Singhalese], a sort of raft used by the Hindoos of the Coromandel coast, is formed of three planks or pieces of wood lashed together. The middle piece is longer than the others. The catamaran, which is propelled by a paddle, is used by the people of Madras to maintain communication between the shore and ships where the surf is so violent that ordinary boats are unsafe. The catamaran is also used on the coast of Brazil.

Catamar'ca, a province or department of the Argentine Republic, is bounded on the W. by the Andes. The soil is mostly fertile, producing grain and cotton. Area, 35,760 square miles. Capital, Catamarca. Pop. 110,000.

Catamarca, San Fernando de, the capital of the above province, is about 650 miles N. W. of Buenos Ayres. Pop. 5150.

Catame'nia (plu.), [Gr. from *κατα*, "according to," and *μήν*, "month"], the monthly sanguineous uterine discharges. They commence in hot climates usually from the age of ten or eleven, and considerably later in colder regions. Each period in a state of health commonly lasts from three to six days. The final cessation occurs, with some exceptions, at the age of forty-five or fifty.

Catamount. See PUMA.

Cata'nia, a province of Italy, in Sicily, is bounded on the E. by the Mediterranean, on the N. by Messina, on the W. by Caltanisetta, and on the S. by Noto. Area, 1948 square miles. The surface is partly mountainous. Among its prominent features is Mount Etna. Capital, Catania. Pop. in 1871, 479,850.

Catania (anc. *Catana*), a city of Sicily, capital of the above province, is beautifully situated on the E. coast, at the foot of Mount Etna, 31 miles N. N. W. of Syracuse; lat. 37° 28′ N., lon. 15° 5′ E. It presents a noble appearance from the sea, and is internally handsome, being well built, with wide and straight streets, which are paved with lava. Some of the public buildings are also constructed of lava. It has been several times nearly ruined by earthquakes and eruptions of Mount Etna, but it has risen again with greater beauty and splendor, and is now perhaps the finest city of Sicily. The most remarkable edifices are the cathedral, rebuilt after the great earthquake of 1693; the town-hall; the university, founded in 1445; and the grand Benedictine convent and church of San Niccolò. Catania has about fifty churches, several hospitals, and a college of arts. In a fine square adjacent to the cathedral is a statue of an elephant formed of lava. The harbor, which was formerly good, has been partly choked by lava from Mount Etna. This city has manufactures of silk and linen fabrics, and of articles and wares formed of amber and lava. The chief articles of export are grain, wine, silk, olives, manna, figs, soda, and snow from Mount Etna. The ancient *Catana* was founded by the Phœnicians or Greeks, and was nearly as old as Rome. It was taken by the Athenian general Nicias about 413 B. C., and was an important city under the Romans, who adorned it with magnificent edifices. The remains of an aqueduct, a temple of Ceres, and a large amphitheatre are still visible here. Catania was severely injured by earthquakes in 1693, 1783, and 1818. Pop. in 1872, 84,397.

Catanza'ro (formerly called **Calabria Ulteriore II.**), a province of Southern Italy, is bounded on the N. by the province of Cosenza, on the E. by the Gulf of Taranto, on the S. by the province of Reggio, and on the W. by the Mediterranean Sea. Area, 2158 square miles. The soil is fertile and the climate healthy. The chief products are wool, cotton, linen, cheese, butter, hemp, oil, silk, wine, and lumber. Chief town, Catanzaro. Pop. in 1871, 412,226.

Catanza'ro, a city of Italy, in the province of the same name, is finely situated on a mountain near the Gulf of Squillace, 33 miles S. S. E. of Cosenza. It has an old castle of the Norman period, a cathedral, a large college, and a royal academy of sciences. Many of its public buildings were destroyed by the earthquake of 1783. Here are manufactures of velvet and of silk and woollen fabrics. Pop. in 1872, 24,901.

Cataplasm. See POULTICE.

Cat'apult [Lat. *catapulta*, from the Gr. *κατά*, intensive, and *πάλλω*, to "hurl"], an engine of war used by the ancients for discharging arrows. We are not able, from any descriptions the ancients have left us, to form any exact idea of either the catapult or the ballista. It appears that in the catapult a rope, suddenly freed from great tension, gave impulse to an arrow placed in a groove. There were great catapults, fixed upon a scaffold with wheels, which were used in sieges, and small ones, carried in the hand, which were employed in the field. Originally, ballistæ were employed to throw stones, and catapults to shoot darts; but the terms were often confounded by the later Roman writers.

Cat'aract [Gr. *καταῤῥάκτης*, from *κατά*, "down," and *ῥήγνυμι*, to "break," so named because the ancients believed that a kind of veil fell down within the eye, obscuring vision], an opaque state of the crystalline lens of the eye, of its capsule, or both. Cataracts are thus lenticular, capsular, or lenticulo-capsular. Various other kinds are enumerated, such as the soft cataract, in which the lens is soft, and sometimes even liquid; the hard cataract, when the lens may be as hard as bone, with many of intermediate consistency. Lamellar cataract affects a limited part of one or more of the lamellæ, or layers of the lens. "Gold-leaf cataract" is of a shining yellow, and contains cholesterine and crystalline degeneration products. Cataract is generally white, but sometimes is brown, black, bluish, silvery, etc. It sometimes has a pearly lustre.

Cataract begins in a gradual impairment of vision, some months generally elapsing before sight is lost. The pupil is sensitive to light and atropia, vision being clearest when the pupil is large. There is no pain or intolerance of light. The patient sees as in a mist, but almost always can perceive at least the presence of light. The pupil on examination is seen to be opaque, but the eye is neither hardened nor softened and the expression of the face is quite natural. One or both eyes may have cataract. It is most frequent in elderly persons, but may occur at any age; children are sometimes born with it. Medical treatment for cataract is

useless, but the skilful surgeon can treat the disease often with the happiest results. The operation is either (1) extraction of the lens and its capsule, (2) depression or couching of the same, or (3) laceration with appropriate instruments, with a view of inducing absorption of the diseased part. This last operation is the most common, and often is the only one admissible. Great care should be taken for a long time to prevent inflammatory action. The place of the lens is supplied by a kind of spectacles called cataract glasses. By these means the sight is often to a great degree restored.

REVISED BY WILLARD PARKER.

Cataracts and Rapids. The regular slope of the river-bed is sometimes interrupted by more inclined and rocky planes, over which the stream, flowing with increased velocity, forms *rapids*, or by abrupt and nearly perpendicular walls, from which the foaming water descends from rock to rock, or in a single leap, in imposing *cataracts* or picturesque *waterfalls*. Usage, however, often confounds these names. The famous cataracts of the Nile are merely rapids, which impede, but do not entirely prevent, navigation. The Falls of St. Anthony, in the Upper Mississippi, the great falls of the Upper Missouri, and, the grandest of all, the rapids of the St. Lawrence at Long Sault and Lachine, above Montreal, are among the noblest examples in our American rivers.

The highest waterfalls are found in mountainous regions in the upper course of rivers; the largest in their middle course. Among the first, that of the Yosemite, in California, is perhaps the most remarkable. It falls from an almost perpendicular ledge of rock over 2500 feet high to the bottom of the valley of the same name, forming three cataracts, the first descending by a single leap of 1500 feet on a shelf of rock, from which it makes a series of cascades and a final plunge of 450 feet to the base of the precipice. The Keelfoss, in Norway, near the Sognefiord, the highest fall in Europe, has an uninterrupted descent of 2000 feet, and the Cascade of Gavarnie, in the Central Pyrenees, falls from a height of over 1300 feet; the Staubbach, in the Swiss Alps, from a 900-feet wall, and is reduced to spray before reaching the ground. In the Falls of Tequendama, in the Andes of New Granada, the river Bogota, compressed in a chasm thirty feet wide, precipitates itself 560 feet into a deep recess amidst the most gorgeous tropical vegetation.

Among the great cataracts of the middle course of rivers Niagara takes the first rank by the volume of its waters, presenting the grand spectacle of a river over half a mile wide pouring itself in two magnificent sheets from a height of 160 feet into the whirlpool below. The Shoshonee Falls in the Snake River branch of the Columbia in Idaho, the Victoria Falls of the Zambese in the heart of South Africa, the Falls of the Cavery in Southern India, which fall 500 feet in seven magnificent cascades, the newly discovered and splendid Cataract of Kaieteur, in British Guiana, formed by a large affluent of the Essequibo, which jumps in a single foaming sheet of water into a vast basin 740 feet below, the Falls of the Rhine, though but 60 feet high, all are said to equal in picturesque beauty, though not in grandeur, the Falls of Niagara.

ARNOLD GUYOT.

Catarrh' [from the Gr. *κατά*, "down," and *ῥέω*, to "flow"], in medical language is a condition characterized by hyperæmia (or congestion) of the blood-vessels of any mucous surface, with great increase of the proper secretion of the part. Thus, there may be catarrh of the nose, the throat, the air-passages, the bowels, the vagina, the bladder, or the urethra; but in popular language "catarrh" designates either a "cold" in general, a "cold in the head," or a chronic catarrh of the posterior nares (nostrils) and throat. Catarrhs in general arise from exposure to cold and wet and to sudden atmospheric changes. They are most common in persons who are ill-fed, and who are not accustomed to out-of-door exercise. The variety of catarrh known as a "cold" is by no means always easy of cure. The popular belief that "a cold must have its run" has some foundation. Hot foot-baths, laxatives, sedatives, demulcents, mild stimulants, or diaphoretics may, however, prove useful in many cases. Judicious exercise, bathing, and life in the open air tend to overcome the morbid inclination to take cold from which some patients suffer. Chronic catarrh of the posterior nostrils is an obstinate disease, best treated by systematic exercise and attention to other hygienic conditions, and by the use of water as a nasal douche.

REVISED BY WILLARD PARKER.

Catasau'qua, a post-borough of Lehigh co., Pa., on the Lehigh River and the Lehigh Valley R. R., 3 miles N. of Allentown; it is also on the Lehigh and Susquehanna R. R., and is the E. terminus of the Catasauqua and Fogelsville R. Rs. It contains about seven churches, one national bank, two machine-shops, two rolling-mills, and five blast furnaces. It has two weekly newspapers. P. 2853.

Catas'trophe [Gr. *καταστροφή*, from *καταστρέφω*, "to overturn"], the final event of a drama or romance, to which the other events are subsidiary; a disastrous revolution or event; a calamity; an unfortunate conclusion. The term is used by geologists to denote a violent convulsion or physical revolution, causing the elevation or subsidence of portions of the globe, and the destruction of large tribes or multitudes of animals.

Cataw'ba, the name of an excellent wine of a rich muscadine flavor which is produced in various parts of the U. S. It is made of the Catawba grape, which originated probably near the Catawba River in North Carolina. This grape, which is highly esteemed for dessert, is red or copper-colored. The first person who cultivated it extensively for wine was Nicholas Longworth of Cincinnati, whose vineyards covered the southern slopes of the hills in the environs of that city. The Catawba grape flourishes in the Middle, Southern, and Western States. A large quantity of this wine is produced in the Ohio Valley, the climate and soil of which are especially adapted to the culture of the grape. The best sparkling Catawba is considered nearly equal to champagne.

Catawba, or **Great Catawba,** a river of the U. S., rises in McDowell co., N. C., and flows nearly eastward to Iredell co. It afterwards runs southward into South Carolina, and forms the E. boundary of York and Chester counties. Below Rocky Mount it is called the Wateree. Its length from its source to Rocky Mount is 250 miles.

Catawba, a county in the W. of North Carolina. Area, 250 square miles. It is bounded on the N. and E. by the Catawba River, and is also drained by the Little Catawba. The surface is diversified; the soil is fertile. Corn, wheat, and wool are important products. Iron ore and marble are found. It is intersected by the Western R. R. Capital, Newton. Pop. 10,984.

Catawba, a township of York co., S. C. Pop. 2893.

Catawba, a post-twp. of Roanoke co., Va. Pop. 845.

Catawba Indians, a once warlike tribe in the Carolinas, now represented by a few half-breeds on a reservation near the Catawba River. They were always friendly to the whites and hostile to their Indian enemies. Their language was akin to that of the Creeks.

Catawba Island, a post-twp. of Ottawa co., O. P. 515.

Catawba Springs, a twp. of Lincoln co., N. C. P. 2097.

Catawis'sa, a post-village of Columbia co., Pa., on the North Branch of the Susquehanna, and on the Danville Hazelton and Wilkesbarre and the Catawissa R. Rs., 52 miles S. E. of Williamsport. Here are several iron-works. The scenery is very fine. Pop., including township, 1614.

Cat-Bird (*Turdus felivox*), a bird common in the U. S., is related to the mocking-bird, which it resembles in its vocal powers. It derives its common name from a note or cry which it utters. It occurs in the Middle States as a summer bird of passage, and breeds in gardens or in the vicinity of dwelling-houses. The color of its upper plumage is dark gray or slate-color. It is serviceable to man in devouring insects and worms. It sometimes imitates the song of other birds, and is remarkable for its boldness and vivacity.

Catch, a kind of music for men's voices; a sort of round or fugue intended for convivial parties. This kind of music is chiefly English, and was especially popular in Charles II.'s time. The effect of the best catches is very fine.

Catch-drains, open drains across a declivity to intercept the surface-water. The term is sometimes applied to under-drains across a declivity.

Cateau, Le, or **Cateau-Cambresis,** a town of France, department of Nord, on the river Selle, 14 miles E. S. E. of Cambrai. It is well built, and was formerly fortified. It has manufactures of shawls, merinoes, and calicoes. The important treaty of Cateau-Cambresis was concluded here between Henry II. of France and Philip II. of Spain, in 1559. Pop. 9974.

Catechet'ical Schools, a name given to the ancient Christian schools of theology, of which the principal were those of Alexandria (160–400 A. D.) and Antioch (from 290 A. D. through the fifth century). The most noted teachers in the great school of Alexandria were Clement and Origen.

Cat'echism [from the Gr. *κατηχέω*, to "sound into" one's ears, to "instruct orally"], an arrangement of questions and answers, generally designed to teach religious doctrine to the young. Catechetic instruction has long prevailed among the Jews, and in the early Christian Church the *catechumens* (or persons receiving instruction preparatory to baptism) constituted, according to several of the Fathers, a separate order in the membership of the Church. This order comprised both the children of be-

lievers and adults from heathen society who desired admission into the Church. What would now be called catechisms were used to some extent in those remote times. Catechisms were used in the Middle Ages by the Waldenses, and later by the Bohemian Brethren. It has been said that the catechisms of Luther (1518–29) were the first which received this name, but this point is not quite certain. The Roman Catholic Church had long used catechisms, though called by other names. Kero of St. Gall in the eighth century prepared one of the earliest in the German language. The principal catechisms of later times have been those of Luther (the Exposition of 1518, the Catechism of 1520, the Smaller and Larger Catechism of 1529), still extensively used in the Lutheran Church; Calvin's catechisms, the Smaller and Larger (1536–39); the Heidelberg Catechism (1562), (Reformed); that of Œcolampadius (1545), of Erasmus (1547), of Leo Judæ (1553); the Tridentine Catechism (1566), a standard in the Roman Catholic Church; the Anglican catechisms—the Larger (Latin, 1570), the Shorter or Middle Catechism, and the Smaller, which, with a few changes, is published in the Book of Common Prayer; the British Presbyterian catechisms—the Shorter (1647) and Larger (1648), which, with the Westminster Confession (1646), are standard books with most Presbyterian churches in the U. S. and Great Britain. The Russian Church has a "Primer for Children" (1720) and a "Shorter" and "Longer Catechism" (1839). Besides these may be mentioned the three Wesleyan catechisms prepared by Richard Watson, and the three Methodist Episcopal Church catechisms (New York, 1852). The number of symbolical or authorized standard catechisms of the various churches is quite large, besides an immense number of private or unauthorized works of the kind.

REVISED BY R. D. HITCHCOCK.

Cat'echu [etymology uncertain], a material employed in tanning leather, as a coloring-matter, and medicinally as an astringent. The catechu of commerce is derived from East Indian trees, such as the catechu tree (*Acacia Catechu*); also from the areca-palm and various other trees. It is known in India by the name *kutt* (our cutch). The heart-wood of the former (now naturalized in Jamaica) yields catechu by cutting it into chips and boiling in water, straining the liquid from time to time, and adding fresh chips, till the extract is of sufficient consistence to be poured into moulds of a square or circular shape; or when of the thickness of tar it is allowed to harden, and is formed into balls about the size of oranges. The catechu manufacturers in India move to different parts of the country at different seasons, and erect huts in the jungles, where they carry on their operations. The catechu tree abounds in Bombay and Bengal and in Burmah and Siam, and is a small thorny tree, with a roundish head. Its sapwood is yellow, the heart dark red. Catechu is brittle, soluble in water, and possesses an astringent taste, but no odor. It affords permanent colors, and is employed in the dyeing of blacks, browns, fawns, drabs, and greens. It contains much tannin, which is of a peculiar kind, called mimo-tannic acid, also catechuic acid, which can be isolated in white silky crystals. This latter acid is often called catechine, and is of important use when catechu is employed as a dyestuff. It is sometimes adulterated with earthy substances, but its solubility in water and alcohol at once show their presence. The catechu of the betel-nut is obtained by boiling first the nuts, and then the extract. A first boiling of the nuts yields a black catechu, called kassu; and a second boiling, after the nuts are dried, a yellowish kind, called coury, which is the best. The former appears in commerce under the name of Ceylon catechu, in circular flat cakes. Gambir may be regarded as a kind of catechu, and is frequently called "pale catechu." Kino is sometimes confounded with catechu, which it much resembles.

Catechu'men [Gr. κατηχούμενος], a person who is learning the elements of any science, but especially one who is receiving instruction preparatory to admission into the Christian Church. Catechumens were anciently divided into three, or, as some writers say, four classes. The probation commonly lasted from two to three years, although it was frequently reduced to a much smaller compass. It was assumed that the children of Christian parents required less instruction than Jewish converts, and Jewish converts less than the heathen.

Cat'egory [from the Gr. κατηγορέω, to "accuse," and hence to "affirm strongly;" Lat. *prædicamentum*]. In philosophical terminology the categories are the ultimate classes in which all objects of knowledge can be systematically arranged. Philosophy and science, acknowledging the impossibility of knowing all things individually, reduce objects to classes; and when we gain knowledge of the class, we have a formal or general knowledge of its constituent objects. This attempt to render knowledge in some sense universal has been made in the philosophy of all ages, and has given rise to various systems of categories—literally, things that may be affirmed. Aristotle seems to have been the first of the Greeks to make anything like a complete classification of them. He makes them ten in number—viz. substance, quantity, quality, relation, place, time, position, possession, action, passivity. This system was unquestioningly received for a long time, but modern criticism has shown that there may be many predicates which could not be contained in any of these categories. Accordingly, Kant and others have attempted to make better classes. Kant makes twelve categories, in four classes of three species each—viz., singularity, plurality, and universality; reality, unreality, and indefiniteness; substance, dependence, and reaction; possibility, existence, and necessity. Various other arrangements have been proposed, but criticism has shown that thus far, perhaps, none are perfect. It is remarkable that the categories of the Hindoo philosopher Kanâda are almost identical with those of Aristotle. Kanâda probably lived before the time of Aristotle. (See MAX MÜLLER's paper on "Indian Logic," appended to ARCHBISHOP THOMSON'S "Laws of Thought.")

Cate'na [Lat. *catena*, a "chain"], in biblical literature, is a commentary made up of selections from various writers. The number of catenæ is very considerable, and some are of great antiquity. Perhaps the most celebrated is the "Catena Aurea" (*i. e.* "Golden Chain") of Thomas Aquinas.

Cat'enary [from the Lat. *catena*, a "chain"], the curve formed by a cord or flexible chain of uniform density and size when suspended or allowed to hang freely from two fixed points. This curve was first noticed by Galileo, but he imagined it to be the same as the parabola. Its true nature was first demonstrated by James Bernoulli. It has several remarkable properties, one of which is that its centre of gravity is lower than that of any curve of equal perimeter and with the same fixed points for its extremities. It is interesting on account of the light it throws on the theory of arches, and by reason of its application to the construction of suspension bridges.

Cat'erpillar. See ENTOMOLOGY, by PROF. SANBORN TENNEY, A. M.

Catesby (MARK), F. R. S., an English naturalist and artist, born in 1679. He visited America in 1710, and after his return to England published a "Natural History of Carolina, Florida, etc.," with colored figures drawn and etched by himself. Died Dec. 24, 1749.

Cat-fish (*Pimelodus*), a well-known genus of fresh-water fishes, of the family Siluridæ, comprising, it is said, thirty or more species in the U. S., divided by some of the later authors into several genera, as *Amiurus*, *Ichthælurus*, *Hopladelus*, etc. They are also called bull-heads and pouts. Some of them are armed with sharp spines. It is said that cat-fish have been taken in the Mississippi weighing more than two hundred pounds. As a rule, they are not very savory as food. The sea cat-fish (*Galeichthys marinus*) is kindred to the above genus, and is a fine fish for the table.

Cat'gut, a material employed for the strings of violins and other musical instruments, for the cords used by clock-makers, bow-strings, fishing-lines, and for belt-stitching in mills, etc. It is generally prepared from the intestines of sheep, and sometimes from those of the horse and ass. It is prepared by an elaborate process, and preserved from putrefaction by treating it with a dilute solution of alkali. The best violin-strings are manufactured in Italy, and are called Roman strings.

Ca'tha, a genus of plants of the natural order Celastraceæ. The *Catha edulis*, which the Arabs call *khât*, is a shrub, a native of Arabia, having narcotic and stimulating leaves, which are eaten by the Arabs. They also make a decoction of the leaves, which is used as a beverage.

Cath'ari [Gr. Καθαροί, the "pure"], a name applied at different times to various sects of Christians, such as the Novatians of the third century, and to the Albigenses, Patarenes, Waldenses, and others in the twelfth century. The name is analogous to "Puritans," and was apparently in some cases assumed, and in others ironically conferred in consequence of their professed aim at greater purity of life than was ordinarily attained. The Cathari proper were Dualists, and were perhaps of Slavonic, possibly of remote Gnostic, origin. They appeared in Italy in the eleventh century, and attained their greatest prosperity in Southern France, where they were confounded with the Albigenses, and were exterminated with them in the thirteenth century. The strict Cathari held no property, abstained from marriage, war, and the killing of animals, and rejected water-baptism.

Cath'arine, a post-township of Schuyler co., N. Y. Pop. 1629.

Catharine, a township of Blair co., Pa. Pop. 907.

Catharine de' Medici [Fr. *Catherine de Médicis*], queen of France, was born at Florence in 1519. She was a daughter of the duke of Urbino, who was a nephew of Pope Leo X. She was married in 1533 to a son of Francis I. of France, who ascended the throne as Henry II. in 1547. On the death of her son, Francis II., in 1560, she became regent of France during the minority of Charles IX., who was her son. She was ambitious, crafty, and perfidious, and made bad use of her power. Her intrigues promoted the civil or religious war by which France was for many years afflicted. She also appears to have been one of the instigators of the massacre of St. Bartholomew (Aug., 1572). Died Jan. 5, 1589. (See EUGENIO ALBERI, "Vita di Caterina de' Medici," 1834.)

Catharine Howard. See HENRY VIII.

Cath'arine [Russ. *Ekaterina*] **I.,** empress of Russia, was born of poor parents at Ringen, near Dorpat, in Livonia, April 15, 1684. Her first husband was a subaltern Swedish officer. She was taken a captive by the Russians in 1702, and was married to Peter the Great in 1711. Peter, having invaded Turkey in 1711, was reduced by want of provisions to a critical position, from which he was extricated by Catharine, who bribed the Turkish vizier. She was crowned as empress in 1724, and died May 17, 1727. Her daughter Elizabeth became empress.

Catharine II., empress of Russia, born at Stettin May 2, 1729, was a daughter of the prince of Anhalt-Zerbst. She was married in 1745 to Peter, a nephew and heir of Elizabeth, empress of Russia. They soon quarrelled and became estranged from each other. On the death of Elizabeth, in 1761, he ascended the throne as Peter III. In July, 1762, he was assassinated by conspirators, of whom Catharine was probably an accomplice, and she assumed sovereign power, for which she was qualified by superior talents; but she was a woman of very dissolute character. She administered the government with energy and success, and increased both the extent and power of the empire. She co-operated with Austria and Prussia in the partition of Poland in 1772, and in the second partition of 1793. The Russians were victorious in a war against the Turks, which was ended by the treaty of Kainardji in 1774. She was a liberal patron of scientific men. She died Nov. 17, 1796, and was succeeded by her son, Paul I. "Her capacity," says Lord Brougham, "was of an exalted order. Her judgment was clear and sure. The history of princes affords few examples of such force of character on a throne perverted to the working of so much mischief." (*Statesmen of the Time of George III.*) (See TOOKE, "History of Catherine II.," 1803; CASTERA, "Vie de Catherine II.," 1796; TANNENBERG, "Leben Catherinens II.," 1797.)

Catharine of Aragon, queen of England, a daughter of Ferdinand and Isabella of Castile, was born in 1486. In 1501 she was married to Arthur, who was the eldest son of Henry VII. of England, and who died in 1502. She was married in 1509 to Arthur's brother, Henry VIII., who was six years younger than herself. She gave birth in 1516 to a daughter, Mary, who became queen. The king, who had conceived a passion for Anne Boleyn about 1527, expressed doubts of the legality of his marriage with Catharine, and applied to the pope for a divorce. The disagreement between the pope and Henry VIII. on this subject was one of the causes of the prevalence of Protestantism in England. Cranmer declared the marriage void in 1533. She died in 1536.

Catharine of Braganza, the queen of Charles II. of England, born in 1638, was a daughter of John IV., king of Portugal, and brought in dower Tangiers and Bombay. She had been religiously bred, and the licentious customs of the English court she found strange. After the death of Charles (1685) she returned to Portugal in 1693, and was made regent by her brother Pedro in 1704. Died Dec. 31, 1705.

Catharine of Valois, queen of Henry V. of England and daughter of Charles VI. of France, was born Oct. 27, 1401. Her hand, together with the right of succession to the French throne, was given to Henry by the treaty of Troyes. After the death of the king, Catharine became the wife of Owen Tudor, a Welsh gentleman. She died Jan. 3, 1437.

Catharine Parr, the sixth wife of Henry VIII. of England, was born in 1513. She was married to Lord Latimer, and after his death became, in 1543, the queen of Henry VIII. She was a woman of considerable learning and no little tact. After the death of the king she was married to Sir Thomas Seymour. Died Sept. 30, 1548.

Cathar'tes Au'ra, the turkey-buzzard, a vulture which is so called from its close resemblance to the common turkey. It mostly inhabits North America, but is sometimes found in Jamaica, where it is called the John crow. The adult bird measures about two feet and a half in length, and is

Cathartes Aura.

six feet between the tips of the wings. The general color of the plumage is black mingled with brown. Turkey-buzzards as scavengers are of much service to man, devouring all refuse substances that are injurious to health. When gorged they perch themselves on some neighboring tree, where they sit with their wings half open, apparently too lazy to hold them in their proper position. They do not construct much of a nest, but generally deposit their eggs in some hollow tree or log. Another species, *Cathartes atratus*, commonly known as the carrion crow or black vulture, is smaller than the above, and is found in the Southern States. In the Southern towns, especially Charleston and Savannah, large numbers may be seen sauntering about the market-places, or, if the weather be cool, perched on the chimney-tops, the heat from which they greatly enjoy. Both species are protected by law, and are in an almost perfect state of domestication.

Cathar'tics [from the Gr. *καθαίρω*, to "purify"], a name at first given to medicines supposed to purify the body from the matter of disease, assumed by the ancients to exist in cases of acute disorder, and to require to be thrown off by the excretions. Ultimately, the term cathartics became limited to remedies acting on the bowels, which are popularly called purgatives. Among the principal cathartics are aloes, colocynth, rhubarb, scammony, jalap, senna, Epsom and Rochelle salts, and castor oil. Sulphur and cream of tartar form a useful mild laxative; magnesia is also administered in cases of indigestion with acidity. The resin of podophyllum (may-apple) is now sometimes used. The most agreeable of all cathartic medicines is the effervescent solution of citrate of magnesia. Croton oil and elaterium belong to a dangerous class of cathartics, as also does the favorite remedy of the ancients, the black hellebore. The number of cathartics is great.

Cathar'tin is the supposed active principle in senna. It can be isolated as a yellowish-red uncrystallizable substance, which is deliquescent, and has a very bitter taste, a characteristic odor, and purging powers, causing nausea and griping. Three grains of cathartin are a full dose. It is not much used, and is perhaps not a definite compound. The same name is given to a purgative principle obtained from buckthorn berries.

Cathay. See KATHAY.

Cath'cart, EARLS OF (1814), Viscounts Cathcart and Barons Greenock (United Kingdom, 1807), Barons Cathcart (Scotland, 1447).—ALAN FREDERICK CATHCART, third earl, born Nov. 15, 1828, succeeded his father July 16, 1859.

Cathcart (WILLIAM SHAW), EARL OF, a British general and diplomatist, born Sept. 17, 1755. He became a major-general in 1794, and was sent on a mission to the court of Russia in 1805. He commanded the land forces which, with aid of the fleet, captured Copenhagen in 1807. In 1813 he was sent as ambassador to St. Petersburg. He was raised to the rank of earl in 1814. His eldest son, Charles

Murray, born in 1783, became a general, and inherited the title of earl. Died June 17, 1843.

Cathe'dral [from Gr. *καθέδρα*, a "chair," a "seat"], the principal church of a diocese, in which is the *cathedra* or throne of the bishop. It is the parish church of the whole diocese. The difference between a cathedral and a collegiate church consists chiefly in the fact that the former is the see of a bishop. The governing body of a cathedral is called the dean and chapter—*i. e.* the dean and canons. In the Anglican Church all the members of the cathedrals, except the dean, are styled canons, and their seat in the cathedral is called their *stall*. Among the remarkable cathedrals of the world are the Duomo at Florence, the cathedral of Milan, that of Notre Dame in Paris, the Strasburg cathedral, and St. Paul's in London. The church of St. John Lateran in Rome is the cathedral or episcopal church of the pope.

Catherine, Saint, of Alexandria in Egypt, suffered martyrdom about 307 A. D. She is supposed to have been a patroness of learning and philosophy.

Cath'eter [Gr. *καθετήρ*, from *καθιήμι*, to "send down" or "thrust into"], in surgery, the name of various instruments used for passing along mucous canals. It is, however, generally applied to tubes through which fluids may pass, and which may give exit to the accumulated contents of such organs as the urinary bladder. The ancients made catheters of copper. In the ninth century silver was substituted by the Arabian surgeons, and still generally used. The urinary catheter for the male varies in length from ten to twelve inches: the female catheter need not be more than four or five inches, and is nearly straight. For the male urethra most surgeons prefer an instrument straight to within the last few inches of its length; the latter should be curved into the segment of a small circle. Others, however, use a double curve. A vertebrated catheter, consisting of short, hollow joints of silver, united into a continuous flexible tube, is often extremely useful. Flexible catheters of gum elastic are used either alone or supported on a wire. Great tact and care are required in introducing catheters into the urinary bladder. It must not be done by force, but by gentle management. Violence in the operation may cause serious injury. Revised by Willard Parker.

Cath'ey's Creek, a township of Transylvania co., N. C. Pop. 515.

Cathlam'et, a post-village, capital of Wahkiakum co., Wash. Ter.

Cathode. See Electricity, by Pres. Henry Morton, Ph. D.

Catholic or **United Copts,** that portion of the Coptic Church in Egypt which acknowledges the supremacy of the pope. They number about 13,000. (See Copts.)

Cath'olic Apostol'ic Church, The, is the name of a body of Christians popularly known as the **Irvingites,** being followers of the Rev. Edward Irving, who died in 1834. They are distinguished by their claim to the exercise of apostolic gifts, such as prophecy, the use of unknown tongues, and the miraculous healing of disease. They receive only the Apostles', the Nicene, and the Athanasian creeds; their officers are called apostles, prophets, evangelists, angels, pastors, deacons, under-deacons, and deaconesses; they are ritualists, imitating closely the service of the Roman Catholic Church, professing to select all that is desirable from all Christian churches. This sect originated in London, but it is found in small numbers in most Protestant countries. (See Irving, Edward.)

Cath'olic [Gr. *καθολικός*, "universal," from *κατά*, "throughout," and *ὅλος*, "all"] **Church.** The phrase Catholic Church is equivalent to "universal church," and cannot properly be limited to any particular sect or body. It was once employed to distinguish the Christian Church from the Jewish, the latter being restricted to a single nation, while the former was intended for the world. Afterwards, it served to mark the difference between the so-called orthodox Church and the sects which sprang from it, such as the Arians, Gnostics, etc. The name has been especially claimed by the Church of Rome. Protestant divines have been careful to deny its applicability, yet the term Catholic is still popularly used as synonymous with Roman Catholic. (See Roman Catholics.)

Cath'olic Emancipa'tion, in British history, the measure enacted April 13, 1829, by which the political disabilities previously resting upon Roman Catholics were chiefly removed. These disabilities weighed most heavily upon the Roman Catholics of Ireland, and the history of the oppressions of Irish Catholics is almost identical with the history of English rule in Ireland, for these oppressions had their origin quite as much in political and social as in religious prejudice.

After the subjugation of Ireland in 1691 by the forces of William III., the whole people were disarmed; priests were banished the country; no Roman Catholic could act as guardian for any child; after 1704 a son turning Protestant could dispossess his father and take his estate; a Catholic heir to landed property was to be set aside in favor of the next Protestant heir; no office, military or civil, could be held by a Roman Catholic; he could not vote or marry a Protestant wife; his son might force him to settle an allowance upon him (the son) at the discretion of a court of chancery; no Roman Catholic could practise law or teach school; no Protestant lawyer could marry a Catholic wife; a priest marrying a Catholic and Protestant was to be hanged. Many of these measures became obsolete in practice, and more were repealed by the Irish Parliament of 1790; and at the union (1800) Mr. Pitt pledged himself to secure an act of emancipation, but through the opposition of George III. he failed. Subsequently, in consequence of the agitation of O'Connell and the Catholic Association, the subject was again taken up, was brought forward in Parliament by Mr. Peel Mar. 5, 1829, and was carried by large majorities in both houses. The only disabilities left upon Catholics were their exclusion from the regency, the chancellorship of England or Ireland, the viceroyship of Ireland, and from the offices and patronage of the Anglican Church, the universities and the Church schools; the prohibition of episcopal titles, the public use of clerical insignia, the extension of monasticism, and the increase of the number of Jesuits. These latter prohibitions are, however, practically overlooked.

Cath'olic Epis'tles, the name given to certain epistles of the New Testament addressed not to particular churches or individuals, but to the Church universal or to a large and indefinite circle of readers. Originally the Catholic Epistles comprised only the first Epistle of John and the first of Peter, but as early as the fourth century the term was applied also to the Epistle of James, of Jude, the second of Peter, and the second and third of John. These seven thus constitute the Catholic Epistles.

Cathol'icos, the title of the patriarchs or chief ecclesiastics in the hierarchy of the Armenian Church, and also of the prelates of the Christians of Georgia and Mingrelia.

Cat'iline [Lat. *Catilina*], (Lucius Sergius), a famous Roman demagogue and conspirator, born about 108 B. C. In his youth he was a partisan of Sulla in the civil war. He was elected prætor in 68 B. C., and afterwards aspired to the office of consul. He was notorious for his crimes, and was ruined in fortune, but his talents and his audacity combined to render him a popular favorite of a large party, many of which were insolvent debtors and desperate adventurers. Having been defeated in the election for consul, he formed a conspiracy against the state. It appears that he and his numerous accomplices proposed to massacre the senators and the friends of order, and to involve Rome in a general conflagration. The leaders of this plot met on the 6th of Nov., 63 B. C., and made arrangements for its speedy execution; but the secret was revealed by Fulvia, the mistress of one of the conspirators, who were baffled by the vigilance and energy of Cicero. On the 8th of November, Cicero uttered in the senate his first oration against Catiline, who was present and attempted to reply, but his voice was drowned by cries of "Traitor!" and "Parricide!" Catiline left Rome in the next night, and went to the camp of Manlius, who was his accomplice and was at the head of an army in Etruria. Lentulus and other conspirators who remained in Rome were put to death in Dec., 63 B. C. The army of the senate encountered that of Catiline near Pistoria (now Pistoia) in 62 B. C. He stimulated the courage of his soldiers with an eloquent harangue, and a desperate battle ensued, in which Catiline was defeated and killed, with about 3000 of his partisans. (See Sallust, "Bellum Catilinarium;" Rose, "History of Catiline's Conspiracy," 1813; Cicero, "Orationes in Catilinam.")

Cat'kin, or **A'ment** (*amentum*), in botany, a term applied to a form of inflorescence of which the willow, poplar, birch, and alder afford examples. It is a close spike of numerous small, unisexual flowers, destitute of calyx and corolla, and furnished with scale-like bracts. The trees which bear catkins form the natural order Amentaceæ (which see).

Cat'lettsburg, a post-village, capital of Boyd co., Ky., on the Ohio River, at the mouth of the Big Sandy, about 150 miles E. N. E. of Frankfort. It has a trade in lumber, various manufactures, a weekly newspaper, and a State normal school. P. 1019. Ed. "Central Methodist."

Cat'lin, a post-township of Vermilion co., Ill. P. 1826.

Catlin, a township of Chemung co., N. Y. Pop. 1342.

Catlin (George), an American traveller and artist, born in Wilkesbarre, Pa., in 1796. He passed many years

among the North American Indians, and published "Illustrations of the Manners, Customs, and Condition of the North American Indians," with engravings (2 vols., 1841). He exhibited in Europe his Indian gallery and collection. Died in Jersey City Dec. 23, 1872, aged seventy-eight.

Cat'mint, or **Cat'nip** (*Nepeta Cataria*), an herbaceous plant of the natural order Labiatæ, is a native of Europe, and is a common weed in the U. S., but not indigenous here. It has cordate and crenate leaves, which are whitish, downy underneath, and emit a peculiar odor. Cats are extremely fond of this plant, which they eat with avidity and signs of excitement.

Ca'to, a post-township of Montcalm co., Mich. P. 523.

Cato, a post-township of Cayuga co., N. Y. P. 2091.

Cato, a post-township of Manitowoc co., Wis. P. 1675.

Cato (Dionysius), a Latin moralist of the third century, of whom nothing is known, is the reputed author of a small volume of moral precepts, entitled "Disticha de Moribus ad Filium," which was a popular book in the Middle Ages. Each precept is expressed in two hexameter verses. Great difference of opinion exists respecting the merit of this work.

Cato (Marcus Porcius), often called Cato Censorius (*i. e.* "Cato the Censor"), a celebrated Roman statesman and patriot, born of a plebeian family at Tusculum in 234 B. C. He was surnamed the Elder, to distinguish him from Cato Uticensis. He fought against Hannibal in the second Punic war, after the end of which he cultivated a small Sabine farm, adopted a simple and frugal mode of life, and became a model of austere and pristine Roman virtue. Having removed to Rome, he gained distinction as an advocate in the courts of justice, and was elected prætor in 198 B. C. He was chosen consul in 195, and commanded an army in Spain, where he displayed superior military talents, and was so successful that he received a triumph on his return to Rome. In the year 184 he was elected censor, in which capacity he acted with uncommon rigor. He was a zealous asserter of old-fashioned principles, and opposed the growing tendency to luxury, and all innovations, good or bad. He was an implacable enemy of Carthage, and often repeated in the senate the phrase *Delenda est Carthago* ("Carthage must be destroyed"). He wrote, besides other works, a treatise on agriculture ("De Re Rustica"), which is extant. Died in 149 B. C. (See Plutarch, "Life of Cato;" Cornelius Nepos, "Cato:" Livy, "History of Rome;" Weber, "Programma de M. P. Catonis Vita et Moribus.")

Cato (Marcus Porcius), surnamed the Younger and Uticensis (*i. e.* "of Utica"), an eminent Roman patriot and statesman, born in 95 B. C., was a great-grandson of the preceding. He studied and adopted the doctrines and discipline of the Stoic philosophers. In 72 B. C. he served in the campaign against Spartacus. Having been elected quæstor (treasurer), he effected some reforms in the treasury department. He became tribune of the people in 63 B. C., and heartily co-operated with Cicero, who was then consul, in his efforts to defeat the treason of Catiline and his accomplices. He opposed the triumvirs, Cæsar, Pompey, and Crassus, after they had formed a coalition. In 54 B. C. he was chosen prætor, and used his power to prevent bribery in elections. He was an uncompromising opponent of corruption, and inflexible in his adherence to what he considered the right and the patriotic policy. As a candidate for the consulship he was defeated, because he declined to gain votes by bribery and other means which were customary, but not strictly right. In the civil war which began about 49 B. C. he adhered to the side of the senate and Pompey. He was not present at the battle of Pharsalia, soon after which he was appointed commander of the army in Africa, but he resigned the command to Scipio. The republican cause having been ruined by the defeat of that army at Thapsus in 46 B. C., Cato killed himself at Utica in the same year. He was regarded as a model of pure and disinterested virtue. (See Drumann, "Geschichte Roms;" Plutarch, "Life of Cato the Younger.")

Catoc'tin, a township of Frederick co., Md. P. 1326.

Ca'ton, a post-township of Steuben co., N. Y. P. 1544.

Catoo'sa, a county of Georgia, bordering on Tennessee. Area, 175 square miles. It is drained by Chickamauga Creek. The surface is hilly. Wool and grain are important products. It is intersected by the Western and Atlantic R. R. Capital, Ringgold. Pop. 4409.

Catoosa Springs, a saline chalybeate spring of Catoosa co., Ga. There are accommodations for several hundred visitors, and the springs are extensively patronized in the summer.

Catoptrics. See Reflection of Light.

Cats [Lat. *Catsius*], (Jakob), an eminent Dutch poet, born at Brouwershaven, in Zealand, in 1577. He studied law, which he practised. He also filled several high civil offices. He was grand-pensionary of Holland from 1636 to 1648, when he became keeper of the grand seal. His poems were very popular. He wrote "Moral Emblems," fables, songs, allegories, etc., which are distinguished by simplicity of style and good moral tendency. Died in 1660. (See Alsche, "Commentatio de J. Catsio," 1828.)

Cat's Eye, a beautiful variety of chalcedonic quartz of various shades of greenish-gray or brownish-red. It displays, when polished, a peculiar pearly opalescence (chatoyance) or floating internal light, much resembling the mutable reflections exhibited by the contracted pupil of the eye of a cat. This results from the parallel arrangement of the minute fibres of the mineral or of the fibres of amianthus or asbestos which it contains. It is obtained chiefly in Ceylon, and is found in Scotland. It is used in jewelry, and is cut *en cabochon*.

Cats'kill, a post-village, capital of Greene co., N. Y., on the W. bank of the Hudson River, at the mouth of Catskill Creek, 34 miles below Albany, and 109 miles by rail N. of New York. It contains a court-house, seven churches, two national banks, and two newspaper-offices. Pop. 3791; of Catskill township, 7677. The Hudson River R. R. passes on the other side of the river.

Catskill Group, the uppermost division of the Devonian system in America. It was named from the Catskill Mountains, which were supposed to be formed of these rocks, but are now known to be mainly composed of strata of the Chemung group. The Catskill rocks are best seen in the northern counties of Pennsylvania—Tioga, Bradford, Potter, etc. They are mainly red sandstones and shales, and contain as characteristic fossils the scales and bones of large ganoid fishes.

Catskill Mountains, of New York, a group of the great Appalachian system, included mostly in Greene county. The highest summit, Hunter Mountain, has an altitude of 4050 feet. On the border of the eastern terraces are the Overlook House, placed at an elevation of 2977 feet, and the Catskill Mountain House, at 2235 feet above the Hudson. The last, which has long been a favorite summer resort, is about 12 miles W. of the village of Catskill. The summits of the mountains command extensive and beautiful prospects. The view at sunrise from these mountain-houses is magnificent and beautiful in the highest degree. The scenery of this group is diversified by cascades, rocky precipices, small lakes, and deep ravines.

Cat's-Tail Grass, a name of the *Phleum pratense*. (See Timothy.)

Cat Tail, or **Cat's Tail** (*Typha latifolia*), an aquatic herbaceous plant of the order Typhaceæ, is indigenous in the U. S. and Europe. It bears flowers in a long and very dense cylindrical spike terminating the stem. Its leaves are of late employed with success in France as a material for paper-making.

Cattarau'gus, a county of Western New York, bordering on Pennsylvania. Area, 1334 square miles. It is intersected by the Alleghany River, and bounded partly on the N. by Cattaraugus Creek. The surface is uneven or hilly; the soil is fertile. Dairy products, grain, and potatoes are largely produced. Leather, lumber, cooperage, metallic wares, flour, cheese, saddlery, etc. are among the manufactures. It is traversed by the Erie, the Atlantic and Great Western, and the Buffalo New York and Philadelphia R. Rs. Capital, Ellicottsville. Pop. 43,909.

Cattaraugus, a post-village of New Albion township, Cattaraugus co., N. Y., on the Erie R. R., 22 miles E. of Dunkirk.

Cat'taro, a seaport-town of Austria, in Dalmatia, on the Gulf of Cattaro, about 37 miles S. E. of Ragusa. It is situated at the base of a steep limestone hill, is strongly fortified, and is surrounded with walls. It has a castle on a precipitous rock, a cathedral, and several churches. It was formerly the capital of a small republic of the same name. Pop. 3589.

Cat'taro, Boc'ca di (*i. e.* "Gulf of"), a tortuous inlet of the Adriatic, at the S. extremity of the coast of Dalmatia, is 30 miles long. It is protected from winds by high mountains on several sides, and forms the best harbor in the Adriatic. The entrance from the sea into this gulf is about 1½ miles wide.

Cat'tegat, or **Kattegat** (anc. *Codanus Sinus*), a part of the ocean which separates Denmark from Sweden and washes the eastern side of Jutland. It communicates with the Baltic by three channels—the Great Belt, the Little Belt, and the Sound. On the other side the Skager-Rack connects it with the German Ocean. It is about 150 miles long and 85 miles wide. Dangerous sand-banks occur in it.

Cattell' (Alexander G.), born in Salem, N. J., Feb. 12, 1816. He became a successful merchant of Philadelphia in 1846, becoming president of the Corn Exchange and of the Corn Exchange Bank. In 1855 he removed to Merchantville, N. J., and was U. S. Senator from N. J. 1866–71.

Cattell (William Cassiday), D. D., a brother of the preceding, was born at Salem, N. J., Aug. 30, 1827, graduated at Princeton College in 1848, at Princeton Theological Seminary in 1852, became professor of ancient languages at Lafayette College in 1855, pastor of a Presbyterian church at Harrisburg, Pa., in 1860, and president of Lafayette College in 1864. His administration of the affairs of the college has been marked by energy and success.

Cat'tle [Old Eng. *catel*, "chattels," "goods," because in ancient times a man's cattle were his principal goods], a collective term which in its widest sense includes all domestic animals, and in the usage of some writers includes also deer and other wild grazing animals. In America, however, its application is limited very generally to beasts of the species *Bos taurus*, the domestic ox, the "neat cattle" or "black cattle" of British writers. There are many varieties or "breeds" of cattle, some of which, in Southern Asia, are distinguished by a large hump or mass of fat upon the shoulders. The original wild stock from which cattle are descended is not well known. The principal breeds in the U. S. are of British origin. The old "native" stock is of extremely mixed descent, but of late years much attention has been paid, with the best results, to the rearing of pure-blooded and "grade" stock. The best are the "short-horn" or "Durham" breed, which produce excellent beef-cattle, and are extensively reared in the U. S., chiefly for fattening purposes; the "Herefords," for working oxen and beef; the beautiful "Devons;" the "Ayrshires," prized for milking qualities; the "Jerseys" or "Alderneys," which yield extremely rich and excellent milk. The continent of Europe has many fine breeds which are little known in the U. S., though the "Dutch" and "Holstein" cattle have been introduced. The Texas cattle are descended chiefly from Spanish stock. (See Solon Robinson, "Facts for Farmers.")

Cattol'ica, a town of Sicily, in the province of Girgenti, 14 miles N. W. of the city of Girgenti. It has productive sulphur-mines. Pop. 5749.

Catul'lus (Valerius), a Roman lyric poet of high reputation, was born at or near Verona about 87 B. C. He became in early life a resident of Rome, and enjoyed the society of Cicero and Cæsar. He was the first Roman who excelled in lyric poetry. He wrote, besides numerous odes and epigrams, a heroic or narrative poem entitled "The Nuptials of Peleus and Thetis," which is his longest work, and a poem called "Atys," which is highly commended. The date of his death is unknown. One hundred and sixteen of his poems are extant. They are admired for the exquisite grace and beauty of their style, but are grossly licentious. Died about 47 B. C.

Cat'ulus (Quintus Lutatius), a Roman general and writer. He was chosen consul and a colleague of Caius Marius in 102 B. C. Catulus and Marius commanded two armies, which united and defeated the Cimbri near Vercelli in 101 B. C. He was a partisan of Sulla in the civil war. Having been condemned to death by the Marian party, he killed himself in 87 B. C. His works are lost except two epigrams.

Catulus (Quintus Lutatius), a son of the preceding, was a conservative and meritorious statesman. He became consul in 78 B. C., and censor in the year 65. Cicero applied to him the epithet "*clarissimus*" ("illustrious"). Died in 60 B. C.

Cau'ca, a river of South America, rises in the Andes and flows nearly northward through Popayan, Cauca, and Antioquía. After a course of 600 miles it enters the Magdalena in lat. 9° 25′ N. The valley of the Cauca is one of the most fertile and populous districts of South America.

Cauca, a state of the republic of Colombia. The surface is partly mountainous. Area, 68,300 English square miles. It is traversed by the river Cauca. Capital, Popayan. Pop. in 1870, 435,708.

Cauca'sian (*i. e.* "pertaining to Caucasus"), a term somewhat loosely employed to designate the principal white races of mankind. The Circassians and Georgians dwelling at the foot of Mount Caucasus have been taken as the type of the Caucasian race, and suggested the name. According to Blumenbach, the Caucasian race is the principal of the five divisions of the human family, and the original stock from which the other races have sprung. It also forms one of the three varieties of Cuvier. It comprises the most enlightened and powerful nations of the earth, including, besides the Aryan races (see Arya), the Hebrews, Phœnicians, and Arabs. But the inhabitants of the Caucasus, so long held to be types of the European variety, are now by some excluded from it altogether, and classed with the Mongols. The question of their relationship is a very obscure one. The basis upon which the theory of the Caucasian type was formed is thus stated by Latham: "Blumenbach had a solitary Georgian skull, and that skull was the finest in his collection, that of a Greek being the next. Hence it was taken as the type of the skull of the more organized divisions of our species. More than this, it gave its name to the type, and introduced the term *Caucasian*. Never has a single head done more harm to science than was done in the way of posthumous mischief by this well-shaped head of a female from Georgia." As commonly used, the term Caucasian is objectionable, as confounding under one name nations (as, for example, the Arabs and Germans) who have at best a very remote relationship; while it has often led to a still greater error—that of separating, on trivial and superficial grounds, nations who are unquestionably closely related, such as the dark-complexioned Hindoos and the light-complexioned Teutons and Celts. It is as if a botanist, instead of classifying fruits according to their internal structure and essential nature, should divide them into classes according to their color, putting the yellow fruits into one division, the red into another, and so on.

Cauca'sian Prov'inces, or **Cauca'sia,** a portion of the Russian empire, situated on both sides of the central chain of the Caucasus. It is bounded on the E. by the Caspian Sea, and on the W. by the Black Sea, being partly in Europe and partly in Asia. The European portion, called Cis-Caucasia, comprises Circassia, Caucasus, and Daghestan. The Asiatic part, called Trans-Caucasia, comprises Georgia, Mingrelia, and Russian Armenia, and has an area of 169,632 square miles. The chief towns are Tiflis, Stavropol, Derbend, and Erivan. (For the physical geography of this region, see Caucasus.) Pop. 4,661,824.

Cau'casus [Gr. ὁ Καύκασος or ὁ Καύκασις], an important and lofty mountain-range which extends between the Black Sea and the Caspian, and forms part of the boundary between Europe and Asia. It is 690 miles long, and extends from the Peninsula of Taman on the Black Sea, in an E. S. E. direction, to the peninsula of Apsheron on the Caspian. Connected with this central chain are several branches or transverse ridges on both sides. The culminating point of the Caucasus is Mount Elboors, which is near the middle of the central chain, and has an altitude of about 18,570 feet. Its base is 7660 above the sea-level. The next highest is Mount Kasbek, 16,552 feet, east of which is the Dariel Pass. This is said to be the only pass by which carriages can cross the Caucasus. The highest summits of this chain are formed of trachyte or porphyry, below which occur granite, syenite, etc. Limestone, slate, and other stratified rocks appear at the base and on the sides of these mountains. The limit of perpetual snow is here about 11,000 feet above the level of the sea. Some parts of the Caucasus are destitute of trees, but the secondary ranges near the Black Sea are covered with magnificent forests of oak, beech, ash, maple, and walnut. The cereal grains flourish 7000 feet above the level of the sea, and the lower valleys produce rice, cotton, indigo, and the grape. The principal rivers that rise among these mountains are the Kooban, Koor, and Terek. The scenery of this region is said to be very beautiful and picturesque. Among its minerals are copper, iron, and lead. The inhabitants of the Caucasus comprise a variety of tribes, who speak different languages and are subject to Russia. Among these tribes are the Circassians, Georgians, and Lesghians. They are noted for their love of freedom; and to maintain their independence they waged a long war against the Russian invaders, which was terminated by the capture of their leader, Schamyl, in 1859. The Caucasus Mountains have been celebrated from a remote antiquity. From them the finest physical type of man derives its name, the Caucasian race. (See Caucasian.)

Caucasus, Indian. See Hindoo-Koosh.

Cauchy (Augustin Louis), a French mathematician, born in Paris in 1789. He gained a prize of the Institute in 1815 for his "Memoir on the Theory of Waves." He became a member of the Academy of Sciences and professor of mechanics in the Polytechnic School in 1816. He published, besides other works, "Lectures on the Differential Calculus" (1826), and succeeded Biot as professor of astronomy in 1848. Died in 1857.

Cau'cus, a meeting of legislators or citizens for the selection of candidates to be supported at a pending election, or to shape and direct political movements of whatever kind. The word is of American coinage, and Boston gave it being about a century ago, during the popular discontent and agitation which culminated in our fathers' Revolutionary struggle—Boston, the cradle and focus of

this agitation, being then a straggling maritime village, mainly supported by commerce and the seaboard fisheries, which gave importance to the arts subsidiary to navigation. The *calkers* of vessels were thus relatively numerous; they were robust, active citizens in the prime of life, and they were enlisted, heart and soul, in the patriot cause. Their work was done at the North End, where but few houses had yet been built, and their dwellings were mainly in that neighborhood. If they had a place of meeting as a craft, it would naturally be chosen for their political gatherings as well; and the Tories or loyalists, seeing these convened at the calkers' head-quarters, would call them *calkers'* meetings, implying that none but low-bred mechanics and their like were hostile to the royal cause. *Caucus*—at first a corruption of *calkers*—thus became the received designation of a political meeting, especially if held with closed doors. The word first appears in the diary of John Adams, under date of Feb., 1763, as follows: "This day found that the *Caucus Club* meets at certain times in the garret of Tom Dawes, adjutant of the Boston (militia) regiment." Adams adds that the town-officers and representatives were first chosen in this club before they were elected in town meeting. Gordon's "History of the Revolution" asserts that the caucus dates back at least to 1725, and that Samuel Adams's father and some twenty others devised and employed it to concentrate the power of the town in their own hands. He adds that Samuel Adams was first made representative of Boston through the instrumentality of the caucus, which thenceforth formed an important part of the machinery whereby the Revolution was incited and maintained.

That the majority of a legislative body should hold a caucus for the selection of the officers of that body cannot be reasonably gainsaid, the minority being at perfect liberty to do likewise; while any member of the majority, dissatisfied with its choice, may claim and exercise, if he will, the right to bolt. But when, about 1804, a caucus of the Republican (Jeffersonian) members of Congress was held expressly to recommend persons to be supported at the polls by Republicans living in districts represented by Federalists, thus giving to the people of those districts no voice in the selection of their candidates, the legitimacy of the assumption involved in such nominations was gravely questioned. Yet the candidates of the caucus continued to be chosen—with docility, if not with alacrity—until 1824, when the system broke down ignominiously upon William H. Crawford of Georgia being nominated for President, with Albert Gallatin of Pennsylvania for Vice-President. This ticket was badly defeated, the friends of John Quincy Adams, General Andrew Jackson, and Henry Clay, forming two-thirds of those elected to either House, uniting in a public recommendation that the fiat of the caucus be disregarded—in fact, defied. Mr. Crawford received less than a fourth of the electoral votes; the vote standing Jackson 99, Adams 84, Crawford 41, Clay 37. This sent the election to the House of Representatives, which elected Adams by a coalition of the supporters of Adams and Clay; the vote standing—for Adams, 13 States; Jackson, 7; Crawford, 4. This was the last caucus of members of Congress which assumed to nominate candidates for the people, and legislative caucuses with like purposes have also been discarded by all parties, though caucuses continue to be held for the choice of candidates to be supported by the body whose members make the nomination.

The first nominating national convention was held in 1832 by the Anti-Masons, who presented William Wirt of Maryland for President, with Nathaniel Ellmaker of Pennsylvania for Vice-President. In 1836 the Democrats held a like convention, which nominated Martin Van Buren of New York for President, with Richard M. Johnson of Kentucky for Vice-President. The Whigs held their first national convention at Harrisburg in Dec., 1839, and presented General William Henry Harrison of Ohio for President, with John Tyler of Virginia for Vice-President. These were elected over Van Buren and Richard M. Johnson, the Democratic incumbents, who had triumphed four years previously. Each and every national party has since selected its candidates mainly by a delegated convention.

But this in time develops abuses, especially in the case of a party whose nomination all but ensures an election; and the latest fashion is that called "the Crawford county (Pennsylvania) system," whereby all the members of a party residing in a designated district are invited to attend a poll in their respective precincts and cast a ballot directly for sheriff, clerk, etc., he who polls the largest vote for any office being the whole party's candidate for that post. But such preliminary elections, being unsanctioned by law, are often corrupted by systematic frauds; and it is manifest that, while a caucus may serve for the choice of Speaker, clerk, etc., of a legislative body, or even of U. S. Senators by a legislature, a perfect mode of selecting candidates for the popular suffrage has not yet been devised.

HORACE GREELEY.

Caudebec, a handsome seaport town of France, on the right bank of the Seine, 26 miles E. of Havre, was formerly fortified. It has a remarkable Gothic church built in the fifteenth century, and manufactures of cotton stuffs. Pop. 2181.

Caudebec-les-Elbeuf, a town of France, department of Seine-Inférieure, on the river Oison, 12 miles S. of Rouen. It has manufactures of cloth. Pop. 9184.

Caude'te, a town of Spain, in Murcia, 50 miles E. S. E. of Albacete, was formerly fortified. Here are some Roman remains. Pop. 6413.

Cau'dex, a Latin word signifying a "trunk of a tree," was also a botanical term applied by Linnæus to the axis of vegetation, or the woody centre around which the leafy organs are arranged. He called the stem *caudex ascendens*, and the root *caudex descendens*.

Cau'dine Forks [Lat. *Furculæ Caudinæ*], two narrow mountain-gorges or defiles near the town of Caudium, in ancient Samnium. They are celebrated in connection with a humiliating disaster which the Roman army suffered in 321 B. C. A large army commanded by the consuls Titus Veturius and Spurius Postumius were marching against the Samnites. According to Livy, this army, supposing the Samnites to be far distant, marched through one gorge or pass into a small valley enclosed by high mountains, and soon found that both of the passes were blocked up with trees and stones. The Romans were compelled by famine to surrender unconditionally to Caius Pontius, the Samnite general, who required them to pass under the yoke, and then permitted them to return to Rome. Caudium was on the Appian Way, 21 Roman miles E. of Capua. Niebuhr expresses an opinion that the Romans must have been defeated in battle before they were shut up between the two passes, and Cicero twice alludes to the battle and defeat of the Romans at Caudium. In one place he says, "Cum male pugnatum ad Caudium esset." (*De Officiis*, iii., 30.)

Caugh'denoy, a post-village of Hastings township, Oswego co., N. Y. Pop. 220.

Caughnawa'ga, a village of Laprairie co., province of Quebec (Canada), at the foot of Lachine Rapids and on the S. side of the St. Lawrence, 9 miles from Montreal. It is on the Montreal Lachine and Province Line Railway, and is entirely inhabited by Iroquois Indians, who number about 500. It is to be the terminus of the great Caughnawaga Ship Canal. (See CANALS OF CANADA, by A. J. RUSSELL, C. E., Crown Inspector of Timber Agencies.)

Caul. See OMENTUM.

Caulaincourt, de (ARMAND AUGUSTIN LOUIS), duke of Vicenza, a French diplomatist, born in Picardy in 1773, entered the army about 1789, and obtained the rank of general. In 1807 or 1808 he was sent as ambassador to Russia, from which he returned in 1811. He afterwards served in the army, and was the travelling companion of Napoleon in his hurried journey from Russia to Paris in 1812. He was appointed minister of foreign affairs in 1813. Died in 1827.

Cau'liflower [Sp. *coliflor;* Ger. *Blumenkohl, i. e.* "flowering cole"], a highly-prized variety of the cabbage (*Brassica oleracea*). The cauliflower differs from the other varieties of its species, its leaves being not fit for use. The parts eaten are the flower-buds and the stalks of the plant transformed by cultivation, and forming a compact mass, generally of a white color. There are many sub-varieties which are more tender than the ordinary forms, and require protection during winter. The seed is sown in hot-beds, that the plants may be ready for planting out in spring. Later sowings are made in the open ground. The cauliflower requires a moist, rich, loamy soil, with abundance of manure, and careful cultivation.

Cau'line [from Lat. *caulis*, a "stem"], a botanical term applied to any parts or organs which grow on the stem of a plant. Leaves which arise directly from the stems are called *cauline*, to distinguish them from radical leaves.

Caulo'nia, an ancient Greek city and seaport of Italy, in Bruttium, between Locri and the Gulf of Scyllacium. It was an important city about 500 B. C. According to Porphyry, Pythagoras sought refuge in Caulonia after his expulsion from Crotona. The people of Caulonia formed a league with those of Crotona and Sybaris. In 389 B. C. Dionysius the Elder invaded Magna Græcia with a large army, and besieged Caulonia, which he took. He then removed the inhabitants to Syracuse.

Caulop'teris, a generic name for the stems of fossil tree ferns found in the carboniferous and triassic measures. They are hollow, and covered with markings similar to the leaf scars on recent tree-ferns. Twelve species have been described.

Caus, de (Salomon), a French engineer, born in Normandy, is considered by his countrymen as one of the inventors of the steam-engine. He published in 1615 a work on motive-powers entitled "Les Raisons des Forces mouvantes," etc., which gives a theorem on the expansion and condensation of steam. He is supposed to have died about 1630.

Cau'sa, a Latin word extensively used by the ancient Romans as a legal and political term. Its meanings and applications were nearly the same as those of the word *cause* in English. It signified in law a "lawsuit," a "judicial process;" in politics, the measures or principles adopted by one party and opposed by another; in general, a subject, affair, reason, etc.; efficient cause, or that which produces any effect.

Cause, in law, an action at law or suit in equity or in a court of probate. It is found in such connections as the following: "matrimonial cause," "testamentary cause," "calendar of causes," "title of a cause," etc. etc.

Cause, in Ontology (which see), means in general any Principle (which see) which in any way whatever embraces the Ground (which see) or Reason (which see) why anything diverse from itself exists. The principle correspondent with *this* principle is called Effect (which see), and the relation which exists between cause and effect is *causality*.

Causes have been divided into five classes (four by Aristotle): I. The *efficient* or operative cause. Its activity may be intransitive—that is, *immanent*—or transitive or transient—that is, *emanent*. The *efficient* cause is by pre-eminence *the* cause, and is usually meant if the word *cause* is not qualified. There may be *requisites* or *conditions*, even to the degree of *sine qua non*, and there may be *occasion*, but these ideas are not to be confounded, as they often are, with that of cause. Efficient causes are subdivided into primary and secondary; universal or general, and particular; principal and instrumental; univocal and equivocal; causes *per se* and *per accidens;* adequate and inadequate; free and necessary; physical and moral; proximate, remote, and ultimate; relative and absolute. There is in the train of causes a *subordination*, and this is Material or Formal (which see).

The ontological principles deduced are: There is no effect without a cause; out of nothing nothing comes; nothing can be the efficient cause of itself; two things cannot be the reciprocal cause of each other; the effect and the cause are *always* proportioned to each other; whatever is in the effect must in some sense be in the cause; the cause of the cause is also the cause of the effect; the same causes always produce the same effects; the cause must be present, either immediately or mediately, with that which it effects.

II. The Material; III. The Formal; IV. The Exemplary (Plato); and V. The Final Cause.

The names most distinguished in connection with the philosophical theories of cause are—Heraclitus and Protagoras (denial of the notion), Plato (idea, matter, operative principle; immediately evident, free and physical; conditional and absolute), Aristotle (fourfold division; first cause of motion), Bruno (principle, internal; cause, external; first cause, final), Hobbes (potency and act), Descartes (assistance), De la Forge, Malebranche (occasional causes), Spinoza (adequate cause; cause of divine acts identical with cause of divine existence), Locke (appearance of changes), Leibnitz (pre-established harmony), Hume, Brown (observation of sequence, habit, not by, but *after*, natural instinct, apart from reason, blind belief), Kant (a fundamental, synthetical, *a priori* judgment, a postulate of pure reason, category of relation), Reid, Stewart (intuition), De Biran, Cousin (self-consciousness, personal causation), Fichte (positings of the Ego, self-originated subjective modification), Schelling, Hegel (spontaneity, all *being* has in it the internal impulse and power to *become*), Hamilton (the conditioned; mental impotence), Schopenhauer (the occasion for the phenomenon of Will). Among later points made, the most important is that each sphere of nature is controlled by a specific modification of the law of causality. All the views are reducible to two: the conception of cause is either *a priori* or *a posteriori*, and each of these is either original or derivative. In the application of the idea of cause arise the terms causal principle, causal judgment, causal nexus, causal connection, causal union, causal relation.

One of the most specious and widely accepted fallacies is that *cause precedes* effect. Cause and effect are absolute correlates, so that in point of *time* cause cannot be *before* effect, but the two sides of the relation come into simultaneous being. Nor can cause, as such, exist without effect. As a term of relation, cause is as dependent on effect as effect on cause. The order of priority is therefore purely logical and mental. Nor is it true that a thing must be (*in time*) *before* it becomes a cause. It is only necessary that it shall be *when* it becomes a cause. Hence the thoughts of an eternal mind, the acts of an eternal being, may be eternal. In the world about us all that *becomes* cause *exists in deed* before it *becomes cause*, but the reason of this is that every source of cause, in our sphere, is also an effect, and must *be* as an effect before it can *act* as a cause. Nevertheless, it becomes cause strictly *simultaneously with* the effect, not *before* it. The true conception of cause therefore is demonstrably not that of sequence in time, as Hume contends, but the one we have given—to wit, that cause is that which contains the reason of the effect, and hence that the relation is a necessary one, and is as certain where we cannot observe its result as where we can. Innumerable instances can be given of the invariable sequence, *in time*, of one thing which is not the effect of another.

That in virtue of which a causal agent can become cause, we call power. Some of the postulates which hold good as to cause and effect in the *inorganic* world are not demonstrably valid in the organic, and seem to fail entirely in the sphere of freedom and of intellect. So complete is the mind's recognition of the nature of cause that on a statement of any number of purely *hypothetical cases* it will at once decide which of the two terms is cause, which is effect, if the statement is such as to help the mind to see which of the terms must contain the reason of the other. C. P. Krauth.

Caus'tic [from the Gr. *καίω*, to "burn"], a term applied to substances which exert a disintegrating or destructive effect upon animal tissues. They usually produce a sensation as of burning, whence the name. "Lunar caustic" is the silver-nitrate, so called because *luna* (the "moon") is the old alchemical name for silver. Caustic lime, potash, soda, and magnesia are these substances when pure, so called to distinguish them from their less active carbonates. Many other chemical reagents are used in surgery as caustics, notably the nitric, chromic, and arsenious acids.

Caustic, in optics, is a term applied to curved lines and surfaces formed by a series of points where (from the intersection of reflected or refracted rays) the heat and light are most intense. Reflected rays produce catacaustics—refracted rays, diacaustics. The study of caustic surfaces and curves is of the greatest importance in the construction of lenses and mirrors. For example, it has been found that the caustic by reflection from a paraboloid of revolution is reduced to a point when the incident rays are parallel to the axis of the paraboloid. For this reason parabolic reflectors have been introduced with great success into many optical instruments.

Cau'tery [Gr. *καυτήριον*, a "branding-iron"], in surgery, the application of a white-hot iron or of a moxa. It is otherwise called "actual cautery," to distinguish it from "potential cautery," or the application of a chemical reagent as a caustic. "Cautery" is also the small iron instrument which is heated and applied in this operation. The actual cautery is useful in destroying certain morbid and gangrenous tissues, in staying hæmorrhages, and in relieving severe local pain. It has a valuable derivative effect in many cases, and when properly applied produces comparatively little pain. It is sometimes used to produce a slight, and sometimes a profound local effect.

Cau'tion [from the Lat. *caveo, cautum*, to "be on one's guard"], a legal term derived from the Roman law, and employed in the admiralty courts. It is substantially equivalent in meaning to security or bail. When security is given under oath, it is called "juratory caution." The word *caution* is employed in the same general sense in Scotch law.

Cavaignac (Godefroy), a French republican journalist, son of Jean Baptiste Cavaignac (1762–1829), who figured in the Revolution, born in Paris in 1801. He was driven into exile in 1835, returned in 1841, and became one of the editors of "La Réforme." He was one of the most popular leaders of the liberal party. Died May 5, 1845.

Cavaignac (Louis Eugène), an eminent French general and statesman, brother of the preceding, was born in Paris Oct. 15, 1802. He served with distinction in Algeria, to which he was sent in 1832, became a colonel in 1841, and governor of the province of Oran in 1847. In Mar., 1848, he was appointed governor-general of Algeria, and in the next month was invited by Lamartine to come to Paris and defend the government against the mob. He reached that capital on the 17th of May, and was then appointed minister of war. He displayed much energy, skill, and presence of mind in his operations against the Socialists and Com-

munists, who began a great insurrection in Paris June 23, and were defeated in a battle which lasted three days. About the 28th of June he was chosen *chef du pouvoir exécutif*, or president of the republic, by the National Assembly. He was a moderate republican, and used his power with clemency. In the autumn of 1848 he was a candidate for the office of president, and received 1,448,302 votes, but was defeated by Louis Napoleon. He retired from power on the 20th of Dec., and took his seat in the National Assembly. He was excluded from political life by the *coup-d'état* of Dec., 1851, and by his refusal to take the oath of allegiance to Napoleon III. Died Oct. 28, 1857. (See Henri Montfort, "Biographie du Général Cavaignac," 1848.)

Cavaillon (anc. *Cabellio*), a town of France, department of Vaucluse, on the river Durance, 16 miles S. E. of Avignon. It has an old cathedral and remains of a Roman triumphal arch. Here are manufactures of silk twist and vermicelli. Pop. 8034. *Cabellio* was a city of the ancient Cavares, and Pliny calls it an *oppidum Latinum*.

Cavalier' [Sp. *caballero;* It. *cavaliere*, from the Lat. *caballus*, a "horse"], an Anglicized French word, signifies a horseman, a knight, an armed horseman, a gentleman (attendant on a lady), a gallant, a soldier who fights on horseback. In English history it is applied to the royalist party which fought for Charles I. against the Roundheads. *Cavalier* is the French for the knight in the game of chess.

Cavalier, in fortification of the old school, is a defence-work constructed on the *terre-plein* or level ground of a bastion. It rises to a height varying from eight to twelve feet above the rampart, and has a parapet about six feet high. Its uses are to command any rising ground held by the enemy within cannon shot, and to guard the curtain, or plain wall between two bastions, from being enfiladed.

Cavalier (John), (1679–81 (Morel says 1685) 1740), often styled the "Baker's boy of Anduze," because at one time apprenticed to that trade, was the son of a Protestant peasant of the Cevennes, of the village of Ribaute near Anduze (Gard), and in his early youth served as a shepherd lad or herdsman. When the Cevenol uprising in defence of the Protestant religious rights broke out in Languedoc in 1702, Cavalier, who had fled in 1701 for safety to Geneva, returned to share the lot of his persecuted brethren, and was soon after recognized as their military commander-in-chief. Such was his instinctive military genius that although he knew nothing more of tactics than what he had picked up by watching the drill of the militia of his district in the streets of his native town, he soon had his rude volunteers under a rigid system of discipline, such as Martinet would have envied, and made them a match for triple (if not quintuple) their number of the very best regulars opposed to them. His grand tactics were unexceptionable, and his handling of troops on the field of battle perfection itself. He could make them perform with resultive effect the most complicated evolutions under the severest fire, demonstrating that he was one of the rarest of mortal phenomena, uniting a power of control, instruction, and influence such as scarcely any general on record has proved equal to. Very shortly after he first exercised any command he undoubtedly became by election or unanimous choice commander-in-chief (commandant-général) of all the Camisard or Cevenol insurgents in arms. Michelet and others question this fact, and attribute the chieftainship to the charming or exquisite Roland, but the facts as set forth by Morel (i., vii., viii.), and the language used by Roland himself, who addresses Cavalier as "commandant les troupes religionaires, ou il se trouvera, en Languedoc," would set the question at rest, were it not further established by his possession of absolute power of life and death in all cases upon his own personal judgment, without calling a council of war. That he never abused this enormous prerogative, at the same time that he did exercise it, testifies to a remarkable self-control in a young man of twenty. In the organization of the Cevenol forces Cavalier was called upon to draw upon the almost obsolete resources of the past as to weapons, as well as to improvise them until his men were armed with the best firearms of the day, captured from his adversaries. He even improvised cannon, but never had time to bring them into the field.

To enter closely into all the details of the career of this Cromwell in miniature, or of a mountain-warfare which under his supreme command did not last over two years, is impossible within the space accorded. His greatest and most glorious engagement was that of Nages (16th April, 1704), which was deemed of sufficient importance by the celebrated engineer and map-maker, Cassini, for a special indication upon his map of the district in which it occurred. Upon this field, surprised through the physical prostration of his men, and no fault of his own, and surrounded by six or seven to his one, Cavalier extricated himself, and in so far defeated the finest soldiery in France that he foiled all the plans of their best commanders. His tactics were not only astonishing in their precision, but sufficiently admirable in their originality to extort the praise of his adversaries; and, if such a thing were possible, the military capacity of this comparative youth exceeded the heroic courage and unsurpassable devotion of the troops he had made and commanded. Although he enjoyed the triumph of treating with Villars, the superb representative of the magnificent Louis XIV., Cavalier certainly betrayed his trust in that he capitulated under stipulations for his own personal benefit, without insisting upon reliable guarantees to ensure the maintenance of the treaty he extorted in behalf of his religious brethren. There is no question but that Villars and Louis both deceived the Cevenol leader, more loyal to his pledges than either marshal or king. Moreover, Louis wounded his pride in a personal interview, and alarmed him for his personal safety. Like Prince Eugène, he quitted the French service for that of his enemies, and with that prince and the duke of Savoy took part in the invasion of France in 1707; and it is questionable if either imperial prince or royal duke inspired more apprehension to the government authorities than the former Cevenol-peasant-generalissimo. From the Dutch he passed into the British service, and remained in it until his death in 1740. He distinguished himself at Almanza (25th April, 1707), where his regiment, composed of Cevenol refugees, was opposed to a French organization in which the Huguenots recognized a portion of their former persecutors. Thereupon this mutual recognition led to such a fearful conflict with the bayonet, that only three hundred of the combatants survived. This is according to the statement of the impassible bigot the duke of Berwick, who never could recall the circumstance without horror. Morel (i., 389) says, "This (Cavalier's) terrible Camisard regiment rushed with the bayonet on the Franco-Spanish army, and made the balance of victory tremble."

The distinguished Malesherbes, after a full consideration of the character of Cavalier, pronounces him "one of the rarest characters which history presents for our contemplation." Villars, no better judge, concedes his vast military capacity. His treating with Cavalier as equal with equal would attest the latter's influence, had we not the marshal's very words to establish the fact. The same is admitted in more or less eloquent language by all the historians of this struggle for religious freedom. Whether Cavalier needed only a wider stage to demonstrate his worthiness to rank with the most distinguished commanders of olden or modern times, or whether his lights were not strong enough to illuminate a vaster space, he had no opportunity to determine. That he did not rise higher and more quickly than he did in the English army is easily explained. William of Orange preferred purely professional soldiers, and his very sense of religious inspiration doubtless marred his prospects, even under the succeeding monarch, Anne. That he was deemed worthy of confidence is shown by his elevation to the rank of major-general in the British service, and his appointment as governor of Jersey, one of the Channel Islands, an outpost of her dominions and nearest their most dangerous enemy. In this position he died in 1740.

Without *one* man—an obscure citizen of Nijni-Novgorod—Kosma Minin, a butcher, "distinguished by nothing but a sound head (strong common sense) and a brave, honest, unselfish heart," Russia, in 1611–12, would have become a Swedish or a Polish possession; and without another one, an equally obscure man, this John Cavalier, a peasant, imbued with instinctive capacity for war and the government of men, France, in 1704, would have acquired such authority in Europe, and resultively in America, that the preponderance of the Latin race would not have been a question for Napoleon III. to attempt to solve, and fail in solving, as in Mexico. Indeed, Cavalier's career exemplifies the rule of great events depending on "small things." The Cevenol uprising and his successes in Languedoc attracted to the south, into Languedoc, 10,000 to 20,000 veteran infantry, besides dragoons, and a large body of artillery, the latter of no use in the mountains of the Cevennes, but sorely needed, to the east, on the Rhone, and to the north, in Flanders. A cabal of women aggravated the evil as regarded the Roman Catholic cause by sending the favored Villeroy where men and a man were most needed, and a man, Villars, into Languedoc. This alone made Blenheim a possibility. Had no Cavalier arisen, Villars would have been in Flanders to prevent Marlborough's flank march into Germany, or to remedy Marson's and Tallard's blunders, there, in 1704. It is admitted that the effect of the Cevenol-Huguenot insurrection, in which Cavalier was the prominent figure, had a momentous effect on the fortunes of the war elsewhere, on the prospects of Louis XIV., and on the future of France.

J. Watts de Peyster.

Cavalry [from *caballus*, a "horse"], that class of troops which serve mounted. It is recognized in modern warfare as one of the three great arms of service, and in earlier times, when war consisted more of predatory expeditions than of regular campaigns, it occupied the chief place. But even among the ancients it appears that this arm was not used to any extent in the earliest wars of which we have any record. The Egyptians, who were the first to organize a standing army, had no cavalry, its place being supplied by armed chariots. It is true that, on the monuments left by this people, pictures of mounted men are to be found, but there is every reason to suppose that these men were used only as messengers or couriers. Later, the Carthaginians, who contended with the Romans for the conquest of the world, in the organization of their armies gave a prominent place to the cavalry, which was made up of the most noble and distinguished citizens. Besides this body of picked troops, furnished by the city, Carthage employed vast numbers of Numidian horsemen. Such fine riders were these latter that they rode not only barebacked, as did all cavalry at first, but without bridles, guiding their horses in all their evolutions with the voice alone. It was to the great superiority of his cavalry that Hannibal, in his memorable campaigns against the Romans, was chiefly indebted for his success. His first five battles show the reliance he placed on this arm, and the efficiency with which he used it. At Cannæ his cavalry turned the issue of the day, and he owed his defeat at Zama to the superiority of Scipio's horse. In Asia an organized army was established among the Medes and Persians about 700 B. C., and in this the lancers, archers, and cavalry were placed in separate divisions. This force was rendered effective under Cyrus, and its main strength consisted in its cavalry. Leaving the East, which was the nursery of arms, as of arts, and turning to the West, we come to the military systems of Macedonia and Greece as the first organized, and upon which most others of antiquity were formed. In their armies both infantry and cavalry were used. The latter, as well as the former, was divided into heavy and light, and there was also another class which fought either mounted or on foot. In the heavy, which was composed of citizens, both horse and rider were clad in mail. Their arms were long spears pointed at both ends. Mercenaries armed with javelins and arrows made up the light cavalry. These wore no mail, nor did their horses, which in all cases were ridden barebacked. The organization of the Greek cavalry approached that of modern times in many particulars. Their *ile*, corresponding to our troop, consisted of 64 men; the *hipparchy*, equivalent to our regiment, contained 512; while their largest formation, an *epitagma*, had 4096, being about equal to a modern division of eight regiments. Philip and Alexander employed cavalry with great success, especially the latter, who was indebted to this arm for many of his most splendid victories. He won that of the Granicus with his cavalry, and in his two great battles with Darius, those of Issus and Arbela, his judicious use of his horse secured the victory, though he had in the latter not more than 8000 to oppose to 40,000 of the Persians. Among the Romans, even as early as the time of Romulus, each of the three tribes was required to furnish, besides its quota of infantry, 100 horse. In addition to this legionary cavalry there were 300 which constituted the body-guard of the king. In the formation of the legion it was customary to allow one mounted man to every ten of foot. Thus, the numbers to make up the legion, as at first constituted, were 3000 infantry and 300 cavalry. Servius Tullius increased these numbers to 4000 infantry and 400 cavalry, and he raised his cavalry to 2400 men. This force was made up, as with the Greeks, of the most noble citizens. The Roman cavalry was trained to fight on foot as well as mounted, and the light-armed infantry would sometimes spring up behind the horsemen, dismounting when the enemy was reached. Horses were furnished by the state. The cavalry was generally divided into ten parts; thus, when 300 of this arm were attached to a legion, they were divided into ten *turmæ* or troops, and were formed in three, or sometimes six, ranks. Their defensive arms were helmet, cuirass, and shield; their offensive, a sword fit for striking only, a dagger, and a lance. Cæsar found that the Gauls used for their cavalry a very broad sword, suitable for cut and thrust. The order of battle among the Romans, though changed at different periods in many particulars, always preserved the system of keeping the flanks covered by cavalry. Sometimes a strong force of this arm was stationed in rear of the centre, which was always held by a Roman legion; and on the repulse of the enemy the infantry opened to allow the cavalry to pass through in pursuit. On the march the head and rear of the column were protected by cavalry. After the fall of the Roman empire the different nations which had for so many ages waged war, either as allies or enemies of Rome, having learned from their great mistress much of the art of war, as well as many of the blessings of civilization, organized military systems so soon as they had established permanent governments. Thus grew up the feudal system of the Middle Ages, in which the mail-clad knights, with their men-at-arms, made up the great body of cavalry and constituted the chief strength of all armies in the field. Their arms consisted of lance, battle-axe, and sword, the latter being generally straight and double-edged. Later, the Germans borrowed the curved sword from the Saracens, and they too invented the spur. In the earlier stages of the cavalry service, as has been mentioned, saddles were not used, but these were subsequently introduced, the first being a mere cushion, which has been developed into the almost countless styles of saddles now in use. During the wars of the Middle Ages the cavalry were used in heavy masses, which by their mere weight and superiority in arms could generally ride down the ill-armed and lighter infantry; but with the invention of gunpowder a new era in warfare commenced. The changes worked by this new and powerful agent were very gradual, for it was used for many years only for heavy artillery. As soon, however, as it was applied to small-arms, the whole system of warfare underwent a radical change. Heavy defensive armor was discarded as useless; strategy and tactics overcame mere weight of numbers, and war became a science. To be enabled to perform the great movements dictated by strategy, and to employ properly the tactics requisite on a battle-field, it was necessary to have disciplined troops; and from this need grew up the standing armies of modern times. In all of these cavalry occupies a prominent position, as a glance at the various military systems of modern times will show. In Prussia the army grew out of the body-guard established by the elector Frederick I. This force was increased and disciplined under his successors, especially the great elector, and Frederick III. had a body of 36,000 admirable troops. But it was to Frederick the Great that the army owed its discipline, its organization, and its fame. Soon after his accession to the throne he issued his military regulations, and in his efforts to perfect the efficiency of his army he paid special attention to his cavalry. To his reign belong two of the ablest and most brilliant cavalry leaders of history—Ziethen, who formed the Prussian hussars; and Seidlitz, who framed the cavalry tactics. So desirous was Frederick to bring this arm of the service to the highest perfection that he called to his aid the most distinguished Hungarian cavalry officers to drill and discipline his troops; and so efficient did they become that under the great leaders just named they gained some of his most important victories. Some of these battles give the happiest illustration of the efficiency of cavalry when properly used and ably handled. In that of Rossbach, Seidlitz threw his troopers against the French columns, broke them, and never allowed them to rally again. So brilliant were his services on this field that Frederick conferred on him the order of the Black Eagle—the highest mark of favor—and made him lieutenant-general. On the bloody field of Zorndorf it was reserved for the same gallant leader to save the day, for when the Prussian infantry gave way he charged the advancing Russians, broke both their cavalry and infantry, and sabred thousands of them. Ziethen, too, Frederick's other great leader of cavalry, contributed largely to the success of the Prussian army in Frederick's campaigns, especially on the field of Torgau, which was won by him.

The Prussian cavalry has well sustained the reputation it won during the wars of Frederick the Great, and it has been regarded as among the finest in the world. It is divided into cuirassier, dragoon, hussar, and Uhlan regiments. The first are armed with long straight swords; the others, with curved sabres, pistols, and carbines for dragoons, and lances for Uhlans. Each regiment is made up of 616 men—636 in those of the guards—and is composed of four squadrons.

The Austrian cavalry is made up of the same class of troops as the Prussians, but there are some differences in arms and organization. The dragoons carry long carbines, and in the Austrian service the regiments are also larger than in the Prussian. The cuirassier and dragoon regiments contain six squadrons and 1294 men; the light-horse and hussar regiments have eight squadrons, and their strength in war is 2044 men. The Uhlan regiments have the same formation and arms as the last named, while they carry also a lance.

Among the French the cavalry is divided into cuirassiers, carbiniers, dragoons, lancers, *chasseurs à cheval*, hussars, and *chasseurs d'Afrique*. The regiments are made up of five squadrons, to which number one can be added in time of war. Their arms are very similar to those of the Prussians. The French cavalry seems to owe its origin to Charles VII., who about the middle of the fifteenth century took into his pay fifteen companies, as

they were called, each of 500 men. In the reign of Louis XII. the cavalry appears to have been first organized in a separate body, with its own general officers and staff. Napoleon used his cavalry with terrific effect, and he called to its command some of his most distinguished lieutenants, though the ablest in this arm of the service was Murat. The battle of Marengo was converted from a defeat into a victory by the charge of Kellermann at the head of a small force of cavalry; and one of the most extraordinary exploits ever achieved by this arm was performed as Napoleon approached Madrid in 1808. Near the city, in the mountain-pass of Sorno-Sierra, were posted 20,000 men and 16 guns, which force checked the advance of the French. The emperor, after a personal reconnaissance, ordered a small body of Polish lancers to charge the formidable works, which they did with complete success. This is one of the most striking instances on record to show not only what can actually be accomplished by cavalry when properly directed, but the powerful moral effect produced by this arm when used with celerity and boldness.

The cavalry of England consists of life guards, which are cuirassier regiments, composed of eight troops of fifty to sixty men each—arms, straight sword; dragoon guards, same strength as life guards—arms, straight sword, pistols, and carbine; heavy and light cavalry—arms, sabre, pistols, and carbine; and lancers—arms, sabre, pistols, and lance. The English cavalry is the best in the world, having proved itself generally superior in the field.

The organization of the cavalry in the smaller states of Europe is very similar to that of the great powers already given, and we therefore do not deem it necessary to enter into details regarding it. In the East, too, especially among the Turks, an effort is being made to conform to European organization, armament, and drill. The khedive of Egypt is making rapid progress in this direction, and he has in his service several American officers who served either in the Confederate or Federal armies during the late civil war.

In the U. S. military system the organization of the cavalry is, with some slight modifications, the same general one which prevails in Europe. A regiment consists of ten companies or troops of sixty-four men each; two troops form a squadron. All the cavalry in the U. S. should be classed as dragoons, their arms being sabre, pistol, and carbine. During the war, when large masses of cavalry were brought together they were formed into brigades, divisions, and corps, a brigade being composed of several—generally four or five—regiments; a division, of two or more brigades; and a corps of all the divisions serving with any army. When in active service it is usual to attach batteries of horse artillery to the cavalry, allowing generally one battery to each brigade. The cannoneers are all mounted for this service, and the guns used are usually light rifled pieces, though occasionally the light howitzer is employed. As an illustration of the organization of the cavalry in this country when in the field, we append a tabular statement of the formation of the cavalry corps of the Army of the Potomac, and that of the Army of Northern Virginia, in the campaign of 1864:

CAVALRY CORPS ARMY OF THE POTOMAC.

First Division, commanded by Gen. Torbert.

	Regiments.		Regiments.
First Brig., Brig.-Gen. Custer.	1st Michigan. 5th Michigan. 6th Michigan. 7th Michigan.	*Reserve Brig.*, Brig.-Gen. Merritt.	1st U. S. Cav. 2d U. S. Cav. 5th U. S. Cav. 6th U. S. Cav. 1st New York. 6th Pa.
Second Brig., Col. Devin.	4th New York. 6th New York. 9th New York. 17th Pa.		

Second Division, commanded by Gen. Gregg.

First Brig., Gen. Davies.	1st New Jersey. 1st Mass. 1st Pa. 6th Ohio.	*Second Brig.*, Col. Gregg.	1st Maine. 2d Pa. 4th Pa. 8th Pa. 13th Pa. 16th Pa.

Third Division, commanded by Brig.-Gen. J. H. Wilson.

First Brig., Col. McIntosh.	1st Conn. 2d New York. 5th New York. 2d Ohio. 18th Pa. 3d New Jersey.	*Second Brig.*, Col. Chapman. Detachment from	1st N. H. 1st Vermont. 3d Indiana. 8th New York. 22d New York. 8th Illinois. 10th New York.

Kautz's Division, commanded by Brig.-Gen. A. V. Kautz.

First Brig., Col. R. M. West.	5th Pa. 3d New York.	*Second Brig.*, Col. S. P. Spear.	11th Pa. 1st D. C. Cav.

Horse Artillery attached to Cavalry Corps.

Randall's Battery,	Cos.	H and I, 1st U. S. Artillery.
Pennington's	"	M, 2d " "
Williston's	"	— — — —
Dennisson's	"	— — — —
Heaton's	"	B and C, 2d U. S. Artillery.
Fitzhugh's	"	E, 4th " "
Ransom's Battery,		Co. C, 3d U. S. Artillery.
Maynardin's	"	" K, 1st " "
King's	"	— — — —

Attached to Kautz's Division.

Horse Battery, Co. B, 1st U. S. Artillery.

By this official return of the cavalry serving with Gen. Grant in his operations before Richmond, and which fell into the hands of the Confederates, it appears that the corps consisted of forty-one regiments, nine brigades, and four divisions. The total effective of nineteen regiments is given, making an average of 431 to each regiment. Putting each of the other regiments at the same strength, the whole force present for duty would amount to 17,641. To these troops were attached twelve batteries, mostly of six guns each.

The cavalry corps of the Army of Northern Virginia at this time was constituted as follows:

CAVALRY CORPS ARMY OF NORTHERN VIRGINIA.

First Division, Maj.-Gen. Wade Hampton.

	Regiments.		Regiments.
Butler's Brig.	4th S. C. 5th S. C. 6th S. C.	*Rosser's Brig.*	7th Virginia. 11th Virginia. 12th Virginia. White's Batt.
Young's Brig.	Cobb Legion. Phillips Leg'n Jeff. Davis L. 7th Georgia. Millen's Batt. Love's Batt.		

Second Division, Maj.-Gen. Fitzhugh Lee.

Wickham's B'g.	1st Virginia. 2d Virginia. 3d Virginia. 4th Virginia.	*Lomax's Brig.*	5th Virginia. 6th Virginia. 15th Virginia.

Third Division, Maj.-Gen. William H. F. Lee.

Garden's Brig.	1st N. C. 2d N. C. 3d N. C. 5th N. C.	*Chambliss' Brig.*	9th Virginia. 10th Virginia. 13th Virginia.

Horse Artillery attached to Cavalry Corps.

Breathitt's Battery	4 guns.	Shumaker's Battery	4 guns.
Hart's "	4 "	McGregor's "	4 "
Thompson's "	4 "		

This was the organization of the cavalry of the Army of Northern Virginia in May, 1864. Later in the campaign two other small brigades, those of Brigadier-generals Gary and Dearing, were added to it, but the second division was transferred to the Valley of Virginia, as was Rosser's brigade of the first division. One other battery, Graham's, was added to the artillery. The field return of Aug. 31, 1864, gives the "total effective" at 5907, and embraced the first and third divisions, with Dearing's brigade, the second division having moved to the Valley.

During the war the cavalry was used on both sides to picket all approaches, to cover all movements, to protect advances or retreats, and to make reconnaissances. The character of the ground on which the armies operated prevented as active participation in the great battles of the contest as is usual in European warfare, but the history of the late war, when fully and impartially written, will show that on both sides this arm was not inferior in courage, discipline, soldiership, and achievements to any other.

During this war, however, the cavalry arm was not employed in the same manner or with the same effect as it has been in European armies in the great battles. In point of fact, as one of the "three arms," it was comparatively ineffective on the great battlefields. Cavalry charges in actual battle were seldom made, except in cavalry-combats, although on a few occasions they were employed against infantry. Most of the notions prevailing on the subject were found inapplicable to the actual conditions. Hence, the use of cavalry was little more than to serve as mounted infantry; that is, for the purpose of conveying men rapidly from point to point, for the purpose of striking some sudden isolated blow or making what is called a *raid*. In most of the battles, however, the cavalry were dismounted and fought as infantry, often taking an important part. Two most notable instances of the kind occurred—one at the fight at Ream's Station, Aug. 25, 1864, where the dismounted Confederate cavalry carried a line of breastworks held by infantry; the other at Five Forks, where the Federal cavalry performed the same feat. During the war there were many instances in which dismounted cavalry fought with the constancy and discipline of the best infantry, and despite the circumstances which prevented their use in heavy masses on the great battlefields of the civil war, many of the most gallant actions in that contest were performed by this arm of the service. The circumstances under which the war was fought, particularly the topographical features of the battlefields, were such as to make it difficult to bring cavalry to bear in mass.

WADE HAMPTON.

Cav'an, a county of Ireland, in Ulster, has an area of 746 square miles, with Fermanagh and Monaghan counties on the N. E., and Leitrim, Longford, Westmeath, and Meath on the W. and S. The surface is partly hilly and partly occupied by bogs. It is drained by the rivers Erne and Woodford. About three-fourths of the land is arable, but the soil is mostly poor, except near the rivers. Among the rocks found here are clay-slate, gray-wacke, and carboniferous strata. It contains coal, iron, copper, and lead. There are many mineral springs, and numerous highly picturesque lakes. There are some linen manufactures. The county returns two members to Parliament. The principal towns are Cavan, Cootehill, Belturbet, and Bailieborough. Capital, Cavan. Pop. in 1871, 140,555.

Cavan, a town of Ireland, capital of the above county, is situated in a fertile vale on the railway from Dublin to Enniskillen, 65 miles N. W. of Dublin. It is mostly ill-built, but has a fine public garden. Pop. 3532.

Cava'nas, or **Cabanas,** a port of Cuba, on the N. W. coast, 38 miles S. W. of Havana. Here is a deep bay which affords anchorage for several hundred ships.

Cavani'lles y Cen'ti (Don Antonio), a prominent Spanish historian, born at Coruña, in Galicia, in 1805, became in 1841 a member of the Royal Academy of History, and soon after also a member of the Academy of Moral and Political Sciences. His "History of Spain" (5 vols., 1860–64, not finished) is among the best historical works of Spanish literature. Died in 1864.

Cavarze're, a town of Italy, in the province of Venetia, on the river Adige, 25 miles S. W. of Venice. It has an active trade in silk, cattle, and firewood. Pop. with suburbs, 11,903.

Cavati'na [It.], a short operatic air, differing from the aria in consisting only of one part, and that more in the form of a song. Many composers, however, disregard this difference.

Cave, or **Cav'ern** [Lat. *caverna*, from *carus*, "hollow;" Fr. *caverne*], a hollow place beneath the surface of the earth. Natural caves have been produced by the upheaval of the strata, by water, or by both combined. The eroding power of water has formed caverns in the courses of rivers and on the coast-line of the sea.

By far the greater number of caves are found in limestone, and they are here formed by the solution of the limestone by atmospheric water, which always contains carbonic acid. The most extensive caves known are subterranean water-courses which have been excavated in limestone by the dissolving power of the stream or streams which flow or have flowed through them. They especially abound in the oolitic limestone, which on this account is sometimes called by geologists "cavernous limestone." The caves of Franconia, of Kentucky, and many others occur in this formation. Next to limestone, caves are mostly found in the strata containing rock-salt, a substance easily removed by water. They are also sometimes met with in igneous rocks; the cave of Fingal, in Staffa, is formed in basalt, and in some places recent lava contains large caverns. Many caves have a calcareous lining, giving them a gorgeous appearance. Sometimes this deposit is pure white, and has, when the cave is lighted up, a wonderful richness and transparency. It is, however, generally colored. To incrustations descending from the roof like icicles the name stalactite is given; those rising from the floor are stalagmites. Sometimes the stalactite meets the ascending stalagmite and forms a column, as if to support the roof. The material of the stalactites and stalagmites originates as follows: The superficial soil, acted upon by moisture and air, evolves carbonic acid, which is dissolved by rain-water, which, permeating the calcareous strata, has the power of taking up lime, until from evaporation the excess of carbonic acid and water is parted with, when the lime returns to its solid state and forms a crust. Caves are inhabited by peculiar species of fishes (such as the blind fish of the Mammoth Cave), by remarkable reptiles (such as the *Proteus*), and by various characteristic insects and crustaceans. They also have an interest from the occurrence, in many, of fossil remains under the incrustations of the floor, frequently concreted into a firm breccia. They belong to the pleistocene period, when Europe was inhabited by hyænas, bears, and lions. Portions of other animals were dragged into their dens as food. In this way the bones of herbivorous animals are mixed with those of the beasts of prey; they have a gnawed appearance, similar to what is produced on bones by the hyæna. Remains of thirty-three species of mammals and five of birds have been discovered in the caves of the British Islands, of which about one-half still survive in Europe, Asia, Africa, and perhaps in America, for the cave-bear has been pronounced to be identical with the living grizzly bear. Among the mammals are species of ox, deer, horse, wolf, dog, fox, bat, hippopotamus, rhinoceros, hyæna, bear, and lion. It is confidently asserted by some geologists that the bones of men are also found in these caves, in circumstances showing that man was coeval with the cave-bear and the mammoth, and lived before the glacial period. The most famous ossiferous cavern in Great Britain is at Kirkdale, 25 miles from York. Ossiferous caves occur in many parts of the globe. The fossils of those in Australia show that the fauna of the pleistocene period in that country had a remarkable resemblance to that of the present day. The remains are chiefly those of kangaroos and other marsupials. The caves of Brazil have yielded many interesting remains.

Revised by J. S. Newberry.

Cave (Edward), an English printer, born at Newton in 1691, was the founder of the "Gentleman's Magazine," first issued in 1731. He was a friend and patron of Dr. Johnson. Died in 1754.

Cave (William), an English scholar and writer, born in Leicestershire in Dec., 1637. He became canon of Windsor in 1684, and vicar of Isleworth in 1690. He published "Primitive Christianity" (1672), a "History of Christ and the Apostles" (1675), and "Lives of the Fathers of the Church in the Fourth Century" (1682), which were highly esteemed. Died Aug. 4, 1713.

Ca'veat [Lat. "let him beware"]. This word is used in law in two senses. (1) A notice given to a court or judge to stay the performance of certain acts, judicial or ministerial. It is used to prevent the enrolment of a decree in chancery, or the issuing of a commission of lunacy, or the grant of letters testamentary to an executor. (2) In patent law it has a statutory effect. It is filed in the office of the commissioner of patents. An inventor makes use of it to obtain time to perfect his invention. It should set forth the design, and pray protection of the inventor's right until the invention is matured. The caveat is filed in the confidential archives of the patent office, and preserved in secrecy. It is operative for one year after its filing. When, however, an application is made within the year by another person for a patent interfering with the caveat, it is treated as confidential, and notice given by mail to the caveator, who must thereupon file his specifications prepared for a patent within three months from the time of mailing the notice, added to the time usually required for the transmission of mail-matter from Washington to the caveator. Resident aliens, under certain regulations, may avail themselves of the privilege of a caveat. (See section 40 of chap. 230 of "Laws of Congress," 1870.)

Ca'veat Emp'tor ("let the purchaser beware"). This is an important rule in the law of sales of personal property. Its general meaning is, that a purchaser must judge for himself of the quality of goods purchased. He will accordingly have no remedy against the seller if the goods turn out to be of an inferior character and of much less value than the price paid. The common law of England differs widely from the civil or Roman law, where the rule prevailed that a "sound price warrants a sound article." The rule (*caveat emptor*) must be confined to the *quality* of the goods. In the case of failure of the *title* to chattels sold by a person in possession, there is, according to the American decisions, an action against the seller, on the theory of an implied warranty. To the general doctrine of "caveat emptor" there are important qualifications. (1) The rule does not extend to cases of fraud. Where there is positive or active fraud, this is extremely clear. There is more doubt in the case where there is only concealment on the part of the seller. A distinction has here been taken between intrinsic and extrinsic defects. The latter would refer to cases where external circumstances affect the value of a chattel, as the outbreak of war or the conclusion of peace. The rule in such cases is that concealment is not a legal fraud, unless there is an active attempt to mislead. In the case of intrinsic defects there is great diversity of opinion. Some authors of repute hold that "the seller may allow the buyer to cheat himself *ad libitum*, but that he must use no effort to mislead." It is to be regretted that a view of the law should be taken so widely at variance with the dictates of common morality, and an effort should be made to find some satisfactory ground upon which they can be reconciled. It is believed that the seller is bound, *in law*, to disclose any facts within his knowledge of the nature referred to which cannot be discerned by the exercise of ordinary observation and good judgment on the part of the buyer, and which materially affect the value of the chattel in ordinary estimation. To use a familiar illustration, if a seller knew that a horse which he exposed for sale in the ordinary manner had a secret defect not discernible by a careful purchaser, it would be a fraud on his part not to disclose it. Of course, this conclusion would not be arrived at if he expressly stated that the sale was "with all faults," etc.

(2) When a sale is made by a manufacturer for a special purpose, the better opinion is that the rule in question has no application. In other words, there is an implied warranty that the chattel is reasonably fit for the purpose for which it is bought. Some authorities of weight maintain that there is an implied warranty in all sales by manufacturers that there is no defect in the *process of manufacturing*, though they would not extend the doctrine to the materials used. (3) Wherever the reason on which the rule is founded fails, the rule itself gives way. The only rational ground of the doctrine of *caveat emptor* is, that when a purchaser has an opportunity to examine goods he should act in the way in which a prudent man usually manages his affairs, and should notice such defects as he may be able to discover. Where there is no such opportunity for inspection, or where the seller takes the burden of selection upon himself, there is no room for the application of the rule. Accordingly, it does not apply to a true sale by sample; that is, where the bulk of the commodity is not present. In this case, the seller impliedly warrants that the bulk of the commodity is equal to the sample. The purchaser must examine the sample for himself. If, however, that course is not open to him, the bulk of the commodity must be equal to the *apparent* qualities of the sample. Thus, if an article like madder were sold by a sample contained in a sealed bottle, the bulk must equal the sample as it appears to the eye. The same general rule would apply to so called executory contracts of sale, as where goods are sold at sea "to arrive" at a prescribed time. In the special case where the selection is made by the seller, the rule also fails. The distinction is put by one of the English judges in an apt form. He says: If the buyer says to the seller, "Sell me *a* gray horse to ride," there must be a horse supplied which the purchaser can ride. If, however, he had said, "Sell me *that* gray horse to ride," pointing to a particular animal, there would be no remedy, in the absence of fraud, if the horse were unfit to ride. In these cases another view might be taken. There is really no contract if the stipulated article is not supplied, the minds of the parties not having met. It seems very clear that if A proposes to sell B wheat by sample, and he furnishes on delivery wheat that does not correspond with the sample, there has been no agreement to buy the thing furnished, and it may accordingly be returned to A when its true character is discovered. (4) There is an exception to the rule in American law resting upon peculiar grounds, and it may be maintained though there be no fraud or other special circumstances. This is the sale of provisions for *domestic use*. There is an implied warranty that the goods are wholesome. The exception is not extended to sales by one dealer to another. It may be added that there is a corresponding rule (*caveat venditor*) applicable to the seller, who is bound in like manner to be on his guard in dealing with the purchaser, though this would also give way in cases of fraud. An instance is where the buyer, having learned that a war has ended, takes advantage of his superior knowledge to make purchases. Such a purchase would be legally valid, though if he misled the seller the fraud would vitiate the transaction. (See also, on this subject, SALES.) T. W. DWIGHT.

Cave City, a post-village of Barren co., Ky., on the Louisville and Nashville R. R., 85 miles S. of Louisville and about 6 miles S. E. of the Mammoth Cave. Pop. 387.

Cave in Rock, a post-township of Hardin co., Ill., on the Ohio River, 51 miles above Paducah, Ky., was once the haunt of a band of river-pirates under one Mason, an outlaw. Pop. 869.

Cav'endish, a post-township of Windsor co., Vt., on the Rutland and Burlington division of the Vermont Central R. R., 23 miles N. by W. of Bellows Falls. It has manufactures of woollen cloth, leather, lumber, furniture, etc. It includes the village of Proctorsville, which has a national bank and important manufactures. Pop. 1823.

Cavendish (HENRY), an eminent English chemist and philosopher, born at Nice Oct. 10, 1731, was a son of Lord Charles Cavendish and a grandson of the duke of Devonshire. He was a man of eccentric and unsocial habits, who devoted himself exclusively to science. From an uncle who died about 1773 he inherited a very large fortune. As a chemical philosopher he occupies the first rank. He was one of the founders of pneumatic chemistry, ascertained the proportions of oxygen and nitrogen in common air in 1783, and discovered the composition of water in 1784 by burning oxygen and hydrogen in a glass vessel. He was profoundly versed in geometry and mathematics. In 1803 he was chosen an associate of the French Institute. He died in London without issue Feb. 24, 1810, and left a fortune of one million pounds sterling. (See G. WILSON, "Life of H. Cavendish.")

Cavendish Experiment, an experiment for determining the mean density of the earth. (See DENSITY OF THE EARTH.)

Caver'na, a post-village of Hart co., Ky. Pop. 479.

Cave Rock, a township of Douglas co., Nev. P. 120.

Cave Spring, a township of Jackson co., Ala. P. 378.

Cave Spring, a post-village of Floyd co., Ga., is the seat of the State asylum for deaf-mutes, and has an extensive cavern and a medicinal spring. It is also the seat of Harn School for young men.

Cave Spring, a post-township of Roanoke co., Va. Pop. 2261.

Cavetown, a post-twp. of Washington co., Md. P. 1899.

Ca'very, or **Cauv'ery** (anc. *Chaberis*), a river of India, in the Deccan, rises near lat. 13° N. and lon. 76° E. It flows south-eastward through Mysore, and after a course of about 470 miles enters the sea by many mouths. Its delta is mostly in the district of Tanjore. It is eminently available for irrigation and useful in agriculture.

Caviare, kav'iar or kaveer', the prepared and salted roe of the sturgeon, made chiefly in Russia, the Caspian fishery alone sometimes yielding several hundred tons annually. There are six or seven species of sturgeon caught for their yield of caviaro—species chiefly living in the Caspian and Black seas and their tributary streams. The roe of the sterlet (*Acipenser ruthenus*) is the best, and its caviare is reserved for the imperial court. Caviare is proverbially disagreeable to the uneducated palate, though highly esteemed by the initiated. It is now manufactured quite extensively in the U. S.

Cavi'te, a fortified seaport-town of Luzon, one of the Philippine Islands, is on the Bay of Manila, 3 miles S. W. of the city of Manila. It has an arsenal, and is the chief naval dépôt of the Spanish possessions in the East. Here is a manufactory of cigars. Pop. about 6500.

Cavour', di (CAMILLO BENSO), COUNT, an illustrious Italian statesman, born Aug. 1, 1810, of an aristocratic Piedmontese family, the son of the marchese Michele di Cavour and his wife Adelaide Syllon d'Allamar, an accomplished Swiss lady. Camillo, a younger son, was destined for the army, In the military academy at Turin he showed such proficiency in mathematical studies that he was made an engineer officer at the age of sixteen and given responsible commands. Military life was repugnant to his tastes, and he entertained radical opinions which he did not hesitate to utter, and thereby displeased the king, Charles Albert. He therefore left the army in 1831, and turned his attention to agriculture, taking part also in the reform agitations of the time. He pursued a zealous inquiry into social and industrial questions, visiting England and France for that purpose. He was one of the founders of the "Associazione Agraria," an energetic reform society, and started the liberal journal "Il Risorgimento" in 1847. When in 1848 the liberal party came into power and a constitutional frame of government was accorded to Sardinia, Cavour stood at the head of the moderate republican press, and, elected to the Chamber, he took an important part in the debates, supporting the moderate ministry of D'Azeglio and opposing the violent demands of the Left, whereby he lost in great measure his popularity. In 1850 he was appointed minister of commerce, in 1851 of finance, and in 1852 became premier, accomplishing a fusion of the Right Centre with the Left Centre under Ratazzi. From that time forth he conducted the policy of Italy, bringing about finally its political consolidation amid stormy internal commotions and foreign complications. He promoted free trade and religious toleration, opposed the encroachments of the papal power, and formed an alliance with England and France in the war against Russia, 1854–55. The grand aim of his diplomacy was to promote the union of the Italian peoples and the liberation of Italy from foreign domination. He thus provoked the hostility of Austria, which invaded Italy in April, 1859. The Austrians were defeated, and obtained peace by ceding Lombardy, which was annexed to the Sardinian states. Cavour resigned office in July, 1859, because he disapproved the treaty of Villafranca, but he resumed the position of prime minister in Jan., 1860. In consequence of the victories of Garibaldi and the general uprising of Italian patriots in 1859 and 1860, nearly all Italy was liberated and united. Cavour was prime minister of the new kingdom of Italy when he died on the 6th of June, 1861. He was never married. He left the reputation of being one of the greatest statesmen of modern times. (See "Reminiscences of the Life of Cavour," translated from the French by EDWARD ROMILLY; also EDWARD DICEY, "Cavour, a Memoir.")

Ca'vy, the name of various South American tailless rodent mammals, closely related to the porcupine family, and by most naturalists referred to the Hystricidæ, but

by others to the family Caviidæ, differing from the hare family in the want of clavicles, and in having the incisors situated not in the manner characteristic of the hares. There are four molar teeth in each jaw, and in the genus *Cavia* these are compound: there are four toes on each of the fore feet, and three on the hind feet, the feet not being webbed. The females have only two teats. One species, *Cavia Cobaya*, has long been domesticated as a pet and plaything of children. It is called the "restless cavy," or more frequently the "Guinea pig," although it is neither a pig nor a native of Guinea. The Guinea pig multiplies with rapidity, producing young ones when only two months old, and afterwards at intervals of two months, from four to twelve in a litter. This fecundity serves for the preservation of the race in a wild state, the little animal being very defenceless. The other species are very numerous in parts of South America.

Caw Caw, a township of Orangeburg co., S. C. Pop. 934.

Cawker City, a post-village and township of Mitchel co., Kan. It is the seat of the U. S. land-office for the north-western district of Kansas, and is favorably situated at the junction of the two branches of the Solomon River. It has one weekly newspaper, a high school, three churches, and a large wholesale and retail trade. Pop. of township, 38.

FLAVIUS MACMILLAN,
ED. AND PUB. OF "SENTINEL."

Cawnpoor', or **Cawnpore,** a town of Hindostan, on the right bank of the Ganges, which is here nearly a mile wide, about 96 miles S. W. of Lucknow; lat. 26° 29′ N., lon. 80° 25′ E. It is an important British military station, having cantonments which accommodate about 7000 men. It is not well built, and contains few remarkable public edifices. Connected with the cantonments are several hundred bungalows for the officers, which are fitted up luxuriously and have large gardens. During the mutiny of the Sepoys in 1857, Nana Sahib massacred here a number of English captives, including women and children. Pop. 108,796.

Caxamarca, or **Cajamarca,** kä-mär'kä (*i. e.* a "place of frost"), a department of Peru, is bounded on the N. by Ecuador, on the E. by Amazonas, on the S. by Libertad, and on the W. by Libertad and Piura. The department, with the exception of the extreme N., is crossed by mountain-ranges, in consequence of which the climate is cool and pleasant. It is irrigated by the Marañon, which flows along its eastern boundary. All products of the tropics and the temperate zones are raised here, as wheat, barley, potatoes, tobacco, etc. Chief town, Caxamarca. Pop. about 120,000.

Caxamar'ca, or **Cajamarca,** a town of Peru, capital of a province of its own name, is near the eastern foot of the Andes, about 83 miles N. N. E. of Trujillo. It has several churches, and manufactures of cutlery and woollen cloth. Silver-mines have been opened in the vicinity. Caxamarca is celebrated in the history of the Spanish conquest. The ruined palace in which Pizarro confined the inca Atahualpa is still to be seen. Pop. 18,330.

Caxatam'bo, or **Cajatambo,** a town of Peru, capital of a province of its own name, is on the W. slope of the Andes, 140 miles N. of Lima. Pop. about 6500.

Cax'ton (WILLIAM), an English merchant, born in Kent about 1412, was the first to introduce printing into England. In 1464 he was employed to negotiate a treaty of commerce between Edward IV. of England and the duke of Burgundy. He translated from the French a "History of Troy," which he printed probably in 1471, but perhaps earlier. This is said to be the first book ever printed in the English language. After he had resided for some time at the court of the duchess of Burgundy, he returned to England and established a printing-office in Westminster in 1476, where he printed several other books. Died about 1492.

Cayam'be, or **Cayambe-Urcu',** a mountain in Ecuador, a peak of the Colombian Andes, is directly under the equator, and about 45 miles N. E. of Quito. It has a beautiful conical form, and an altitude of 19,511 feet. It is covered with perpetual snow, and forms one of the most remarkable landmarks on the globe.

Cayenne, a seaport-town of South America, capital of French Guiana, is on the Atlantic, and on an island of its own name at the mouth of the Cayenne River: lat. 4° 56′ N., lon. 52° 13′ W. It has a shallow harbor, and is defended by a fort and batteries. Considerable quantities of coffee, sugar, cotton, indigo, and cacao are exported from this place. Pop. about 6000. Cayenne Island is about 30 miles in circumference, and is separated by a narrow channel from the mainland. Cayenne is a penal colony to which criminal offenders are transported.

Cayenne Pepper. See CAPSICUM.

Cayes, a seaport-town of Hayti, on its southern coast, 92 miles W. S. W. of Port-au-Prince. Pop. 3000.

Cay'man, ki'man [a word belonging to the Guinau language of South America] is either the distinctive appellation of some, or the common name for all the Crocodilidæ of South America and the West Indies. The genus *Alligator* is by some naturalists divided into three genera, to one of which the name *Caiman* is given. The eye-browed cayman

Cayman.

(*Alligator palpebrosus*), to which the name cayman is applied in Guiana, is not the largest of its tribe. The three bony plates which form each eyebrow, projecting as large knobs, and the scarcely webbed feet, constitute the characters of the genus or sub-genus *Caiman*, to which belong also *Alligator trigonatus* and *Alligator gibbiceps*.

Caymans, The, three small islands in the Caribbean Sea, belonging to Great Britain, 130 miles N. W. of Jamaica. They have few inhabitants, and chiefly produce turtles.

Cayu'ga, a county in W. Central New York. Area, 756 square miles. It is bounded on the N. by Lake Ontario, and partly on the W. by Cayuga Lake. It also contains Owasco Lake, and is traversed by Seneca River. The surface is undulating; the soil is very fertile. Wool, cattle, butter, cheese, fruit, grain, and tobacco are extensively raised. Among the minerals found here are gypsum and corniferous limestone. The rocks of this county are of the Silurian and Devonian formations. The county has various manufactures, including metallic wares, castings, lumber, flour, carriages, agricultural tools, etc. It is intersected by the Central, the Southern Central, and the Cayuga Lake R. Rs. Capital, Auburn. Pop. 59,550.

Cayuga, a post-town of Ontario (Canada), capital of Haldimand co., is on Grand River, which is navigable, 14 miles from its entrance into Lake Erie and 25 miles S. of Hamilton. It has two newspapers and a heavy trade in grain and plaster.

Cayuga, or **Cayuga Bridge,** a post-village of Aurelius township, Cayuga co., New York, on Cayuga Lake near its outlet, and on the New York Central R. R., 11 miles W. of Auburn at its junction with the Cayuga Lake R. R. It has four churches. The railroad here crosses the lake by a bridge nearly a mile long. Pop. 435.

Cayuga Lake, a beautiful lake of New York, forms the boundary between Cayuga and Seneca counties, and is

about 38 miles long. Its width varies from one to three miles, and its greatest depth is supposed to be above 500 feet. The surface is 387 feet above the level of the sea. Its banks are formed of Silurian and Devonian rocks. Whitefish and many other species of fish are caught in it. Steamboats ply daily between Cayuga Bridge and Ithaca, which is at the head of the lake. The outlet of this lake flows into Seneca River, which separates Central from Western New York.

Cayugas. See SIX NATIONS.

Cayu'ta, a post-township of Schuyler co., N. Y. P. 641.

Caza'lla de la Sier'ra, a town of Spain, province of Seville, 39 miles N. N. E. of the city of Seville. It is on a declivity of the Sierra Morena, and in a district which abounds in silver, copper, iron, and marble. It has manufactures of linen, machinery, etc. Here are several ruined villas and Roman and Arabic antiquities. Pop. 6852.

Cazem'be, or **Kazembe,** the name of a country in the S. E. of Africa. It is between Lake Tanganyika and the river Zambesi, but its limits are not definitely known. Its fortified capital, Lucenda, is between lat. 8° and 9° S., and between lon. 28° and 29° E. The soil is well watered and fertile. Among the chief productions are maize, manioc or cassava, sugar, palm wine, ivory, copper, and sesamum.

Cazeno'via, a post-township of Woodford co., Ill. Pop. 990.

Cazenovia, a post-village of Madison co., N. Y., is on a small lake 18 miles S. E. of Syracuse. The Cazenovia and Canastota R. R., 15 miles long, connects it with the Central R. R. The Syracuse and Chenango Valley R. R. connects it with Syracuse on the N., and with the New York and Oswego Midland R. R., at Earlville on the S. It is the seat of Central New York Conference Seminary. It has a woollen-mill, a pasteboard-factory, a paper-mill, a lock-factory, and a machine-shop, one national bank, and one newspaper-office. Pop. 1718; of Cazenovia township, 4265. IRVING C. FORTE, PUB. CAZENOVIA "REPUBLICAN."

Ceano'thus America'nus, New Jersey Tea, or **Red Root,** a shrubby plant of the order Celastraceæ, is a native of the U. S. It is about two feet high, and has ovate, serrate leaves, which were used as a substitute for tea during the Revolutionary war. It has small white flowers in clusters, which are crowded in dense panicles. The beautiful native shrubs called in California wild lilac belong to this genus.

Ceará, or **Ciará,** a maritime province in the N. E. of Brazil, has a coast-line of nearly 350 miles. Area, 36,887 square miles. Pop. in 1867, 550,000. Gold, copper, and iron are found here. Ceará is covered by fine forests, and produces balsams and resins. Capital, Fortaleza.

Ce'bes [Gr. Κέβης], sometimes written **Kebes,** a Greek philosopher, born at Thebes, was a disciple and friend of Socrates. One of his works, entitled "Pinax" (the "Tablet or Picture"), is extant. It is a dialogue on human life, which is highly commended, and has been translated into many languages.

Ce'bus [Gr. κῆβος, a "monkey"], a genus of American monkeys characterized by a round head, long thumbs, and a long prehensile tail covered with hair. The species are numerous, remarkably intelligent and active, and live in trees. They feed chiefly on fruits, but also on eggs, insects, worms, and mollusks. They are included under the designation sapajou in its wider sense, and among them are the monkeys to which this name is more strictly applied. The names capuchin, sajou, weeper, and sai are also given to them. The name Cebidæ is given to the American monkeys as a family by those who recognize the limits of this family as being the same as those of the tribe Platyrrhinæ.

Cebus, or Sajou Monkey.

Cecidomyi'a [from the Gr. κηκίδιον, a "gall-nut," and μυῖα, a "fly"], a genus of two-winged insects of the gnat and mosquito family, having downy wings, which are horizontal when at rest; antennæ as long as the body, with joints, and whorls of hairs at the joints; long legs, and the first joint of the tarsi very short. The species are numerous, of small size, but some of them are very important on account of the ravages which their maggots effect in grain crops. *Cecidomyia cerealis,* called the barley midge, a brownish-red fly with silvery wings, of which the maggot is vermilion-colored, is very destructive to barley and spelt. The maggots live in families between the stalk and the sheath of the leaf, abstracting the juice of the plant. The wheat-fly and the Hessian-fly belong to this genus. Some of the species of *Cecidomyia* deposit their eggs on the young buds of trees, which the larvæ transform into galls.

Ce'cil, a county which forms the N. E. extremity of Maryland, is at the head of Chesapeake Bay. Area, 409 square miles. It is partly bounded on the W. by the Susquehanna River, and is intersected by the Elk River. The soil is productive. Wheat, corn, oats, fruit, and wool are extensively raised. The county contains large quarries of granite and valuable mines of chromium, iron, and fire-clay. The manufactures include flour, iron, paper, etc. It is traversed by the Philadelphia Wilmington and Baltimore and the Philadelphia and Baltimore Central R. Rs. Capital, Elkton. Pop. 25,874.

Cecil, a township of Washington co., Pa. Pop. 1102.

Cecil (Rev. RICHARD), an eminent evangelical clergyman of the Church of England, born in London in 1748, died in 1810. He was a devout, fervent Christian, and an impassioned pulpit orator. His works were published (London, 1811) in 4 vols. 8vo. The fourth volume, containing his "Remains," is considered the most valuable. There is also an American edition (New York, 1845) in 3 vols. 8vo.

Cecil, Lord ROBERT. See SALISBURY, MARQUIS OF.

Cecil. See BURLEIGH.

Cecil'ia, SAINT, a Roman virgin who is supposed to have suffered martyrdom in the second or third century. She is regarded as the patroness of musicians and the inventor of the organ. Raphael, Domenichino, and other great artists painted pictures of her, and Dryden wrote a celebrated "Ode for St. Cecilia's Day," which is the 22d of November.

Cecil'ian Col'lege, a Catholic male boarding school at Cecilian, Hardin co., Ky., on the Elizabethtown and Paducah R. R. It was founded in 1860, and chartered in 1867. Its proprietors and professors are laymen. Its average number of matriculants for thirteen years is 150. No uniform is required. The discipline is firm and strict, the students being at all times in the care of the officers of the school. Degrees are conferred by this college both in the classical and business departments. The school term is of forty weeks, at a charge of $5 per week, covering all expenses.

H. A., S. G., and A. D. CECIL,
PROPRIETORS.

Cecilius. See CÆCILIUS.

Ce'cilton, a post-village and township of Cecil co., Md. Pop. 462; of township, 3337.

Cecro'pia, a genus of trees of the order Artocarpaceæ. The *Cecropia peltata,* a very common tree of the West Indies and South America, called trumpet-wood and snake-wood, is remarkable for its hollow stem and branches, with membranous partitions at the joints. The small branches are made into wind instruments. The wood is very light, readily takes fire by friction against hard wood, and is much used by the Indians for procuring fire. The fruit is agreeable, and resembles a mulberry.

The trunk and branches yield a large quantity of saline matter, employed by planters in the purification of sugar. The bark is strong and fibrous, and is used for cordage. It is also astringent, and is employed in diarrhœa and gonorrhœa. The juice yields caoutchouc.

Cecro'pia Moth, a lepidopterous insect of the family Bombycidæ, and nearly related to the silkworm. The systematic arrangement of this family is unsettled, but of the numerous names proposed for this insect perhaps *Platysamia cecropia* is the best. This is the largest North American moth yet known. When expanded it often measures six inches and a half across. It is of a dusky-gray color, variegated with white, black, and various neutral tints. It appears in the U. S. in June, and is a most striking and beautiful object. Its larva is over three inches long, of a light-green color, with red and yellow warts armed with bristles. The cocoon is of a very strong silk, which is abundant in quantity, but it cannot be reeled. It has, however, been carded and spun into an excellent thread, and but for the delicate character of the larvæ, which are hard to raise, it would become an important article of commerce. The *Telea polyphemus*, an American relative of this moth, has attracted much attention from the excellence of its silk and the hardiness of its young. The ailanthus silkworm of China also closely resembles the larva of the cecropia moth. From the fact that the common silkworm has become subject to several destructive diseases, the scientific world is much interested in the effort to find another silkworm which shall be hardy and productive of useful cocoons.

Ce'crops, or Kekrops [Gr. Κέκροψ], a semi-fabulous hero of the Pelasgian race, was called the first king and legislator of Attica. According to tradition, he instituted marriage and instructed the Athenians in agriculture, navigation, religion, etc. The people of Attica were sometimes called Cecropidæ.

Ce'dar [Gr. κέδρος; Lat. *cedrus*; Fr. *cèdre*], the common name of several species of evergreen trees of the order Coniferæ. They afford durable and valuable timber. The name red cedar is given to the *Juniperus Virginiana*, a native of the U. S., which is prized for its durable, compact, and odorous wood, and is used by cabinet-makers. It grows mostly in dry and sterile soils. In the Western States it attains the height of seventy feet or more, but in the Eastern States it is a small tree. The American white cedar (*Cupressus thyoides*), an evergreen tree, abounds in the swamps of the U. S., and grows from thirty to seventy feet high. The timber of this tree will remain for a long time under water without decaying, and is an excellent material for posts of fences and for shingles. Various other coniferous trees are called cedars in the U. S. The name white cedar is given in America to the wood of *Cupressus thyoides* and *Thuya occidentalis*—the latter throughout the Northern States. The cedar of Lebanon is the true and original cedar. It is not, like the American cedars, related to cypress, but to the pine and larch, the foliage resembling that of the latter, but evergreen as in the former. The cones are similar to those of larch, but are larger and very broad. *Cedrus*, the cedar genus, consists of three species, which are by some supposed to be geographical varieties of one—viz. *Cedrus Libani*, confined to Lebanon, the Caucasus, etc.; *C. Atlantica*, of the Atlas Mountains; and *C. Deodara*, the deodar of the Himalayas. The character of the light reddish, fragrant, and durable timber is the same in all these. They thrive in England, and even in Scotland, but not in any part of the Atlantic U. S. They may be expected to flourish on our Pacific coast. Of the celebrated cedars on Mount Lebanon, eleven groves still remain. The famous B'Sherreh grove is three-quarters of a mile in circumference, and contains about 400 trees, young and old. Perhaps a dozen of these are very old; the largest, 63 feet in girth, is thought by some to have attained the age of 2000 years. The name of cedar is also applied to the wood of a few trees which are not related to the Coniferæ, the color and odor being somewhat similar. Spanish cedar, of which cigar-boxes are made, and which is used for wardrobes and sometimes for lead-pencils (as a substitute for red cedar), is the wood of *Cedrela odorata*, a West Indian tree of the mahogany family.

Cedar, a county in the E. of Iowa. Area, 576 square miles. It is intersected by the Cedar and Wapsipinicon rivers. The surface is diversified by woodlands and undulating prairies, the soil of which is very fertile. Grain, wool and beef-cattle are very largely raised. It is traversed by a branch of the Chicago and North-western R. R., and contains quarries of good Devonian limestone. Capital, Tipton. Pop. 19,731.

Cedar, a county in the W. S. W. of Missouri. Area, 435 square miles. It is intersected by Sac River, and also drained by Horse Creek. The surface is uneven; the soil is fertile. Corn, tobacco, and wool are staple products. Capital, Stockton. Pop. 9474.

Cedar, a county of Nebraska, bordering on Dakota, has an area estimated at 700 square miles. It is bounded on the N. by the Missouri River, and also drained by Big Bow Creek. The soil is productive. Wool, wheat, and corn are the chief products. Capital, St. James. Pop. 1032.

Cedar, a township of Clarke co., Ark. Pop. 897.

Cedar, a township of Knox co., Ill. Pop. 2153.

Cedar, a township of Benton co., Ia. Pop. 1041.

Cedar, a township of Black Hawk co., Ia. Pop. 731.

Cedar, a township of Cherokee co., Ia. Pop. 250.

Cedar, a township of Floyd co., Ia. Pop. 415.

Cedar, a township of Greene co., Ia. Pop. 306.

Cedar, a township of Jefferson co., Ia. Pop. 816.

Cedar, a township of Johnson co., Ia. Pop. 1094.

Cedar, a township of Lee co., Ia. Pop. 1196.

Cedar, a township of Lucas co., Ia. Pop. 764.

Cedar, a township of Mahaska co., Ia. Pop. 1265.

Cedar, a township of Mitchell co., Ia. Pop. 733.

Cedar, a township of Monroe co., Ia. Pop. 831.

Cedar, a township of Muscatine co., Ia. Pop. 421.

Cedar, a township of Van Buren co., Ia. Pop. 1090.

Cedar, a township of Washington co., Ia. Pop. 957.

Cedar, a township of Wilson co., Kan. Pop. 539.

Cedar, a township of Boone co., Mo. Pop. 5020.

Cedar, a township of Callaway co., Mo. Pop. 2453.

Cedar, a township of Cedar co., Mo. Pop. 788.

Ce'darburg, a post-village of Ozaukee co., Wis., on Cedar Creek and on the Milwaukee and Northern R. R., 20 miles N. of Milwaukee. It has a national bank. Pop. of Cedarburg township, 2557.

Cedar Creek, in the N. part of Virginia, rises in Shenandoah co., and enters the North Fork of the Shenandoah about 4 miles below Strasburg. On this creek the army of Gen. Sheridan was encamped when, Oct. 19, 1864, during Sheridan's absence, it was surprised at daylight, at Alacken, by the Confederate army under Gen. Early, its left flank turned and driven in confusion, the remainder of the army retiring, yet in good order. Gen. Wright, in command at the time, after having succeeded in restoring something like order among the surprised troops, seeing that the position they had fallen back to was an exposed one, ordered a general retreat, to enable him to restore communications. The retreat was conducted in good order, and Gen. Wright had halted and restored his line when, at 10 A. M., Gen. Sheridan, who had heard of the disaster at Winchester, arrived on the field. He was informed by Gen. Wright of the dispositions made by him, to which Sheridan gave his approval. The pursuit by the Confederate army had ceased, the men being occupied plundering the camps of the Eighth and Nineteenth corps. Gen. Sheridan arrived, then, to find that his army had been surprised and routed; but he found that the worst was over, the line reformed, and the army not demoralized. His presence lent an inspiring effect, so that, after making his line as compact as possible, an attack made upon it at 1 P. M. was successfully repulsed. At 3 P. M., after making some charges with his cavalry, he attacked the Confederates with great vigor, driving and routing them, and capturing over fifty pieces of artillery, including twenty of his own lost in the morning, about 2000 prisoners, and releasing many of our men captured in the morning. The cavalry drove them still farther next day, the 20th, and during that night Early retreated, and the military operations in the Shenandoah Valley were at an end.

Cedar Creek, a township of Carroll co., Ark. Pop. 511.

Cedar Creek, a township of Crawford co., Ark. Pop. 952.

Cedar Creek, a township of Sevier co., Ark. P. 117.

Cedar Creek, a village and hundred of Sussex co., Del. The village is about 30 miles S. S. E. of Dover, and near the Delaware R. R. Pop. 3544.

Cedar Creek, a township of Allen co., Ind. P. 1713.

Cedar Creek, a township of Lake co., Ind. P. 1326.

Cedar Creek, a township of Cowley co., Kan. P. 79.

Cedar Creek, a township of Marion co., Kan. P. 105.

Cedar Creek, a township of Muskegon co., Mich. Pop. 660.

Cedar Creek, a township of Wayne co., Mo. P. 379.

Cedar Creek, a post-township of Cumberland co., N. C. Pop. 2358.

Cedar Creek, a twp. of Lancaster co., S. C. Pop. 1505.

Cedar Creek, a township of Bath co., Va. Pop. 903.

Cedar Creek Mines, a township of Missoula co., Mon. Pop. 1486.

Cedar Dale, a village of Whitby township, Ontario co., province of Ontario (Canada), on the Grand Trunk Railway, 33 miles from Toronto.

Cedar Falls, a city and township of Black Hawk co., Ia., on the Cedar River and the Illinois Central and the Burlington Cedar Rapids and Minnesota R. Rs. It has eight churches, two newspapers, and several mills, and other manufactories. P. 3070; including township, 4381.
C. W. & E. A. Snyder, Eds. Cedar Falls "Gazette."

Cedar Fork, a township of Wake co., N. C. P. 1533.

Cedar Grove, a post-twp. of Orange co., N. C. P. 2047.

Cedar Island, in the township of East Hampton, Suffolk co., N. Y., at the entrance to Sag Harbor, Long Island; lat. 41° 02′ 26″ N., lon. 72° 15′ 19″ W., has a granite lighthouse, with a fixed white light 34 feet above the sea.

Cedar Keys, a seaport of Levy co., Fla., on the Gulf of Mexico, at the S. W. terminus of the Florida R. R., on Way Key, a small island, 154 miles from Fernandina. Its harbor is formed by a group of keys, or small islands, which give name to the town. It has a lighthouse on Seahorse Key; lat. 29° 05′ 49″ N., lon. 83° 04′ 46″ W. It shows a revolving light 75 feet above the sea. The lumber-trade is the chief industry. Pop. 440.

Cedar Lake, a post-twp. of Scott co., Minn. P. 756.

Cedar Mills, a post-twp. of Renville co., Minn. P. 205.

Cedar Mountain, a twp. of Culpeper co., Va. P. 1708.

Cedar Mountain, Va., about 2 miles W. of Mitchell's Station, Culpeper co., on the Orange Alexandria and Manassas R. R., was the scene of a desperate and sanguinary conflict on the 9th of Aug., 1862, between the forces of Gens. Pope and Jackson, in which the Federal forces under the immediate command of Gen. Banks were outnumbered and defeated with a loss of nearly 2000 in killed, wounded, and missing, and a large quantity of war-material; the Confederate loss was about 1300.

Cedar Mountains, of South Africa, are in Cape Colony. This range extends nearly parallel with the Atlantic, and is near the meridian of 19° E. The highest summits of it rise about 6590 feet above the level of the sea. They are partly covered with forests of cedar.

Cedar Rapids, a city of Linn co., Ia., on Cedar River, 219 miles W. of Chicago and 265 miles S. of St. Paul, on the Chicago and North-western, the Burlington Cedar Rapids and Minnesota (also the Milwaukee and Pacific divisions of that road), and the Dubuque and South-western R. Rs. It is the head-quarters of the Iowa R. R. Land Company, of the Sioux City and Pacific R. R., of a coal company, and of the Burlington Cedar Rapids and Minnesota R. R., whose shops are here. It has a valuable water-power, two national and one savings bank, two weekly, one monthly, and one daily newspaper, flouring-mills, steam bakery, foundries, planing-mills, manufactories of furniture, confectionery, paper, oil and lint, beer, oatmeal, woollens, knit goods, agricultural tools, wagons, carriages, door-latches, etc. Pork-packing is extensively carried on. The wholesale trade is important. The city is lighted with gas, has excellent schools and churches, and is increasing in population and prosperity. Pop. 5940. F. McClelland, Ed. "Times."

Cedar (or **Red Cedar**) **River,** of Iowa, rises in the S. part of Minnesota. It flows nearly south-eastward through Mitchel, Floyd, Bremer, Black Hawk, Benton, Linn, and Cedar counties of Iowa. Then turning to the S. W., it enters the Iowa River about 15 miles above Wapello. Total length, estimated at 350 miles. Devonian and magnesian limestones are abundant along its banks.

Cedar Rock, a post-twp. of Franklin co., N. C. P. 1112.

Cedar Run, a township of Fauquier co., Va. P. 2145.

Cedar Springs, a post-village of Kent co., Mich. It has one weekly newspaper.

Cedar Springs, a twp. of Abbeville co., S. C. P. 1503.

Cedar Springs, a post-village in Spartanburg co., S. C., on the Spartanburg and Union R. R. It contains the State institution for the deaf, dumb, and blind, founded in 1849.

Ce'dartown, a post-village, capital of Polk co., Ga., about 60 miles W. N. W. of Atlanta. Pop. 323.

Ce'darville, a township of Hale co., Ala. Pop. 1920.

Cedarville, a post-village of Smith co., Kan. It has one weekly newspaper.

Cedarville, a twp. of Menominee co., Mich. P. 194.

Cedarville, a post-village of Greene co., O., in a township of the same name, on the Columbus and Xenia R. R., 47 miles S. W. of Columbus. Pop. 753; of township, 2361.

Cedarville, a township of Warren co., Va. Pop. 1734.

Cedrela'ceæ [from *Cedrela*, one of the genera], a natural order of exogenous trees and shrubs, very nearly allied to Meliaceæ, and chiefly distinguished by the winged seeds, numerous in each cell of the fruit, which is a capsule. The known species are few, all tropical or sub-tropical, most of them trees valuable for their timber. To this order belong mahogany, satin-wood, toon, Barbadoes cedar, the yellow-wood of New South Wales, etc.

Cefalù (anc. *Cephalœdium*), a town of Sicily, in the province of Palermo, situated on the Mediterranean, 40 miles E. S. E. of Palermo. Here is a fine cathedral of Norman architecture. The town is situated at the foot of a mountain or high rock, on which are the ruins of an ancient Phœnician structure and of a Saracenic castle. It has marble-quarries and sardine-fisheries. Pop. in 1872, 11,799.

Ceglie, chå'lyå, a town of Italy, province of Lecce, 23 miles W. of Brindisi. It has several churches, one of which is collegiate, and two annual fairs. Pop. 11,261.

Cehegin, thå-å-heen', a town of Spain, in the province of Murcia, 35 miles W. N. W. of the city of Murcia. It has manufactures of cloth, paper, soap, and pottery, and a trade in wine and fruits. It is partly built of marble quarried in the vicinity. Pop. 6186.

Ceil'ing [perhaps from the Fr. *ciel*, "heaven," referring to its vaulted shape, and possibly to the blue color and stars of gold common in mediæval ceilings], the covering or upper surface of a room. Ceilings among the ancients were usually flat, but crossed at right angles by beams, forming square *lacunæ* or panels, often ornamented with rich designs. Similar ceilings were common in Middle-Age structures, but the arched ceiling, barrel-vaulted, made of "cants" or a succession of flat surfaces, plastered, wainscoted, ribbed, plain, gilt, embossed, or otherwise ornamented, was a much more common form than in ancient Rome, where, however, arched ceilings were not unknown.

Cel'andine (*Chelidonium*), a genus of herbs of the order Papaveraceæ. The common celandine (*Chelidonium majus*) is a perennial, with yellow flowers in simple umbels, frequent in waste places in most parts of Europe and in the U. S. The root, stem, and leaves have a disagreeable smell, and are full of a yellow juice which is very acrid. Celandine in medicine is a drastic purgative, and in large doses an active poison; in small doses it is said to be useful in scrofulous diseases, disease of the glands, etc. The fresh juice, applied to warts, sometimes removes them.

Celano Lake. See Fucino.

Celastra'ceæ, a natural order of exogenous shrubs, having simple leaves and seeds furnished with arils. They have acrid properties, sometimes stimulant. Two genera of this order, *Celastrus* and *Euonymus* (spindle tree), are natives of the U. S. (See Euonymus.) The *Celastrus scandens*, called bittersweet or waxwork, has five stamens and alternate serrate leaves. The orange-colored pod and seeds, enclosed in a scarlet aril, are ornamental in autumn.

Cel'ebes [native, *Negree-Orang-Boogis*], a large island of the Malay Archipelago, is about 75 miles E. of Borneo, from which it is separated by Macassar Strait. It extends from lat. 1° 50′ N. to 5° 30′ S., and is mostly included between lon. 119° and 125° E. It has a very irregular form, being divided by deep bays into four peninsulas, one of which (called Menado) is about 400 miles long and very narrow. These peninsulas are formed by chains of mountains radiating from the central part of the island. The highest summit rises about 7000 feet above the level of the sea. Though the area of Celebes is only 72,647 square miles, it has a coast-line of nearly 2500 miles. The peninsula of Menado is bounded on the N. by the Sea of Celebes, and on the S. by the Bay of Tomini. The two southern peninsulas are separated by the large bay of Boni. The vegetation is luxuriant, and the island is partly covered with forests of oak, teak, palm, cedar, and upas trees, and partly by vast grassy champaigns which are used in common by the natives. The nutmeg, the clove, and the bamboo also flourish here. Among the minerals are gold, copper, tin, and iron. Coffee, rice, sugar, indigo, and manioc are cultivated. Chief town, Macassar. Celebes is partly occupied by a race called Boogis, who are strong and well built, revengeful in character, and fond of the chase. The tribe of Wadjus are an intelligent race who pursue commerce; the Arafuras inhabit the central regions, and are the aborigines of this archipelago. This island was visited by the Portuguese in 1512. The Dutch expelled the Portuguese in 1660, and planted there colonies, which they still possess. Pop. of the residency of Celebes in 1869, 341,000; and of the residency of Menado, 508,000.

Cel'ery, a plant of the order Umbelliferæ. The common celery (*Apium graveolens*) is found wild in most parts of Europe, in wet saline soils. The wild plant, called smallage, has a stem about two feet high, a slender root, a penetrating odor, and a bitterish acrid taste. By cultivation its taste becomes agreeably sweetish and aromatic, and either the leaf-stalks increase in thickness or the root-stalk assumes a form resembling that of the turnip. The latter variety is called *celeriac*. The stalks of the former variety, blanched, are used as a salad or to impart flavor to soups, etc. They contain sugar, mucilage, starch, and a substance resembling manna-sugar, which sometimes acts as a stimulant on the urino-genital organs. The blanching of the stalks is accomplished by drawing up earth to the plants, which are transplanted from the seed-bed into richly-manured trenches, and as they grow the trenches are filled, and the earth finally raised into ridges. Another species (*Apium australe*) grows abundantly in wet places about Cape Horn and in Staten Land. It is a large and luxuriant plant, and is described as wholesome, and nearly equal in its wild state to garden celery.

Céleste (Madame), a danseuse, born in Paris Aug. 6, 1814, became in childhood a pupil at the Royal Academy of Music. When fifteen years old she came to the U. S., and soon after married a Mr. Elliot. After her husband's death she went to England, where she met with great professional success. She subsequently passed several years in the U. S. (1834–37 and 1865–68), where she was received with the greatest enthusiasm. The greater part of her life has been passed in England, where she was successful as an actress and a theatrical manager.

Cel'estine [from the Lat. *cælum*, the "sky," in allusion to its color], a mineral which is essentially sulphate of strontia, with occasional mixture of sulphate of baryta and carbonate of lime in small proportions. Its color is often a beautiful indigo-blue. It resembles heavy spar, but is not quite equal to it in specific gravity. Fine specimens of crystallized celestine are found in Sicily. It is useful as a source of strontia. The finest crystals of celestine are found on Strontian Island, Lake Erie.

Cel'estine (or **Cœlesti'nus**) **I.,** Saint, a native of Rome, became pope in 422 A. D. He promoted the meeting of a council which deposed Nestorius. He died in 432, and was succeeded by Sixtus III.—Celestine II., Pope, originally Guido di Castello, was born in Tuscany. He succeeded Innocent II. in 1143, and died in 1144.—Celestine III. (Giacinto Orsini) was elected pope in 1191 as the successor of Clement III. He promoted the first Crusade, and excommunicated Leopold, duke of Austria, for detaining Richard Cœur de Lion in prison. He died in 1198, aged about ninety-two years.—Celestine IV. (Goffredo Castiglione) succeeded Pope Gregory IX. in Sept., 1241, but he died in October of the same year.—Celestine V., Saint (Pietro da Murrone or Morone), Pope, was born at Apulia in 1215. He was elected in 1294 as the successor of Nicholas IV. Before that event he had founded an order of hermits called Celestines (which see). He abdicated the office before the end of 1294, and was succeeded by Boniface VIII. Died in 1296.

Cel'estines, an order of hermits or monks founded in 1264 by Pietro da Murrone, who became Pope Celestine V. This order spread rapidly in France, Italy, and Germany between 1264 and 1400, but it is now nearly extinct. These monks followed the rule of Saint Benedict, and preferred a contemplative life.

Cel'ibacy [from the Lat. *cœlebs*, an "unmarried man"], the condition of a person never married; applied often to the voluntary life of abstinence from marriage assumed by religious devotees and the clergy of some churches, such as the Roman Catholic. Practised in ancient Rome in the case of the vestal virgins, in Judæa by the Essenes, and in the East by the priests of Booddhism, it is probable that it took its origin in the belief that the material body is the source of evil and the prison of the soul; while the passages of Saint Paul recommending the celibate condition as desirable during the stormy years which preceded the destruction of Jerusalem were used among early Christians as authority for advocating religious celibacy. Accordingly, virginity was held in peculiar honor in the early Church. But it is certain from the inscriptions found in the catacombs, from passages in the canon law, and from the positive testimony of history that celibacy was not enforced, even among the higher clergy. For centuries this matter was a subject of discussion in the councils. The Council of Tours (566) suspended from their functions for one year all secular priests and deacons with wives; but in 692 the Council of Constantinople allowed priests and deacons to marry once only; and in parts of the Greek Church their marriage is compulsory, though bishops and patriarchs are celibates. In the West, decretals were from time to time issued against the marriage of the clergy, leading to many struggles within the Church. These struggles culminated in the eleventh century, and the point was finally settled by the vigor and determination of Gregory VII. in 1074, positively forbidding the marriage of the clergy. The Council of Trent (1593) finally set at rest the controversy by imposing the same prohibition. There is, however, an exception made in favor of priests and deacons of the Eastern rites, who are allowed to retain their wives if married before ordination.

Celi'na, a post-village, capital of Mercer co., O., is on the N. W. bank of the Great Reservoir, near the source of the Wabash River, 115 miles W. N. W. of Columbus. It has seven manufactories, four churches, and two newspapers. Pop. 859.

C. Bidlack, Ed. Celina "Journal and Standard."

Celina, a post-village, capital of Jackson co., Tenn., on the Cumberland River, at the mouth of the Obey.

Cell [Lat. *cella*], a term applied in anatomy primarily to lacunæ in tissues of any kind, such as the air-vesicles in the lungs, the minute sacs in which fats are contained, and the hollows in cancellated bone. But of late the term especially designates the simplest of the histological elements of which animals and plants are built up, some of the lowest plants and animals (*Protococcus, Gregarina*) consisting of single cells and their contents, and many others consisting of a mere aggregation of cells. The animal or vegetable character of these low forms can only be determined by careful observation of their functions (see Animal), but it is observed that animal structures have more generally an interstitial substance lying between the constituent cells; while plants often have their cells packed together with no intermediate substance, or with only air between. This intermediate substance, when fluid, plastic, and nutritive, is called a *blastema;* when solid, it is a *matrix.*

Cells are propagated (1) by division of the parent cell; (2) by free formation within the parent cell, the contents assuming the cell-form, and ultimately escaping from the original cell—a process observed especially in the lower plants; and (3) by free formation in a fluid plasma, as observed chiefly in animal life.

The primary form of the cell is spherical or nearly so, but by mutual pressure and by other conditions (some of them unexplained by science) their shape is often modified, especially in the solid tissues; cells which are stellate, spindle-shaped, flat, conical, etc. being well known to every observer. The cell consists usually of a membranous "cell-wall" enclosing "cell-contents," which are fluid, granular, or solid. The diameter of animal cells varies (without noticing exceptional cases) between $\frac{1}{1000}$th and $\frac{1}{3000}$th of an inch. Vegetable cells are sometimes much smaller and often much larger than animal cells (from $\frac{1}{10}$th to $\frac{1}{5000}$th of an inch). The vegetable cell-wall is of cellulose, a non-nitrogenous substance; the animal cell is of some nitrogenized protein compound. The vegetable cell-wall is lined by a peculiar layer called the primordial utricle.

The "cell-contents" usually contain a "nucleus," which is regarded by many theorists as the essential part of the cell. Thus, Schultze says: "The cell is only the protoplasm surrounding a nucleus;" but on the other hand it has been demonstrated that the nucleus is not always present in the cell, and it is believed by some that it is not an essential element. Sometimes there are several nuclei in a cell. Each nucleus is a hollow spheroid, often containing one or more round "nucleoli," but the nucleolus is by no means a constant element. Animal cells may contain water, salts, pigments, various secretion or excretion compounds, oils, fats, and granules of various kinds, etc. Vegetable cells may contain salts, water, oils, resin, starch, sugar; and all these substances (except excretive matters, water, and the salts) are produced, it is believed, in great part, through the agency of cells. It is known that a great part of the functional activity of organized bodies is carried on by means of cells, such as excretion, secretion, absorption, etc. The ovum, the spermatozoon, the pollen grain, is but a cell. Many animal cells are ciliated, or provided with a vibratile tail or cilium, which assists by its motion in some most important functions. Cells are also in many cases so transformed and metamorphosed that it is difficult to recognize them at all as cells; for example, the muscle-fibres, the tubules of dentine in the teeth, wood-fibre, flax and other vegetable fibre, hollow tubes and vessels, etc., are held to be transformed cells; and in some such cases the nucleus is yet visible. It is generally believed that the cell is the ultimate structural element of all organized tissues, though this is denied by some recent biologists. The red blood-corpuscle is at present not generally regarded as a true cell, but the white corpuscle is undoubtedly so. It is regarded as identical with the tissue-cell, the pus-cell, the mucus-cell, and the colostrum

corpuscle; and the whole group have been named "leucocytes." (See KÖLLIKER, "Human Histology:" LEYDIG, "Lehrbuch der Histologie:" VIRCHOW, "Cellular Pathology;" TYSON, "Cell Doctrine:" BURNETT, "The Cell:" and the works of VON MOHL, BRÜCKE, UNGER, REMAK, and HAECKEL.) CHAS. W. GREENE.

Cel'le, or **Zelle,** a town of Germany, in Hanover, is on a sandy plain on the river Aller at the head of navigation, and on the Hanover and Brunswick Railway, 22 miles N. E. of Hanover. Here is a noted government breeding stud. It has an old castle, a gymnasium, and a library of 60,000 volumes; also manufactures of wax candles, printers' ink, thread and yarn, pianofortes, tobacco, matches, etc. Pop. in 1871, 16,147.

Celli'ni (BENVENUTO), a celebrated Italian artist, born at Florence in 1500. He was a skilful engraver, goldworker, and sculptor. He was in Rome in 1527 when it was attacked by the army of Constable Bourbon, and according to his own statement he killed that commander on that occasion. He was a man of passionate and quarrelsome temper, and much inclined to egotism. Among his patrons were Pope Clement VII., Francis I. of France, and Cosimo de' Medici. He worked in Rome, Paris, and Florence, produced, besides other works, a bronze of "Perseus with the head of Medusa." His interesting autobiography is translated into German by Goethe and into English by Roscoe (1822). The first complete edition was issued by Tassi, Florence, in 1829. Died Feb. 25, 1571.

Cel'lular Tis'sue, more properly **Are'olar Tis'sue,** in animals, is the soft, elastic, filamentous substance which underlies the skin and the serous and mucous membranes, and which fills the spaces between muscles and between their fibres, and indeed surrounds almost all important organs, such as nerves, glands, blood-vessels, etc., throughout the body. It normally contains a small quantity of serous fluid, which in certain diseased conditions becomes increased, constituting anasarca, a form of dropsy.—Cellular tissue in botany is simply non-vascular substance composed entirely of untransformed cells. It forms the soft substance of plants, and is called parenchyma.

Cel'lulose ($C_{18}H_{30}O_{15}$) is the term applied to the substance which forms the mass of the cell-membranes of plants. Cellulose forms the framework or skeleton of all plants; next to water it is the most abundant substance in the vegetable kingdom. During the early stages of the development of the plant the cell-walls consist entirely of cellulose, but as the plant grows the walls become incrusted with resins, coloring-matters, etc. Some tissues consist almost entirely of cellulose, as the pith of the Chinese rice-paper plant (the *Æschynomene paludosa*, or perhaps the *Aralia papyrifera*) and the vegetable ivory. Cotton, linen, hemp, and unsized paper consist of almost pure cellulose.

The following percentages of cellulose are found in some of the most common vegetable matters in the air-dry state:

	Per cent.		Per cent.
Potato tubers	1.1	Red clover hay	34.
Wheat kernels	3.0	Timothy hay	23.
Maize kernels	5.5	Oat straw	40.
Oat kernels	10.3	Wheat straw	48.
Buckwheat kernels	15.0	Rye straw	54.

Cellulose is said to exist in the animal kingdom in the mantle of Mollusca (Tunicata) and the integuments of insects and Crustacea. It is more probable, however, that these tissues consist of the nitrogenized body CHITIN (which see). Virchow (*Compt. Rend.*, xxxvi., 492, 860) found cellulose in degenerated human spleen and in the brain. De Luca (*Compt. Rend.*, lii., 102, lvii., 43) found cellulose in the skin of the silkworm and of the serpent.

Preparation.—Owing to the insolubility of cellulose in water, alcohol, ether, dilute alkalies, and dilute acids, it is generally prepared by subjecting vegetable tissues to the successive action of these agents, by which all foreign substances—sugar, starch, gum, resins, oils, fats, etc.—are removed. It may then be bleached by the action of chlorine water. Thus prepared, it retains more or less perfectly the structure from which it was obtained. Skeleton leaves, which are made up into the beautiful "phantom bouquets," consist of nearly pure cellulose. They are prepared either (1) by boiling the leaves in a dilute solution of caustic soda till the epidermis and parenchyma separate readily, removing them to a vessel of cold water, and carefully rubbing them with the fingers, and then bleaching by immersion in a solution of hypochlorite of lime, to which a little acid has been added; or (2) by adding to a pint of nitric acid, of a specific gravity of 1.1, an ounce of chlorate of potassa in fine powder, and suspending the leaves in the mixture for ten to twenty days. They are then thoroughly washed, and dried between sheets of blotting-paper. In the conversion of rags, straw, wood, etc. into paper the cellulose is rendered nearly pure by treatment with caustic soda, hypochlorite of lime, and sulphuric acid. Swedish filter-paper is almost chemically pure cellulose. Common paper receives an addition of a considerable proportion of kaolin (china clay), and is sized on the surface. (See PAPER.) In bleaching the textile fibres cotton, flax, and hemp the process has for its object the purification of the fibrous cellulose by the removal of resinous and coloring matters. (See BLEACHING.)

Composition.—Cellulose usually contains about 10 per cent. of moisture, which may be removed by drying. It then contains, in 100 parts, carbon 44.44, hydrogen 6.17, oxygen 49.39. Its composition is represented by the formula $C_{18}H_{30}O_{15}$. This is also the composition of starch, a body possessing totally different properties. Sugar and gum are nearly allied to cellulose in composition. All these bodies are called *carbohydrates*, because they consist of carbon in combination with hydrogen and oxygen in the proportions in which they exist in water, H_2O.

Properties.—When pure, cellulose is fibrous or spongy, white, and translucent, and often silky. Under the microscope the fibrous varieties appear like spun glass. It is tough and elastic. Its specific gravity is 1.5. When pure it is unalterable in the air, but when associated with albuminous and other easily alterable bodies, it gradually decomposes (decays) in moist air, undergoing a slow combustion, and changing to a yellow or brown friable substance called touchwood, and finally to humus. (See DECAY, PUTREFACTION, PRESERVATION OF TIMBER.) Cellulose is insoluble in water, alcohol, ether, and oils—both volatile and fixed. It is not sensibly affected by boiling in water, unless it has been derived from a very soft or imperfectly developed portion of a plant, when it becomes pulpy; and in the case of cellulose from Iceland moss, which is easily disintegrated and finally converted into soluble dextrine. Mulder observed that on boiling Swedish filter-paper with water under pressure at 400° F. a little glucose was produced.

Solution of Cellulose.—An ammoniacal solution of oxide of copper was discovered by Schweitzer to dissolve cellulose without changing its character. The solvent is prepared by dissolving hydrated oxide of copper in ammonia, or partially immersing copper turnings in ammonia. The cellulose is precipitated from the solution in amorphous flakes by boiling, diluting, or the addition of acids in excess. By dipping paper or cotton or linen fabrics in the copper ammonia solution, and then passing them between rolls, they are rendered waterproof. Several layers of such sheets or cloths pressed together form an artificial wood of great strength. A plastic mass can be prepared of this material suitable for the manufacture of water-pipes, gas-pipes, hats, clothing, boats, etc.

Action of Acids, etc.—Cold dilute acids and alkalies have little action on cellulose. Long boiling with dilute hydrochloric or sulphuric acid converts cellulose into glucose. In concentrated hydrochloric and sulphuric acids it dissolves, exhibiting different products according to the temperature and the duration of the treatment: (1) disaggregated, dissolved cellulose, precipitated by dilution; (2) an amyloid body; (3) dextrine, which differs from starch dextrine in having little action on polarized light. Strong boiling hydrochloric acid converts it into a fine powder, without change of composition. Boiled for a short time with dilute sulphuric acid, it is converted into a pulpy mass, still exhibiting the composition of cellulose, and not sensibly soluble in water. By dipping unsized paper for a few seconds into a mixture of 2 volumes of sulphuric acid and 1 volume of water, and then thoroughly washing with water and dilute ammonia, it is converted into "parchment-paper," a substance of the appearance and properties of animal parchment. Neumann proposes to make cotton and linen fabrics stronger, more compact, and waterproof by subjecting them to the above treatment and pressing between rolls. Parchment-paper is an excellent material for the septa used in dialysis. (See ENDOSMOSIS.) If cellulose is ground with concentrated sulphuric acid, without allowing the mixture to become heated, it forms a pasty mass, which when largely diluted deposits an amorphous body which is blued by iodine, and is hence called *amyloid*. Longer digestion with sulphuric acid converts cellulose into dextrine, and, on diluting with water and boiling, into glucose. Strong nitric acid, or a mixture of nitric and sulphuric acids, or of nitre and sulphuric acid, converts cellulose into nitro-substitution products, such as GUN COTTON (which see). Moist chlorine gas and warm solutions of hypochlorites rapidly cause the oxidation of cellulose. For this reason care must be observed in bleaching paper-stock and fabrics by chlorine. (See BLEACHING and ANTICHLORE.)

Cellulose in its more compact forms is not rendered blue by iodine until it has been disintegrated by sulphuric acid or caustic alkalies. Some lichens and algæ—Iceland moss,

for example—give the blue color after being boiled with water. Caustic alkalies disintegrate cellulose very slowly, except when heated under pressure to about 400° F., when hydrogen is evolved, and methylic alcohol (wood-naphtha), formate, acetate, propionate, and carbonate of potassa are formed. No carbon is set free. By heating cellulose with a mixture of potassic and sodic hydrates, at a temperature of 400° to 500° F., for several hours, it is converted into OXALIC ACID (which see). Cellulose is immediately blackened by fluoride of boron, being carbonized. Heated in close vessels, cellulose, in all its forms, undergoes destructive distillation, yielding charcoal, which remains behind, and combustible gases, tar, and a mixture of water, acetic acid, and methylic alcohol, all of which distil over. (See ACETIC ACID, CHARCOAL, and TAR.)

Digestibility of Cellulose.—Although wood and straw are not easily digestible by most animals, the cellulose of young and succulent stems, leaves, and fruits is digested to a large extent; and therefore cellulose, which forms a large proportion of the food of herbivorous animals, contributes directly to their nutrition. *Fungin* from fungi, and *medullin* from the pith of various trees, are mere modifications of cellulose. *Hordein* from barley is a mixture of cellulose with starch and a nitrogenized body. C. F. CHANDLER.

Cel'sius (ANDERS), a Swedish mathematician, born Nov. 27, 1701, was the nephew of Olof Celsius, professor of theology at Upsala and author of "Hierobotanicon." His father was professor of mathematics at Upsala, and at the same university Anders became professor of astronomy in 1730—a position which he left in 1732 in order to pursue the study of astronomy where he could have the advantages of an observatory and instruments. He remained some time at Nuremberg with Doppelmayer, in which city he published "Observationes luminis borealis." He then visited Rome, determining with greater exactitude the meridian drawn by Bianchini and Maraldi. Here he made observations upon the intensity of light, and established the true size of the ancient Roman lineal measures. In 1734 he went to Paris, and with Maupertuis went to Lapland to determine the measure of a degree of latitude. He afterwards returned to Upsala, wrote "De observationibus pro figura telluris determinanda in Gallia" (1738), and worked out a theory regarding Jupiter's satellites. At his instance the observatory at Upsala was constructed. The centigrade division of the thermometer, called sometimes the Celsius scale, which divides the difference of temperature between freezing and boiling water into one hundred equal parts, was first proposed by Celsius. Died April 25, 1744.

Cel'sus, a celebrated writer who lived about 150–170 A. D., and is supposed by some to have been an Epicurean philosopher, mentioned by Lucian as his friend. He may, however, not improbably have been another person of the same name. He was the reputed author of a work against Christianity and Judaism entitled Λόγος ἀληθής, a "True Discourse," which is not extant, but some fragments of it have been preserved by Origen, who to confute it wrote a book, "Contra Celsum." These fragments indicate ingenuity and a talent for sophistry. But his objections are not generally regarded by Christian students as very formidable, though he has brought forward some acknowledged difficulties. The effect of his argument is marred by his sophistries, and especially by his calumnious spirit.

Celsus (AURELIUS CORNELIUS), an eminent Latin medical writer who is supposed to have lived at Rome in the reign of Augustus. The events of his life are mostly unknown, except that he wrote works on various subjects, including philosophy and rhetoric. These are all lost except his excellent work on medicine, "De Medicina," in eight books, the style of which is remarkably elegant and pure. He adopted most of the medical doctrines of Hippocrates. (See F. VALORI, "Dissertatio de A. C. Celso," 1835.)

Celt [Welsh, *celt*, a "flint"], the name given by archæologists of Europe to certain instruments of stone or bronze which were used by pre-historic peoples. Similar stone tools are found in the U. S., but are not often called "celts." They are generally of a kind of chisel shape, but vary greatly in this respect, some being extremely rude and simple; others, especially the bronze ones, are sometimes ornamented with some taste with cut lines. In length they vary from two inches to two feet. They often had handles, and seem to have served for axes and domestic utensils, as well as for weapons of war and the chase.

Celtibe'ri, or Celtibe'rians, an ancient and powerful people who inhabited the northern or north-eastern part of Spain. They were supposed to have been a mixture of indigenous Iberians with Celtic people who came from Gaul. Their country was called *Celtiberia* (Gr. Κελτιβηρία). They were a warlike nation, and were subdued by Hannibal with great difficulty. In the Second Punic war they fought for the Carthaginians. They made a brave and long resistance to the Romans, who conquered them about 143–133 B. C., and they renewed the war under Sertorius. Among their chief towns were Segobriga and Numantia. Celtiberia proper comprised the south-western part of Aragon, Cuenca, Soria, and the greater part of Burgos, but the name was sometimes applied by the Romans to a larger region.

Celts, or **Kelts** [Lat. *Celtæ*; Gr. Κελταί], one of the great divisions of the Indo-European family of mankind, itself divided into at least two groups—the Western, Erse, or Gaelic Celts (now marked by the use of the Irish, Gaelic, and Manx languages), and the Cymric or Kymric Celts, to whom belong the Welsh and Armorican (extant) and the Cornish (extinct) languages. But the Celtic blood is much more widely diffused than those relics of their language would seem to indicate. Certain critics hold that the Cimbri and Cimmerii were Cymric Celts. Almost all France (Gallia) was inhabited by Celts. The Belgæ are thought to have been partially Cymric, as the ancient Britons undoubtedly were. The name *Celtiberi* indicates that in Spain the Celtic was probably long ago mixed with the Basque or Iberian blood. Northern Italy was long so entirely Celtic as to be called Cisalpine Gaul. The Celts under Brennus invaded Greece. In Asia Minor they settled and gave name to Galatia. In Germany the Boii gave name to Bohemia and Bavaria. In Great Britain the Cymri long had sway in Cornwall, Cumberland, and Strathclyde. It is probable that the present Cymric element of North-western France, though generally traced to a supposed Welsh immigration, is largely of direct Gaulish descent. Many of the Latin and Germanic races have a strong infusion of Celtic blood. The relationship between the two branches of the Celtic race seems never to have been intimate, and is not very clearly determined. The two groups of languages are distinct, having some common roots, with but little else in common. The languages of each group are, however, possessed of strong family likeness to the others of their own group.

The ancient Celtic religion was a rude polytheism, the mythology and doctrines of which are now for the most part unknown. The priestly caste of Druids were lawgivers, poets, and prophets as well. Human sacrifices were common. The common people were grossly superstitious and ignorant. Weakened by the workings of their rude social system of clans and septs, oppressed by the exactions of their priesthood, and harassed by the constant inroads of Rome and the Germanic tribes, the Celts, after the dawn of history, are almost constantly seen to be the losing race. But they yielded nothing except to force, and among all the races none were ever more distinguished for valor. Among their other characteristics may be mentioned profound religious feeling and acute sensibilities.

The Celtic literature is of very ancient origin, all the old Celts having a literary class called "bards," sometimes of noble and sometimes of sacerdotal rank. The ancient Irish wrote in a rude alphabet called the Ogham. The people of Gaul have left comparatively few inscriptions, and these are often much Latinized. Some have apparently Gaelic roots, but Cymric roots appear in the names of places. The chief existing Celtic literature consists of the hymns, martyrologies, annals, and laws of Ireland (see GAELIC LANGUAGE and IRELAND); the Welsh poems and laws, and many historical and theological works, mostly of a somewhat later date than the Irish; with the Mabinogion, a collection of tales. There are also a few extant Cornish religious dramas. The Manx literature is not extensive, and is quite recent. The number of people speaking the Irish, Manx, and Gaelic languages is rapidly diminishing, while the number of persons of Celtic blood seems to be increasing. The English language is fast displacing the others in Ireland, Scotland, and the Isle of Man. In Wales, however, the use of the Cymric language is probably much more extensive now than for many centuries past. Intense national feeling and systematic, persistent, and widely sustained effort have caused the old language to maintain its ground. (See ZEUSS, "Grammatica Celtica," revised by Ebel; M. A. PICTET, "De l'affinité des langues celtiques avec le Sanscrit" (1837), and his "Les origines indo-européens" (1859 *seq.*).)

Cem'bra Pine, called also **Swiss Stone Pine,** the *Pinus Cembra*, a noble and stately forest tree of Asia and Europe, cultivated to some extent in parks and arboretums in the U. S. It is prized for its seeds, which, though hard to extract from the cone, are very agreeable, and are used for dessert, and with those of *Pinus Pinea* (the stone pine of Southern Europe and Barbary) are sold under the name of pine-nuts. The Cembra pine yields also a thin fragrant turpentine, called Riga balsam, Carpathian balsam, or balsam of Lebanon. It is caught in bottles as it flows from the wounded twigs, and is used in medicine.

Cem'ents [from the Lat. *cæmentum*, literally, a "cutting" or "chip;" a name applied both to building-stone and to the fragments of marble used in making mortar], a term applied to fluid, semi-fluid, or plastic substances which are capable of uniting solid bodies together when interposed between the surfaces, and afterwards solidifying. There are many kinds of cements, either animal, vegetable, or mineral substances, used separately or in combination with each other.

Glue is an animal cement in common use. It is a hard, brittle, brownish gelatine, obtained by boiling to a soft jelly the skins, hoofs, etc. of animals. When heated gently with water it becomes viscid, and is employed for uniting solid bodies, mostly wood. In drying it becomes very tough and hard, but is easily softened again by water. Marine glue is formed by dissolving 1 pound of india-rubber in 5 gallons of coal-naphtha, and adding to this solution an equal weight of shellac. The mixture is then placed over a gentle fire, and thoroughly incorporated by stirring. This glue is insoluble in water, and is very tenacious and adhesive. A cement for iron pipe, etc. is made as follows: mix together in a mortar 2 ounces of muriate of ammonia in powder, 1 ounce of flowers of sulphur, and 16 ounces of cast-iron filings, and keep the mixture dry for use. When the cement is to be used, take 1 part of this mixture, 20 parts of clear iron borings or filings, pound them together in a mortar, mix them with water to a proper consistency, and apply the compound between the joints. A good cement for resisting moisture is made by mixing 8 parts of melted glue, of the consistency used by joiners, with 4 parts of linseed oil, boiled into varnish with litharge. This cement hardens in forty-five to fifty hours, and renders the joints of wooden cisterns and casks air and water tight. A good cement for coating the outside of buildings consists of linseed oil, rendered dry by boiling with litharge, and mixed with porcelain clay or well-dried pipeclay in fine powder, to give the consistency of stiff mortar. Oil of turpentine added in small quantity to thin the cement aids its cohesion to stone, brick, or wood. A cement designed to improve the composition of artificial stone, stucco, etc. is made by dissolving 1 pound of gum shellac in 3 to 4 ounces of concentrated alkali in aqueous solution. This mixture is then diluted with water, and used for mixing up the materials—hydraulic cement, lime, and sand—of which the artificial stone or stucco is made. The water required to mix one cubic foot of the materials should contain 1 to 2 ounces of gum shellac. Shellac dissolved in a concentrated solution of borax gives a good cement for uniting broken stone. Singer's cement for joints between brass and glass is made by melting together 5 pounds of rosin, 1 pound of beeswax, 1 pound of red ochre, and 2 table-spoonfuls of gypsum. Ure recommends for cementing voltaic plates into wooden troughs, and for similar uses, a cement made of 6 pounds of rosin, 1 pound of red ochre, half a pound of gypsum, and a quarter of a pound of linseed oil; the ochre and gypsum to be calcined beforehand, and added to the other ingredients while in fusion. French plumbers employ for the joints of glazed pottery pipes, used for distributing water, a cold cement made of quicklime, cheese, milk, and the white of eggs, or a hot cement made by melting rosin, beeswax, and lime together. There are a great variety of cements composed of vegetable, mineral, and animal substances mixed, which it is not deemed necessary to mention.

There is a class of cements of which plaster of Paris or gypsum is the basis, the hardening of which is due to the union of the plaster with water, and not to the formation of silicates, as in the hydraulic cements hereinafter described. Plaster of Paris, however, never attains sufficient hardness and tenacity to be used with water alone. It may be advantageously combined with alum. Keene's cement is made by mixing powdered gypsum with an aqueous solution of alum, then heating the mixture until the water of combination is driven off. It is then finely ground in a suitable mill, and slaked with a solution of 1 part of alum to 12 or 13 parts of water, by weight. Martin's cement differs from Keene's in adding to the original mixture a portion of carbonate of soda or of potassa. It is burnt with a higher degree of heat. In Parian cement borax is used instead of the carbonate of soda or of potassa.

Cement—Common Lime, Hydraulic Lime, and Hydraulic Cement.—Considered as materials for use in the builder's art, the products derived from the calcination of pure and impure limestones are classified into common or fat lime, hydraulic lime, and hydraulic cement. Common lime is sometimes called air lime, because a paste or mortar made from it requires exposure to the air to enable it to "set" or harden. The hydraulic limes and cements are also called water limes and water cements, from their property of hardening under water.

Common Lime.—The limestones which furnish the common lime of commerce are seldom if ever pure, but usually contain, besides the carbonate of lime, from 3 per cent. to 10 per cent. of impurities, such as silica, alumina, magnesia, oxide of iron, oxide of manganese, and traces of the alkalies. Lime, common lime, quicklime, or caustic lime (synonymous terms) is a protoxide of calcium, and is produced when marble or any other variety of pure or nearly pure carbonate of lime is calcined with a heat of sufficient intensity and duration to expel the carbonic acid. It has a specific gravity of 2.3, is amorphous, highly caustic, has a great avidity for water, and when brought into contact with it will rapidly absorb nearly a quarter of its weight of that substance, accompanied and followed by a great elevation of temperature, the evolution of hot and slightly caustic vapor, the bursting of the lime into pieces, and finally its reduction to a powder, of which the volume is from two and a half to three and a half times that of the original lime. In this condition the lime is said to be slaked, and is ready for use in making mortar. The purer the limestone the larger is its *growth* or increase of volume in slaking. The paste of common lime is unctuous and impalpable to the sight and touch; hence these limes are sometimes called *fat* or *rich* limes, as distinguished from others known as *poor* or *meagre* limes. These latter usually contain more or less silica in the form of sand, and a greater proportion of other impurities than the fat limes, and in slaking exhibit a more moderate elevation of temperature, evolve less hot vapor, are seldom reduced to an impalpable, homogeneous powder, yield thin paste, and are characterized by less *growth* of volume. They are less valuable for mortar than the fat limes, but have an extensive application as a fertilizer. When used for building purposes they should, if practicable, be reduced to powder by grinding, in order to remove all danger of subsequent slaking.

Water dissolves, according to Sir H. Davy, about $\frac{1}{400}$ of its weight of lime, or, according to Thomson, $\frac{1}{778}$, while Dalton states it to be, at 60° F., $\frac{1}{778}$, and at 212°, $\frac{1}{1270}$. The solutions commonly called lime-water are valuable reagents and antacids. Lime being more soluble in cold than in hot water, its solution becomes turbid when boiled. A similar result is produced by breathing into a solution through a tube, owing to the carbonate of lime formed by respiration; which, however, is dissolved by an excess of carbonic acid gas. A paste of the slaked lime is therefore a mixture of the hydrate of lime and lime-water.

Lime may be distinguished by its dilute solution giving a white precipitate of oxalate of lime when a solution of oxalic acid is added to it, which is not redissolved by an excess of oxalic acid, and by not yielding a precipitate with sulphuric acid and sulphate of soda.

The purest minerals of the calcareous class are the rhombohedral prisms of calcareous spar, the transparent double refracting Iceland spar, and white or statuary marble. They are entirely dissolved in dilute hydrochloric acid, with a brisk effervescence, due to the escape of carbonic acid, and contain, according to an analysis of a specimen of white marble by Gen. Treussart, about 33 per cent. of carbonic acid, 64 per cent. of lime, and 3 per cent. of water.

Common lime, when mixed into a paste with water, or when slaked with sufficient water to produce a paste, may be kept for an indefinite time in that condition without deterioration, if protected from contact with the air so that it will not dry up. It is customary to keep the lime-paste in casks, or in wide, shallow boxes in which it was slaked, or heaped up on the ground, covered over with the sand to be subsequently incorporated with it in making mortar. It is convenient, for some purposes, to keep the slaked lime on hand in a state of powder, which may be done in casks under cover, or in bulk, in a room set apart for that purpose. Most common limes contain impurities which prevent a thorough, uniform, and prompt slaking of the entire mass, and hence the necessity of slaking some days before the lime is to be used, to avoid all danger to the masonry by subsequent enlargement of volume and change of condition.

A paste or mortar of common lime will not harden under water, or in continuously damp places excluded from contact with the air. It will slowly harden in the air, from the surface towards the interior, by desiccation and the gradual absorption of carbonic acid gas, by which a subcarbonate with an excess of hydrated base is formed, or $CaO.CO_2 + CaO.HO$.

The pastes of fat lime shrink, in hardening, to such a degree that they cannot be employed as mortar without a large dose of sand, and are unsuitable for masonry constructions under water, or in soils that are constantly wet. In other situations they have a very extensive application, possessing, as they do, a great advantage in economy over the hydraulic limes and cements, on account of the large augmentation of their volume in slaking, their extensive distribution over the surface of the globe, and the simplicity

attending their manufacture. For masonry constructions of importance, and particularly upon our public works, a mortar or a concrete containing common lime only as the cementing medium is seldom used at the present day. Hydraulic lime or hydraulic cement is usually added, to a greater or less extent, in order to hasten the induration and secure greater ultimate strength and hardness.

The Hydraulic Property.—A lime is said to possess *hydraulic* properties when, after being calcined, reduced to powder, and made into a paste with water, it will harden or set under water, or in damp places excluded from contact with the atmospheric air. If the calcined stone can be slaked to powder in the presence of water, it is customary to call it *hydraulic lime*. The *cements* possess the hydraulic property to a greater degree than the hydraulic limes, and are reduced to powder by grinding. In both initial and ultimate strength and hardness, the hydraulic mixtures are greatly superior to those of common lime, even when the latter are employed under the most advantageous circumstances, but their maximum strength is not reached under a period of several years. The best cements, when mixed to a paste without sand, attain during the first month, or month and a half, fully one-half their greatest ultimate strength and hardness. After the first two years, the increase in strength and hardness proceeds very slowly, and at the end of three years the monthly increment requires the use of delicate instruments for its measurement. This principle, of slow and gradually diminishing induration, is characteristic of all hydraulic mortars, whether derived from the cements or the hydraulic limes, either natural or artificial. The most *active* hydraulic limes or cements, or those which set the most quickly, are not necessarily those which attain the greatest ultimate strength and hardness. The latter are characterized as possessing the greatest hydraulic *energy*.

The *argillaceous hydraulic limes* of commerce are generally derived from limestones containing from 10 to 20 per cent. of clay, homogeneously mixed with carbonate of lime as the principal ingredient. Traces of the alkalies, and a small percentage of the oxides of iron and carbonate of magnesia, are also present in most cases. The clay ingredient usually contains from 1½ to 2 of silica to 1 of alumina. During the burning, which is conducted at a heat just sufficient to expel the carbonic acid, all the silica and alumina is neutralized by entering into combination with a portion of the lime, forming both the silicate of lime and the aluminate of lime, leaving in the burnt product an excess of quick or caustic lime, which induces slaking, and becomes hydrate of lime when brought into contact with water. As this lime is burnt at a low heat, the double silicate of lime and alumina, which is formed only at a high heat, is not produced. The silicate of lime is first formed, and the alumina, reacting upon the quicklime as an acid, produces aluminate of lime. When slaked by sprinkling, the quicklime alone is hydrated.

Argillaceous hydraulic lime is therefore composed of—

Anhydrous silicate of lime.....	$SiO_3.3CaO$, or	{ Silica.... 23 Lime..... 43
Anhydrous aluminate of lime..	$Al_2O_3.3CaO$, or	{ Alumina 17 Lime..... 28
And hydrate of lime.....	$CaO.HO$, or	{ Lime..... 34 Water... 11

When argillaceous hydraulic lime is mixed into a paste with water or made into mortar, the anhydrous silicate and aluminate of lime form hydro-silicates and hydro-aluminates of lime by combining with six equivalents of water, and subsequently undergo a species of crystallization technically called *setting*. This setting will ensue under water, and constitutes the hydraulic property.

If, in the general case, more than 20 per cent. of clay be present in a homogeneous limestone, a larger proportion of the lime will combine with silica or alumina during the burning, leaving insufficient quicklime present to induce slaking; and such stone may be expected to furnish a hydraulic cement. Some heterogeneous limestones, however, containing as high as 30 to 35 per cent. of clay, will slake more or less thoroughly after burning, for the reason that the ingredients are not in sufficiently close contact to combine in the kiln in the formation of the hydraulic elements. In such cases the burnt product contains an excess of lime, of silica, and of alumina, and, after slaking as much as possible, there still remains a lumpy residue.

Limes containing 10 per cent. of clay are *moderately hydraulic*. If made into a paste and immersed in water in small cakes, they will harden so as to resist crushing between the thumb and finger in from twelve to fifteen days. The *eminently hydraulic limes*, derived from homogeneous stones containing from 18 to 20 per cent. of clay, will harden under water in from twelve to twenty hours. If the stone contains more clay than this, and still yields hydraulic lime by slaking, the excess of clay does not combine with lime, and therefore confers no additional hydraulic energy. On the contrary, it impairs the strength and value of the lime for building purposes.

In consequence of their peculiar properties, the hydraulic limes cannot be kept on hand in a state of paste, like common lime. They are preserved in casks or sacks in the condition of powder, and in using them for mortar or concrete, especially those that are eminently hydraulic, it is not well to mix more than one day's supply in advance. The lime and the sand may be mixed together dry, and kept on hand a long time in that condition if protected from the weather, but the water should not be added until a few hours before the material is to be used, whether for mortar or concrete.

The method usually pursued in manufacturing hydraulic limes is as follows: The stone, after being quarried and broken up into pieces not exceeding generally twelve or fifteen pounds in weight, is burnt in any suitable kiln at a heat just sufficient to expel the carbonic acid, and then, after being drawn from the kiln and while still warm, is sprinkled with from 15 to 20 per cent. of its own weight of water. The slaking soon begins, and the stone falls to pieces, some of it in fine powder, and the rest in unslaked lumps of various sizes. The mass is then thrown together in large heaps, where it remains undisturbed for six or eight days, in order that the slaking may be completed by the steam evolved. It is then screened through fine wire-cloth to get rid of the unslaked lumps, packed in sacks or barrels, and sent to market.

With some varieties of argillaceous limestones, the lumpy, unslaked residue, which does not pass through the screen, is natural hydraulic cement, in which case it is reduced to powder by grinding, and is either incorporated with the lime in order to improve its quality, or is marketed separately as hydraulic cement. The lumpy portion either contains too much clay, or has been burnt at too high or too low a heat, to be susceptible of thorough slaking by exposure to the air or sprinkling with water; and its quantity will be great in proportion to the amount of clay in the stone, or the extent to which the heat in burning has been improperly regulated. In some localities the residue is thrown away as dangerous or worthless, while in others it is customary to grind it up separately and mix it with the powder obtained by slaking.

When the burning has taken place at a heat suitable for common lime, the residue owes its origin to the presence of too much clay, and may be, for all useful purposes, inert, or it may be a light, quick-setting cement like the Roman. If the former, it should be rejected; if the latter, its incorporation with the lime-powder will augment its hydraulic activity and energy. When the residue is due to insufficient burning, it may cause damage by subsequent slaking in the masonry, and should be rejected. When the burning has been conducted at a high heat, the residue may be slow-setting Portland cement, or it may be clinker, partially or wholly vitrified, and inert. For these reasons the utilization of the unslaked lumps, arising, from whatever cause, in manufacturing hydraulic limes, requires watchful care, in order that the introduction of ingredients that are either worthless or dangerous may be avoided.

It is not known that any deposits of argillaceous limestones capable of furnishing good hydraulic lime exist in the U. S. It is manufactured in several localities in France, notably at Seilley, about 70 miles from Paris. The Seilley lime has recently been brought to the U. S. in small quantities for use in making artificial stone. When fresh it weighs about fifty pounds to the struck U. S. bushel, loosely measured. If made into a stiff paste, it will set in the air in ten or twelve hours, and will resist crushing between the thumb and finger in from twenty to twenty-four hours. It is not active enough for laying masonry under water, but will harden under water after the initial set has taken place in the open air.

The *siliceous hydraulic limes* are generally derived from siliceous limestones containing from 12 to 18 per cent. of silica, less than 90 per cent. of carbonate of lime, with a small proportion of alumina and oxide of iron. The process followed in their manufacture is similar, in all essential respects, to that described for producing argillaceous hydraulic lime. They owe their hydraulic property, when mixed to a paste with water, to the crystallizing energy of the anhydrous silicate of lime, formed during the calcination: $SiO_3.3CaO$ = { Silica. 23. / Lime, 43. } The best type of siliceous hydraulic lime is derived from the quarries at Teil on the river Rhone, department of Ardèche, France. It is known as hydraulic lime of Teil. The raw stone contains from 11 to 15 per cent. of silica, from 1 to 2 per cent. of alumina, from 80 to 84 per cent. of carbonate of lime, and a trace of oxide of iron. When newly made this lime weighs about fifty-six pounds to the struck U. S. bushel,

loosely measured, but if exposed to the air it absorbs moisture so that its weight is considerably augmented. In initial hydraulic energy, the Teil lime does not materially differ from the lime of Seilley, but in ultimate strength and hardness it is believed to be superior to it. Analyses of the Teil hydraulic lime after burning, by Professor Rivot, gave the following composition:

Lime	78.29		73.60	
Silica	18.20	21.70	17.20	20.50
Alumina	1.80		1.70	
Quartz sand	1.70		1.60	
Oxide of iron	traces		traces.	
Water and carbonic acid	—		5.00	
	99.60		99.10	

The elements of hydraulic energy in this lime may be stated to be 60 per cent. of the whole immediately after calcination, as indicated below, neglecting a small quantity of alumina and oxide of iron:

Silicate of lime... 66	Silica	23	$SiO_3.3CaO$.
	Combined lime	43	
Free lime	34	34	CaO.
	100	100	

Artificial hydraulic lime can be manufactured by mixing together, in suitable proportions, thoroughly slaked common lime and unburnt clay, tempering the mixture with water, and then burning it in the form of bricks or rounded balls in an ordinary lime-kiln. The burnt material can be slaked in the ordinary way. For the common lime, powdered limestone, preferably chalk, may be substituted. It is better, however, when it becomes necessary to resort to artificial mixtures to produce the hydraulic ingredient of mortar, to make hydraulic cement at once, on account of its superior hydraulic energy.

Heavy, Slow-setting, Argillaceous Cement (Portland Cement).—When a homogeneous, argillaceous limestone contains so large a proportion of clay, usually exceeding 20 per cent., that it will not slake after calcination, it may be expected to furnish some grade of hydraulic cement. The stone from which the celebrated Portland cement is derived contains from 20 to 22 per cent. of clay and 78 to 80 per cent. of carbonate of lime. The clay itself is composed of 1½ to 2 parts of silica to 1 of alumina. When calcined at a high, long-continued heat, all or nearly all the silica and alumina of the clay combines with a portion of the lime, producing both silicate of lime, represented by the formula $SiO_3.3CaO$ { Silica, 23, Lime, 43, and double silicate of lime and alumina, as expressed by the formula

$$SiO_3(Al_2O_3 + CaO)_3 \begin{cases} \text{Silica,} & 15, \\ \text{Alumina,} & 51, \\ \text{Lime,} & 28. \end{cases}$$

The burnt product does not contain any uncombined, and therefore inert, silica and alumina to adulterate the cement and impair its hydraulic properties; while the quantity of uncombined lime is not sufficient to cause the mass to slake to powder in the presence of water. After calcination the cement is therefore reduced to powder by grinding between ordinary mill-stones.

Good Portland cement, when made into paste and formed into small cakes, will set under water in from two to four hours, so as to resist crushing between the thumb and finger. When stone suitable for Portland cement is calcined at a low heat, barely sufficient to expel the carbonic acid, the silicate of lime (as above) and the aluminate of lime ($Al_2O_3.3CaO$) are formed, and a light, quick-setting cement is usually the result, greatly inferior to Portland cement in weight as well as in ultimate strength and hardness.

The superior quality of Portland cement appears to depend in a great measure upon the presence of the double silicate of lime and alumina, which is formed only at a high heat. The weight of Portland cement, as well as its hydraulic energy and its ultimate strength and hardness, is increased by augmenting the intensity and duration of the heat employed in burning, within the limit of vitrification. The initial hydraulic activity, however, is diminished by high burning, so that the best Portland cements are slowest in setting. A cement weighing 100 pounds to the struck U. S. bushel may be burnt to weigh 125 pounds to the bushel, and its strength will be nearly doubled thereby.

It is not known that any deposit of argillaceous limestone suitable for making the best quality of Portland cement exists in the U. S., and there is only one such in Europe now worked. It is found at Seilley, in France, intermixed with the layers from which the argillaceous hydraulic lime is derived. Near Boulogne-sur-Mer, in France, there is a deposit of calcareous clay, from which very excellent Portland cement is manufactured. In its manufacture the wet process, described below, is followed.

Artificial Portland Cement.—Fully nineteen-twentieths of all the Portland cement used at the present day is artificial. It is made by thoroughly mixing together, in suitable proportions, clay and finely pulverized carbonate of lime (either chalk, marl, or compact limestone), burning the mixture in kilns at a high heat, and then grinding the burnt product to fine powder between ordinary mill-stones. There are two methods of manufacture, both well adapted to the character of the materials employed, and known respectively as the "wet process" and as the "dry process."

Portland Cement by the Wet Process.—The works in the vicinity of London, England, employ the wet process. The carbonate of lime is furnished by both the white and gray chalks of the neighborhood. The clay procured from the shores of the Medway and Thames, and from the adjoining marshes and inlets, contains about 2 parts of silica to 1 of all the other ingredients, comprising alumina, oxide of iron, soda, carbonate of lime, etc.

First. The clay and chalk are mixed together with a large quantity of water, in a circular wash-mill or basin, provided with heavy harrows attached to the horizontal arms of a revolving vertical shaft. By this means the chalk is thoroughly pulverized and incorporated with the clay in a semi-fluid state. The proportions are about 1 of clay to 3 of chalk, by weight. *Second.* When a thorough mixture of the ingredients is thus effected, the liquid mass, resembling whitewash in appearance, is conducted into large reservoirs called *backs*, where it is left to settle. When the heavier material, or raw cement, has settled to the bottom, and the surplus water has become clear on top, the latter is drained off. By subsequent evaporation the drying process is continued, until the raw cement has attained the requisite stiffness. During the time the mixture remains in the backs samples of it are taken from time to time and made into cement by burning in sample kilns, in order to test the accuracy of the proportions. If any error in this respect is discovered, it is corrected by conveying from the wash-mills additional material containing an excess of either clay or chalk, as the case may require. Sometimes the needed correction is secured by mixing together the contents of two or more backs. *Third.* When, by evaporation, the raw cement mixture has attained the consistency of butter, or rather of stiff clay, it is taken out of the backs by shovelfuls, and in that form and condition is removed to rooms artificially heated, or spread out around the tops of the kilns, and further dried. *Fourth.* After being dried, although it is not necessary to expel all the moisture, the cement is burnt in suitable kilns with nearly a white heat, just below the point of incipient vitrification. The kilns may be intermittent or perpetual, the latter being most economical in current expenses, though somewhat more costly in original outlay for construction. When properly burnt, the pieces of cement, called *clinker*, are of a greenish-brown color, contorted and much shrunken from the effect of the heat. *Fifth.* The cement clinker is then finely ground between ordinary mill-stones, packed in barrels, each containing 400 pounds net, and sent to market.

Portland Cement by the Dry Process.—By the dry process any of the compact limestones, as well as the chalks and marls, may be used in making Portland cement. *First.* The raw materials—the carbonate of lime and the clay—are kiln-dried at 212° F., in order to expel the moisture and prevent caking in the kiln, and otherwise facilitate grinding and sifting. *Second.* After drying, the clay and the carbonate of lime are mixed together in suitable proportions, and reduced to a fine powder. In most localities the proportion will vary from 20 to 23 per cent. of clay and 80 to 77 per cent. of the carbonate. One kind of machine will not suffice for grinding the raw material economically. In Germany, whence most of the artificial Portland cement made by the dry process is derived, three machines are used—viz. (1) A stone-breaking machine of the kind usually employed in breaking stone for roadways or for concrete. Through this the dried and mixed materials are passed, issuing therefrom in pieces varying from the size of a pea to that of a hen's egg. (2) A further reduction is effected by a vertical mill or edge-runner. (3) The material is then finely ground between horizontal mill-stones. *Third.* The powdered material is then tempered to a rather stiff paste in a brick-making machine, and made into bricks of a suitable size for burning. During this mixing the material is kept warm by coils of steam-pipe or otherwise, and the water used for tempering is rendered strongly alkaline by adding 3 to 6 per cent. of calcined soda, and an equal amount of newly burnt slaked lime. *Fourth.* The bricks are dried by artificial means, and are then burnt at a high heat and ground to a fine powder, as in the wet process. The same number of mills is necessary for grinding the cement as for pulverizing the raw materials. The clinker is first put through a stone-breaking machine, then into a vertical mill or edge-runner,

and lastly is ground to an impalpable powder in a horizontal mill. The dry process is followed in manufacturing Portland cement in Germany.

Tests for Portland Cement.—Portland cement should be ground so fine that at least 90 per cent. of it will pass a No. 30 wire sieve of 36 wires to the lineal inch, both ways, and should weigh not less than 106 pounds to the struck bushel, loosely measured. When made into a stiff paste without sand, it should sustain without rupture a tensile strain of 400 pounds on a sectional area 1½ inches square, or 2¼ square inches (equal to 178 pounds to the sectional square inch), seven days after being moulded, the sample having been in water six of these days. The composition of 1000 parts of the natural Boulogne Portland cement, after burning, is as follows:

Lime	651
Magnesia	6
Silica	204
Alumina, and small quantity of oxide of iron	139
Sulphate of lime	a trace
	1000

When burnt at the high heat essential in manufacturing Portland cement, the double silicate of lime and alumina is first formed by 139 of alumina combining with 40 of silica, and this compound, with 75 of lime, thus producing 254 of the double silicate of lime and alumina. The balance of the silica (164 parts) then takes up 304 of lime, producing 468 of silicate of lime, leaving 272 of uncombined lime.

The composition of Boulogne Portland cement, just after calcination, with reference to its hydraulic properties, is therefore as follows:

254 parts of double silicate of lime and alumina, $SiO_3(Al_2O_3 + CaO)_3$,
468 parts silicate of lime, $SiO_3.3CaO$,
272 parts free hydrate of lime, CaO.HO,
A fraction of compounds of magnesia.

The artificial Portland cement of London contains—

Lime	681
Silica	206
Alumina	104
Oxide of iron	9
	1000

The elements are combined as follows:

238 parts double silicate of lime and alumina,
506 " silicate of lime,
295 " free hydrate of lime and oxide of iron.
1039

Light, Quick-setting, Argillaceous Cements.—When an argillaceous limestone, containing more than 23 per cent. of clay homogeneously mixed through the mass, is burnt with the great intensity and duration of heat necessary to produce Portland cement, it generally fuses into a species of slag or glass, in consequence of the large amount of silica present, and becomes nearly destitute of hydraulic energy. But if the calcination be kept below the point of vitrification, it may be expected to yield a quick-setting hydraulic cement, weighing about seventy pounds to the struck bushel, loosely measured. In the burning, a portion, and in some cases all, of the lime enters into combination with a portion of the silica and alumina of the clay, producing silicate and aluminate of lime, leaving generally an excess of uncombined clay, but more especially of silica, which, being inert, adulterates the cement, injuring its hydraulic energy, and consequently impairing its strength. Cements of this class, if mixed into a paste and immersed in water, will set so as to lose their plastic condition in ten or fifteen minutes, but are far inferor in ultimate strength and hardness to Portland cement of average quality. Some of these contain as high as 10 or 15 per cent. of the oxides of iron, the proportion of clay in such cases being generally below 23 per cent.

The cement of Vassy, Grenoble, Camp Rond, and Corbigny, in France, and the English and French Roman cements made from nodules of septaria, belong to this class. No deposits of this type of argillaceous limestones have been discovered in the U. S.

This grade of cement may also be produced artificially, by burning at a low heat a mixture of lime and clay, and was manufactured largely in England and France by this method, before the superior and peculiar qualities of the Portland cement were discovered.

Argillo-Magnesian Cements.—All the natural hydraulic cements of the U. S. are made from argillo-magnesian limestones—that is, limestones of which the principal ingredients are carbonate of lime, carbonate of magnesia ($MgO.CO_2$), and clay. The Rosendale cements, from the valley of Rondout Creek, in Ulster co., N. Y., and those found at Shepherdstown, Va., Cumberland, Md., Louisville, Ky., and at different points on the line of the Erie Canal, and at Sandusky, O., Utica, Ill., and other localities in the West, belong to this class. The process followed in their manufacture is essentially the same for all. The stone is quarried, and then broken up into pieces of irregular size, seldom exceeding twelve or fifteen pounds in weight, and burnt in an ordinary kiln (either intermittent or perpetual), with either wood or coal as fuel. Where coal is used the perpetual method of burning is usually followed, the kiln being filled, in starting, with alternate layers of coal and stone, and then fired with wood at the bottom. As the burning proceeds, the charge settles down, the burnt stone is drawn at the bottom of the kiln, and alternate layers of coal and stone added at the top. The burnt cement is then crushed up into small fragments by suitable machinery, ground between ordinary mill-stones, packed in barrels of 300 pounds each, and sent to market.

In burning the argillo-magnesian cement both the lime and the magnesia combine with the silica and alumina of the clay. The result is the formation of the silicate and aluminate of lime and magnesia—compounds which become hydrates when water is added, and are capable of undergoing the species of crystallization or hardening under water called *setting*. The argillo-magnesian cements cannot be burnt with that intensity and duration of heat necessary in making Portland cement without fusing into slag, destitute of hydraulic energy. Those manufactured in the U. S. are all quick-setting, and their weight does not ordinarily exceed seventy pounds to the struck bushel, loosely measured. The Rosendale cement is regarded as the most valuable of them all, but even this will never attain, under the most favorable circumstances, more than one-third the ultimate strength and hardness of the best Portland cement.

Test for Rosendale Cement.—This cement should be ground so that 90 per cent. of it can pass a No. 30 wire sieve of thirty-six wires to the lineal inch, should weigh not less than sixty-eight pounds to the struck bushel, loosely measured, and when made into a stiff paste, without sand, should sustain, without rupture, a tensile strain of 135 pounds on a sectional area of 1½ inches square, or 2¼ square inches (equal to 60 pounds to the sectional square inch), when seven days old, the sample having been six days in water.

The elements of hydraulic energy in limes and cements are composed as follows, the proportions being given by weight:

Silicate of lime, $SiO_3.3CaO$	Silica	23
	Lime	43
Aluminate of lime, $Al_2O_3.3CaO$	Alumina	17
	Lime	28
Silicate of alumina, $2SiO_3.Al_2O_3$	Silica	30
	Alumina	17
Double silicate of lime and alumina, $SiO_3.(Al_2O_3+CaO)_3$	Silica	15
	Alumina	51
	Lime	28
Silicate of magnesia, $SiO_3.3MgO$	Silica	23
	Magnesia	30

Magnesian Cement.—Pure carbonate of magnesia, called magnesite, when burnt at a heat of moderate intensity, about cherry-red, ground to a fine powder, and made into a paste with water, possesses considerable hydraulic energy. This calcined magnesite has been patented under the name of Union cement. Its characteristic property, however, upon which it depends for its peculiar value, is not developed when mixed with water alone, for in that case the induration or setting is due to the crystallization of the hydrated magnesia or oxide of magnesium. But if the burnt and pulverized magnesite, or Union cement, be mixed up with the chloride of magnesium—for which the bittern water of seaside salt-works has been found to be a cheap and suitable substitute—a chemical combination takes place between the oxide and the chloride of magnesium, and oxychloride of magnesium is formed. This is a very remarkable hydraulic cement, being greatly superior to any other known cement in strength and hardness, not excepting even Portland cement.

Dolomite, or the double carbonate of lime and magnesia, when burnt at a low heat, reduced to powder, and made into mortar, also exhibits hydraulic properties. But if the heat be carried sufficiently high—say about 400° C.—to reduce the carbonate of lime also, thus forming caustic or quicklime, the addition of water causes slaking, and the hydraulic energy is destroyed or impaired by the presence of the hydrate of lime.

Any magnesian limestone containing as high as 60 per cent. of carbonate of magnesia may be presumed to be capable of yielding hydraulic cement of greater or less value, if properly underburnt, no matter whether clay be present or not. If clay exists as one of the principal ingredients, there are formed in the kiln silicate and aluminate of magnesia, as well as silicate and aluminate of

lime. All of these compounds become hydrated when brought in contact with water, and are then in condition to undergo that species of crystallization called setting.

Mortar.—Mortar is a mixture of the paste of lime or cement with sand. The paste may be made before adding the sand, or the materials may be incorporated dry, and afterwards tempered to a plastic condition with water. In common mortar the cementing substance is common lime. Hydraulic mortar may be made by mixing a paste of hydraulic lime or cement with sand, or by adding hydraulic materials to common mortar.

Common Mortar.—As a paste of common lime hardens or *sets* very slowly, even in the open air, unless it be subdivided into small particles or thin films, it is important that the volume of lime-paste in common mortar should be but slightly in excess of what is sufficient to coat all the grains of sand and fill the voids between them. If this limit be exceeded the strength of the mortar will be impaired. With most sands the proper proportion will be from $2\frac{5}{10}$ to 3 volumes of sand to 1 volume of lime-paste. Generally, if either less or more sand than is herein indicated be used, the mortar will be injured; in the former case from excess of lime-paste, and in the latter from porosity.

Hydraulic Lime Mortar.—With mortars of hydraulic lime the volume of sand should not be less that $1\frac{8}{10}$ times that of the lime-paste, in order to secure the best results regardless of cost. The usual proportions are, however, for ordinary work, the same as in common mortars, care being taken to incorporate sufficient paste to coat all the grains of sand and to fill up the voids between them.

Hydraulic-Cement Mortar.—A paste of good hydraulic cement hardens simultaneously and uniformly throughout the mass, and its strength is impaired by any addition of sand. For ordinary use, however, it is customary to add as much sand as possible without making the mortar porous: 1 barrel of cement, as packed for market, to 3 barrels of sand, is the proportion usually followed. The usual practice is to mix the cement and sand together dry, and afterwards temper to a plastic condition with water.

Tensile or Cohesive Strength of Mortar per square inch, in pounds.

Composition of the Mortar.	One Month Old.	Two Years Old.
Portland cement mixed to a paste without sand	300 to 400	500 to 600
Good Portland cement. 1 vol.. Sand 3 "	50 to 80	200 to 230
Rosendale cement mixed to a paste without sand	80 to 100	180 to 220
Rosendale cement 1 vol. Sand 3 "	15 to 20	75 to 85
Portland cement paste.. ½ vol. Fat lime paste ½ " Sand 3 "	.....	95 to 110
Rosendale cement paste. ½ vol. Fat lime paste ½ " Sand 3 "	.....	45 to 60
Tiel hydraulic lime dry 3 vol. Sand 5 "	25 to 35	120 to 160
Good common mortar Common lime-paste 1 vol. Sand 3 "	.....	40 to 60

Crushing Strength of Mortars and Concretes, from Trials upon Cubes and Parallelopipedons of various sizes, in pounds per square inch of top surface.

Composition of the Mortar.	Six Months Old.	Two Years Old.
Portland cement without sand..	4500 to 5300	5000 to 6000
Dry Portland cement... 1 vol. Sand 3 " Mixed to a stiff mortar	1500 to 2200	2000 to 2600
Dry Portland cement... 1 vol. Sand 5 " Mixed as above	1200 to 1600	1600 to 2000
Rosendale cement without sand	1500 to 1800	1800 to 2000
Dry Rosendale cement, 1 vol. Sand 3 " Mixed to a stiff mortar	450 to 600	550 to 700
Good hydraulic lime, like Tiel 3 vol. Sand 5 "	450 to 590	550 to 600
Common lime-paste 1 vol. Sand 3 "	.....	400 to 500
Poor common lime-mortar	.....	200 to 250
Composition of Concrete.		
Mortar { 1 Portland cement, 3 Sand } 1 vol. Broken stone 3 "	.....	2000 to 2500
Mortar { 1 Rosendale cement, 3 Sand } 1 vol. Broken stone 3 "	.....	700 to 800

Cement and Lime Mortar.—When it is desirable, from any cause, to lessen the cost of cement mortar, the best way is to add a portion of common lime to the cement, rather than to increase the quantity of sand, as this last method produces a porous mortar. The volume of the cementing paste, whether of pure cement or a mixture of cement and lime, should be slightly in excess of what is theoretically necessary to coat all the grains of sand and completely fill the voids. A mortar of cement and sand loses about four-tenths of its strength if one-half of the cement paste is replaced by an equal volume of common lime-paste, but is then quite suitable for ordinary work.

Concrete or *Béton.*—These terms in modern practice are synonymous, and apply to any mixture of mortar (generally hydraulic) with coarse materials, such as fragments of brick or stone, gravel, pebbles, or shells. The volume of mortar should be slightly in excess of the volume of voids in the coarse materials. Among American engineers it is customary, in making concrete by hand, to (1) mix the cement and sand, or cement, lime, and sand, together, dry; (2) then add water, and mix to a stiff mortar; and (3) then spread the mortar evenly over the platform; (4) the coarse fragments are then spread out upon the mortar, and the whole mixed together thoroughly with shovels. The coarse materials should be kept damp, or sprinkled with water before they are incorporated with the cement and sand. After mixing, the concrete is conveyed away in wheelbarrows, and compacted in position by ramming in layers six inches to eight inches thick. Concrete should not be mixed with too much water, but when ready for use should be quite coherent, and capable of standing at a steep slope without the water running from it; otherwise it will be impossible to compact it by ramming. It should not be plastic and jelly-like under the rammer.

In carrying on large operations it is advantageous, on many accounts, to make the concrete in a mill, of which there are several kinds. Any box or cylinder to receive the ingredients, revolving slowly about either a diagonal or concentric axis, will answer the purpose. A cubical box, measuring four feet in length on each edge, was used by the writer upon the fortifications on Staten Island with entire success. The box was rigidly mounted upon an iron axle passing through opposite diagonal corners, and was provided with a trap-door, about two feet square, close to one of the angles farthest from the axis, through which the materials were introduced. Eight revolutions of the box, made in less than one minute, were found to be quite sufficient to secure a thorough incorporation of the mortar with the coarse material (broken stone and pebbles). In using a mill of this description, it is not necessary that the mortar should be first prepared by a distinct and separate process, but all the ingredients of the concrete—the cement, lime (if lime be used), sand, water, and coarse materials—may be introduced promiscuously into the box. The mill may be charged by wheelbarrows from a platform arranged at the proper height, or preferably by a large tub manœuvred by a derrick. The proper charge for the box, in order to ensure thorough mixing, should not exceed one-half to five-eighths of its total capacity. One tubful (thirty-six to forty cubic feet) should charge the box.

The standard formula for making Rosendale cement concrete upon government works is:

Concrete No. 1.

1 barrel of cement, 3 " " sand } = 3.27 barrels of concrete mortar;
5 " " broken stone, or brick, gravel, oyster-shells, or a mixture of two or more of them.

This batch will make 21.75 cubic feet of concrete rammed in place. The mortar of this concrete, tested by itself, possesses a crushing strength of 130 pounds per square inch when two months old, the test being applied to 5-inch or 6-inch cubes. For unimportant works, six to six and a half barrels of broken stone, instead of five, may be incorporated, and the concrete may be cheapened still further by replacing a portion of the cement by common lime, as in No. 2.

Concrete No. 2.—In foundations above water the concrete mortar may be composed as follows:

1 barrel of Rosendale cement = 3.70 cubic feet of paste,
½ " " common lime = 2.50 " "
3½ to 4 " sand, loosely measured.

The concrete should contain 1 volume of this mortar to about 2½ volumes of ballast.

Concrete No. 3.—Portland cement concrete possessing a little more strength than the No. 1 above may be made as follows:

1 barrel of Portland cement, 1 " " slaked lime-powder, 10 " " sand } = 10.37 barrels of concrete mortar;
16 " " broken stone or other good ballast.

This batch will produce 69½ cubic feet of concrete rammed

in position. The mortar of this concrete will sustain a crushing weight of 154 pounds to the square inch when two months old.

Omitting the common lime, the following formula will give a good concrete:

Concrete No. 4.

1 barrel of	Portland cement	= 5.4 barrels of concrete mortar.	
5½ "	" sand		
6 "	" gravel and pebbles	= 12½ barrels mixed and shaken down, containing 26½ per cent. of voids.	
9 "	" broken stone		

This batch of concrete produces 50 cubic feet rammed in position, and is suitable for the best quality of concrete work.

It is desirable, in all cases, that the mortar for concrete should be hydraulic, in order to secure simultaneous induration throughout the entire mass after it has been compacted in position. Having established the quality of the mortar, whether of cement and sand, or cement, lime, and sand, the proportion of mortar to the coarse materials should be adjusted, so that the volume of the former should be somewhat in excess of the volume of voids in the latter.

The *natural pozzuolanas* comprise pozzuolanas proper, tras or terras, the arènes, some of the ochreous earths, and the sands of certain graywackes, granites, basalts, etc. Their principal ingredients are silica and alumina, the former largely preponderating, and most of them contain small quantities of soda and potash, and the oxides of iron and manganese. They possess the peculiar property that when finely pulverized, even without previous roasting, and combined with a paste of common lime, a hydraulic mixture is produced which will compare favorably with the mortars of hydraulic lime and sand. Pozzuolana itself was first discovered near the village of Pozzuola, near the base of Mount Vesuvius, and its properties were known to both Vitruvius and Pliny. It was extensively used by the Romans before their day. Vitruvius gives a formula for its use in monolithic or *pisé* masonry, which, with slight variations, has been followed in Italy ever since. It is as follows:

12 parts of pozzuolana, well pulverized,
6 " " quartzose sand, well washed,
9 " " rich lime, recently slaked.

This constitutes the mortar. To this is added 6 parts of broken stone, porous and angular, when it is intended for a pisé or filling in.

Tras closely resembles pozzuolana, and is employed substantially in the same way. It is found on the Rhine between Mayence and Cologne, and in various localities in Holland. The arènes are a species of ochreous sand, containing so large a proportion of clay that they can be mixed into a paste with water without the addition of lime, and used in that state for pisé work, as well as for common mortar. Mixed with rich lime, they yield hydraulic mortars of considerable energy. Many of the natural pozzuolanas are improved by a slight roasting, and an artificial pozzuolana may be produced by subjecting clay to a slight calcination. Brick-dust mixed with common lime gives a feebly hydraulic mortar. Forge scales from the smith's anvil, the slags from iron-foundries, and the ashes from lime-kilns, containing cinders, coal, and lime, are artificial pozzuolanas. (For bituminous cements, mastics, etc., see BITUMEN.) Q. A. GILLMORE, *U. S. Army*.

Cementa'tion of Steel is the process followed in the production of blistered steel or steel of cementation. The term cementation is also applied to other cases of incorporation together of two solids, under the influence of high heat without fusion. (See STEEL, by A. L. HOLLEY, C. E.)

Cem'etery [Lat. *cæmeterium*; Gr. κοιμητήριον, from κοιμάομαι, to "sleep," to "repose;" Fr. *cimetière*]. In all ages the disposition of the human body after death has engaged the thoughts of mankind.

The earliest records of our race indicate an interest in the interment of the deceased. "Bury me not, I pray thee," said the patriarch Jacob—"bury me not in Egypt, but I will lie with my fathers. And thou shalt carry me out of Egypt, and bury me in their burying-place. . . . There they buried Abraham, and Sarah his wife; there they buried Isaac, and Rebekah his wife, and there I buried Leah." Such are the natural expressions of human feeling; it is a matter of instinct, a spiritual impulse, which supersedes belief and disdains question. Even the American Indians have been known to burden themselves with the bones of their ancestors when removing to new reservations. These feelings are common to all ages—to the barbarian and the civilized, to the bond and free, to the heathen, to the Christian. They are manifested by the barrows, cairns, and mounds of olden times; and everywhere spots seem to have been so selected that the magnificence of nature might administer comfort to human sorrow and incite to human sympathy.

The aboriginal Germans interred their dead in groves consecrated by their priests. The Egyptians soothed their grief by embalming the dead and interring them in vast catacombs or enclosing them in stupendous pyramids. The Hebrews watched with religious care over their places of burial. They usually selected for this purpose ornamental gardens, deep forests, fertile valleys, or rocky mountains; and they still designate them, with a sad emphasis, as the "house of the living." The ancient Asiatics lined the approaches to their cities with sculptured sarcophagi and mausoleums embosomed in shrubbery. The Greeks exhausted the resources of their exquisite art in adorning the habitations of the dead. They discouraged interments within the limits of their cities, and consigned their relics to shaded groves in the neighborhood of streams and fountains, and called them "places of repose" (κοιμητηρια). The Romans erected the monuments of the dead in the suburbs of the city, on the sides of their spacious roads, in the midst of trees and ornamental walks. The Appian Way was crowded with columns and obelisks in memory of their heroes, and at every turn the short and touching inscription met the eye—*Siste, viator* ("Pause, traveller"), inviting at once to sympathy and thoughtfulness. These suggestions must have given formerly, as they may do still, to the language of the senseless stone a voice enforced by the benignity of that nature with which it is in unison. The Moslems placed their burial-grounds in rural retreats and embellished them as a religious duty.

The Greek term *cemetery*, signifying a place of rest or repose, was applied to the usual places of interment of the early Christians, who followed the customs of the Romans; but the desire to lie under the religious sanction of the Church afterwards transferred their burial-places to the vicinity of religious buildings or within towns; and still in some countries the Church derives revenue from interments. The practice is now happily changed, and few comparatively attach importance to the protection which churches were supposed to afford; indeed, the protection has proved fallacious, religious sects having almost ceased to provide for the dead. When their ground becomes valuable or the site of the church is to be changed, disinterment too often takes place, without a symptom of the tenderness with which the remains were deposited. The extension of cities has been too often attended by the painful spectacle of burial-grounds torn up and the occupants removed. In the rural cemetery this cannot occur, for each lot-holder possesses a deed in fee for burial purposes, and he is as positively the owner of his lot as he is of his dwelling-house, and he cannot by law be dispossessed. The desire so long cherished to be interred under the shadow of the church has nearly passed away, and there can be no doubt as to the advantages of the new rural mode. The refining influences of a well-kept cemetery are too obvious to need to be dwelt upon.

Chadwick, in 1843, had demonstrated the unhealthfulness of church and city interments, and the world woke up to the necessity of a change. America led the way. Boston instituted Mount Auburn, on which occasion Judge Story delivered a beautiful and appropriate dedicatory address; Laurel Hill, Philadelphia, immediately followed; Greenwood, New York, came next, and others succeeded, till now nearly every city (as well as many villages) has its rural burial-place. It was a fortunate thing that the first examples were governed by cultivated men; they inaugurated a taste for fine planting that culminated in a general demand for ornamental grounds. Boston, Philadelphia, and New York were fortunate, also, in the location of their cemeteries, having chosen grounds capable of high embellishment, and now these cities are establishing still more desirable places of sepulture in Forest Hills, West Laurel Hill, and Woodlawn, where the improvements suggested by experience are introduced, such as receiving-tombs carefully constructed, and the selection of trees and shrubs adapted for permanence, or such as when fully grown will not interfere with the monuments. Much depends on the first planting of a cemetery.

The great body of English poetry is more rich on the subject of sepulture than the poetry of any other nation, and abounds with references to the practice of ornamenting graves with flowers, shrubs, and trees. A rich vegetation exercises a powerful influence in preventing the escape of deleterious miasmata, though this is not to be feared where graves are single and of a depth of seven or eight feet, as they always should be. Trees should be chiefly of fastigiate growth, which neither cover a large space with their branches nor give so much shade as to prevent the growth of grasses. Of these, are all the arbor-vitæ family, the junipers, the yews, hollies, and a few species of oaks, magnolias, and in general the trees of middle size

suitable to each particular climate. The attempt made at Laurel Hill to introduce as many varieties as possible has been attended with partial success: its specimens of the cedar of Lebanon and other historical and rare trees are justly admired.

How to lay out a cemetery is an important topic. It should conform to the character of the ground and be made as cheerful as possible. The so-called landscape plan, lately introduced at Cincinnati, has no enclosures, the lots only marked by a sunken post at each corner, with but one monument in the centre, and the interments surrounding this on all sides; the advantages claimed are a park-like appearance and more open space, with more facility for neat keeping, etc. To this it is replied that where there is no impediment the footprints of visitors and habitués will soon create paths in various directions; short cuts will inevitably follow, and paths be made over the graves. The correct way will be found to devote a portion of each cemetery to the new plan, and let individual wishes be consulted; this has been done at Woodlawn and West Laurel Hill with advantage.

The rules to be observed in cemeteries in common use in America indicate a general desire to promote good order, and are in the main judicious. Bricked vaults under ground of greater or less size are not uncommon, and a more general desire for those above the surface is observable. These latter should never be allowed unless provision is made to effectually seal the crypts in which bodies are deposited; otherwise the vicinity is liable to be infected with unhealthy odors which the wonderful purifying power of sufficient earth entirely prevents. Iron railings, which prevailed in the early period of our rural burying, are happily disappearing, and should no longer be permitted, as indeed all perishable materials should be discarded. A hedge, however, is allowable, provided it be of an enduring kind, such as the slow-growing holly. Permanency should be aimed at, and this cannot be commanded by even iron, which perishes by rust, and all unions of iron and stone become disfigured. Granite is much used as a curbing; this suffices for the enclosure, and marks the possession of each family, and is the most enduring; the best burnt bricks for underground structures are also lasting; marble or other veneering must soon give out by the introduction of water in the interstices, which in freezing it opens with great force.

The best material for monuments is granite, either the expensive Aberdeen or the American. Italian marbles are not adapted to a cold climate; they inevitably split and crumble, while the American will do the same if not laid in the position of its natural bed.

JOHN JAY SMITH, *Pres. Laurel Hill Cemetery.*

Cenas (AUGUSTUS H.). See APPENDIX.

Cen'ci (BEATRICE), a beautiful Roman lady whose father was very depraved and treated his children with great cruelty. Her father having been found dead under suspicious circumstances, Beatrice, her brother, and her stepmother were accused of his murder, and for that crime were executed at Rome Sept. 11, 1599. Her story is the subject of one of Shelley's tragedies and of a novel by Guerazzi. The portrait of her by Guido Reni is well known.

Cenis, Mont. See MONT CENIS.

Cenon-la-Bastide, a town of France, province of Gironde, in which are carried on shipbuilding and plaster manufacture. Pop. 6817.

Cen'ser [Fr. *encensoir*, from the Lat. *incendo, incensum*, "to burn;" Lat. *acerra*], a vase or other vessel used for burning perfumes and incense in temples and churches. Censers were used by the ancient Hebrews and Greeks, and are now employed in the Roman Catholic Church at mass, vespers, and other services. The censer is suspended by chains which are held in the hand, and is tossed or swung in the air. It is frequently called the THURIBLE (which see).

Cen'sor [Fr. *censeur;* from Lat. *censeo*, to "judge or estimate"], the title of two magistrates of high rank in ancient Rome, who were appointed to take the census—*i. e.* to make an enumeration of the citizens and a valuation of their property—also to inspect and regulate their manners and moral conduct. In the early ages of the republic these duties were performed by the consuls, and no special magistrates were elected for the purpose until 443 B. C. The censors were originally chosen for a term of five years (which was soon reduced to eighteen months), and only patricians were eligible to the office. About 340 B. C. a law was enacted that one of the censors must be a plebeian. The censorship (in Lat. *censura*) was regarded as the highest dignity in the republic except the office of dictator. The power of the censors was in a great measure undefined and irresponsible, especially in the regulation of morals (*regimen morum*). They had power to expel a senator from the senate for a misdemeanor, and to punish with marks of ignominy those whose conduct did not accord with their own ideas of rectitude. They could degrade persons from a higher to a lower rank, and fill vacancies in the senate. Among their duties was the administration of the finances of the state and the erection of new public buildings. As a general rule, the only persons eligible to the office were those who had previously been consuls. No person could be elected censor for a second term.

Cen'sorship of Books, the term applied to interference by a government with the freedom of the press, exercised formerly over books alone, but since the rise of journalism extended to periodicals also. The censorship of books did not come into operation until the invention of printing (except that heretical books were prohibited by the Church). It soon became common to all European countries, Great Britain included. The censorship of books was established by act of Parliament in 1662, and renewed from time to time: but its renewal was refused in 1693. In 1766 it was abolished in Sweden; in 1770, in Denmark; in 1791 in France, where it was restored in 1805, again abolished in 1814, and after having again been in turn restored and abolished, was finally suppressed in 1827, but has since been from time to time, to some extent, revived. In Germany and Austria freedom of the press was promised in article 18 of the Federal act (1815), but not established until 1848. In 1872, Russia was the only country of Europe in which it formally existed, but in several others the police authorities have a supervision of books and periodicals. In the republics of North and South America a censorship of books has never been known.

The Church of Rome has long claimed the right of censorship over books. Some of the early provincial councils prohibited the reading of suspicious or heretical works, but the first catalogue of the kind now known was issued in 494 A. D., in the time of Pope Gelasius.

The INDEX LIBRORUM PROHIBITORUM, a list of fully prohibited books, was first authoritatively issued by Pope Pius IV. (1557–59), though previously lists more or less complete were published in various parts of Europe. The work was vigorously pushed on by the Council of Trent, and has been kept up by the subsequent popes. The best-known edition of the Index is that of 1819, published at Rome. Frequent additions to the Index are made by decree.

The INDEX EXPURGATORIUS is a list published, like the above catalogue, by the "Congregation of the Index" at Rome, and contains the names of books which cannot be read until certain specified passages are expunged. Bishops have power to give the learned the privilege of reading prohibited books. The ecclesiastical censorship of books does not command much respect, even in countries bound by concordat to accept and enforce it. The Russian Greek Church has also a catalogue of prohibited books, and the influence of the system is greater and worse in the Eastern than in the Roman Catholic Church.

Cen'sus [a Latin word, from *censco, censum*, to "weigh, estimate, tax, assess;" a registering and rating of Roman citizens; the censors' lists; the registered property of Roman citizens; Fr. *recensement*, a "statement, return, verification;" *cens*, "census," or amount of direct tax qualifying one to be an elector; Eng. *cense* (obsolete), a "public rate," "rank," "condition;" also *cess* (obsolete), to "rate," to "assess"], an official enumeration of the inhabitants of a state or municipality. The various forms and significations of the word, as given above, indicate the chief objects for which the census has been used in the different periods of history, though in many cases other objects have been associated with these. (For a discussion of the origin and progress of statistical inquiry, in its more general bearings, see STATISTICS. The census proper is a branch of this more general subject.)

I. THE CENSUS OF ANCIENT NATIONS.—An inquiry into the censuses of ancient nations is valuable only in so far as it exhibits the objects had in view and the methods employed. It is alleged that China ordained a census more than twenty centuries before Christ; also, that a census was taken in Japan a century before the Christian era; also, that statistical information was taken by officials in Peru under the reign of the Incas. But these and similar notices of ancient censuses are too vague and uncertain to possess much value. This article will be directed chiefly to those nations of which history speaks with definiteness and reasonable certainty.

1. *The Jewish Census.*—It was ordered in the Jewish law that the first-born of man and beast, as well as the first fruits of agricultural produce, should be set apart for religious purposes: the first-born of man to be redeemed—the first-born of the beasts, excepting the ass, and the first fruits of the earth, to be offered unto the Lord (Ex. xiii. 11–13; xxii. 29). According to Archbishop Ussher's chronology, this enactment must be referred to the year 1491 B. C. The law further provided that when the sum of the

children of Israel was taken they should give every man a ransom for his soul, amounting to a half shekel of silver (Ex. xxx. 12-16). So far as appears, this is the original institution of the Jewish census. It is clear that it was primarily for religious purposes. The Hebrew word answering to census or enumeration means a "numbering combined with lustration," from a verb signifying to "survey, in order to purge." The four most notable enumerations recorded in the Old Testament were—1st. In the third or fourth month after the exodus the males of the Hebrews, twenty years of age and upwards, were enumerated by Divine command, chiefly for the purpose of raising money for the tabernacle (Ex. xxxviii. 26). The enumeration amounted to 603,555. The number of men at the time of leaving Egypt is stated (Ex. xii. 37), but it is hardly probable that a formal enumeration was made at that time. Probably the result, 600,000, was retrospectively inferred from the first numbering at Sinai. 2d. A second enumeration was made at Sinai in the second month of the second year after the exodus (Num. i. 2, 3). Here a new idea appears, as this numbering was to ascertain—1, the number of fighting men between the ages of twenty and fifty; and 2, the amount of the redemption-offering. Exclusive of the Levites, the result was the same as the first. 3d. The next enumeration was made just before the tribes entered Canaan, thirty-eight years after the one just mentioned (Num. xxvi. 63-65). The number of men had slightly fallen off. 4th. The most notable of the Jewish censuses was that taken in the reign of King David. Its history can be gathered from 2 Sam. xxiv. 1-9; 1 Chron. xxi. 1-7, 14; xxvii. 23, 24. This enumeration was followed by a three days' pestilence, which destroyed 70,000 men. The pestilence is credited to David's presumption. It is not altogether clear in what his offence consisted. According to Josephus (*Ant.* vii. 13, § 1), the king's transgression was in not collecting the redemption-offering required by the law. This account is more generally followed by biblical scholars, but some attribute the pestilence to David's presumption and pride, of which the enumeration is regarded as an indication. It appears from Ex. xxx. 12, either that the customary ransom was to avert a plague among the people, or that such plague was to be the penalty for neglecting to require the offering. The pestilence made a lasting impression on the minds of men; for to this day, in both Mohammedan and Christian countries, especially in the former, there are superstitious fears attending enumerations of the people. David's enumeration of the people was not recorded.

All the objects comprehended in the Jewish census are stated above. It does not appear that the law made any provision as to the time or manner of making the enumerations. The censuses referred to in the New Testament were taken under Roman authority, and were in no proper sense Jewish.

2. *The Greek Census.*—History gives us no definite knowledge of a census in any portion of Greece except at Athens, where the census was established by Solon, who held the office of Archon from 558 to 549 B. C. He made a radical change in the constitution of Attica. Before his time the honors and duties of the citizen were based on birth; he introduced what was called the *timocracy*, or government based on wealth. He distributed all free citizens, without regard to birth or rank, into four classes, according to the amount of property they owned. The classes were—1st. Those whose annual income was equal to or exceeded 500 medimni of corn (about 700 English bushels). 2d. Those whose income was less than 500 and more than 300 medimni. 3d. Those whose income was less than 300 and more than 200 medimni. 4th. All whose property yielded an income less than 200 medimni. The medimnus of corn was valued in the time of Solon at about one drachma, or 9¾*d.*

The first class (Πεντακοσιομέδιμνοι) alone were eligible to the principal public offices. The second class (Ἱππεῖς) were knights, or those having sufficient income to keep horses and perform cavalry service. The third class (Ζευγῖται, so named from their being able to keep a yoke of oxen) formed the heavy-armed infantry. The fourth class (Θῆτες), which comprised the great body of the people, were ineligible to any office, paid but little if any tax, and in case of war served only as light-armed infantry, with weapons furnished by the state.

The census was instituted for the double purpose of making this classification of citizens, and of laying the foundation of the Athenian system of taxation. The idea of assessment was as much a part of the census as that of enumeration. The Greek word for assessment (τελεῖν) has also the general meaning of rank or class; and the phrase τελεῖν τὸ τέλος, which signifies "to comply with the requisition assessed," signifies also to belong to a class. The census was taken, at first, by the Naucrari, and afterwards by the Demarchi. A record was kept, showing the class to which each citizen belonged, and the list of his taxable property. The census was taken sometimes once a year, and sometimes once in four years, according as property fluctuated in value. The classification of Solon lasted, with some modification, to the close of the Peloponnesian war (404 B. C.), and was in part preserved after the renovation of the democracy in the following year. The classification of citizens and the mode of assessment were changed during the archonship of Nausinicus (in 378 B. C.), in order to levy increased taxes for carrying on the war against Sparta.

(For the latest and fullest discussion of the Greek census see Boeckh's "Political Economy of the Athenians" (English trans., Boston, 1857), book iv., chap. 5; Grote's "History of Greece," vol. iii., chap. 11, and vol. x., chap. 87; Plutarch's "Solon," i., p. 168; and Smith's "Dictionary of Greek and Roman Antiquities," words *Censor* and *Census*.)

3. *The Roman Census.*—The institution of the census at Rome was intimately connected with the great reform in the Roman constitution consummated by Servius Tullius. Before his time all the political and military authority was wielded by a few powerful Roman families, and clans or groups of families, called *gentes*. The word *populus* applied to these families alone. Around the members of this ruling class were gathered, under the name of *clients*, a large number of foreigners (*metoeci*) residing at Rome, subjugated people, and freedmen, who possessed no political rights, paid no regular taxes, and were neither compelled nor permitted to serve in the army. Most of them were farmers, and many were wealthy. As the city grew this plebeian class rapidly increased. In order to equalize the burdens of the state, but particularly to strengthen the army and make it more national, Servius Tullius so changed the constitution as to place the burdens of taxation and the duties and honors of military service, not upon the patricians as such, but upon freeholders between the ages of seventeen and sixty, without regard to family or rank. All these were distributed into five classes, according to the amount of land owned by each. It has been held by most writers that the classification was based upon the amount of wealth, in any form, possessed by the citizen; but Mommsen and other late authorities insist that the basis was land.

The first class comprised those who owned an entire *hide* of land—a full Roman farm—not less than twenty jugera (about fourteen acres). The second, third, fourth, and fifth classes consisted of those who owned respectively three-fourths, one-half, one-fourth, and one-eighth of a *hide* of land. The non-freeholders (*proletarii*), counted by some authorities as the sixth class, were called *capite censi* (*i. e.*, "counted by the head"). They could not vote, paid no taxes, and were not liable to perform military service. The rights and duties of all Romans were determined by the class to which they were thus assigned.

In order to effect these changes in his government, Servius Tullius instituted the census (555 B. C.). Every citizen was compelled to declare his name, age, and tribe, the name of his father, the number of his children, the value of his estate, and the number of his slaves. The record thus made was both a land-register and a roster or rank-roll of the Roman people. When the enumeration and registration were completed the people were assembled in the Campus Martius, where the religious solemnities of the lustration were performed. The sacrifices attending it were called *suovetaurilia*, because a pig, a sheep, and an ox, after being led three times around the campus, were sacrificed for the purification of the people. This was called the closing of the lustrum. As the census was taken quinquennially, the word *lustrum* came to signify a period of five years.

At first, the census was taken by the kings in person. After the expulsion of the kings it was taken by the consuls; but the duties accompanying the census became so important that in 443 B. C. two magistrates, called *censors*, were chosen from the patricians, to whom this duty was entrusted. The office of the censors ranked next to that of dictator. Their powers and duties were threefold: 1st. They took the census and made and kept the official record. In performing this duty they were the sole judges of the qualifications required by law for the rank or class to which a citizen should be assigned. 2d. They were conservators of public and private morals. This branch of their power was called *regimen morum*. If in their judgment a citizen was guilty of immoral or unworthy conduct, they placed him in a lower class. They could even degrade a senator by omitting his name from the senatorial list. Ulpian says in his "Digest" (tit. 1-6): "Roman citizens are free who have been made free by the act of manumission, by the census, or by a lawful will." (See also Cicero, Top. ii. 10.) Any one known to absent himself from the registration was

called *incensus*, and was subject to the severest punishment. In the time of Servius Tullius this punishment might be imprisonment or death. In the days of the republic the *incensus* might be sold as a slave: "Maxima capitis diminutio est, per quam et civitas et libertas amittitur, veluti cum incensus aliquis venerit." (*Ulpian*, "Digest," tit. xi. 11.) 3d. They were charged with the administration of the finances of the state. The tribute assessed upon a Roman citizen depended upon the amount of his property, as registered in the census; and the regulation of taxes was placed in their hands, though they did not receive nor disburse the revenues.

The censorship continued 421 years, when its powers were absorbed by the emperors. Augustus extended the census to the provinces, and ordered a general enumeration of persons and property throughout the empire. Domitian assumed the title of "perpetual censor." The enumeration continued to be made for several centuries, but the ceremony of lustration was not observed after the reign of Vespasian; and later, the censuses were taken but once in fifteen years. With the dissolution of the Roman empire, the census seems to have disappeared from history; and in the general decline of intellectual life that followed, even the original meaning of the word was practically lost from the customs of nations.

II. The Census during the Middle Ages.—In mediæval times the word "census" was still employed, but it was applied almost exclusively to the records of landed estates and the assessment of taxes. Until the thirteenth century there is no record of a distinct enumeration of the population in the annals of any mediæval people. In that dreary waste of history a few attempts were made to learn something concerning the people and their condition. In the year 780, Charlemagne appointed officers called *missi dominici*, or royal commissioners, who travelled from province to province to examine the condition of his empire. Their reports contained some valuable statistics concerning the people, the soil, and the products of his vast dominions. (See Martin's "Histoire de France," tom. ii. 277–284.) These reports were not kept up after the death of Charlemagne.

A more elaborate and successful effort in the same direction was made in England in 1081, by William the Conqueror, in the institution of the famous "Doomsday Book." An inquisition was made throughout the kingdom concerning the quantity of land contained in each county, the name of each Saxon and Norman proprietor of land, and the slaves and cattle belonging to each. All these were registered in a book, each article beginning with the king's property, and proceeding downward according to the rank of the proprietors. By this register the king could know the wealth, rank, and position of all his subjects. It served as the basis of taxation, and was used in the courts as the evidence of property. Of this book Burke says: "It was a work in all respects useful, and worthy of a better age."

Several early attempts at a census were made in Spain—one by Peter the Ceremonious, king of Aragon, in the fourteenth century, the results of which were not published until the present century; and another in the fifteenth century, by order of the Crown of Castile.

In different parts of Europe a few statistical works appeared; but their scope was narrow and their materials were scanty and inaccurate.

It would appear that a comprehensive census is found only in enlightened despotisms or in free communities. Neither of these were frequent in the Middle Ages, and this may account for the absence of enumerations of the people during that period.

III. The Census in Modern Times.—The modern census is of slow growth, and seems to have developed only as nations came to appreciate the fact that the strength and glory of a state depend upon the condition of its people and their industries. While rulers were unwilling to allow their people any share in public affairs, there was little attention paid to the population and its condition. Till within the last two centuries scarcely an effort was made in any modern country to obtain any comprehensive knowledge of the people.

Sweden has the honor of being the first modern government to establish a systematic plan, and to record important facts concerning its population. The frequent recurrence of famine and pestilence in that country near the beginning of the sixteenth century led the clergy to keep a register of the marriages, baptisms, and burials within their several parishes. The keeping of this register was made obligatory by an ecclesiastical law of 1686, which is still in force. That law required a register of marriages, births, and deaths, with many accompanying particulars; a record of all persons removing to or from each parish; a list of the inhabitants by houses and households; and a record of all extraordinary accidents occurring during the year. These registers were intended to serve the requirements of religion, and also to afford the means of correcting the register of landed property and households kept by the tax-collectors. As these registers were made on a uniform plan, and by a body of intelligent and cultivated men, who were well acquainted with the people of their parishes, the records were exceedingly accurate and valuable. For a long time the results were not collected; but in consequence of a memorial presented to the Diet in 1746 by the Academy of Sciences of Stockholm, schedules of questions concerning the movement and condition of the population were distributed among the parishes, with orders to the pastors to make returns from their registers for the previous twenty-five years. In the year 1749 a return was made, which contained a large number of valuable details concerning the condition of the population, but it was many years before these facts were published. The number of inhabitants was long regarded as one of the most important state secrets; and it was forbidden under heavy penalties to reveal to the public anything respecting it. It was only in 1762 that permission was given to publish some extracts from the official reports concerning the progress of the population. It was from facts thus obtained that Doctor Price prepared his first essay in the form of a letter to Doctor Franklin, which laid the basis for the famous life-tables founded on the statistics of Sweden.

From 1749 to 1751 the reports of population were made annually; from 1754 to 1772, triennially; from 1775 to the present time the census has been taken once in five years. In towns the head of the household, in accordance with instructions, fills up the schedules, which are collected by the agents of the police. In the country districts the census is still taken by the pastors as a part of their parochial duties.

England was very slow in achieving a census. In 1592, when the plague was in London, records were kept of the number of deaths in the city; but the practice soon fell into disuse, and was not revived until 1603, the first year of the reign of James I., when a weekly account was ordered to be kept of burials and christenings in London. These records were regularly kept thereafter, but little attention was paid to them until the year 1661, when Sir William Petty, writing under the name of Captain John Graunt, published a tract entitled "Natural and Political Observations, mentioned in a following index, and made upon the Bills of Mortality of London, with reference to the Government, Religion, Trade, Growth, Air, Diseases, and several changes of said City." This work attracted much attention, and the author followed it up by several similar works—one on the mortality bills of Dublin; another in 1686, entitled "An Essay concerning the Multiplication of Mankind," together with an "Essay on Political Arithmetick," concerning the growth of the city of London.

It is curious to observe what vague and erroneous opinions prevailed, even among the most intelligent thinkers of that time, concerning the number of people in any state or city. A striking illustration of this may be seen in the fact that when Sir William began his investigation of the population of London, he mentions it as a matter of general belief that the city then contained several millions of people. The imperfections of the statistical methods employed in his day may be seen in the following passage from Sir William's "Third Essay in Political Arithmetic," 1686, pp. 21 and 22:

"Proofs that the number of people in the 134 Parishes of the London Bills of Mortality, without reference to other cities, is about 696 thousand—viz.:

"I know but three ways of finding the same:

"1. By the houses, and families, and heads living in each.

"2. By the number of burials in healthful times, and by the proportion of those that live to those that die.

"3. By the number of those who die of the plague in pestilential years, in proportion to those that 'scape."

In applying his first method he has no count of the houses, but, as he says, "pitches upon a number" as a rough estimate, then guesses at the average number of families to a house and persons in a family, and finally applies his arithmetic. His second and third methods were even more vague.

During the eighteenth century several efforts were made to guess at the population of England, but nothing of value was accomplished till near the close of that century. Considering the fact that economic science had already attained a high degree of development in England, that many writers had successfully investigated and ably discussed statistical subjects, and that censuses had been ordered in the American colonies by the home government since the seventeenth century, it is surprising that no attempt was made to ascertain the population of any one of the three united kingdoms by actual inquiry until 1790; when Sir John Sinclair, a high authority in matters of public finance in his time, and a man of rare intelligence, enterprise, and perseverance, undertook the compilation of a complete popula-

tion, agricultural, commercial, and industrial census of Scotland. For this purpose he addressed one hundred and sixty questions, on as many different subjects, to all the clergymen of the Established Church. He had much difficulty in obtaining answers from them, but by dint of persistently-repeated appeals he succeeded, after several years, in securing returns from nearly all the parishes. The returns were published by him successively in a series of twenty-one volumes. The energy of this remarkable man may be judged from the fact that he secured no less than 900 contributors to his census, and that the whole compilation and publication was completed in just seven years. He subsequently prepared a masterly compendium of the series, entitled an "Analysis of the Statistics of Scotland." His statistics were not absolutely accurate, but they formed, although the work of a single individual, a more complete census than any yet undertaken by any government. Sir John Sinclair may be said to be the founder of British public statistics; for it was mainly at his suggestion that Parliament, on December 31, 1800, passed an act providing for a general enumeration of the population of England, Wales, and Scotland in the following spring, and every tenth year thereafter. The bill was offered in the Commons by Charles Abbott (afterwards Lord Tenterden), and the motion for leave to introduce it was seconded by Mr. Wilberforce. The first census was taken on the 10th of March, 1801, in England and Wales; for Scotland a later day was assigned, owing to the inclemency of the season. The law contained but one schedule, and the following inquiries were made: The number of houses, inhabited and uninhabited; the number of families; the number of inhabitants, male and female; a classification of the population according to occupation, in three divisions: 1st, persons chiefly employed in agriculture; 2d, persons chiefly employed in trade and manufactures or handicrafts; 3d, all other persons not comprised in these two classes; the number of baptisms and burials each tenth year from 1700 to 1800; and the number of marriages from 1754 to 1801. In the two subsequent enumerations, in 1811 and 1821, the same schedule was followed, except that the occupations of the heads of families only were entered. In that of 1821 a classification of ages was also adopted. In 1831 a uniform system of registration of births, marriages, and deaths was established by act of Parliament for England and Wales, under the supervision of the registrar-general's office. Under the act the territory to which it was applied was divided into over two thousand registration districts. The same act provided that subsequent enumerations in England and Wales should be taken by the local registrars under the direction of the registrar-general. The creation of a regular statistical service greatly facilitated the census of 1841 in England and Wales. In Scotland the less efficient method of employing the parish schoolmasters as local censors was continued.

In Ireland the first attempt at a general census was made in 1811, with very unsatisfactory results. It was repeated in 1821, but produced nothing but a mere enumeration of doubtful accuracy. The next census, taken in 1831, was subjected to a correction in 1834. In 1841 the constabulary force was employed as census-takers, with better results. An attempt was made, in connection with the census of the year last named, to obtain statistics of the rural economy of the Irish kingdom, which proved very successful.

Great efforts were made to render the sixth census of England, Wales, and Scotland, in 1851, superior in results to the preceding enumerations. The special law enacted for the purpose provided that the census should be taken on one and the same day—31st of March—in the three parts of the kingdom named. For that purpose 30,610 competent enumerators were appointed, with the authority of the registrar-general, by the 2190 district registrars then in function in England and Wales. Only as much territory was assigned to each enumerator in the registration districts as could be conveniently canvassed by one person. There being no uniform system of registration in Scotland, the thirty-two sheriffs of that kingdom were authorized to appoint 1010 temporary registrars —generally parochial schoolmasters—and 8130 enumerators: the government appointed 257 enumerators for the smaller islands. Some days before the census-day the enumerators delivered to every occupier of a house or tenement a "householder's schedule," containing inquiries as to the name, the head of family, condition, sex, age, occupation, and birthplace of every person in Great Britain, and also as to the number of blind, deaf, and dumb. For the use of the lower classes of Wales schedules were printed in Welsh. The schedule was to be filled up in the night of March 30–31. No one present on that night was to be omitted except workingmen and others performing night-labor away from their habitations. Travellers were enumerated at the hotels and houses at which they arrived on the following morning. Simultaneously with the household schedules the enumerators distributed in the proper quarters forms for collecting information respecting places of worship, scholastic establishments, and miscellaneous institutions. The schedules were taken up by the enumerators at an early hour on the 31st of March. The collectors filled up those parts which persons had either neglected or were unable to fill. They were also required to note all the unoccupied houses and buildings in course of construction. The floating population — that is, such persons as spent the night named in barges or boats on canals or small streams, in barns, sheds, tents, and the like —the enumerators were required to estimate according to the best information they could obtain. Special notice was to be taken of all extraordinary assemblages of people anywhere at the time of the census.

The enumerators were allowed one week for the transcription of their schedules and the completion of summaries and estimates called for in their very full instructions. The revision of the returns by the district registrars, in which the latter were to pay particular attention to nine specially-defined points, had to be completed in a fortnight. The revised returns were subjected to another revision by the superintendent registrars before they were finally transmitted to the census office.

The custom-house officers took the census of sea-going vessels in port. Persons belonging to the navy and commercial marine were also separately enumerated by the proper authorities. The government furnished the statistics of the army, half-pay officers, and pensioners, the civil service, the civilians and Europeans in the East India Company's service, and of all British subjects living in foreign parts, as far as they could be ascertained through consular and diplomatic organs.

The British census of 1851 was the most successful statistical operation, both as regards quickness and accuracy of execution, performed up to that time in any country where public statistics were cultivated. The plan of the census of 1861 did not vary in any essential respect from that of the preceding one. Its execution was equally rapid and fruitful of satisfactory results, in spite of the greater difficulty of the task from the growth of population, etc.

In Ireland the censuses of 1851 and 1861 were again taken by the constabulary force. The mode of enumeration was essentially the same as in England, except that the schedules represented a wider field of inquiry. The additional interrogatories related to insanity, idiocy, degree of education, attendance at school, buildings other than habitations, and language. Since 1804 a general registration of births and deaths in Ireland is made by civil officers; up to that time registers were kept only for the Protestant population.

While both in Ireland and in Scotland an agricultural census, which serves to determine the area devoted to the culture of different products of the soil, and the number of live-stock, had been required for many years, a first cattle census was taken in England and Wales only in May, 1866; it was followed soon after by a comprehensive agricultural census.

The digestion of the English and Irish census-reports by the central statistical authorities is conducted in a thoroughly scientific manner. The general reports and the special compilations therefrom on a variety of subjects are unsurpassed by the corresponding records of any other country. Their great value to statisticians and economists is universally acknowledged. The movement of the population of the United Kingdom is annually determined by the registrar-general's office through the agency of the district registrars.

In 1871 the eighth census of the United Kingdom was taken. Over 32,000 enumerators were employed in taking it. Several minor inquiries were added to the schedules, and some important inquiries concerning education were made to supply the demand for information by the school board established under the Elementary Education act of 1870. In London alone the school board was supplied with certain particulars concerning the 700,000 children between the age of three and thirteen living within the limits of the London school board district.

France established a census only after many ineffectual attempts and against formidable obstacles. The first comprehensive suggestion of a census was made by Vauban, the great engineer and scholar of the seventeenth century. Seeing the distress into which France had been plunged by the long wars of Louis XIV., and deploring the heavy and unequal burdens of taxation which had been laid upon the people, he entered upon a careful survey of the condition of France, and in the first years of the eighteenth century developed a plan to sweep away the great army of fiscal officers and establish a uniform tax on all the property of the realm.

This he called the "projet d'une dixme royale," which he

published in 1707 in a volume addressed to the king. In order to apply his plan, it was necessary to know the number and classes of the population. His method of estimating the number was peculiar. Selecting a portion of France which he regarded as having an average density of population, he caused it to be accurately measured and its population estimated. From this he calculated the area of France and its population; but near the conclusion of his book he appealed to the king to provide by law for the numbering of the people, and set forth in strong and eloquent language the advantages of such an enumeration. "There is no battalion," said he, "in the kingdom, however insignificant it may be, that is not subject at least to a dozen reviews and inspections during each year. If such pains be taken with one battalion, of how much greater importance it is to enumerate and review the condition of that great body of the people from which the king draws all his glory and all his riches!" This book appeared in January, 1707. It gave great offence to Louis XIV., because it assumed that the glory of the realm consisted of the people and their wealth, and it further assumed that kings and ministers needed to study the people and their wants, in order to the proper performance of their duties. By a royal decree of February 14, 1707, the book was ordered to be seized and burned in the pillory, and all the booksellers were forbidden, under heavy penalties, to keep or sell it. Vauban survived the shock of this disgrace but six weeks. He died of a broken heart. The treatment he received is a striking illustration of that arrogant ignorance which refuses to draw instruction from the only true source of knowledge and statesmanship.

Several attempts were made at different times to ascertain such facts relating to the people as would aid the French monarchs in making their military levies; but nothing of value was accomplished except by individual effort. In the latter part of the reign of Louis XV., M. D. Gourney, minister of commerce, organized a bureau of information, which gave some attention to the subject of population. M. Moheau, who was attached to this bureau, collected some important statistics, which were published by order of the government in 1774. In 1784 appeared the work of M. Necker, minister of finance of Louis XVI., entitled "Traité de l'Administration des Finances," in which the number and condition of the population were discussed. But nothing was done to establish a census until after the Revolution of 1792. Before the close of the eighteenth century a law was passed requiring prefects of the departments to prepare from the civil registers exact annual abstracts of the number of marriages, births, and deaths. This law, with some modifications, is still in force. In 1801 the legislature decreed that national censuses should be taken once in five years. A census was taken in 1801, and another in 1806. No other was taken under the first Napoleon. The next general enumeration was taken six years after the final restoration of the Bourbons. Since that year quinquennial censuses have been the rule.

Belgium has carried the work of census-taking to a high degree of thoroughness and completeness since the revolution which made her an independent sovereignty. This revolution was immediately followed by active efforts in the direction of statistics. One of the first acts of the provisional government in 1831 was the creation of a special statistical service. In 1841 a central commission of statistics was established by royal decree, with which M. Quetelet and other distinguished statisticians have been connected from its organization. In 1843 provincial statistical commissions were instituted throughout the kingdom. In 1856 a law was enacted newly regulating the mode of taking the census and keeping the civil register. It provided that a general census should be taken every ten years throughout the kingdom, and that the population-returns should form the basis of representation. The census was to be taken in such a manner as to give the actual as well as the legal population. The prescribed inquiries included surnames and Christian names, sex, age by year and month, birthplace, civil status, occupation or condition, habitual domicil, and town and country population. Three schedules, printed in the French, German, and Flemish languages, were distributed and collected throughout the kingdom by special census-agents. Both the distribution and collection were to be made in one day. Temporary census bureaus were established, one for each province, which were to receive the returns of the agents after they had been revised by the communal juries—bodies appointed for each community, and consisting of officials and private citizens. The statistics of schools and public institutions were taken by means of special schedules. The military authorities were charged with the army census. The refusal to give information to the census-agents was punishable by fine and imprisonment. The law of 1856 also contained provisions regarding the keeping of civil registers, which ensured greater accuracy in the recording of the movement of the population.

Two general censuses have been taken under the law of 1856—one in that year and another in 1866. In the latter, comprehensive inquiries into the agricultural, mining, and manufacturing industries of the kingdom were made. In 1858 a special census of deaf-mutes and the blind was taken. The central statistical commission receives the returns of the successive censuses, yearly abstracts from the civil registers, and the results of special inquiries, and prepares the whole for publication.

Prussia.—As in many European countries, Prussia obtains her population-reports through a central bureau of statistics, which was established in 1805, and continues to the present day, though with some modifications. The labors of the bureau are directed to—1, general statistics; 2, births, marriages, and deaths; 3, schools and churches; 4, medical statistics; and 5, statistics of mechanical trades and manufactures. From 1805 to 1820 these inquiries were made annually, but since the latter date, information relative to the first, third, and fourth subjects was collected but once in three years. When the customs union of 1834 was established, triennial censuses of the population were authorized, and have been taken regularly since that date.

At first, the inquiries concerning population were the actual population, according to sex, age, birthplace, religion, immigration, and emigration. In 1840 the enumeration was made nominative, which resulted immediately in a large increase in the population-returns. In 1846 the number of families was determined, and in 1849 the distribution of the population by habitations. In 1858 the persons of the two sexes between seventeen and forty-five years of age were returned in five classes. In 1861 the unmarried and widowed were specially classified. With the census of the same year an inquiry was added in reference to the language spoken and the social condition and occupations of the population. The Prussian census is taken by civil officers, in the month of December, on one day, by means of printed schedules. Great expedition is shown in the publication of the returns. In addition to the statistics of population, many statistics are obtained showing the nature, extent, and distribution of real property, wages and salaries, insurance, aid and co-operative societies, and the numerical strength of the Catholic and Protestant churches.

Austria.—During the last half of the eighteenth and the first half of the nineteenth century no censuses were taken in Austria, except such as were connected with military conscription and inquiries to ascertain what portion of the population were liable to do military duty. Separate systems of enumeration prevailed in the different provinces, and the materials for a general knowledge of the whole population of the empire were very meagre. A uniform enumeration was made throughout the empire for the first time in 1851, but its results were so imperfect that in 1855 a commission of high administrative officers was appointed for the preparation of a new census law, which received the imperial sanction in 1857. By its provisions the military needs of the state were no longer the main motive for a census; but statistics of population, wealth, and industry were to be obtained as a basis for the safe conduct of public affairs. It provided that a census, based on the actual population, should be taken once in six years, exclusively by the civil authorities. Printed schedules were distributed by municipal and administrative officers, to be filled up by the heads of families, owners of tenement-houses, and those in charge of convents, schools, and public institutions. Detailed printed instructions accompanied the schedules. Those that intentionally failed to furnish the desired information were punished by fine and imprisonment. The schedules called for information under the following heads: Composition of families, including servants; age; sex; names and titles; civil status; social condition; religion; occupation; marriages, births, and deaths; the number of cities, towns, hamlets, villages, dwellings, and renters. The number of Austrian subjects living in foreign parts was obtained through the imperial legations. The census of the naval and military population was separately taken by the proper authorities. In 1828 a central bureau of statistics was created, and charged with the duty of consolidating the census-returns and preparing them for publication.

Russia.—Partial censuses were taken by order of the Russian government in 1700, 1704, 1705, and 1710. In 1718, Peter the Great required all landed proprietors to make a declaration of the number of serfs belonging to each. The same year he organized a special commission to visit the separate provinces of his empire for the purpose of making a general census. No enumeration of females was made in these early censuses, which were taken solely for the purposes of revenue and military conscription. A decree of 1722 directed that a census should be taken once in twenty years; but this interval of time was not regularly observed

during the remainder of the eighteenth century. In 1802 a central bureau of statistics was organized under the direction of the minister of the interior, who superintended the returns of population, agriculture, commerce, and industry. This bureau was reorganized in 1852 under the name of the statistical commission. The commission has taken censuses in 1812, 1815, 1834, 1850, 1860, and 1870. The census is taken by means of printed schedules distributed by the local authorities, who are made responsible for the proper returns. The work of consolidating and publishing the returns devolves upon the statistical commission.

Norway.—A decennial census was instituted in Norway in 1815, and has continued up to the present time, comprising inquiries as to age, sex, civil status, number of families and habitations, useful domestic animals, and the territorial area of each district. A bureau of statistics superintends all forms of public statistics except those pertaining to the administration of justice, public education, and financial administration. Inquiries are made once in five years in regard to the condition of industry. Annual exhibits are made of births, marriages, and deaths, of commerce and navigation, of the administration of justice, and of the population suffering from physical and mental disabilities.

Spain paid but little attention to public statistics after her census of 1798 until 1856, when a central statistical commission was organized, under whose supervision a general census was taken in 1857, and since then once in three years. The census is taken in one night by government officials charged with the collection, verification, and consolidation of the returns. A final revision is made by the statistical commission.

Switzerland.—The original constitution of the Swiss federation required a census to be taken once in twenty years. Most of the inquiries were conducted by the several cantonal governments. The returns were not uniform, and were generally inaccurate. In 1860 a law of the Federal assembly prescribed a decennial census for the whole federation, and instituted a federal bureau of statistics under the direction of the interior department. The first census under the new law was in 1860. The inquiries included sex, age, civil condition, origin, birthplace, domicil, religion, language, physical disabilities, immigration, the distribution of real property, the number of families, and the number of habitations and other buildings. The statistical bureau is endeavoring to extend the range of the census, but finds its efforts somewhat impeded by the difficulty of dealing with twenty-five cantonal governments. The cantonal statistics collected by the local governments are consolidated and published by the central bureau. The latter is endeavoring to give a more national character to the statistical service. Until a few years ago, the different cantons followed different methods in the collection of vital and mortuary statistics, but at the instance of the bureau they have now adopted a uniform plan. In 1866 the central bureau initiated the census of live-stock, and later collected very full statistics of railways, savings banks, and fire-insurance companies.

Italy.—Soon after the establishment of the modern kingdom of Italy, in 1859 and 1860, a bureau of statistics was created with ample powers, under the direction of Doctor Maestri, an eminent statistician. The first general census, which was to afford the basis of representation in the national parliament, was taken December 31, 1861, under a law prescribing general enumerations once in ten years. The census is taken in one day by means of previously distributed schedules. Since 1861 the central bureau has been charged with additional inquiries relative to mutual-aid societies, savings banks, public charities, industrial corporations, libraries, and institutions of education.

The census in modern *Greece* dates from her last struggle for independence. The first general enumeration of the people was made in 1836. From that date censuses were taken annually until 1845; since when they have been taken at irregular intervals—viz., 1848, 1853, 1856, 1861, and 1868.

Statistical Congress.—The work of taking modern censuses has been greatly facilitated, and the value of the results greatly increased, by the efforts of the "International Statistical Congress," an organization which resulted from the great exposition held in London in 1851. The congress is composed principally of men from all civilized nations, who in their own countries are members, leaders, and chiefs of bureaus of statistics, or who have charge of the census. Sessions of the congress were held in Brussels in 1853, Paris in 1855, Vienna in 1857, London in 1860, Berlin in 1863, Florence in 1867, at The Hague in 1869, and the eighth and last at St. Petersburg, August, 1872.

The census has been a leading topic of discussion by the congress. Statements have been made of the condition of the census movement in the various countries, and the congress earnestly recommended uniformity in the census inquiries, in order that comparisons could be made of the vital statistics of the different countries. Many valuable modifications have been made in the censuses of nearly all the nations, in consequence of the suggestions of the congress. As a result of these efforts, Messrs. Quetelet and Heuschling published at Brussels in 1865 a volume of international statistics, in which the population reports of the United States and all the leading states of Europe are collected and arranged in comparative tables.

The Census of the United States.—Considering the character of the present work, the census of the United States should receive much more attention than that of any other country. The matter will be distributed under three heads:

1. *The Colonial Period.*—The American census originated in the colonial period of our history. The British board of trade played an important part in colonial affairs. At times it was almost the supreme directing power, and under its instructions several enumerations of the population of the colonies were attempted. The tables were prepared under the immediate direction of the colonial governors by the sheriffs and justices of the peace, and were exceedingly inaccurate. Mr. Bancroft, speaking of enumerations in the latter part of the seventeenth century, says: "The positive data in those days are half the time notoriously false." (*History*, vol. ii., p. 450, *note.*) Speaking of the same materials in the middle of the eighteenth century, he says: "Nearly all are imperfect." (Vol. iv., p. 128, *note.*) The so-called enumerations should rather be called computations. No general examination, embracing all the colonies, was ever attempted. The tables prepared for the board of trade were in great part based on muster-rolls and returns of taxables. "Enumeration is a slow and laborious process," says Sir G. C. Lewis, "and until experience has taught us its necessity, where correctness is required there is a disposition, especially among uncultivated people, to rely upon computation." Besides, the aggregates found in the tables were no doubt generally too large. "To count," says Doctor Johnson, "is a modern practice; the ancient method was to guess; and when numbers are guessed they are always magnified." That no accurate enumerations of population were made in the colonial period should excite no surprise. The census had not yet assumed scientific form and definiteness. England took her first census in 1801, and even then the work was so imperfectly done that the results were of no great value. On general grounds it would be absurd to suppose that the board of trade took accurate enumerations of the British colonists in America a half century or century before England counted her own people. Besides, the directing authority was three thousand miles distant from the people to be enumerated, and the sparseness of the population, scattered over immense areas, as well as the free and independent modes of life prevailing in many localities, made thoroughness and accuracy impossible. Superstition also opposed census-taking. In 1712, Governor Hunter undertook an enumeration of the inhabitants of New York. In writing to the home government he excused the imperfection of the returns in part by saying that "the people were deterred by a simple superstition and observation that the sickness followed upon the last numbering of the people." (*Colonial History of New York*, vol. v., p. 339.) Governor Burnett of New Jersey, in a communication to the English board in 1726, alluding to an enumeration made in New York three years before, said: "I would have then ordered the like accounts to be taken in New Jersey, but I was advised that it might make the people uneasy, they being generally of a New England extraction, and thereby enthusiasts; and that they would take it for a repetition of the same sin that David committed in numbering the people, and might bring on the same judgments. This notion put me off at that time, but, since your lordships require it, I will give the orders to the sheriffs that it may be done as soon as may be." (*Ib.*, vol. v., p. 777.)

The tables prepared under the direction of the board of trade are so inaccurate that the more careful of recent writers have generally preferred to construct new tables rather than rely on them. Mr. Bancroft constructs a valuable table, showing the population at different dates from 1750 to 1790. (*History of the United States*, vol. iv., pp. 127, 128, *note.*) He uses as data the returns, computations, and official papers of current history, and also private letters and journals. Mr. Bancroft says: "He who will construct retrospectively general tables from the rate of increase in America since 1790 will err very little." In 1688, the period of the English Revolution, the population of the colonies was about 200,000. The aggregates found in three tables prepared for the board of trade are here presented (see Bancroft, vol. iv., p. 128, *note*):

Year.	Whites.	Blacks.	Total.
1714	375,750	58,850	434,600
1727	502,000	78,000	580,000
1754	1,192,896	292,738	1,485,634

Mr. J. D. B. DeBow, following "Holmes's Annals" as his chief authority, gives three other tables:

Year.	Total.
1701.....	262,000
1749.....	1,046,000
1775.....	2,803,000

II. *The Continental Period.*—In the Continental Congress the question early arose, How shall the burdens of the war be distributed? During the whole struggle for independence Congress found no more perplexing question. On the 26th of December, 1775, that body authorized and directed the emission of $3,000,000 in bills of credit. It also resolved that the thirteen United Colonies be pledged for the redemption of these bills; that each colony provide ways and means to sink its proportion in such manner as it sees fit; that the proportion of each colony be determined according to the number of its inhabitants of all ages, including negroes and mulattoes; and that it be recommended to the colonial authorities to ascertain in the most effectual manner their respective populations, and to send the returns to Congress properly authenticated. Most of the colonies failed to comply with this recommendation. Immediately after the adoption of the Declaration of Independence, Congress began to discuss the form of a confederation to be entered into by the States. After long discussion the Articles of Confederation were perfected and submitted to the States in 1777, but failing of an earlier ratification, they did not go into operation until 1781. The ninth article declared: "The United States in Congress assembled shall have authority . . . to agree upon the number of land forces, and to make requisition from each State for its quota, in proportion to the number of white inhabitants in such State." In November, 1781, a resolution was introduced into the Congress recommending to the several States that they cause to be taken and transmitted to Congress the number of their white inhabitants, pursuant to the ninth article of the Confederation. The resolution failed to pass, and the article was inoperative. The financial machinery provided by the eighth article of the Confederation wholly broke down; rather, it was never set in motion. In 1783, Congress sought to induce the States to provide new machinery. An amendment to the eighth article was proposed, which declared that "All charges of war and other expenses that have been or shall be incurred for the common defence or general welfare, and allowed by the United States in Congress assembled, except so far as shall be otherwise provided for, shall be defrayed out of a common treasury, which shall be supplied by the several States in proportion to the whole number of white and other free citizens and inhabitants, of every age, sex, and condition, including those bound to servitude for a term of years, and three-fifths of all other persons not comprehended in the foregoing description, except Indians not paying taxes in each State; which number shall be triennially taken and transmitted to the United States in Congress assembled, in such mode as they shall direct and appoint." This amendment did not prevail, and the Articles of Confederation remained unchanged until they were superseded by the present national Constitution. The proposed amendment, however, contains the original suggestion of the "three-fifths rule." During the continental period no general enumeration of population was secured. Various estimates and computations were produced in Congress from time to time, but they came no nearer accuracy than those made in the colonial period. Thus far, no complete enumeration had been effected. But it had become clear that there never could be such enumeration until the work was done by a central directing authority. It was left to the Constitution to give us first an enumeration of population, and afterwards a national census.

III. *The Constitutional Period.*—The framers of the Constitution had few, if any, more difficult questions to deal with than the apportionment of representatives and direct taxes. After long deliberation the matured opinion of the convention assumed the well-known form: "Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct." In a subsequent clause this enumeration is called a census, but it did not contemplate a census in the present received sense of that word. Enumerations of the people have almost always originated in military or fiscal necessities, and have been used for immediate practical ends. The varied and important uses for which statistics are now employed are altogether modern. But while the framers of the national Constitution never contemplated a census that should answer the thousand questions of social and political science, they nevertheless provided an instrument by which many of those questions are now answered. At its second session, the first Congress passed a law to carry the constitutional provision into effect. It was approved March 1, 1790. As this law was the model of subsequent legislation upon the same subject for fifty years, its leading provisions are here stated. The marshals of the several judicial districts were authorized and required to cause the inhabitants within their districts, excluding Indians not taxed, to be enumerated; the marshals were empowered to appoint as many assistants as the service required; the enumeration was to commence August 1, 1790, and was to be completed within nine months thereafter; the marshals were to file the returns with the clerks of their respective district courts, who were directed to receive and carefully preserve the same; the aggregates were to be transmitted to the President of the United States by September 1, 1791; each assistant marshal was required to cause a correct schedule of the inhabitants enumerated within his division, duly signed, to be set up for inspection at two of the most public places within said division; and every person above sixteen years of age was required to give the census-taker all necessary information in his possession. The law further prescribed the necessary oaths, penalties, forms, and compensation. Although all inquiries strictly pertained to population, the schedule incorporated in the law covered two or three items of information not strictly required by the Constitution. The inquiries were six in number: 1, Names of the heads of families; 2, free white males of sixteen years and upwards, including heads of families; 3, free white males under sixteen years; 4, free white females, including heads of families; 5, all other free persons; 6, slaves. Under this law the first real enumeration of population within the United States was made.

Just before the census law of 1800 was enacted, two learned societies memorialized Congress on the subject. The American Philosophical Society, Thomas Jefferson its president, represented that the decennial census offered an occasion of great value for ascertaining sundry facts highly important to society, and not otherwise to be obtained. It therefore prayed that the next census might be so taken as to present a more detailed view of the inhabitants of the United States under several different aspects; such as the effect of soil and climate on human life; the increase of population by birth and emigration; and the conditions and vocations of the people. To gain the first of these ends, the society suggested that the population should be much more minutely analyzed with respect to age. To gain the second, it was proposed that a table should be used presenting in separate columns the respective numbers of native citizens, citizens of foreign birth, and aliens. To reach the third end, it was proposed that the number of free male inhabitants of all ages engaged in different professions and pursuits should be ascertained, such as merchants, agriculturists, handicraftsmen, mariners, etc. The other memorial came from the Connecticut Academy of Arts and Sciences, Timothy Dwight president. It had in contemplation to collect the materials for a complete view of the natural history of man and society in this country. Its suggestions were similar to those contained in the former memorial, but were less detailed. Both memorials were presented to the Senate January 10, 1800, and were referred to the committee already charged with drafting a census bill. They do not seem to have attracted any attention. In the year 1800 the national legislature was poorly prepared to appreciate the value of such a census as these memorialists prayed for; but it is interesting to note the fact that there were then thoughtful men in the country, who appreciated the importance of statistical investigation, and who saw the national Constitution had provided all necessary machinery to gather its materials. The law of 1800 contained some new features of minor importance. The schedule was considerably extended. It registered the name of the county, parish, town, etc. where the family resided; the name of the head of each family; free white males under ten years of age; free white males of ten and under sixteen; free white males of sixteen and under twenty-six; free white males of twenty-six and under forty-five; free white males of forty-five and upwards. The last five inquiries were duplicated in reference to females. All other persons,

except Indians not taxed, and slaves, were also enumerated, but without distinction of age.

The general direction of the census was placed in the state department, where it remained until the passage of the present census law.

In 1810 the population schedule of 1800 was used without change or modification. The scope of the census was enlarged so as to embrace other statistics than those relating to population. An act approved May 1, 1810, amendatory of the census act approved March 1, 1810—thereby showing that the enlargement was an afterthought—required the marshals and their assistants at the time for taking the enumeration to take, under the direction of the secretary of the treasury, and according to such instructions as he should give, an account of the several manufacturing establishments within their several districts and divisions. The construction of the schedule was left to the discretion of the secretary of the treasury. The one used was a mere aggregation of items, and evinced no skill in selecting and classifying the inquiries. For this reason, as well as the further one that the manufacturers were but poorly prepared to co-operate with the census-takers, the results obtained were of no great value.

The census of 1820 presents no new features of marked importance. The population schedule discriminated between foreigners naturalized and not naturalized, while slaves and free colored persons were classified with respect to age. A new manufacturers' schedule was introduced, which was an improvement upon that of 1810. It comprehended fewer details, but was much more discriminating in inquiries and more scientific in arrangement. This part of the work, however, was so imperfectly done by the census-takers, that the results obtained possessed but little value.

In the census of 1830 no attempt was made to obtain industrial statistics of any sort. The schedule made a more minute classification of population than had been before attempted. The number of the deaf and dumb and the blind in the three great classes of white, free colored, and slave population was ascertained as far as practicable in conducting a new experiment.

In 1840 still other statistics of population were collected, the number of insane and idiotic people was recorded, the number of persons engaged in the great industries, such as agriculture, mining, manufactures, and commerce, was ascertained; likewise the number of Revolutionary pensioners. Several columns were added to the schedule for educational statistics of universities or colleges, academies, and grammar, primary, and common schools; the number of scholars in these schools; together with the number of white persons over twenty years of age who could not read and write. The attempt to obtain statistics of industry was renewed, and an extended though badly-arranged list of questions was incorporated in the population schedule. As there was no penalty for refusing to answer these questions, in some localities the people refused to answer them, on the ground that they were illegal and inquisitorial. A leading journal asked: "Is this Federal prying into the domestic economy of the people a precursor to direct taxes? Is nothing to escape its inquisitors or tax-gatherers? Is it worthy of the dignity and high functions of the Federal government to pursue such petty investigations?" (See "Compendium of the United States Census," 1850, p. 12.) The industrial statistics obtained, however, were the most valuable yet procured.

There have been two important events in the history of the American census: first, the incorporation in the national Constitution of the clause requiring a decennial enumeration of the people; secondly, the passage of the law under which the last three censuses have been taken.

As the time for taking the seventh census drew near, the subject began to attract an unusual degree of attention. A census board, consisting of the secretary of state, the attorney-general, and the postmaster-general, was created by an act approved March 3, 1849. This board was empowered to appoint a secretary, and was charged with the duty of preparing forms, schedules, etc. for taking the next census, but was instructed not to incorporate into the schedules more than one hundred questions of all kinds. At the next session of Congress the Senate raised a special committee on the census, and imposed upon it a similar task. Several eminent statisticians were called to Washington for consultation. As the result of this preparatory work a bill was finally matured and passed which greatly extended the sphere of the census. This act, approved May 23, 1850, is entitled "A general act providing for the census of 1850, and for every subsequent census." It created a census office in the newly-created department of the interior, and placed the taking of the seventh and each succeeding census under the charge of an officer known as the superintendent of the census. The six schedules incorporated in the law bore the following names by number: 1, "Free inhabitants;" 2, "Slave inhabitants:" 3, "Persons who died during the year ending June 1:" 4, "Productions of agriculture:" 5, "Products of industry;" 6, "Social statistics." Two important new features were incorporated in the first schedule: the name, age, sex, and color of each person, together with the place of his birth, whether State, Territory, or country, were required.

The third or mortality schedule contained a class of inquiries wholly new in the American census, and which led to valuable results. The fourth, fifth, and sixth schedules related to subjects that had received some attention in previous censuses, but they were now for the first time investigated with much thoroughness. The census of 1850 was a great improvement on all its predecessors, and went far to place our census in the front rank of national enumerations.

The census of 1860 was taken, under the superintendence of Mr. J. C. G. Kennedy, on the same plan as that of 1850, with but few modifications. Its statistics, however, were more complete than those of 1850.

Before the census of 1870 was taken, an attempt was made to procure a new law which should provide new machinery and remodel the old schedules. An elaborate bill passed the House of Representatives, but failed to receive the sanction of the Senate. The census of 1870 was taken under the law of 1850, with such modifications as were required by the amendments to the Federal Constitution. Some important additions to the inquiries were also made by the census office, under the superintendence of Mr. Francis A. Walker. In consequence of the abolition of slavery the old schedule relating to statistics of slaves was dropped. To meet the requirements of the fourteenth amendment to the Constitution, two columns were added to the population schedule—the first to obtain the number of male citizens of the United States in each State of twenty-one years and upwards; the second to obtain the number of such citizens whose right to vote is denied or abridged on other grounds than rebellion or crime. Many changes were made by the census office in the forms of the inquiries, by which they were rendered more definite and more easily understood. Besides the inquiries concerning "place of birth," two columns were added requiring a statement of the parentage of each person. This has enabled us to know the number of our people born of foreign parents. An inquiry was also added concerning the public debt of towns, cities, counties, and States, the results of which are very interesting. A striking feature has been added in the publication of results by the construction of fourteen finely-engraved, graphic maps, illustrating the various classes of statistics. They represent the density of the total population; the distribution of the colored and foreign elements of population; the dispersion over the States of natives of the leading European countries; the illiteracy and the wealth of each section in contrast; the geographical and political divisions of the United States at each period from the organization of the government to 1870; the range in degree of four leading groups of diseases; and the range in degree of five principal agricultural products.

The ninth census was completed in a much shorter space of time than any of its predecessors. The actual enumeration of inhabitants began June 1, 1870, and was completed on the 9th of January, 1871. On the 1st of November, 1872, the superintendent announced the completion of his report. It is not too much to say that the reports of the ninth census form one of the noblest contributions which any country has ever made to statistical science.

It clearly appears from this historical review that the census of the United States is the result of a uniform and steady development. Its germ is found in the national Constitution, and its epochs of growth are the periods of the recurring decennial enumerations. Instead of one schedule, comprehending six inquiries, as in 1790, we now have six schedules, comprehending about one hundred inquiries. Two other series of facts exhibit this growth in a manner equally striking—viz., the official publication of the results of successive censuses, and the total cost of each census. These facts are shown in the following exhibit:

1790. "Return of the whole number of persons within the several districts of the United States, etc."—an octavo pamphlet of 52 pages, published in 1792. Cost of this census, $44,377.18.

1800. "Return of the whole number of persons within the several districts of the United States, etc."—a folio of 78 pages, published in 1801. Cost of second census, $66,609.04.

1810. The report of this census was in two folio volumes: I. "Aggregate amount of each description of persons within the United States, etc."—an oblong folio of 90 pages, the date of publication not named. II. "A series of tables showing the several branches of American manufactures, exhibiting them in every county of the Union, so far as

they are returned in the reports of the marshals and the secretaries of the Territories, and of their respective assistants, in the autumn of 1810; together with returns of certain doubtful goods, productions of the soil, and agricultural stock, so far as they have been received"—170 pp., 4to. Cost of third census, $178,444.67.

1820. I. "Census for 1820, etc."—a folio of 164 pp., published in 1821. II. "Digest of accounts of manufacturing establishments, etc."—a folio of 100 pp., 1823. Cost of fourth census, $208,525.99.

1830. "Fifth census of enumeration of the inhabitants of the United States"—a folio of 163 pp., 1832. (This report was so wretchedly printed that Congress required by law a republication, which was made the same year under the immediate direction of the secretary of state.) Cost of the fifth census, $378,543.13.

1840. I. "Compendium of the enumeration of the inhabitants and statistics of the United States"—a folio of 378 pp., 1841. II. "Sixth census or enumeration of the inhabitants of the United States"—folio, 470 pp., 1841. III. "Statistics of the United States, etc."—folio, 410 pp., 1841. IV. "Census of pensioners of Revolutionary and military service, with their names, ages, and places of residence, etc."—4to, 196 pp. Cost of sixth census, $833,370.95.

1850. I. "The seventh census of the United States"—quarto of 1022 pp., 1853. II. "Statistical view of the United States"—octavo, 400 pp., 1854. III. "Mortality statistics of the seventh census, etc."—octavo, 304 pp., 1855. IV. "Digest of the statistics of manufactures"—octavo, 143 pp., 1859. Cost of seventh census, $1,329,027.53.

1860. I. "Preliminary report of the eighth census, 1860"—octavo, 294 pp., 1862. II. "Final report:" vol. I. "Population," pp. 694, 1864; II. "Agriculture," pp. 292, 1864; III. "Manufactures," pp. 746, 1865; IV. "Mortality and miscellaneous statistics," pp. 584, 1866. Cost of eighth census, $1,922,272.42.

1870. "Ninth census of the United States." Vol. I. "The statistics of the population of the United States, embracing the tables of race, nationality, sex, selected ages, and occupations, to which are added the statistics of school attendance and illiteracy, of schools, libraries, newspapers, and periodicals, churches, pauperism and crime, and of areas, families, and dwellings"—quarto, pp. 804, 1872; II. "The vital statistics of the United States, embracing the tables of deaths, births, sex, and age, to which are added the statistics of the blind, the deaf and dumb, the insane, and the idiotic," 1872; III. "The statistics of the wealth and industry of the United States, embracing the tables of wealth, taxation, and public indebtedness, agriculture, manufactures, mining, and the fisheries, with which are reproduced, from the volume on population, the major tables of occupations," 1872; also, "A compendium of the ninth census, compiled pursuant to a concurrent resolution of Congress." Cost of the ninth census, $3,336,511.41.

STATE CENSUSES.—In most of the States of the Union a census is required at some time within the interval between the national censuses, for the purpose of ascertaining the basis of representation in their legislatures. In some of the States (for example, Massachusetts, Rhode Island, and New York) the enumerations are made with great care, and many valuable statistics are obtained in connection with them. But in most of the States nothing but a simple enumeration is attempted, and this is made with but little accuracy. In all the States, except Connecticut, Georgia, and West Virginia, a census is authorized or required by their constitutions. The constitution of Indiana, adopted in 1851, required a census in 1853, and every six years thereafter. The constitution of Pennsylvania requires a census to be taken once in seven years, in such manner as the legislature may direct. In Kentucky a census was required to be taken in 1857, and every eight years thereafter. In the following States censuses are required once in ten years, beginning as follows: Tennessee, 1841; Michigan, 1854; Illinois, New York, Wisconsin, and California, 1855; Massachusetts, Kansas, Minnesota, and Oregon, 1865; Alabama, Arkansas, Florida, Iowa, Louisiana, Nebraska, Nevada, North Carolina, South Carolina, and Texas, 1875; and Missouri, 1876. The constitutions of Maryland, New Jersey, and Rhode Island permit the taking of a census once in ten years. The constitution of Mississippi requires a census to be taken once in ten years, after a day to be fixed by the legislature. The constitution of Maine permits a census once in five years, and requires it once in ten years. Delaware and New Hampshire have no provisions in their constitutions requiring a census. The constitution of Ohio permits a State census; for many years the legislature has provided for a State statistician, who makes annual reports on vital and other statistics.

The classes enumerated in the several State censuses are as follows: In Kentucky and Tennessee, qualified voters; in Pennsylvania, taxable inhabitants; in Michigan, white inhabitants and civilized persons of Indian descent not belonging to Indian tribes; in Indiana, white male inhabitants over twenty-one years of age; in Illinois, Oregon, and Texas, white inhabitants; in Maine, the whole population except foreigners not naturalized, and Indians not taxed; in Nebraska and Wisconsin, the whole population except Indians not taxed and soldiers and sailors in the army and navy of the United States; in New York, the whole population except aliens and colored persons not taxed. In all the other States where a census is required the whole population is taken.

Besides the works already referred to, the following may be consulted on the general subject: SINCLAIR (Sir JOHN), "Analysis of the Statistical Account of Scotland," 8vo, Edinburgh, 1825; MACAULAY'S "History of England," vol. i., chap. iii.; MCCLINTOCK and STRONG, "Encyclopedia of Biblical, Ecclesiastical, and Theological Literature;" SMITH, "Dictionary of the Bible," 3 vols. 8vo, London, 1860–63; SMITH, "Dictionary of Greek and Roman Antiquities," 8vo, London, 1842; BABBAGE, "Ninth Bridgewater Treatise," 8vo, London, 1837; "Journal of the Statistical Society of London," vols. i. to xxxiv., 8vo, London, 1839; HUME, "Essay on the Populousness of Ancient Nations," Philosophical Works, vol. iii., Boston edition, 1854; CAPTAIN JOHN GRAUNT (Sir William Pettit), "Natural and Political Observations upon the Bills of Mortality," 5th edition, 16mo, London, 1676; "Annuaire de l'Économie Politique et de la Statistique," 1e–28e année, Paris, 1844–72; "Journal des Économistes," 1e–28e année, Paris, 1841–69; "Report of the Proceedings of the International Statistical Congress, Fourth Session, at London, 1860," quarto, London, 1861; "British Almanac for the year 1872," 12mo, London, 1873; AD. QUETELET, "Statistique Internationale" (Population), 4°, Bruxelles, 1865; AD. QUETELET, "Physique Sociale, ou Essai sur le Développement des Facultés de L'Homme," Bruxelles, 1869, 2 vols. 8vo; MOREAU DE JONNÈS, "État Économique et social de la France depuis Henri IV. jusqu' à Louis XIV.," Paris, 1867.

GENERAL JAMES A. GARFIELD,
B. A. HINSDALE,
President of Hiram College, Ohio.

Cent [Lat. *centum*, a "hundred"], a coin of the U. S. worth the one-hundredth part of a dollar, or nearly one halfpenny sterling. It is now coined of an alloy of copper, tin, and zinc, and is legal tender for the payment of sums not exceeding twenty-five cents. The Dutch cent is the one-hundredth of a guilder, and is worth about one-third of the American cent.

Centaure'a [Lat.], a genus of herbs of the order Compositæ, several species of which are naturalized from Europe in the U. S. It includes the blue bottle (*Centaurea Cyanis*), common in corn-fields, of which the flowers yield a fine blue dye; the sweet sultan (*Centaurea moschata*), a fragrant garden-flower; the knapweed (*Centaurea Jacea*), sometimes cultivated for the fine yellow dye it affords.

Cen'taurs [Gr. Κένταυροι: Lat. *Centauri*], fabulous animals which the ancient Greek poets imagined to be half men and half horses, the head and anterior part being human. They were supposed to be the offspring of Ixion and a cloud, and to have lived in Thessaly. The battle of the Centaurs with the Lapithæ was celebrated in Greek mythology, and was a favorite subject of ancient art.

Centau'rus (the "Centaur"), a constellation of the southern hemisphere, contains two stars of the first magnitude, designated respectively as α Centauri and β Centauri.

Cen'taury, a popular name of several Old World herbs of the genus *Erythræa* and order Gentianaceæ; and also of the *Sabbatia angularis*, their American representative, all valuable bitter tonics, used in dyspepsia and intermittent fevers. The *Erythræa Chilensis* of Chili has similar uses. The *Erythræa acaulis* of Barbary is extensively used for dyeing yellow.

Centen'nial [Lat. *centennis*, from *centum*, "a hundred," and *annus*, "a year"], occurring once in a hundred years, or completing the period of a hundred years. The term is used chiefly to denote the anniversary of an event which is celebrated one hundred years after it occurred, and at the end of each subsequent period of one hundred years.

Centennial Exhibition. The Congress of the U. S., by two acts, approved Mar. 3, 1871, and June 1, 1872, provided for the celebration in the year 1876 of the one-hundredth anniversary of the Declaration of American Independence by an "international and universal exhibition," designed to be of the most cosmopolitan character. It is intended that the exhibition shall be held in Fairmount Park in the city of Philadelphia. The first of the above-mentioned acts of Congress provides for the appointment (by the President) of the "U. S. Centennial Commis-

sion," consisting of two commissioners from each State and Territory. The second act incorporates the Centennial Board of Finance, and provides for the issue of stock to the amount of ten millions of dollars, in one million shares of ten dollars each. It also has been proposed to distribute the stock among the people of the different States and Territories in the ratio of their population, but subscriptions are received without regard to the amount allotted to each State. The stockholders organized a board of directors on April 1, 1873.

The stimulus given to industrial pursuits by the great exhibitions already held in London, Paris, etc. has been very remarkable; and it is believed this undertaking, even as a business investment, will be profitable to the country. It is designed to make it a "comprehensive display of the industrial, intellectual, and moral progress of the nation during the first century of its existence."

Center. See CENTRE.

Cen'tering, the framework upon which an arch or vault of stone, brick, or iron is supported during its construction. The simplest form of centering is that used by masons and bricklayers for the arches of common windows and doors. This is merely a board of the required shape, upon the curved edge of which the bricks or stones of the arch are supported until they are keyed in. In building bridges or other structures where arches of great span are to be constructed, the centering is usually made of framed timbers or timbers and iron combined.

Centerville. See CENTREVILLE.

Cen'tigrade [from the Lat. *centum*, a "hundred," and *gradus*, a "step," "degree"] **Thermometer,** the name of a thermometer having its scale between the freezing and the boiling-point of water divided into one hundred equal parts, or degrees, the freezing-point being taken as zero, and the boiling-point as 100°. This scale was invented about the year 1741 by Prof. Anders Celsius of Upsala in Sweden, and hence it is often called Celsius's thermometer. Its use was for many years mostly limited to Sweden and Russia, but it is now the scale generally used in France; and its excellencies so commend it that it will probably come into almost universal use. In Germany it is rapidly superseding the scale of Réaumur, while in England, Holland, and the U. S., where Fahrenheit's scale is more generally known, the centigrade is used in chemical and other scientific operations, and thermometers are often marked with both scales, one on each side of the mercurial column. The advantages of the centigrade scale are that its zero and its hundredth degree are natural, and not arbitrary, and, above all, that its divisions are in harmony with the decimal system of measurement. The objection to the centigrade, that its degree is too large, is obviated by dividing the degree into decimals, which are marked on the scale, thus greatly increasing its precision. One degree centigrade is equal to 1.8 Fahrenheit, or, conversely, one degree Fahrenheit nearly equals .55 of a degree centigrade; but there are some practical difficulties in reducing temperatures from one to the other, which will be noticed under the article THERMOMETER (which see).

Cen'tipede [Lat. *centum*, a "hundred," and *pedes*, "feet"], a popular name for various insects of the order Myriapoda, but properly given to those of the sub-order Chilopoda, and especially to the family Scolopendridæ. They have long slender bodies, and twenty-one to twenty-three pairs of feet. Some tropical species are nearly a foot long. The bite of many species is poisonous, and even dangerous. *Scolopendra heros* is the largest U. S. species, and is found in the South.

Cen'to [from the Lat. *cento*, "patchwork"], a name applied to literary trivialities in the form of poems manufactured by putting together distinct verses or passages of one author, or of several authors, so as to make a new meaning. The cento was a favorite recreation in the Middle Ages.

Cen'tral, a township of Franklin co., Mo. Pop. 2271.

Central, a township of Jefferson co., Mo. Pop. 1789.

Central, a post-township of St. Louis co., Mo. P. 8923.

Central, a township of Humboldt co., Nev. Pop. 23.

Central, a township of Essex co., Va. Pop. 3449.

Central, a township of Rockingham co., Va. P. 2882.

Central, a township of Doddridge co., W. Va. P. 833.

Central America. See AMERICA, revised by PROF. J. S. NEWBERRY, M. D., LL.D.

Central Bridge, a post-village of Schoharie township, Schoharie co., N. Y., at the junction of the Schoharie Valley and the Albany and Susquehanna R. Rs., 36 miles W. of Albany.

Cen'tral City, the capital of Gilpin co., Col., is situated among the Rocky Mountains, 40 miles W. by N. from Denver, on the Colorado Central R. R. It derives its prosperity from its gold mines, which produced $1,650,000 in 1870. It has many fine stone and brick buildings, several quartz-mills, a national bank, six churches, and a fine school building. Two daily and weekly papers are issued here. Pop. 2360.

Central City, a post-township of Marion co., Ill. Pop. 833.

Central Falls, a post-village of Lincoln township, Providence co., R. I. It is situated on the Blackstone River, about 6 miles N. of Providence, and has one weekly newspaper and extensive manufactures.

Central Forces, in mechanics, are those which radiate from a point or centre. A body impelled by a constantly acting force towards a fixed centre will move up to that point with a constantly increasing velocity; but if it have an initial motion in a direction towards some point other than the centre, the constantly acting central force will deflect it from its original path, but will not draw it to the centre of force. The resultant path will be a curve. The straight line from the moving body to its centre of force is called a "radius vector," and it is found, mathematically, that radii vectores of a body moving in a curve under the influence of a central force will pass over equal areas in equal times, whatever the rate of motion. We further find that the velocity of such a body is at all times inversely proportional to the perpendicular from the fixed point on the tangent to the curve at the point considered. Therefore, if the motion be uniform, the path of motion is a circle. If the path be an ellipse, and the centre of force be the centre of the curve, the central force is directly proportional to the distance; but if the centre of force be at a focus of the ellipse (or of a hyperbolic or parabolic path), the force acts with an energy inversely proportional to the square of the distance.

The laws of central forces are abundantly verified by the observed motions of the planets; and the same laws show that unless some disturbing force interfere the planets can never be drawn into the sun by gravitation.

Centra'lia, a city of Marion co., Ill., at the junction of the main line and the Chicago division of the Illinois Central R. R., 253 miles S. of Chicago. It has a national bank, two newspapers, machine-shops of the Illinois Central R. R. Company, a coal-mine, an iron-foundry, and various other manufactories. There are in Centralia several parks, a public library, six churches, a high school, and graded schools. The Southern Illinois fair-grounds are situated in the city. Pop. 3190; of township, 3579.

FLETCHER & WILLCOX, PUBS. "SENTINEL."

Centralia, a post-village of Nemaha co., Kan., on the Central branch of the Union Pacific R. R., 62 miles W. of Atchison. It is one of the most thriving towns in that region.

Centralia, a post-village of Boone co., Mo. It has one weekly newspaper.

Centralia, a post-borough of Columbia co., Pa., on the railroad which connects Mauch Chunk with Mount Carmel, 12 miles W. of Mahanoy City. Pop. 1342.

Centralia, a post-township of Wood co., Wis. P. 893.

Cen'tral In'stitute, a township of Elmore co., Ala. Pop. 907.

Central Park. The Central Park, the most important public work undertaken by New York City, next to the Croton Aqueduct, was the first place deliberately provided for the inhabitants of any city or town in the U. S. for exclusive use as a pleasure-ground, for rest and exercise in the open air. The well-known Boston Common, it is true, dates back to 1634, and by a clause in the city charter it is made public property for ever, and cannot be sold or exchanged. Its original purpose, however, was not as a place for exercise and recreation, but for a "common," such as the earlier settlers had known in the villages of the mother-country, and such as still exist there—places on which the owners of cattle, horses, sheep, and geese pasture them in common; and it is only since Boston and other New England towns, such as Salem and Lynn, have increased so greatly in size, that these tracts—all comparatively small: the Common in Boston is only 48 acres—have been appropriated to their present use.

New York, we believe, never had a common, but the city remained for so many years confined to the lower part of the long and narrow island on which it is built that there was no need felt for any ground being set apart, either for the pasturing of cattle or for the recreation of the inhabitants. The Battery supplied, for many years, a most charming promenade, many of the streets long retained a semi-rural or village character, and the immediate suburbs of the city, which, within the easy memory of men now living, began as low

down as Canal street, were as pleasant places for strolling, on foot or in the homely vehicles of the time, as could be desired. The very name of the Bowery tells us what was the look of the old country-road with its overarching trees; it is not long since an old pear tree stood to mark where once the old Stuyvesant farm sunned its broad acres, that now show ranks of houses where once waved ranks of corn; and not a few of the hugest of New York fortunes are the result of the rise in the value of land once cultivated as market-gardens by the fathers of its present aristocratic owners.

It was not till more than two hundred years had elapsed since the founding of the city that the inhabitants of New York began to feel the need of some place specially devoted to open-air enjoyment. The late A. J. Downing was the first to propose the establishment of a great public park, and the articles he wrote in 1850 on the subject in the "Horticulturist," a journal devoted to rural affairs he was at that time editing, gave eloquent expression to the public feeling, and soon bore practical fruit. In 1851, Mr. A. C. Kingsland, then mayor of New York, in a message to the common council, strongly recommended the establishment of a public park within the limits of the city, and it was at once referred to the committee on land and places. This committee reported in favor of adopting the mayor's recommendation, but the report gave rise to an unfortunate controversy that postponed for two years the undertaking of the so-much needed improvement. When it was first determined in the popular mind that New York must have a public park, two rival schemes presented themselves for consideration. One of these was the Jones's Wood scheme, the other the Central Park scheme, and the advocates of each measure mustered such good argument and such powerful influence that the legislature itself was puzzled for a time, and after having on the 21st of July, 1853, passed an act authorizing the city to take possession of the land now known as the Central Park, it actually on the same day passed another act authorizing the city to take possession of Jones's Wood! But the opinion of the public was too plainly in favor of the central site, and the next year (April 11, 1854) the act relative to Jones's Wood was repealed, and no further attempt was made to revive it. The site known as Jones's Wood had very little to recommend it, and it had two serious defects—its insufficient size and its position at one side of the city. Its recommendations were, the undulating character of its surface, the fact that it was already covered with a good growth of forest trees, and, above all, that it lay along the East River, always an animated scene with its steamboats, shipping, the islands, and the neighboring shore. Unfortunately, one of these islands, Blackwell's, extended along the whole water-front of the proposed park, which was bounded on the N. and S. by Seventy-fifth and Sixty-sixth streets, and on the W. by the Third avenue; and an island inhabited by convicts would not have been an edifying prospect. There is little to be gained by thinking of what might have been, but the Jones's Wood scheme might have had a better chance if, instead of limiting itself to the narrow area of 150 acres included between the above-named streets and the East River, it had boldly proposed to take possession of Blackwell's Island, and even to pass over to the shore of Long Island itself by means of (eventually) several bridges. Engineering difficulties we do not pretend to have thought about may have stood in the way of such a project; but, apart from any such lions in the way, the plan itself had many obvious advantages. It would have given us much more variety than we have at present, together with a water-view, always a delightful addition to a public pleasure-ground, and as much land, with as irregular an outline, as was needed. For in truth it would appear that the only recommendations the Central Park site had to offer were just its more central position and its greater size. And it is not to be denied that these were very considerable advantages, and that, on the whole, no better solution of the problem than this offered could have been found within the limits of the island. If the project for a park had been mooted either earlier or later, we might have avoided what we think will generally be admitted a serious drawback to the beauty of the park—the presence of the two huge reservoirs, which no ingenuity could make agree with any design in landscape gardening. Earlier, we might have secured our park-below the small reservoir at Fortieth street; later, we might have had it upon the Harlem River. In either case it would not have been necessary to lose 150 acres out of a little more than 800, as we do in the Central Park to-day.

As we have said, the popular preference for the larger and more generally accessible site was plainly expressed, and great gratification was manifested when the legislature had settled the matter in such a way that a beginning might reasonably be looked forward to in carrying out the long-wished-for scheme. On the 17th of Nov., 1853, five commissioners were appointed by the supreme court, through Judge William Mitchell, to take the land for the Central Park. These commissioners were William Kent, Michael Ulshoeffer, Luther Bradish, Warren Brady, and Jeremiah Towle. All these gentlemen were well known in the community, and a general confidence was felt that their difficult task would be performed with fairness and judgment. Nor did this confidence prove to be ill-grounded. The commissioners employed nearly three years in the work of estimating and assessing, sending in their report on the 4th of Oct., 1856, and, as Judge Harris remarked in confirming their report, it is an evidence of the success with which they accomplished their intricate task that but about one in forty of the owners of the lots taken for the park appeared before him to object to the award of the commissioners. The supreme court confirmed the report of the commissioners, and in Feb., 1856, the common council passed an ordinance for the payment of $5,160,369.90, of which $1,657,590 were to be paid by the owners of lands adjacent to the park, in view of the benefit they would receive from their neighborhood to it.

As the legislature had done nothing during its winter session towards arranging a government for the park, the city authorities took the matter into their own hands, and on the 19th of May, 1856, the board of aldermen adopted an ordinance appointing the mayor and the street commissioner commissioners with full authority to govern the park, to determine upon a plan for its improvement, and to appoint such persons as they might see fit to carry out their intentions. At that time Mr. Fernando Wood was mayor and Mr. Joseph S. Taylor street commissioner, and they sought the best advice they could obtain from gentlemen who held public and social positions—such as, taken with their reputation for taste and judgment, necessarily gave their opinions weight. These gentlemen, Washington Irving, George Bancroft, James E. Cooley, Charles F. Briggs, James Phalon, Charles A. Dana, and Stewart Brown, were invited to attend the meetings of the commissioners, and to form a board of consultation for the purpose of discussing what course had best be pursued in order to secure a suitable design for laying out the park. The first of these meetings was held on the 29th of May, 1856. Mr. Irving was made president of the board, and the preliminaries were settled for carrying out the objects of the commission. Many plans were presented at subsequent meetings for the improvement of the park, but nothing suitable, and matters dragged until a plan was presented by Mr. Egbert L. Viele, a gentleman who had been appointed engineer of the park. This plan was strongly recommended by Mayor Wood, and was adopted, but fortunately nothing further was done towards carrying it out. No money was appropriated for the use of the commission, and the body accomplished nothing whatever of benefit to the public. It was soon found that unless either the legislature or the city authorities took more active measures for securing a plan for laying out the park, the enterprise must fall through; and accordingly, on the 17th of April, 1857, the legislature appointed a new commission, consisting of eleven members, who were to hold office for five years, and who were empowered to spend a sum of money the interest on which was not to exceed $30,000. To raise this money the common council of the city issued stock having thirty years to run. This stock was highly popular, and was immediately taken up by the public.

The new commission went vigorously to work, and after discarding Mr. Viele's crude and insufficient plan, advertised for new plans to be sent in in competition. On the 1st of April, 1858, the latest day on which plans were to be sent in, thirty-three had been received. These were placed upon public exhibition, and up to the 21st of April the board held frequent meetings in the room in which the plans were hung, in order to make easier a careful examination and full discussion of the merits of the designs. On the 21st of April the plan No. 33, bearing the motto "Greensward," was declared on the first ballot, by the votes of seven out of the eleven members, to be entitled to the first prize of $2000.

The authors of "Greensward," the successful plan, proved to be Mr. Frederick Law Olmsted and Mr. Calvert Vaux; both well known and highly esteemed by a large and cultivated circle in this community. Mr. Olmsted, young as he was, had already a national reputation. He had long been a successful practical farmer, and while still engaged in that pursuit had published a remarkable little book, the record of a vacation ramble, called "Walks and Talks of an American Farmer in England." He became more widely known by a series of letters written from the Southern States to the New York "Times" newspaper, under the signature of "Yeoman," and afterwards republished in book-form with the title "The Seaboard Slave

States." This book contained the first trustworthy account of the condition of society in the South, especially in the regions remote from the great cities, that had, up to that time, been published at the North. To write such a book as this last required energy and courage in no small measure: to these qualities were added a love of natural scenery and the power to trace the secret of the combinations to which a landscape owes its charms, a singular faculty for observation, and, as was afterwards shown in the management of the Central Park, an ability altogether exceptional for administration.

Mr. Calvert Vaux is an Englishman by birth and training, who came to this country and adopted it for his permanent home in 1852. He was the partner in business of the late A. J. Downing, and after Mr. Downing's death in 1853 he succeeded to his large and profitable clientage. At the time of the acceptance of his and Mr. Olmsted's design for the park he was successfully established as an architect, and had published a valuable and popular book on domestic architecture.

FIG. 1. Map of Central Park.

Here, then, were two men thoroughly fitted for the work that was put into their hands, and that work one the importance of which can hardly be estimated, not merely to the city which owns it, but to the whole country. It was our first great public park; it has already proved the parent of others, two of them, at least, of far greater importance than their original, and in the end no doubt every city on the continent of any considerable size will have a public park. What a piece of good fortune, then, that the Central Park, from which they all date, should have been, from the first, the fruit of a pure and manly taste, of sound sense, and of practical knowledge! It has been a first-rate example, according to its opportunities, and no matter how much it may be improved upon by other communities with ampler space and a more varied and picturesque conformation of ground to begin upon than fell to us, the Central Park will always be looked upon with a sort of affectionate pride, as having been the first to point out the way and to show us the possibility of walking in it.

The Central Park is two and a half miles long and half a mile wide. It extends from Fifty-ninth street on the S. to One-hundred-and-tenth street on the N., and is bounded on the E. and W. by the Fifth and Eighth avenues. It is thus a perfect parallelogram, but it is virtually divided into two unequal parts, between which are the two great reservoirs of Croton water—one a quadrangular basin of masonry, the other much larger, with an irregular outline, and confined in an embankment of earth lined with stone. The two basins cover in all nearly 150 acres. The smaller of the two is nearly a third of the short diameter of the park in width, while the larger nearly touches the eastern and western boundaries of the park, and extends N. and S. from Eighty-fifth street nearly to Ninety-eighth street. The original park enclosure contains 776 acres, to which have been added 68 acres at one time, and, more recently, Manhattan Square, so that it now contains 862 acres. It follows that nearly one-sixth of the ground covered by the Central Park is occupied by these unsightly embankments, which obstruct the view and offer nothing in return, since the water they contain cannot be seen except by mounting to a level with their summits. If the park were large enough, there could be no objection to such a division as we now have into Upper and Lower Parks, particularly if it were made by a sheet of water or by any picturesque feature—a ravine, for instance. But, as it is, there is no compensation for the loss of the ground, and moreover the communication between the two divisions is narrowed, especially by the larger reservoir, to such a point that all dignity is quite lost.

The two divisions of the park which we have called "the Upper" and "the Lower" are not only separated artificially from one another by the two reservoirs; they are really quite diverse in character. The Upper Park is distinguished by the freer sweep and greater variety of its horizon lines, by the fine views that it commands of the surrounding country, and by the greater play of the surface, making it easy for the landscape-gardener to produce his legitimate effects with grass and trees, rocks and water, and not obliging him to make up for want of interest in the natural features of the place by a resort to architecture. Up to the present time the Upper Park must have called for a much smaller expenditure of time and money than has been found necessary in the lower portion, since that is almost entirely artificial. The park lies along the eastern slope of a long ridge of rock which crops out of the ground somewhere about Thirtieth street, and extends thence to Manhattanville. This ledge is not continuous, but is broken by several transverse ridges with answering depressions, which indicate, we suppose, the points where the ends of the inclined strata would be found as they lie overlapping one another. There are four of these *irregular* ridges, the chief of them crossing the park diagonally, and the greatest elevation will be found in the central, westerly, and north-westerly portions. In the Lower Park were two swampy valleys lying between three of these ridges, and into these has been collected all the surface-drainage, with the happy result of producing two sheets of water—one, the smaller, a picturesque pond with steep rocky banks intermingled with patches of grass and shrubbery; the other a sheet of water nearly twenty acres in extent, the view across which from the most favorable point is of considerable breadth, and entirely unbroken for at least a quarter of a mile. The ridge that divides these two valleys has been treated with great skill. One large boggy tract has been filled in to an average depth of two feet, all the rocks that stuck out of the ground have been removed by blasting, and some large adjoining ledges reduced in the same way, and the depressions filled up; so that there have been secured thirty acres of level, or but slightly undulating, ground. East of this fine green extends another level space eighty rods in length and twelve in width, separated from the first by a carriage-drive. This tract is occupied by a broad walk, with two rows of

FIG. 2. Mall and Ward's Shakspeare.

American elms on each side, called "The Mall," which leads directly to the Terrace, the chief attraction to most persons in this portion of the park, and which we shall presently describe.

These are the main features of the landscape of the southern part of the Central Park—the "Lower Park," as it is conveniently called—but the designers have known how to introduce great variety in the treatment, and they have been so successful that this portion of the grounds must long be the favorite with the general public over the less finished and more natural upper half.

To the Lower Park there are nine entrances. Four of these are on the southern side, answering to the four avenues that touch the park there—viz. the Fifth, the Sixth, the Seventh, and the Eighth. Of these the Sixth and Seventh stop at the park, while the Fifth and Eighth continue along its eastern and western sides respectively. Of the five other entrances, three are on the Fifth avenue at Sixty-fourth, Seventy-second, and Seventy-ninth streets—although that at Sixty-fourth street is rather an entrance to the Museum than to the park proper—and two are on the Eighth avenue, at Seventy-second and Seventy-ninth streets, opposite, as will be noticed, two of the gates on the Fifth avenue. These entrances are at present merely openings in the boundary-wall, and as the erection of formal gateways is a very unimportant feature, so far as the decoration of the park is concerned, and practically is a matter of very little importance, it is to be hoped that it may be put off for some considerable time longer, until the growth of public culture shall make good taste in the design more certain than probably could be hoped for now. Whoever is in the habit of using the park, not merely as a place of recreation, but as an episode in his daily walk to his place of business, or as an introduction to the long ride thither in the cars or omnibus, or whoever, having no such intimate acquaintance with it, has examined a plan of it, must have remarked with how much skill the walks are arranged to unite the different entrances and to lead to places of interest. There is no twisting and winding of the paths and drives merely for the sake of irregularity. Every path and drive has a well-defined purpose: it unites two points or leads to some thing it is supposed will interest the visitor. In general, it may be stated that, as far as possible, the walks and drives *lead in*, for it is plainly to be desired that the attention of those who come to the park should not be drawn to the boundaries any more than can be avoided. The park is so narrow in proportion to its length that no skill will avail to hide the defect altogether; for though the planting-out of the walls is merely a question of time, the houses could never be planted-out. People who build on the Fifth and Eighth avenues are determined that their houses shall command the park from their windows, and, lest the trees should shut out their view, they build their houses so high as to make that danger impossible, and with a superfluous caution set turrets on their roofs. It is a misfortune, but it is now too late to avoid it, that in time the park will be shut in by a nearly solid wall of city houses. This was easy to foresee, and it was so manifest an objection to the site that it ought to have been taken into serious consideration. However, the men who designed the park were of a practical turn, and crying after spilt milk was not in their books; they made the best they could of what they had. They drew the walks and drives as much as possible towards the long axis of the park, and kept the striking points of interest mainly on the same line. Yet they so contrived it that there should

be also a circuit-drive for the pleasure of those who should come to the park rather for exercise than for sight-seeing, and who would naturally prefer as long a stretch as possible.

Along this central line of the Lower Park, then, are found the Children's Shelter, an immense tent of rustic woodwork, handsome, solid, well-contrived, with abundance of seats and benches and capacious fixed tables for the accommodation of children and their nurses; the Swings, and, near both these, the Dairy, where a good plain lunch may always be had, with excellent milk; then, passing under the Marble Archway, we reach the Mall with the statues of Shakspeare and "The Indian Hunter" by Ward

FIG. 3. Lake from Circle.

—statues of which any park in the world might be justly proud; farther on, the Casino, a restaurant close by the Carriage-concourse, where horses and carriages wait while their owners walk about, or take refreshments as they listen to the music in the pretty Pavilion sitting under the Vine-trellis, which is rather affectedly called in the latest report "the Pergola"—an Italian name for the thing. We notice a slight tendency on the part of the commissioners to give fine names to common things. For our part, we should like to get rid of such names as Casino, Carrousel, Pergola, Concourse, Esplanade, Plaza, Belvedere, and to have in their places plain English titles. Perhaps "Casino" and "Esplanade" are naturalized, or at least well enough understood to be allowed, but for the rest we are sure it would be better to take more homely names. Finally, we have, near the centre of the park, the Terrace, thus far, the only instance in our country of that treatment of a bluff or of a hillside sloping to a level ground which is so common

FIG. 4. Terrace.

in Europe, and which, as an opportunity, has been made so much of by foreign landscape-gardeners. When well treated it is very effective and very popular. Everybody likes "a view" (and many a mistake in house-building and in house-buying has been made under the impression that if a thing is desirable now and then, it is desirable always); and one that is obtained, not by climbing, but by walking to the edge of a terrace or out upon a balcony, owes some of the pleasure that it gives to its unexpectedness. The Terrace at the park is small and insignificant, of course, compared with those at St. Germain, at Meudon, or at Perugia; but few modern public parks have so fine a

one. It looks out upon the Lake, a handsome irregular piece of water always alive with boats, and across it to the Ramble. It consists of two flights of ample steps of light-colored freestone, with noble ramps, elaborately sculptured with arabesques of birds and flowers, and with rails equally handsome terminating in stone pedestal-posts, which will at some distant day be the support of statues. All the railings that enclose the Terrace are similar in design to the stair-rails, though the carving in no two of the panels is alike; and wherever the design calls for them the pedestal-posts are repeated, so that, if ever they are all crowned with statues, the effect ought to be singularly imposing. The only obstacle to one's complete enjoyment of the Terrace *as* a terrace is the fact that it is crossed by a carriage-drive; but it is only on very crowded days that this can make it dangerous or troublesome to pass directly from the Mall to the platform that overlooks the Lake. The lower level is reached either by passing *underneath* the carriage-drive through a well-lighted and prettily decorated hall, or by crossing the drive and descending the steps above alluded to. People take one or the other as convenience or inclination prompts, but here, as everywhere in the park, it has been made impossible for accidents to occur to pedestrians unless by their own fault. The carriage-drives, horseback-drives, and walks are kept distinct throughout, and at convenient points, wherever it has been found necessary, the walks are carried over or under the drive. There is no part of the park where a child or an old person or an invalid cannot move about in safety by simply keeping to the walks; and there are several points in the park where areas of considerable extent have been arranged with a particular view to the complete security of all persons, whether young or old, who come to amuse themselves with playing or strolling about, unconfined by formal pathways. Such are "the Ball-ground," "the Green," "the Children's Quarter" near the "Dairy," and the "Ramble." The "Mall," too, and the "Esplanade" are capital places for children and nurses; they may spend the whole day here without interruption, and refreshments may be had close at hand in the Casino.

FIG. 5. Terrace Detail.

These are the principal points to be noted in the Lower Park, with the exception of the Ramble, which, to many people, is, and must always be, one of the pleasantest features of the place. It is a rocky hill that rises from the northern side of the Lake, and which the art of the landscape-gardener has transformed from barrenness into rural beauty. Pretty walks run in every direction, with good seats conveniently placed; and what with abundant shrubbery, charmingly varied in character, and allowed to grow as freely as it will, a plenty of the commonest wild flowers, and a running stream where ducks of the finer breeds and a crane or two to pique curiosity have their quarters, there are not many places near the city where so much of the charm of wildness may be enjoyed as in these few acres. Our wild birds of this region build and breed freely here, and before "the Ring" entered on their brief but disastrous rule quail were abundant. But these men, who were as ignorant in all practical matters connected with the proper management of the park grounds as they were in matters of taste, cut away a great deal of the underbrush, much of which had been carefully planted, and all of it encouraged to grow. Many of the trees, too, that feathered naturally to the ground, and whose growth no one, with any knowledge of what constitutes beauty in a tree, would think for a moment of interfering with, have been deprived of their lower branches. Trees such as the ash, the elm, the lime, and the beech, with almost all the Coniferæ—firs, pines, spruces, and hemlocks—have this beautiful habit of feathering to the ground; and perhaps there is no surer test of the mere cit than the liking he has for trimming up the lower limbs, thus depriving the tree not only of a chief beauty, but of a feature essential to its well-being, for, as is often seen, a tree, especially if it be an evergreen called upon to support a weight of snow or to resist a strong wind, will succumb if by the cutting away of its broad base all the weight has been thrown to the top. And these limbs, once removed, are never supplied again, so that the loss is irremediable. The pranks of "the Ring" in the park were wild and various, but in nothing did they offend so seriously as in this matter. One of the immediate results has been that the quail and many other birds, who depend upon the shelter afforded by the lower branches of these trees and by the underbrush, have either died or left for other places where "Rings" are unknown, or too well known to be allowed to meddle with public interests.

The Ramble is laid out, as we have said, upon a hillside, and this hill has been tunnelled to admit the passage of one of those traffic-roads that make so important a feature in the design of the park. The park, lying as it will in the midst of a thickly populated region, ought not, it is evident, to lay itself open to the charge of being an obstruction to the daily business of the neighboring region; and this was plainly seen by the designers, who also saw, however, that it was of equal importance that the traffic of the neighborhood ought not to be allowed to obtrude itself upon the park. The ingenuity which has met both difficulties and both wants, as they have been met by the traffic-road, is its own best commendation. Four of these roads cross the park, uniting, E. and W., Sixty-fifth, Seventy-ninth, Eighty-fifth, and Ninety-seventh streets, respectively. They are only so much curved as has been found necessary to accommodate them to the surfaces of the park, nor are they sunk any farther than is made necessary by the same conditions. Indeed, it is not correct to say that they are ever *sunk* at all, the road-bed being always on a level with the avenues that bound the park;

they only appear in certain cases to be sunk because they cut through rising ground. They are paved, lighted, and provided with sidewalks like ordinary streets, and they are in common use as traffic-roads, though not of course to the extent that they will be when the region about the Central Park becomes more densely populated. The object of the designers has been to make them completely independent of the park as a pleasure-ground, and they are so; indeed, in only a few cases can they be entered at all from the park, except where their terminations are coincident with the park gateways, and in no case can they be so entered by carriages. The gates that here and there communicate with them are to facilitate the removal of rubbish or the bringing in of materials. These communications are, however, not for the use of the public, and visitors to the park are not supposed to be aware of their existence. In no instance do these roads ever cross the surface of the park on a level with the walks and drives, but always under them or over them—generally by the former mode—and they are well planted-out by shrubbery where, without it, they would obtrude themselves upon the view.

The Ramble has a central point of interest to those who

Fig. 6. "Glen."

do not care for the solitude and quiet that make it attractive to so many, in the Belvedere, a picturesque edifice composed of a balustraded platform, with a tower from which a view of no mean extent can be had by those who like a moderate climb. The platform itself commands a pretty view, into which the rectangular tank of the smaller reservoir, on the edge of which it is built, enters as the most important feature.

It will thus be seen that almost all the special attractions of the Lower Park—we mean those apart from what may properly be called the landscape—are brought near the long axis running N. and S. This arrangement draws the main body of the visitors away from the boundaries, and thus prevents them from being forced upon our observation. Yet this result is brought about quite naturally and without effort; no one perhaps would perceive it if his attention were not called to it. There are, however, other points of interest in this Lower Park, and no doubt every year will see the attractions more and more distributed, until the present centralization will be overcome and forgotten. There are the collections of the Natural History Society, temporarily exhibited in the old Arsenal building, with the cages near it—some exposed and some under shelter—containing the animals which have from time to time been presented or loaned to the city. The latest report of the commissioners informs us that the collections of the Natural History Society have been open to the public every week-day during the year (1872), and that the attendance on many days may be estimated at 10,000. By the joint action of the park department and the trustees of the Museum two days in each week, Monday and Tuesday, are reserved for special students and for teachers and pupils of public schools; by this means opportunities are given for lecturing to classes with abundant illustration, and the Museum becomes an important part of the educational system of the city. The collections are constantly increasing in value, partly by purchase and partly by presents from those who are interested in the success of the institution. Manhattan Square, a piece of ground lying between Eighth and Ninth avenues and between Seventy-seventh and Eighty-first streets, was some time ago added to the park, and it is now decided to carry out a plan long contemplated for establishing a Zoological Garden and a Museum of Natural History upon this site. The plans for the new building for the accommodation of the Natural History Society have been already designed and accepted, and the work will be begun without delay. We suspect, however, that it will be found necessary to establish the Zoological Garden in some other place. Either institution would need all the room that the square affords.

The present collection of living animals belonging to the park, with those loaned to the trustees by private owners or by proprietors of travelling-shows, though comparatively small, is of great interest and gives an immense deal of pleasure. The animals are well housed and cared for under the direction of an intelligent keeper, whose special report makes one of the most valuable features of the annual report of the trustees. "The department has already received specimens of many of the most valuable foreign tropical animals, and now desires additions to its collections of our native species. Of the various American deer, only two, the common Virginia deer (*Cervus Virginianus*) and the American elk (*Cervus Canadensis*), are found in the park. Specimens of the black-tailed deer, the mule-deer, the reindeer, the Mexican deer, the moose, the caribou, and the prong-horned antelope would be much valued. Specimens of almost any of the smaller animals of the Far West, the squirrels, gophers, rabbits, and hares, would be desirable acquisitions. Thirteen species of foxes are enumerated as peculiar to this continent, of which but two, the common gray and red fox of the East, have as yet reached the park. The department usually pays the transportation-expenses of animals given to it, and it is found that when sent by express, with proper directions as to the supply of air, water, and food, they come by rail and boat from the more distant parts of the country with safety."

The sheets of water which in summer add so much to the landscape effect of the park are thronged in winter by skaters, for whose comfort and safety every provision is made by the park authorities. The ice is flooded, scraped, and swept with great skill and promptness, information as to the state of the ice is conveyed by signal to all parts of the city, temporary structures of wood, sufficiently warmed, are provided for putting on skates and for refreshment, and the means of cheap and healthful exercise are supplied to thousands of people, men and women, boys and girls. A visitor who watches these crowds of skaters from the banks or from the bridge that commands so wide a view of the lake, will surely be struck with the good behavior of the crowd: he will see no rudeness, no coarse manners, but a general good-nature and civility; and though the excellent park-police are always on hand, they have hardly ever any occasion to make an arrest, or even to administer a rebuke.

The building for the Metropolitan Museum of the Fine Arts is to be erected in the park on the ground between

the smaller reservoir and the Fifth avenue—a decision greatly to be regretted, we think, both because of the effect the building will have of still further closing up the already scrimped communication on that side between the Upper and Lower Parks, and from the injury to the appearance of the building itself, placed alongside or under the shadow of these immense water-tanks. We have to regret that land outside the park could not have been obtained on the eastern side, answering to Manhattan Square on the W., and the new Museum have been built on that. Besides giving a better and freer site for the building, it would have given greater apparent breadth to the park itself at the point near the reservoirs, where it presents an unfortunately cramped aspect.

Long before the Central Park was finished—and in the main it may be said to be finished now—it was found too small for the immediate demand upon it, especially in the way of drives and horseback rides; and it was plain that ampler provision must be made for the needs of the future. What was felt to be wanted was not merely room for more extended drives and rides than are possible within its present limits, but a more continuous park accommodation for

FIG. 7. Ball Ground.

the region N. of One Hundred and Tenth street, which region is rapidly being built up and settled. It was felt very early that the park was too far away from the populous part of the city, too much time was consumed merely in getting to it, and the approaches to it were devoid of all interest and variety. It has long ceased to be possible to control the southern approaches to the park; the land is all taken up, and is too valuable, but the disposition of the upper part of the island is within our own control, and the problem, How to provide for the future in this direction, has been solved in a most satisfactory manner by Messrs. Vaux and Olmsted in the Park-way System. (See PARK-WAYS.) This system, if it could have been taken in hand a little earlier, would have made the park begin, in fact, at Madison Square, by the simple plan of changing Fifth avenue or Broadway into a stately Mall, with a plantation of trees along the middle, a double carriage-track, a horseback-ride, and ample sidewalks; in short, a finer Champs Elysées. There might easily, at small expense, have been a Circus or Round at Thirty-fourth and Forty-second streets. The reach between Madison Square and the Central Park having been thus transformed from a dull walk between nearly unbroken lines of stone walls to an open promenade for exercise and enjoyment, the work now in hand of enlarging and planting the park-ways (called by the unmeaning name of "boulevards," in our New York love of French names), by which the western side of the upper part of the island is being saved from the monotony and meanness of the lower part, would have been only an extension of the plan, and would have made the Central Park merely a beautiful incident in the long line of drives, rides, and walks, with delightful accompaniments of grass and trees, stretching from Madison Square to the Westchester suburb now being laid out under the control and management of the Park Commission. No city in the world would have had such ample accommodation for enjoyment and exercise—convenient, too, to the great majority of her inhabitants—as New York, if this plan, once easy of execution, could have been carried out. The portion of it that covers the land S. of the Central Park has long ceased to be possible, but the connections N. of the park, between it and the Westchester suburb, are now being created, and when finished will make an era in the material and social history of our island. The plan will be fully explained in the article on PARK-WAYS; it has been thus cursorily alluded to here to show that a need widely felt and often expressed, of more park accommodation, has been attentively considered, and that there is every prospect of its being satisfactorily met, in the upper part of the island at least, by those who have the park in charge.

The park has been a great civilizer, and its mission in this respect is only just begun. When it was first established it was the only park in the country; now there are a dozen, and there will be more and more. Without the Central Park we should not have had in this generation the Brooklyn Park, the Fairmount Park in Philadelphia—a noble undertaking—the Chicago Park; nor would those stupendous projects of the Yosemite Valley Park and the Park of the Great Cañon of the Yellowstone have been conceived and carried out. Indeed, they are Gargantua's play-grounds, and make Hyde Park and Versailles look pinched and mean. They have been laughed at as bits of brag, but, in truth, they are the merest good sense and wise provision, with no trace of exaggeration. Would that the founders of New York could have so looked ahead, even fifty years ago! Would that we ourselves could look ahead in season, and, forecasting the time when our city shall cover the lower half of Westchester county, seize promptly on at least 3000 acres (the area of the Philadelphia Park) of that region.

We must not forget that if it was a great piece of good-fortune to get the Central Park at all—and who can doubt it?—it was an inestimable happiness that it was entrusted to the hands that have made it what we see it. New York can never honor the men enough who, with the exception of a brief time of nightmare, when "the Ring" tried to make it their stye, have cared for it with disinterested devotion from the beginning. They deserve our gratitude for this, that, in a dark time, when public honor, and even common honesty in public men, seemed thrown overboard, they helped us to support our self-respect, and to make a return to better things seem possible by keeping steadily in view the sight of at least one civic department administered with good sense, economy, and honesty, and with a single eye to the public good. CLARENCE COOK.

Cen'tral Point, a township of Goodhue co., Minn. Pop. 160.

Cen'tral Prov'inces, The, one of the great administrative divisions of British India, are situated between lat. 18° and 24° N., and between lon. 77° and 85° E. Area, 82,838 square miles. They were formed into a chief commissionership in 1861, and they are divided into four commissionerships and nineteen districts. The line of railway connecting Bombay with Calcutta passes through these provinces, and has completely altered the condition of the country, which, up to the time when it was formed into a chief commissionership, was almost unknown. The traffic that passes through the capital, Jubbulpore, is larger than that of any other city in India except Bombay. The revenue of the provinces in 1869–70 amounted to £1,043,954. Pop. in 1871, 7,987,476.

Cen'tral Square, a post-village of Hastings township, Oswego co., N. Y., at the crossing of the New York and Oswego Midland and the Syracuse Northern R. Rs. Pop. 359.

Cen'tral Vil'lage, a post-village of Windham co., Conn., is on the Boston Hartford and Erie R. R., 20 miles N. N. E. of Norwich. It is on the Moosup River, at or near its entrance into the Quinebaug. It has water-power and a number of cotton-mills. Pop. about 2000.

Cen'tre, or Center [Gr. *κέντρον*; Lat. *centrum*], originally a "point;" hence the point of a compass which remains fixed while the other is moved round to describe a circle. The centre of a circle is a point within it equally distant from every part of the circumference. The centre of a sphere is a point equally distant from every point of the surface. In war, the term *centre* is applied to the main body of an army located between the two wings. In French politics the *Centre* is used to designate a party of moderate royalists or conservatives who support a policy intermediate between that of the *Droit*, "right," and that of the *Gauche*, "left."

Cen'tre, a county which is the most central part of Pennsylvania. Area, 1000 square miles. It is partly bounded on the N. W. by the West Branch of the Susquehanna, and is intersected by Bald Eagle Creek. The surface is diversified by several ridges, one of which is called Bald Eagle Mountain. The soil of the valleys is fertile. Grain, hay, butter, wool, and potatoes are the chief crops. Among the manufactures are those of flour, lumber, leather, carriages, harnesses, etc. Coal, iron, and limestone abound. This county is traversed by the railroad which connects Lockhaven with Tyrone. Capital, Bellefonte. Pop. 34,418.

Cen'tre, a post-village, capital of Cherokee co., Ala., is near the Coosa River, about 140 miles N. by E. from Montgomery, near a steamboat landing. It has two churches, an academy, and one newspaper-office.

Cen'tre Col'lege, Danville, Ky., was chartered as a State institution in 1819. An amendment to the charter gave the control of the school to the Presbyterian synod of Kentucky, upon condition of synod's paying $20,000 towards the endowment. The condition was fulfilled, and Centre College became a synodical school in 1831. The following list gives the names of its presidents and the dates of their election: Rev. Samuel Findlay (pro tem.), 1822; Rev. J. Chamberlain, D. D., 1822; Rev. D. C. Proctor, D. D. (pro tem.), 1826; Rev. Gideon Blackburn, D. D., 1827; Rev. J. C. Young, D. D., 1830; Rev. L. W. Green, D. D., 1857; Rev. W. L. Breckinridge, D. D., 1863; Ormond Beatty, LL.D., 1872. Under the long presidency of Dr. Young the college rose to great eminence among Western schools. It retained both its numbers and reputation until the civil war, when the number of students was reduced from 200 to less than 50. The close of the war did not bring peace to the Church. The synod of Kentucky was rent asunder, the larger body joining the Southern Presbyterian Church—the smaller, and with it Centre College, adhering to the General Assembly. Litigation ensued, and all the courts, both State and Federal, decided that the Assembly had the rightful control. Amidst this litigation (now closed) the number of students steadily increased, the last annual catalogue giving a roll of 91, with a training-school of 95 pupils; total, 186. Centre College aims to give simply a liberal education. The college course em-

braces the usual curriculum, along with special advantages for acquiring the leading languages of modern Europe. Other features of interest are a four years' course of lectures on the history, structure, and literature of the English language, and a daily lecture by the professor of ethics on biblical themes or on subjects relating to the development of a true Christian manhood. Students find boarding in private families. The village is quiet and healthful, and there is a high degree of culture among the citizens. Tuition to ministers' sons and young men of limited means is $5, to all others $50. The faculty consists of a president, vice-president, and seven other instructors. The libraries of the college contain about 8000 volumes. Facilities for instruction in the sciences are good and increasing. The alumni at the close of 1872 numbered 754. Among them are some of the most distinguished men of the land. The college year begins the first Monday in September, and closes the last Thursday in June. The endowment yielding an income amounts to about $140,000; the buildings and grounds are estimated at $75,000 additional.

ORMOND BEATTY.

Cen'tre Creek, a post-township of Martin co., Minn. Pop. 377.

Centre Creek, a post-township of Jasper co., Mo. Pop. 765.

Cen'tre Grove, a township of Dickinson co., Ia. Pop. 283.

Centre Grove, a township of Guilford co., N. C. Pop. 1110.

Cen'tre Hall, a post-village of Centre co., Pa. It has one weekly newspaper.

Cen'tre Har'bor, a post-township of Belknap co., N. H., 37 miles N. of Concord, on Lake Winnipiseogee, is a place of summer resort. It is visited by the steamboats which ply on the lake, and is noted for its fine scenery. Pop. 446.

Cen'tre of Grav'ity, the point in a body which is always in the line of the resultant of the weights of all the particles composing that body, no matter in what position the body be placed. Each particle of a body held above the surface of the earth is acted upon by gravitation, and we may look upon the gravitation of each particle as being one of a system of parallel forces, and the gravitation of the whole as a resultant of those forces. Whatever be the direction of these forces with respect to the mass, the resultant will always pass through a fixed point within the mass, which point is the centre of gravity for the body. Every mass which is supported above the earth must have its centre of gravity so placed that a line drawn from it perpendicularly downward will fall within the base; otherwise the body will fall. The centre of gravity of many bodies may be found by geometrical rules, but with the supposition that the bodies are of homogeneous or uniform specific gravity—a condition which is not often found exactly fulfilled in practice.

Cen'tre of Mag'nitude, The, is a point so situated that all straight lines passing through it, and terminated by the circumference or superficies of the figure or surface, are bisected in it.

Cen'tre Point, a post-village of Washington township, Linn co., Ia. Pop. 443.

Cen'treport, a post-village of Huntington township, Suffolk co., N. Y., on the Northport branch of the Long Island R. R., 37 miles from New York.

Cen'tre Star, a post-township of Lauderdale co., Ala. Pop. 1627.

Cen'tre Vil'lage, a post-village of Colesville township, Broome co., N. Y., on the Susquehanna River, has an extensive tannery. Pop. 146.

Cen'treville, a post-village, capital of Bibb co., Ala., on the Cahawba River, at the Lower Falls, 38 miles S. E. of Tuscaloosa. Pop. of Centreville township, 1285.

Centreville, a village in Hamden township, New Haven co., Conn., on the New Haven and Northampton R. R., about 6 miles N. of New Haven. It has manufactures of various kinds.

Centreville, a post-village of St. Clair co., Ill., 7 miles S. S. E. of St. Louis, on the St. Louis and Cairo and the Illinois and St. Louis R. Rs. It has two steam flouring mills. Coal is mined in the vicinity. Pop. 1116.

Centreville, a post-village, capital of Wayne co., Ind., on the Pittsburg Cincinnati and St. Louis R. R., 5 miles W. of Richmond. It has a female college, a national bank, and one weekly newspaper. Pop. 1077.

Centreville, a post-village, capital of Appanoose co., Ia., on the Chicago and South-western R. R., 125 miles W. S. W. of Muscatine. It has a national bank and two newspaper-offices. It is the present terminus of the Missouri Iowa and Nebraska Railway, has a fine court-house, several churches in process of building, and manufactures of various kinds. It is underlaid with an abundant supply of coal of very fine quality. Pop. 1037. ED. OF "CITIZEN."

Centreville, a post-township of Linn co., Kan. Pop. 1034.

Centreville, a township of Neosho co., Kan. Pop. 889.

Centreville, a post-village and seaport in Barnstable township, Barnstable co., Mass., on the S. side of Cape Cod.

Centreville, a township of Washington co., Me. Pop. 145.

Centreville, a post-village, the shire-town of Queen Anne co., Md., 30 miles E. by N. from Annapolis, in a township of the same name, situated in a large peach-growing region. Steamboats leave twice a day for Baltimore. It has an academy, an agricultural implement factory, a foundry, and two newspapers. It is the terminus of the Queen Anne's and Kent R. R. Pop. of township, 5360; of village, 915. ED. "OBSERVER."

Centreville, a township of Delta co., Mich. Pop. 86.

Centreville, a twp. of Leelenaw co., Mich. Pop. 939.

Centreville, a post-village, capital of St. Joseph co., Mich., on Prairie River and on the Air-Line division of the Central R. R., 132 miles E. of Chicago. It has one newspaper-office, a large knitting factory, good schools, and one national bank. Pop. 749.

ED. "ST. JOSEPH REPUBLICAN."

Centreville, a post-village of Anoka co., Minn., on the Lake Superior and Mississippi R. R., 17 miles N. of St. Paul, in a township of the same name, on the Rice Lakes. It is a famous resort for sportsmen. Pop. of township, 687.

Centreville, a post-village, capital of Reynolds co., Mo., on the West Fork of Black River, about 40 miles S. by W. of Potosi. Pop. 32.

Centreville, a township of Dixon co., Neb. Pop. 168.

Centreville, a station in Jersey City, N. J., on the Central R. R. of New Jersey, 7 miles from New York. It is a thriving place, inhabited by people doing business in New York.

Centreville, a post-village and township of Allegany co., N. Y. Pop. 167; of township, 1043.

Centreville, a village of Portland township, Chautauqua co., N. Y. Pop. 141.

Centreville, a village of Mooers township, Clinton co., N. Y., on Chazy River and on the Ogdensburg and Lake Champlain R. R., 15 miles W. of Rouse's Point. It has three churches, and an active trade and manufactures.

Centreville, a village of Clay and Cicero townships, Onondaga co., N. Y. Pop. 288.

Centreville, a borough of Butler co., Pa. Pop. 366.

Centreville, a post-borough of Crawford co., Pa. Pop. 322.

Centreville, a post-village of Warwick township, Kent co., R. I., has one national bank, and manufactures of cotton goods.

Centreville, a township of Anderson co., S. C. Pop. 1880.

Centreville, a post-village, capital of Hickman co., Tenn., on Duck River, 50 miles S. W. of Nashville. P. 175.

Centreville, a post-village, capital of Leon co., Tex., 130 miles N. E. of Austin City, has one newspaper. Pop. 221.

Centreville, a post-village of Fairfax co., Va., 27 miles W. of Washington. Pop. of Centreville township, 1721.

Centreville, a township of Tyler co., West Va. Pop. 1079.

Centreville, a township of Manitowoc co., Wis. Pop. 1650.

Centrip'etal and **Centrif'ugal,** terms used in botany, and applied to two modes of inflorescence. When the terminal flower-bud is the first to expand, the inflorescence is said to be centrifugal. When the expansion begins with the bud which is nearest the base of the floral axis (or nearest the circumference in a cyme or corymb), and proceeds towards the terminal or central bud, the inflorescence is centripetal.

Centripetal and **Centrifugal Forces.** If we suppose a body to move in a circle with a uniform velocity, it is shown by the laws of motion that it must be acted upon continually by a uniform force directed towards the centre; which force expends itself each instant in deflecting the

moving body from the straight line in which it would normally move, this line being a tangent of the circle in which motion takes place. The force with which the body is impelled towards the centre is called *centripetal;* the equal and opposite force which tends to make it fly from the centre is the *centrifugal* force. Both together are the *central* forces. Each is equal to the weight of the body multiplied by the square of the velocity, and divided by the acceleration of gravity and the radius.

Centrop'olis, a post-township of Franklin co., Kan. Pop. 1034.

Cen'turies of Mag'deburg, the first church history by the Protestants, the preparation of which occupied many eminent scholars for a long period. The plan of an extended work, which should reveal the deviations of the Roman Church from the practices of the early Christians, was first conceived by Matthew Flacius of Magdeburg in 1552. The labor begun by him was carried forward by Wigand, Matthew Judex, Basil Faber, Andreas Corvinus, and Thomas Holzhuter, and the means therefor were provided by the evangelical princes and great men. The work appeared at Bâle in 13 vols., each volume covering a century (1559–74). The *centuriatores,* as the authors were called, never brought it down beyond the year 1300. In refutation of the "Centuries," Baronius wrote the "Annales Ecclesiastici."

Centu'rion [Lat. *centurio,* from *centuria,* a "hundred men"], an officer of the ancient Roman army who commanded one hundred men or a company called *centuria.*

Cen'tury [Lat. *centuria,* from *centum,* a "hundred"], a company of one hundred men in the Roman army; also a civil division of the Roman people formed for the purpose of voting. According to this division, which was founded on property, the people voted in the *comitia centuriata.* (See Comitia.) Servius Tullius divided the citizens of Rome into 193 centuries. In modern times the term is mostly used to denote a period of 100 years.

Century Plant. See Agave.

Cephalas'pis [from the Gr. κεφαλή, "head," and ἀσπίς, a "shield"], a genus of fossil fishes armed with rhomboidal ganoid plates of enamelled bony structure. Several species are found in the upper Silurian and in the Devonian rocks. They had large heterocercal tails, and appear to have been rapidly moving, predaceous fishes. The name is derived from the large plate which covered the head, the sharp anterior edge of which may have served the fish as an offensive weapon.

Cephaliza'tion [from the Gr. κεφαλή, "head"]. As the head is the seat of power in an animal, the part that gives honor to the whole, it is natural that among species rank should be marked by means of variations in the structure of the head; and not only by variations in structure, but also in the extent to which the rest of the body directly contributes, by its members, to the uses or purposes of the head. *Cephalization* is, then, simply the degree of head domination in the structure, as implied in the derivation of the term. The following are some of the ways or methods in which it is manifested:

1. With *superior* cephalization—that is, as species rise in grade or rank—more and more of the anterior part of the body or of its members render service to the head; with *inferior,* less and less. In many cases, part of the organs that serve as feet in the lower tribes serve as jaws in the higher, or, in other words, are transferred from the locomotive to the cephalic series, and thus the structure indicates higher cephalization.

2. With *superior* cephalization the structure of the head or of the anterior portion of the body becomes more and more compacted, perfected, and condensed or abbreviated; with *inferior,* the same portion becomes more and more lax in its parts or loosely put together, and imperfect in the parts or members themselves, and at the same time the whole is more and more elongated and spaced out or enlarged.

3. With *superior* cephalization the posterior portion of the body becomes more and more compacted, or firmly put together and abbreviated; that is, as concentration goes on *anteriorly* there is abbreviation *posteriorly.* Even the tail shows grade; for great length or size or functional importance is actually a mark of inferior grade, other things being equal.

4. With *superior* cephalization there is an upward rise in the head-extremity of the nervous system; and this reaches its limit in man, in which it becomes *erect* and points heavenward. With *inferior,* there is the reverse condition, and the limit is seen in the *horizontal* fish.

5. With *inferior* cephalization there is not only a less and less concentrated or compacted and perfected state of the whole structure before and behind, but in its lower stages the degradation of the structure extends to an absence of essential parts, as teeth, members, senses; and often also to a gross enlargement of the body beyond the size which the system of life within can properly wield, and in this case the body is stupid and sluggish.

The laws of cephalization act conjointly with another principle in animal life—that of the *oppositeness subsisting between the cephalic or anterior and the posterior extremities of the animal structure,* which is a kind of antero-posterior or fore-and-aft polarity. This oppositeness or polarity is *up and down* in the plant, and *fore and aft* in the animal. The fore and aft becomes strictly up and down *in position* in man; and this by elevating heavenward the cephalic extremity, not by a change of the axis of symmetry to that of the plant.

The following are examples of cephalization, and of decephalization as the reverse steps are properly designated, in some of the classes of animals:

The subdivisions of the division of brute mammals (or quadrupeds) containing the larger species are four:

First, the Quadrumanes, or monkeys.

Second, the Carnivores, or flesh-eaters, including the lion, cat, dog, bear, and the like.

Third, the Herbivores, or plant-eaters, including the elephant, rhinoceros, horse, hog, ox, deer, etc.

Fourth, the Mutilates, including the whales, dolphins, etc., in which the limbs are degraded to the structure and uses of fins, and part are wanting, and therefore the species are in a sense, *mutilated,* whence the term *Mutilates.* Such forms are appropriately styled *degradational* forms, since they correspond to a degradation of the mammalian structure or type. These several subdivisions have their distinctions, and also their naturalness, strongly exhibited in characters based on this principle of cephalization. Illustrations of this fact may be drawn first from the fore limbs.

In the Quadrumanes or monkeys the fore limbs are so constructed and arranged that they serve (1) for carrying their young, (2) for supplying the mouth with food, (3) for taking their prey, and (4) for locomotion; in the Carnivores, they serve (1) for taking their prey, and (2) for locomotion; in the Herbivores, only for locomotion—for cattle use their fore legs for their simple legitimate object of walking, nothing higher, nothing lower; in the Mutilates, or whales (*degradational* species, as before styled), they are fit only for something lower, for they are merely fins, like those of fishes. It thus appears that in the passage from Carnivores to Herbivores the fore limbs lose all cephalic use, they not even serving in the latter to get or carry food to the mouth; and lower down, in the whales and related species, they are degraded into swimming organs.

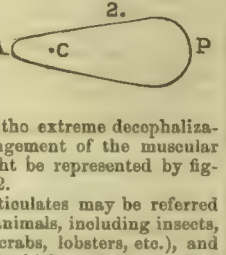
Passing, now, from the highest of these four subdivisions—that of the monkeys—up to man, there is a sudden elevation of structure, corresponding well with the spiritual elevation. The fore limbs are taken out of the foot-series, and thus rescued from the inferior service of locomotion. As in some brutes, these members serve to carry the young and to collect food and convey it to the mouth. But along with such uses there are others more exalted, demanded by the spirit within. Moreover, far the larger part of the body is thus made to belong to the anterior portion, and this anterior portion is consequently much increased, while the posterior stands on its narrow base of two feet, and is reduced to a minimum.

Let us now look at the above four subdivisions of mammals with reference to other methods of cephalization, and see how they exhibit, in accordance with this principle, their differences of grade.

The Quadrumanes, or monkeys—the highest of the brute species—have the body most raised from the horizontal; the head in the typical species shortest and most compacted; and the superior species among them—the manapes, as the gorilla and orang—have no tail, so that this kind of posterior abbreviation is at its extreme limit.

The Carnivores, as the cat, lion, etc., also have a short, well-compacted head, but one more projecting than that of the higher monkey; the hind feet, as well as fore feet, are provided with claws to aid in climbing; and the mouth is prostituted from the proper or normal use of the organ to that of carrying its young or its prey.

The Herbivores, as the ox, horse, tapir, etc., have the head very much elongated (a strong mark of decephalization), and in some appropriated to the inferior use of self-defence; part of the teeth usually wanting; and the feet fitted for locomotion, and not in any case for grasping. Moreover, in the ox, goat, deer, and allied species, and in the horse, the hind legs are very much the stronger, on which account from this group come the draft-animals used by man; and this characteristic indicates a backward transfer of force, which is a prominent mark of decephalization.



The Mutilates, or the whales, have a head sometimes

many yards in length, made of bones imperfectly united; the teeth often entirely wanting, and sometimes excessively numerous—the latter a mark of feeble concentration in the life-system, in consequence of which the parts grow or multiply to excess (something as a tree grows in size, because given up to the uncontrolled power of growth); and not only the fore legs reduced to fins and feeble in locomotion, but the hind limbs wanting; the body behind enormously enlarged and prolonged; and the prolonged tail, thus made, serving as the main organ of locomotion—a low, fish-like condition of the structure, indicating in a striking manner its extreme decephalization. If the Carnivore is a *prosthenic* animal, or *strong before*, the whale, like a fish, is eminently *metasthenic*, or *strong behind*.

The four grand divisions of mammals are thus strikingly marked off by characters based on this principle of cephalization.

Turn now to man, at the head of the system of life. He is vastly above even the man-apes in the form of the head, as well as in its perfection of make, for the jaws project but slightly, when at all, beyond the forehead, and his back, in his natural position, only a little behind the posterior side of the brain. His nervous system stands vertical, with the brain at the summit; and in average specimens of the race the brain is nearly treble the size of the brain of a gorilla. His teeth are simply for cutting soft food and for chewing, not for tearing flesh or branches of trees, or for carrying his young. His fore limbs take no part in locomotion; they are transferred completely from the locomotive series to the cephalic. His feet may be thought to be inferior to a monkey's, since they cannot clasp a stick or branch, like a hand. But this latter quality makes a good climber, and serves well a being with the monkey's propensities and necessities, but is not befitting man's erect body and higher purposes, which are best served by feet that give a firm support.

The question as to the condition of the life-forces thus passes from the sphere of speculation to one of direct observation. A lion, for example, exhibits to the eye the high degree of cephalization of its structure by its strength anteriorly, or that of its head and fore limbs, and the correlate form and structure of these and other parts of the body; and a whale manifests its low degree by its degraded head and senses, its feeble limbs partly obsolete, and the immense size and strength of the tail; and this is so obvious that the muscular or motorial force of the two might be sufficiently well represented by the annexed figures; Fig. 1 corresponding to that of the lion, and 2 to that of the right whale, A being the anterior or cephalic extremity, and P the posterior or caudal extremity. The figures give a faint idea of what is meant by *cephalization* and *decephalization*. If the sensorial forces of the lion were taken into consideration, the contrast between the two would be still greater. C is the position of the prime systemic centre; its remoteness from the front margin in the right whale (Fig. 2) is one of the marks of the extreme decephalization of the structure. The arrangement of the muscular force in different Herbivores might be represented by figures intermediate between 1 and 2.

For further illustration, the Articulates may be referred to; that is, the sub-kingdom of animals, including insects, spiders, centipedes, crustaceans (crabs, lobsters, etc.), and worms, the body and members of which are jointed. The three classes are—1, Insecteans; 2, Crustaceans; 3, Worms. The transfer of members from the locomotive to the cephalic series, or the reverse—one of the most striking marks of cephalization in animals having limbs—is well shown in the two higher of these classes. The three orders or grand divisions of Insecteans are—1, Insects; 2, Spiders; 3, Myriapods or Centipedes.

Insects, the highest, have *three* pairs of feet and *three* pairs of mouth-organs. Spiders have *four* pairs of feet and *two* of mouth-organs. Here *one* pair out of the series of head-organs in insects is transferred in spiders to the locomotive series. Insects and spiders are hence very distinct types of structure; and the higher is based on superior cephalization; for in insects a larger part of the structure is embraced in the cephalic or anterior portion than in spiders.

Both insects and spiders are structures with fixed or closed limits, for the number of pairs of feet is limited, and the segments of which the body is made admit of no increase beyond the normal or regular number. But Myriapods are not limited in the number of segments of the body, or in that of the pairs of feet; on the contrary, they allow of any number of feet and of indefinite lengthening behind. The order is distinguished by the degradational character of indefinite posterior elongation, and as indefinite a number of legs—an evidence of low decephalization.

It appears, then, that in passing from Myriapods to typical spiders there is first posterior abbreviation—one mark of cephalization; and in addition the body of the spider is not worm-like in being made up of a large number of similar segments, but has an anterior part set off for the purposes of the head and locomotion (called the cephalothorax) distinct from the abdomen. Next, in passing from spiders to insects, one pair of locomotive organs, the anterior, becomes a pair of jaws—that is, it is given over to head-uses; and, moreover, the head becomes a separate segment from the thorax, which shows further concentration of the forces anteriorly, or a higher grade of cephalization.

The orders of Crustaceans are three: 1, Decapods, or the ten-footed; 2, Tetradecapods, or the fourteen-footed; 3, Entomostracans, or species with defective feet. In the highest, the Decapods, there are *five* pairs of feet and *six* pairs of mouth-organs; while in the next order, that of Tetradecapods, there are *seven* pairs of feet and *four* pairs of mouth-organs. In the latter, then, the feet have gained *two* pairs, the mouth has lost *two;* or, in other words, *two* pairs have passed from the cephalic to the locomotive series. Hence, the Decapods and Tetradecapods differ on the same principle as insects and spiders; that is, in the transfer of part of the mouth-organs of insects to the locomotive series. Like the latter, also, the feet are perfect and *fixed* or *limited* in number, the regular or normal number never being exceeded. They are, therefore, regular or normal types.

In descending to the third order, or the Entomostracan, from the Tetradecapods, the mouth loses other pairs of organs by this method of transfer—in some *one* pair, in others *two*, in others *three*, in others *four* (or all). The Entomostracans are defective in both their feet and segments, and are *degradational* forms; and hence these several grades of transfer have not separately the importance which belongs to them in the regular or normal types. In going up from Entomostracans to Tetradecapods, the system of structure becomes normal and the number of mouth-organs or jaws four pairs, the locomotive numbering seven pairs; and then in passing from Tetradecapods to Decapods, the two of the seven pairs of locomotive organs become jaws, or are turned over to the head.

Again, among Decapods, or ten-footed Crustaceans, the prime difference between the crab and the lobster or shrimp is, that in the former the head of the latter is shortened, and its parts abbreviated and more compacted together, and the abdomen or tail-portion reduced from great length and great strength (which makes an organ of locomotion) to a very short, narrow, and feeble organ packed away under the rest of the body. There is concentration and compacting of the whole structure—a shortening in before and behind—on an extraordinary scale, and thus the crab exhibits its higher grade of cephalization.

Again, an insect and a crab are both Articulates, and are built on a common fundamental type of structure. At the same time, the insect, though very much the smaller, is greatly higher in degree of cephalization. The head and thorax of the insect answer together to the *head alone* of the crab, its three pairs of jaws and three pairs of legs corresponding to simply the six pairs of jaws in the Decapod. Thus, abbreviation before and behind, and concentration of the system, are here carried to an extreme perhaps not exceeded in the whole animal kingdom. We appreciate this when we consider the minuteness of the brain—or, more properly, of the cephalic ganglion—of a bee or an ant, and the wonderful instinctive intelligence, and also mechanical power, which proceed from it.

The varieties of the human race afford other illustrations of the principle of cephalization. The lower races of men have projecting jaws, a retreating forehead, and generally a head elongated behind. With upward progress in cephalization, the jaws shorten in, and the head changes in proportions from elongation hindward to fulness in front, with increasing breadth and height and verticality of forehead. There is an increase of head-power accompanying this shortening before and behind, and the bringing of the mouth directly under the vertical forehead; and all is an effect of upward progress in cephalization. It has been stated by American dentists that it is not uncommon for the outer incisor to be crowded out, and the posterior molar to fail of development; and this, if true, may be a direct effect of the shortening of the jaws still going on. Whether so or not, it is certain that the jaws of man are made short through the rejection of twelve of the forty-four teeth that belong to the typical mammals, man having but thirty-two, so that the progress in cephalization of the mammalian

type has apparently forced out three from either side of either jaw—viz. one incisor and two premolars. Another effect of cephalization, or concentration headward, in the highest type of mammals has been a shortening of the arms, the arms being extra long in the apes, man apes included. Dr. B. A. Gould found in his measurements of soldiers (to which work he was called by the Christian Commission during the war) that the negroes had the arm on an average an inch longer than the whites. We may hence conclude that cephalization has presided over the greater part of the changes in form which man has undergone in passing from the savage to the civilized state.

It follows from the facts that have been presented, that if the animal races have made progress through the ages as a consequence of a struggle for life and natural selection, as claimed by Darwin, or if there has been any system of natural causes at the basis of evolution, the progress must have been subordinated to this law of cephalization. The brain is the part of an animal that, in one way or another, comes most into contact with the outer world; for all the senses react upon it, and hence all outside influences and the whole constitution of the being bear upon its condition. It would be likely, therefore, to undergo modifications for better or worse according as the conditions favor progress or the reverse. This may not unfrequently be the source of new varieties of animals—that is, the means by which an impress is made on the embryo and a new variety initiated.

The evidences of the connection of grade, and also of classification, with cephalization, might be traced through all the grand divisions of the animal kingdom. But to give full illustrations of the subject in the various departments of zoology would require a mention of details that would here be out of place. Sufficient has been brought forward to explain the principle, and give some idea of its importance. J. D. Dana.

Cephalo'nia [anc. *Cephallenia;* Gr. Κεφαλληνία], the largest of the Ionian Islands, and now constituting one of the nomarchies of the kingdom of Greece, is in the Mediterranean near the W. coast of Greece. It is about lat. 38° N. and lon. 20° 30′ E. The greatest length is 32 miles, and the area 300 square miles. The surface is mountainous, the climate is pleasant, and the soil is mostly thin. The highest summit rises about 5000 feet above the level of the sea. The chief articles of export are currants and olive oil. The principal towns are Argostoli and Lixuri. There are many ancient ruins upon the island. This island was called *Samos* by Homer. Pop. in 1870, 77,382.

Cephalop'oda, or **Ceph'alopods** [from the Gr. κεφαλή, "head," and πούς (gen. ποδός), the "foot," because the "arms" or "feet" surround the mouth], the highest class of the Mollusca, including the cuttle-fishes, nautili, argonauts, ammonites, etc., all marine and carnivorous, and all laterally symmetrical, having a shell usually straight, but sometimes coiled in a vertical plane. The nautili and argonauts alone have external shells, though many extinct species had them; but the other living species have generally an internal shell, of which "cuttle-fish bone" affords an example. The cephalopods have muscular arms or tentacles, used in prehension and locomotion; many have fins, and all have the power of locomotion by forcibly expelling water from the gill-chamber. They generally have two large eyes, ear cavities, each containing an otolite, two jaws, and a fleshy, spinous tongue. The nervous system is well developed. The brain is a peri-œsophageal ring. The gills are either two or four in number, placed in a chamber into which water is admitted by a slit, and from which it is expelled through a "siphon" or "funnel." The class is divided into two orders—Dibranchiata and Tetrabranchiata, 2-gilled and 4-gilled cephalopods.

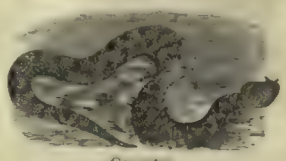
The Dibranchiata are swimmers, having (except the argonauts) an internal shell, or rarely none at all; eight or ten arms, with suckers and sometimes sharp hooks upon them; and an ink-bag filled with a dark fluid for coloring the water, concealing the animal in times of danger. The Dibranchiata are divided into octopods, having eight arms only (argonauts and Octopodidæ), and decapods, having ten arms, two of which are longer and used as tentacles (squids, belemnites (fossil), cuttle-fishes, and spirulæ).

The Tetrabranchiata are mostly extinct. They have external chambered shells, are creepers instead of swimmers, have four gills instead of two, have very numerous arms, eyes on a stem instead of being sessile, and have one heart with a single chamber, while the Dibranchiates have also two gill-hearts. The Tetrabranchiata have no ink-bag. The *Nautilus* proper (not the argonaut or paper nautilus) is the only living genus. The fossil species are very numerous, and include Nautilidæ, Orthoceratidæ, and Ammonitidæ.

Cephalop'tera [from the Gr. κεφαλή, the "head," and πτερόν, a "fin" or "wing"], a genus of cartilaginous marine fishes belonging to the ray family, and including the *Cephaloptera vampirus*, called sea-devil or vampire, sometimes weighing several tons. It is much wider than it is long, measuring some seventeen feet by ten. Each side of the head has a pre-cephalic fin coiled upon itself in the shape of a horn. It is sometimes found on the southern coast of the U. S., and is said to have been known to seize the cables of small vessels and tow them for miles at a great speed.

Ce'pheus, a constellation of the northern hemisphere, comprises about thirty-five stars, the largest of which is Alderamin, a star of the third magnitude.

Cerac'chi (Giuseppe), a skilful Italian sculptor, born about 1760, came to Philadelphia in 1791, and executed fine busts of Washington, Alexander Hamilton, and others. Among his works is a statue of Bonaparte. As an accomplice of Arena in a conspiracy against the life of Bonaparte, he was executed in 1802.



Ceram', or **Zeram',** an island of the Malay Archipelago, is the largest of the Moluccas except one. It is between Booroo and Papua, about 3° S. of the equator. Its length E. and W. is nearly 200 miles, and its area about 6500 square miles. Pop. 67,000. It is partly occupied by mountains, the highest points of which rise 8000 feet or more above the level of the sea. The vegetation here is luxuriant, and the highlands are mostly covered with forests. The clove and nutmeg grow wild in Ceram, which also produces the sago-palm in abundance. The lowlands are peopled by Malays, who are bold sailors and pursue trade. The mountains are inhabited by fierce Alfooroos. The Dutch claim the sovereignty of this island.

Ceramia'ceæ, a natural order of cryptogamous plants, or a sub-order of Algæ, consisting of sea-weeds of a rose color, with fronds formed of cells arranged in rows or in a single row; the sporocarps contain cells or spores, often in fours, with a transparent perispore, and enclosed in receptacles. They are found in the seas of the northern temperate zone. Many of them are beautiful, and some species afford food, as dulse and Carragheen (which see). The edible birds' nests of the Chinese market are supposed to derive their value from a plant of this order.

Ceram'ic [from the Gr. κέραμος, "potter's clay," an "earthen vessel" or "pottery"], pertaining to pottery, fictile. The term ceramic art is applied to the department of plastic art, which comprises all objects made of baked clay, as vases, urns, bassi-rilievi, etc.

Cerami'cus [Gr. Κεραμεικός; see last article], a place near Athens and without the walls where citizens who fell in battle were buried at the public expense; the potter's field or quarter.

Ceras'tes [from the Gr. κέρας, a "horn"], or **Horned Snake,** a genus of venomous serpents of Northern Africa, having a flattened head, two rows of plates under the tail, and keeled but not spinous scales. The nostril is small and semi-lunar. Its name is derived from the horned scale which grows upon the eyelids of the male. Several deadly species of *Clotho* of West and South Africa have somewhat similar horns, and are by some included in this cognate genus.

Cerastes.

Ce'rate [Lat. *ceratum,* from *cera,* "wax"], a compound of wax with other oily and medicinal substances in such proportions as to have the consistence of an ointment. Simple cerate is made by melting together equal parts of white wax and olive oil; they are to be heated together, and carefully stirred into a uniform consistence while cooling.

Ce'ratites [from the Gr. κέρας, a "horn"], a genus of the fossil Ammonitidæ (which see) characteristic of the Trias formation, to which it is peculiar. It is distinguished by having the lobes of the sutures serrated, while the intervening curves, directed towards the aperture, are simple.

Cer'berus [Gr. Κέρβερος], the triple-headed dog which, as the ancient Greeks imagined, guarded the portal of the infernal regions. He resisted only those who attempted to come out of Hades. Hercules is said to have overpowered him and dragged him out. The name Cerberus was given by Hevelius to a northern constellation.

Cerca'ria, the larval form of various trematode worms (*Distoma, Bilharzia,* etc.). The perfect worm deposits an egg, which hatches into a curious little sac, formerly known as *Opalina,* itself often entozoic, and once believed to be

an infusorian. The opalina in turn gives birth by internal gemmation to one or more *Cercariæ*, which are oval tailed organisms which swim actively in water, and finally enter, if possible, into the bodies of insect larvæ, mollusks, fishes, etc., and are thus often indirectly, or in many cases directly, introduced into the stomachs of men and various vertebrate animals. Here they become developed into trematode worms.

Cer'cis Canaden'sis, Red Bud, or **Judas Tree,** a small tree of the natural order Leguminosæ, is a native of the U. S., and is cultivated as an ornamental tree. It has cordate, pointed leaves, and red-purple flowers in umbel-like clusters. It flowers early in the spring, before its leaves are opened. (See JUDAS TREE.)

Cercoce'bus [from the Gr. *κέρκος*, a "tail," and *κῆβος*,

Cercocebus fuliginosus.

a "monkey"], a genus of long-tailed African monkeys, collectively called "mangabeys" by Buffon. They are remarkable for their ludicrous antics, their almost constant grotesque grinning, and their general good temper. The sooty monkey (*Cercocebus fuliginosus*) is the best known.

Cercopithe'cus [from the Gr. *κέρκος*, a "tail," and

Cercopithecus cynosurus.

πίθηκος, an "ape"], a genus of small, long-tailed African monkeys of the family Simiadæ. The species are very numerous. They have mostly long hair, and long and large tails, which they carry over the back. They are collectively called guénons by some authors. One of the best known is the malbrouck (*Cercopithecus cynosurus*), or dog-tailed monkey.

Cère, a river of Southern France, noted for the picturesque beauty of its valley, flows through Cantal and Lot, and enters the Dordogne. It is about 55 miles long.

Cere'a, a market-town of Italy, in the province of Verona, in Lombardy, 19 miles S. S. E. of Verona. It has the ruins of an ancient castle. Pop. 5518.

Ce'real [Lat. *cerealis*, from *Ceres*, the goddess of agriculture]. Originally, *cerealis* signified pertaining to Ceres or sacred to Ceres. Bread or grain was called *cerealia munera* ("cereal gifts," or "gifts of Ceres"). In modern language, cereal means pertaining to edible grain or breadstuffs, as wheat, rye, maize, and barley; as a noun it denotes those articles of food.

Cerea'lia, or **Cereal Plants,** the plants which produce edible grains, and are cultivated for their seeds, which are used as breadstuffs. With the exception of buckwheat, they belong to the order Graminaceæ (true grasses), but differ widely in structure and characters. Having been cultivated from a very remote antiquity and modified by cultivation, their original forms and native countries cannot be ascertained. Difficulty is found in arranging the numerous varieties in their proper species. The most important cereal grasses are wheat (*Triticum*), barley (*Hordeum*), maize (*Zea*), rye (*Secale*), rice (*Oryza*), and oats (*Arena*). Rice is the chief food of a greater number of the human family than any other grain, but wheat is generally admitted to be superior as a material for bread to all the other cereals. Maize will thrive in regions which are too warm for wheat. The cereal grains are extensively used in the manufacture of fermented and distilled liquors.

Cerebellum. See BRAIN, by PROF. HENRY HARTSHORNE, A. M.

Cer'ebro-spi'nal Flu'id, a serous liquid, of alkaline reaction, containing a small percentage of saline and animal matters. It fills the subarachnoid space, between the arachnoid membrane and pia-mater, both within the skull and the vertebral canal. It prevents injury from concussions and shocks, and perhaps prevents undue pressure upon the brain by withdrawing itself into the spinal canal at times when the brain contains more blood than usual. In certain diseases it is secreted in great excess.

Cerebro-spinal Meningitis. See MENINGITIS.

Cere'do, a post-village of Wayne co., West Va., on the Ohio River, about 12 miles S. E. of Ironton (O.). It has a manufactory of glass bottles. Pop. including Ceredo township, 1297.

Cereop'sis, a genus of Australian geese, extremely common on the continent and islands of its native region They are large and easily domesticated, but are quarrelsome, and when tamed are so fierce and so tyrannical in the poultry-yard that they have not been generally bred. Unlike other geese, they seldom seek the water. The *Cereopsis Novæ Hollandiæ*, or Cape Barron goose, is the best known species.

Ce'res, the Roman name of the goddess of agriculture, whom the Greeks called DEMETER, and to whom men were supposed to be indebted for the gift of breadstuffs. She was said to be the daughter of Cronos (Saturn) and the mother of Proserpine. The most remarkable part of the myth of Ceres was the abduction of her daughter by Pluto, and the long search which Ceres made for her. (See PROSERPINE.)

Ceres, the name of an asteroid discovered by Piazzi at Palermo in Jan., 1801. It was the first asteroid ever discovered. Its apparent size is nearly equal to that of a star of the seventh magnitude.

Ceres, a township of McKean co., Pa. Pop. 798.

Ceres'co, a township of Blue Earth co., Minn. Pop. 313.

Cérésole (PAUL), a Swiss statesman, born Nov. 16, 1832, son of a clergyman, studied law in Lausanne. He held several offices in the cantonal government of Vaud, and became a member of the Swiss Federal Assembly in 1870, of which he became vice-president in 1872, and president in 1873. He was identified with a movement by which the central government was greatly strengthened.

Ce'reus, a genus of plants of the order Cactaceæ, comprises about 100 species, some of which have beautiful flowers. The *Cereus speciosissimus*, a native of Mexico, is cultivated in greenhouses. Its flowers are large and of a fine scarlet color, and its fruit, when well ripened, is delicious. The night-blooming cereus (*Cereus grandiflorus*), a native of South America, bears large, beautiful, and fragrant flowers, which expand and fade in the course of one night. It has been used in medicine as an antispasmodic.

Cerigno'la, an episcopal town of Italy, in the prov-

ince of Foggia, 24 miles S. E. of Foggia. It has a college and several convents; also manufactures of linen. The Spaniards gained here a decided victory over the French in 1503, and the French commander, the duke of Nemours, was killed in that action. Pop. 17,242.

Cer'igo [anc. *Cythera*; Gr. Κύθηρα], one of the Ionian Islands, now constituting, with the neighboring small islands, an eparchy of the nomarchy of Argolis and Corinth, in the kingdom of Greece, is in the Mediterranean, and is separated by a narrow strait from the Morea. Area, 107 square miles. The surface is mountainous and rocky. The soil is not rich, but produces some wheat, olives, grapes, etc. Here is a remarkable stalactitic cavern. The ancient *Cythera* was sacred to Venus, and said to be her favorite residence. Capital, Capsali. Pop. in 1870, 10,637.

Cerin'thus [Gr. Κήρινθος], a heretic who lived in Asia Minor and Syria between 50 and 100 A. D. He was the founder of a sect called Cerinthians, and appears to have been a Gnostic. He taught that the righteous shall arise from the dead and enjoy a millennium in this world. The statements of the early Christian writers on the subject of his doctrines are contradictory. It is supposed that St. John wrote his Gospel to confute the errors of Cerinthus.

Ce'rite, or Och'roite, a name of a mineral which contains a silicate of cerium, and is found in Sweden. It occurs in granular pieces of a clove-brown, cherry-red, or gray color, and has a splintery fracture and adamantine lustre. It contains in 100 parts—peroxide of cerium, 26.55; oxide of lanthanum, 33.38; silica, 16; carbonic acid, 4.62; peroxide of iron, 3.53; alumina, 1.68; lime, 3.56; water, 9.1.

Ce'rium (symbol Ce; equivalent 92), a rare metal which is obtained from cerite. It is not employed in the arts and manufactures, but its oxalate is a valuable anti-emetic medicine in certain cases. Combined with oxygen, it forms two oxides. It is difficult to procure it in a separate or metallic state.*

Cerre'to Sanni'ta, a town of Italy, in the province of Benevento, is on a slope of the Apennines, 22 miles N. E. of Capua. It has a cathedral with fine paintings, a collegiate church, and manufactures of coarse woollen cloth. Pop. 5168.

Cer'ro-de-Pas'co, or Pasco, a town of Peru, department of Junin, is 138 miles N. E. of Lima, and 13,673 feet above the level of the sea. It is ill-built and irregular. The population is variable, and consists of miners. Here are rich silver-mines. Pop. 14,000.

Cer'ro Gor'do, a county in the N. of Iowa. Area, 576 square miles. It is drained by Shell Rock River and Lime Creek. The surface is undulating; the soil is fertile. Corn, wheat, and wool are staple crops. It is intersected by a branch of the Milwaukee and St. Paul R. R., and by the Central R. R. of Iowa. Capital, Mason City. Pop. 4722.

Cerro Gordo, a post-village, capital of Holmes co., Fla., 105 miles W. N. W. of Tallahassee, on the navigable Choctawhatchie River. Pop. 672.

Cerro Gordo, a post-township of Inyo co., Cal. P. 474.

Cerro Gordo, a township of Piatt co., Ill. Pop. 1650.
